650-M.* The Effect of Segregation on the Diffraction From a Face-Centered Cubic Alloy With Deformation Faults. B. T. M. Willis. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 683-689.

Calculation of X-ray scattering from a deformation faulted f.c.c. alloy in which segregation of the alloy components has taken place at the faults. 8 ref. (M22g, M26s, 3-68)

651-M.* On the Crystal Structure of Protactinium Metal. Jerry Donohue. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 697-698.

X-ray diffraction data interpreted in terms of orthorhombic structure in contrast to previously proposed tetragonal structure. (M26n; Pa)

652-M.* On the Crystal Structure of Protactinium Metal. W. H. Zachariasen. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 698-700.

Re-examination of X-ray diffraction data and re-affirmation of tetragonal structure. (M26n; Pa)

653-M.* Crystal Structures of $ZrBe_5$ and Zr_2Be_{17}. Allan Zalkin, Ray G. Bedford and Donald E. Sands. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 700.

X-ray powder patterns for $ZrBe_5$ and Zr_2Be_{17} intermetallic compounds. 5 ref. (M26q; Zr-b, Be-b)

654-M.* A New Intermediate Phase in the Niobium-Aluminum System. C. R. McKinsey and G. M. Faulring. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 701-702.

X-ray diffraction data for intermediate sigma phase Cb_2Al. 5 ref. (M24b, M26q; Cb-b, *Al*)

655-M.* The Crystal Structures of $PuNi_3$ and $CeNi_3$. Don T. Cromer and Clayton E. Olsen. *Acta Crystallographica,* v. 12, Sept. 10, 1959, p. 689-694.

Structure of $PuNi_3$ and structure and composition of $CeNi_3$ determined by single crystal X-ray methods. 9 ref. (M26q, M25m; Ni-b, Ce-b, *Pu*)

656-M. Application of Electron Microscopy. Jaroslav Koutsky and Jaroslav Jezek. *Metal Treatment and Drop Forging*, v. 26, July-Aug. 1959, p. 264-272.

(M21e)

657-M. Reciprocal Lattice Concept. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 80-82.

In relation to X-ray diffraction. (M22g)

658-M. Cylindrical Powder Cameras. George J. Klems. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 82-86.

Principles of powder method, sample preparation, use of camera, interpretation of results and application. (M22g, 1-53)

659-M.* Technique for Determining the Orientation of Single Crystals of Bismuth. D. T. J. Hurle and S. Weintroub. *British Journal of Applied Physics*, v. 10, July 1959, p. 336-339.

Both X-rays and light figures are used to determine orientation of Bi crystal by back-reflection Laue technique. (M26c, M22g)

660-M. (Russian.) High-Temperature Constitution of Unsaturated Solid Solutions. B. I. Prosvirin. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 13-18.

Microhardness measurements performed with Cr-Ni steels of varying composition. Effect of holding at 1200 and 1300° C., previous to water quenching, on identical results obtained from microhardness measurements is explained by the formation of atom complexes. 17 ref. (M25, Q29q, 2-64, 2-62; SS)

661-M. (Russian.) Change of the Substructure After Completion of One Cycle of Loading. M. Ya. Gal'perin, E. P. Kostyukova and B. M. Rovinskii. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 56-61.

Al and Ni were subjected to one alternate bending cycle to study its effect on the substructure. Influence of the substructure present before loading; significance of the substructure on the strain hardening effect observed in the beginning of cycling and disappearing as the number of cycles increases. 14 ref. (M26n, N7e, Q5, 1-63, 3-71; Al, Ni)

662-M. (Russian.) Atomic X-Ray Scattering in Solid Solutions of Copper With Nickel. L. N. Guseva and B. I. Ovechkin. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 82-85.

Effects of composition ratio and temperature on X-ray diffraction. 6 ref. (M22g; Cu-b, *Ni*)

663-M. Cathodic Bombardment Etching of Nuclear Materials. D. Armstrong, P. E. Madsen and E. C. Sykes. *Journal of Nuclear Materials*, v. 1, July 1959, p. 127-135.

Simple apparatus for cathodic etching by ion bombardment; etching conditions for variety of metals, alloys and ceramics including U, Th, Zr and other materials. 18 ref. (M20q; U, Th, Zr)

664-M.* Effect of Irradiation on Fuel Materials. J. H. Kittel and S. H. Paine. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 500-509.

Damage which occurs at moderate irradiation temperatures is primarily due to surface roughening and anisotropic growth. Certain alloying additions greatly refine the grain size in uranium, thus eliminating surface roughening. These also alter the transformation kinetics permitting preferred orientations to be removed by heat treatment. 12 ref. (M27c, T11g, 2-60, 2-64, 2-67; U-b)

665-M.* (English.) On the Defect Structure of Rutile. Tor Hurlen. *Acta Chemica Scandinavica*, v. 13, no. 2, 1959, p. 365-376.

Theoretical analysis of the oxidation behavior of Ti and Ti alloys. Structural considerations, effect of impurities, color observations, density, conductivity, weight change measurements and oxidation phenomena. 21 ref. (M26r, M26s, R1h; Ti)

666-M.* (English.) X-Ray Investigations on Me-Si-B Systems (Me=Mn, Fe, Co). Pt. 1. Some Features of the Co-Si-B System at 1000° C. Intermediate Phases in the Co-Si-B and Fe-Si-B Systems. Bertil Aronsson and Gunvor Lundgren. *Acta Chemica Scandinavica*, v. 13, no. 3, 1959, p. 433-441.

Crystal structures and compositions of phases. 23 ref. (M26r, M24c; Co, Fe, Mn, *B, Si*)

667-M.* (English.) An X-Ray Investigation of the Nickel-Boron System. The Crystal Structures of Orthorhombic and Monoclinic Ni_4B_3. Stig Rundqvist. *Acta Chemica Scandinavica*, v. 13, no. 6, 1959, p. 1193-1208.

Existence of Ni_3B, Ni_2B and NiB confirmed. Unit cell of orthorhombic Ni_4B_3 varies slightly with phase composition. 16 ref. (M24b, M26r; Ni, NM-a37, B)

668-M. (Russian.) Light Reflection Patterns Obtained From Tungsten Crystals. V. K. Shtein. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 90-95.

After etching, a fine beam of light is directed to the crystal surface. The reflected light pattern projected on a screen is typical for individual crystal planes and their position with reference to the surface. 6 ref. (M26n, P17a; W, 14-61)

669-M. (Russian.) Reaction of Tellurium With Aluminum Antimonide. M. S. Mirgalovskaya and E. V. Skudnova. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no.2, 1959, p. 104-108.

Thermal analyses, microstructure and microhardness tests performed with Al-Sb-Te alloys of varying composition. Phases determined are AlSb, $AlTe_3$, Sb_2Te_3 and Sb. 11 ref. (M24c; Al-b, *Sb, Te*)

670-M.* Etch Pits in Zinc. Guido Bassi and J. P. Hugo. *Institute of Metals, Journal*, v. 87, July 1959, p. 376-379.

Quenching and annealing of coarse-grained Zn containing 0.002% Sn result in localized chemical attacks known as etch pits. At higher temperatures there is a progressive increase in size and decrease in number. Above a limiting temperature a decrease in size occurs. This behavior can be explained by diffusion of the Sn atoms to the dislocations. 5 ref. (M20q, 2-61, 2-64; Zn, *Sn*)

671-M.* Austenitic Grain-Size Control of Medium-Carbon and Carburizing Steels. B. L. Biggs. *Iron and Steel Institute, Journal*, v. 192, Aug. 1959, p. 361-377.

Austenitic grain size obtained by heat treatment of medium-carbon and carburizing steels. Effects of pure Al, or Al alloyed with Si, Mn, V, Ca, Zr or Ti, in increasing grain coarsening temperatures (M27c, 2-64, 2-60; CN-p, *Al, Si, V, Mn, Ca, Zr, Ti*)

672-M. Low Melting Point Alloys of Cerium With Iron, Cobalt and Plutonium. J. K. Critchley. *United Kingdom Atomic Energy Authority*, AERE-M 488, 1959, 17 p.

Ce-rich portions of the Ce-Fe, Ce-Co, Ce-Fe-Co and Ce-Co-Pu systems investigated by thermal analysis. Low-melting alloys of potential use as fast reactor fuels occur in the Ce-Co-Pu system; solidification behavior. (M24b, M24c; Ce-b, *Fe, Co, Pu*)

673-M. (Russian.) Equilibrium of the System W-Cb. B. I. Krimer and Yu. E. Matveev. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat Moscow, 1958, p. 420-426.

By means of radiographs the presence of one phase of a bcc. lattice can be proved. Effect of composition ratio and heat treatment on hardness, resistivity lattice constant and melting point. 4 ref. (M24b, Q29n, P15g, M26, P12n, 2-61, 2-64; W-b, *Cb*)

674-M.* Magnetic Susceptibilities of Titanium-Rich Titanium-Oxygen Alloys. Y. L. Yao. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 851-854.

Solubility limit of oxygen in alpha Ti at 850° C. is determined by magnetic measurements as 12.5 ± 0.5% (29.0—30.9 at .%). Also, in the susceptibility-concentration curve, there is a distinct but not sharp maximum at 19.0 ± 0.5 wt. % (40.5—42.1 at .%), which indicates the presence of the delta phase. 7 ref. (M24b, P16, P12e; Ti-b, *O*)

675-M.* Studies of the Compound Ni_3Al by High-Temperature X-Ray Methods. R. W. Guard and J. H. Westbrook. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 871-872.

Observations of the Debye-Scherrer patterns for Ni_3Al taken at 800 and 1000° C. 5 ref. (M26q, 2-62; Ni-b, *Al*)

676-M.* (Japanese.) Electron-Microscopic Observation of A-Type Nonmetallic Inclusions in Ball-Bearing Steel. Kiyoji Deguchi, Tomitaka Nishimura and Hiroshi Suyama. *Tetsu to Hagane*, v. 45, July 1959, p. 705-712.

Indentification and classification of types of inclusions. (M21e; CN, 9-69, SGA-c)

677-M. X-Ray Investigations on Me-Si-B Systems. (Me=Mn, Fe, Co). Bertil Aronsson and Gunvor Lundgren. *Acta Chemica*

Scandinavica, v. 13, no. 3, 1959, p. 433-444. 23 ref. (M24c; Fe, Mn, Co, *Si*, B)

678-M. (Russian.) Phase Constitution of the Liquid System Nickel-Sulphur. S. E. Lyumkis, B. M. Mimukhin and L. L. Chermak. *Tsvetnye Metally*, no. 3, 1959, p. 29-32.

12 ref. (M24b; Ni, *S*)

679-M.* Temperature Dependence of Grain Migration in High-Purity Lead Containing Small Additions of Tin. K. T. Aust and J. W. Rutter. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 820-831.

Data on bicrystals of zone-refined Pb containing from 20 to less than 1 ppm. by weight of Sn. The apparent activation energy in the temperature range from 320 to 200° C. is markedly dependent upon the solute Sn concentration and the orientation relationship of the grains adjacent to the grain boundary. 28 ref. (M26b, 2-60, 2-61; Pb-a, *Sn*)

680-M.* Preferred Orientation in Extruded Aluminum Rod. C. J. McHargue, L. K. Jetter and J. C. Ogle. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 831-837.

Orientation as a function of extrusion temperature, extrusion speed and position in the rod. Duplex <111> - <001> textures were developed for slow extrusion speeds at temperatures of 75 to 850° F. and for fast extrusion speeds at temperatures of 75 to 450° F. The <001> textures component is primarily due to recrystallization occurring during fabrication. 36 ref. (M26c, F24, 2-61, 3-67, N5; Al, 4-55)

681-M.* Observations on the Decomposition of Delta Phase in a Copper-Tin Alloy. Ronald D. Nelson and D. H. Polonis. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 874-875.

Delta decomposition in Cu-Sn alloy powders containing 32.6% Sn. Alloy lump specimens exhibited entirely delta phase after fairly slow cooling (air cooling) from above 350° C. Only delta phase was detected by X-ray diffraction in powders which were heat treated 4 hr. at 450° C. and air cooled to room temperature. Lattice parameter of delta was found to be 17.92A. 6 ref. (M24b; Cu-b, *Sn*)

682-M.* (German.) Determination of Structure of Nitrided Zones With Optical and Electron Microscopy. M. Koch. *Metalloberflache*, v. 13, Aug. 1959, p. 242-245.

Structure as dependent on nitriding process and also steel composition. (M21e, M27, J28k; ST)

683-M.* (German.) Use of the Electron Microscope in the Investigation of Corrosion and Protective Films. M. Hollo and F. Guba. *Metalloberflache*, v. 13, Sept. 1959, p. 273-276.

Electron microscopy of polished pure Al surfaces, after annealing at 300-600° C., to determine the theoretical diffusion conditions along the grain boundaries. Lattice structure and pore diameter of Al oxide layers. (M21e, M27f, M26, 2-64; Al-a)

684-M. The Measurement of Grain Contiguity in Opaque Samples. J. W. Cahn and J. E. Hilliard. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 759-761.

The degree of contiguity (or contact) between adjacent grains are described by three parameters which can be rigorously determined from measurements on a random plane of polish. (M27c)

685-M. (French.) Structural Changes in Refractory Steels and Alloys Used in Furnaces for Gas Carburization. G. Pomey. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Oct. 1959, p. 471-483.

9 ref. (M26, N8r; SS)

686-M.* Electron Diffraction Studies of Structure Changes in Vacuum-Deposited Films. Rudolf Thun and George Hass. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 58-71.

Data on crystal growth, changes of crystal orientations, transitions from an amorphous to a crystalline modification or from one crystalline phase to another, reactions between solids and reactions between a gaseous and a solid phase. 16 ref. (M22h, M26, 1-73; 8-72, 14-62)

687-M.* Texture of Evaporated NiFe Thin Films. R. R. Verderber. *Journal of Applied Physics*, v. 30, Sept. 1959, p. 1359-1363.

Determination of the texture of thin NiFe films to obtain quantitative pole figures. Films of a thickness of 1000 or 2000 Å were deposited on glass slides under vacuum condition. Method of determination utilizes X-ray reflection technique and employs a reflection goniometer. (M26c; Ni-b, Fe, 14-62)

688-M.* Phase Diagram of Rubidium to 150,000 Kg/Cm² and 400° C. F. P. Bundy. *Physical Review*, v. 115, July 15, 1959, p. 274-277.

Correlation between pressure, temperature, electrical resistance and melting temperature is found by experimental measurements. A room temperature transition is found at 107,000 kg. per sq. cm. 10 ref. (M24a, P15g, 2-61, 3-74; Rb)

689-M.* (German.) Isolation of Microconstituents in Nickel Alloys. C. Ilschner Gensch. *Technische Mitteilungen Krupp*, v. 17, Sept. 1959, p. 130-136.

Ideal electrolytic isolation conditions determined by current curves. Microscopic analysis of the isolated phases; lattice structure. 8 ref. (M23s, M26; Ni-b)

690-M.* (Japanese.) Investigation on the Phase Diagram of the System Al-Zn-Mg. Hisafuji Watanabe. *Japan Institute of Metals, Journal*, v. 23, May 1959, p. 285-288.

Diagram was obtained by inverse rate thermal analysis, electric resistance measurement, X-ray analysis and microscopic observation. (M24c; Al-b, *Zn, Mg*)

691-M.* (Japanese.) Fine Bands Appearing in an Electron Micrograph of Martensite in Kovar. Zenji Nishiyama, Ken'ichi Shimizu and Ryusuke Kawanaka. *Japan Institute of Metals, Journal*, v. 23, May 1959, p. 311-314.

Observation of the fine lamellae in the martensite in Kovar using replicas. Lamellae are hardly seen in the surface relief, but are clearly revealed by light etching of that surface. (M20r; Co-b, *Ni, Fe*)

692-M.* (Japanese.) Study of the Crystal Structure of Zinc Powders by X-Ray Diffraction Method. Pt. 6. Reactivity of Zinc Powders. Yoshio Kubota. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 448-452.

Relationship between crystal structure and chemical reactivity of caustic electrolytic Zn powders. 14 ref. (M26, P13b, H10b; Zn, 6-68)

693-M.* (Japanese.) Equilibrium Diagram of the System Ti-Al. Tomo-o Sato, Yen-Chien Huang and Yutaka Kondo. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 456-460.

Emphasis is placed on Ti-rich portion of system. Phase equilibria, compositions and reactions at high temperatures; structure of various solid phases. 11 ref. (M24b, M27; Ti-b, *Al*)

694-M.* (Japanese.) An X-Ray Study on the Structure of Ordered Guinier-Preston Zone Formed in Aged Magnesium-Rich Magnesium-Silver Alloys. Shin'ichi Nagashima. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 460-464.

Two zones existing in a 12.6% Ag magnesium alloy are of platelet and oblate elipsoid form. The second zone possesses an ordered arrangement of Ag atoms. 6 ref. (M26p, N7a, M21f; Mg, *Ag*)

695-M.* (Japanese.) An X-Ray Study on the Structural Aging Characteristics of Magnesium-Rich Magnesium-Silver Alloys. Shin'ichi Nagashima. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 465-468.

Effect of aging time and temperature on the formation of Guinier-Preston zones and gamma phase precipitates in a 12% Ag alloy. 5 ref. (M26, M27d, M21f, 2-65, 2-61; Mg-b, *Ag*)

696-M. (French.) Microscopic and Electron Diffraction Testing of Thin Titanium Foils Containing 7.10 or 15% Al. A. Saulnier and M. Croutzeilles. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Sept. 1959, p. 379-387.

13 ref. (M21, M22h; Ti-b, *Al*, 4-56)

697-M. (French.) Creation of Fine Grain in Uranium by Small Additions and Heat Treatment. H. Aubert and J. Gerland. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Sept. 1959, p. 393-402.

8 ref. (M27c, 2-64, 2-60; U, AD-p35)

698-M. (Russian.) Method to Determine Phase System in Binary Alloys. I. B. Borovskii and I. D. Marchushkova. *Doklady Akademii Nauk SSSR*, v. 125, Apr. 1959, p. 835-837.

Suggested method is more simple than the combination of chemical, X-ray and dilatometric tests. 7 ref. (M24b, 1-54)

699-M. (Russian.) Characteristic Temperatures of a Copper-Aluminum Alloy From 96 to 803° K. A. S. Kagan and Ya. S. Umanskii. *Izvestiya VUZ-Tsvetnaya Metallurgiya*, no. 5, 1959, p. 143-145.

Temperatures of X-ray diffraction maxima. (M22g, 2-61; Cu-b, *Al*)

700-M. (Russian.) The Titanium-Aluminum-Columbium System. M. V. Mal'tsev, G. P. Danilova and A. R. Avidon. *Izvestiya*

VUZ-Tsvetnaya Metallurgiya, no. 5, 1959, p. 146-150.
(M24c; Ti-b, *Al*, *Cb*)

701-M. (Russian.) Electron Microscopy of Temperature Changes in Magnetic Structure of Ferromagnetics. I. S. Svitnikov, G. V. Spivak and I. M. Saraeva. *Izvestiya Akademii Nauk, SSSR*, v. 23, June 1959, p. 734-737.
(M21e, M27g; SGA-n)

702-M. (Russian.) Clarification of the Structure of Metals and Alloys by Cathodic Bombardment. V. E. Yurasov, G. V. Spivak and F. F. Kushnir. *Izvestiya Akademii Nauk, SSSR*, v. 23, June 1959, p. 746-749.
7 ref. (M20q)

703-M. Studies of Individual Dislocations in Crystals by X-Ray Diffraction Microradiography. A. R. Lang. *Journal of Applied Physics*, v. 30, Nov. 1959, p. 1748-1755.
Observation of individual imperfections within Si by X-ray diffraction images showing a projection of a crystal slice. (M22g, M22b, 3-71; Si-a, 14-62)

704-M. (Russian.) Structure of Oxides Forming on the Surface of Titanium. D. I. Lainer and M. I. Tsypin. *Zavodskaya Laboratoriya*, v. 25, no. 10, 1959, p. 1209.
(M26r, R1h; Ti)

705-M.* (German.) Energy and Electrical Resistivity of High-Angle Grain Boundaries in Metals. A. Seeger and G. Schottky. *Acta Metallurgica*, v. 7, July 1959, p. 495-503.
Calculation of energy and electrical resistivity for a simple model of high-angle grain boundaries using the electron theory of metals. Comparison with measurements of grain boundary energy made on Ag and Cu. 16 ref. (M27f, P15g; Ag, Cu)

706-M.* Dislocation Arrangements in Aluminum Deformed in Tension or by Fatigue. R. L. Segall and P. G. Partridge. *Philosophical Magazine*, v. 4, Aug. 1959, p. 912-919.
The dislocation distribution in Al deformed in tension as a function of stress. At stresses up to 3 kg. per sq. mm. the distribution is extremely irregular; at higher stresses, up to the fracture stress, polygon boundaries are formed which become increasingly well developed with increasing stress. 19 ref. (M26b, 3-68, 3-66; Al)

707-M.* X-Ray Measurement of the Atomic Scattering Factor of Iron. Boris W. Batterman. *Physical Review*, v. 115, July 1, 1959, p. 81-86.
X-ray powder diffraction reflection intensities for Fe relative to Cu and single-crystal NaCl; atomic scattering factors determined independently from extinction, preferred orientation and surface roughness effects. Comparison with theoretical scattering from free-atom wave functions. (M22g, M25n; Fe-a)

708-M.* Dislocation Dynamics at Low Temperatures. J. Lothe. *Physical Review*, v. 115, Aug. 1, 1959, p. 543-550.
Derivation of creep rate at low temperature for stress-independent activation energy based upon a model for the nucleation and growth of kinks in dislocation lines below the Peierls energy barrier. Comparison with experimental data for pure single crystals of Al under conditions of single slip. (M26b, Q3n, 2-63; Al-a, 14-61)

709-M.* Dislocations and the Plastic Deformation of Crystals. Robert V. Coleman. *Yale Scientific*, v. 34, Oct. 1959, p. 19-21.
Edge and screw dislocations determined in pure Fe crystals by etch pit technique. Polygonization of crystals produced by annealing at 600-800° C. for a number of hours. (M26b, M20q, 3-68, 2-64; Fe-a, 14-61)

710-M. (Translation—AIP.) Study of the Imperfect Structure of Metallic Single Crystals by Neutron Diffraction. B. G. Liaschenko, D. F. Lituin, I. M. Puzei, G. Abov and V. S. Golovkin. *Soviet Physics, Crystallography*, v. 3, July 15, 1959, p. 147-152.
Intensity of diffraction reflections associated with neutron scattering in Ni alloys. (M22j; Ni, 14-61)

711-M. (Translation—Brutcher no. 4413.) Effect of Columbium on the Structure of Welds in Austenitic 18-8 steels. N. F. Lashko. *Avtomaticheskaya Svarka*, v. 11, no. 6, 1958, p. 84-87.
(M26, 2-60; SS-e, 7-51, *Cb*)

712-M. (Translation—Brutcher no. 4503.) Dendritic Segregation of Silicon in Steel. Ya. N. Malinochka. *Stal'*, v. 18, Dec. 1958, p. 1130-1132.
See item 137-M 1959. (M27, S11e; ST, *Si*, 9-69)

713-M. (Translation—Brutcher no. 4738.) Effect of Aluminum, Silicon and Chromium on the Primary Structure of Low-Carbon Steel. O. D. Moldavskii and A. P. Pronov. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo*, no. 2, 1959, p. 40-42.

Effects of Al and Si on the primary grain is explained by changes in the surface tension between the liquid metal and the developing crystal. The grain size was not changed by addition of 0.5-3% Cr. 7 ref. (M27d, P13h, 2-60; CN-g, *Al, Si, Cr*)

714-M. (Translation—ConBur.) Investigation of the Structures of Liquid Bi-Sn Alloys. N. V. Alekeev and Ia. I. Gerasimov. *Proceedings of the Academy of Sciences of the USSR, Physical Chemistry Section*, v. 121, July-Aug. 1958, p. 521-525.

Radial distribution and normalized intensity curves. 5 ref. (M26; Bi-b, Sn-b, 14-60)

715-M. (Translation—ConBur.) Interaction Between Plutonium and Other Metals in Connection With Their Arrangement in Mendeleev's Periodic Table. A. A. Bochvar. *Soviet Journal of Atomic Energy*, v. 5, Sept. 1958, p. 1177-1191.

Binary alloys, solid solutions and intermetallic compounds of Pu with respect to the atomic number and atomic weight of the other constituent. Phase diagrams of the more important Pu alloys; structural data of compounds. (M24b, 2-60, 2-61; Pu, 14-67, 14-68)

SECTION N

TRANSFORMATIONS and RESULTING STRUCTURES

1-N.* Preparation of Single-Crystal Ingots of Silicon by the Pulling Technique. E. Billig and D. B. Gasson. *Journal of Scientific Instruments*, v. 35, Oct. 1958, p. 360-365.

Construction and operation of a laboratory furnace for preparing monocrystals of Si by the pulling technique. Design allows close observation of the growth front of the ingot during preparation. It has been found possible to assess the quality of high-grade Si and to obtain an indication of the concentration of dominant impurities responsible for the measured resistivity by comparison with computed distribution curves. (N3r, X24f, 14-61; Si)

2-N.* Recrystallization of Tungsten Wires. G. L. Davis. *Metallurgia*, v. 58, Oct. 1958, p. 177-184.

Tungsten wires recrystallize first by formation of a columnar structure with good retention of strength and ductility, while at higher temperatures secondary recrystallization occurs with embrittlement and lowered strength. The practically important temperature for onset of this coarsening is very sensitive to the nature of the starting material and its history. 17 ref. (N5; 4-61, W)

3-N.* (Russian.) Phase Transformation Gamma → (Gamma + Alpha) in Iron-Nickel Alloys. M. I. Zakharova, I. A. Ignatova and N. A. Khatanova. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 475-479.

The transformation in Fe alloy with 30-32% Ni is very slow at 400° C.; cold deformation at room temperature does not accelerate the gamma-to-alpha transformation; deformation of an alloy subjected previously to martensite transformation at -196° C. quickens the reverse gamma-to-alpha transition. (N6p; Fe, Ni)

4-N.* (Russian.) Transition of White Into Gray Tin. A. I. Bykhobskii. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 487-495.

New data regarding initial transition stage of beta-to-alpha Sn brought about by mercury surface diffusion; other methods give the final transition stages. Surface diffusion occurs in thin layers. The diffusion coefficient sharply increases in the presence of lattice tension. Effect of accelerated Hg surface diffusion is sharply noted in distorted surfaces and lowered temperatures. Transition is similar to martensite transition. 11 ref. (N6p, N1; Sn, Hg, 2-61)

5-N.* (Russian.) Microkinetics of Martensite Transformation. V. N. Arskii. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 496-504.

A 45% C, 19% Ni steel hardened at 1200° C. and having austenitic structure at room temperature was subjected to elongated deformation and lowered temperature. The process of martensite formation under these conditions consists of separate consecutive impulses. In one impulse (about 10^{-2} sec.) a large quantity of martensite crystals is formed. These can be expressed by a kinetic curve of phase transformation. There is no transformation between impulse intervals notwithstanding increased tension or lowered temperature. 13 ref. (N8p, 2-61, 3-68)

6-N. Use of Radioisotopes in Studies of Intermetallic Diffusion. David Lazarus. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/834, 1958, 17 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $.50.

By determining the diffusivity of various tracers at several different temperatures activation energies for the diffusion process can be determined to an accuracy of about 1%. Measurement of the diffusion of impurities in a pure metal, compared with the rate of self-diffusion, has provided quantitative rules for predicting a number of important properties of various alloys of the base metal. (N1c, 1-59)

7-N. (Japanese.) Chemical Composition and Graphite Spheroidization of Imported Pig Irons. I. Aoki and T. Tottori. *Japan Foundrymen's Society, Journal*, v. 30, Aug. 1958, p. 633-636.

(N8q, 2-60; CI-a)

8-N. (Russian.) Diffusion in Limited Solid Solutions of Nickel. A. Ia. Schiniaev. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 450-455.

Diffusion in systems: Ni-Ti; Ni-Ti-Cr and Ni-Ti-Cr-W-Al carried out at 920 - 1250° C. Iron was used as a diffusing media but was not a part of any of the alloys. 16 ref. (N1e; Ni, Ti, Cr, W, Al, 14-67)

9-N. (Russian.) Grain Sizes and Distortion Changes of the Second Order of Alpha and Gamma Phases in the Tempering of Hardened Chromium Steel. Z. K. Kosko. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 480-482.

Investigation of thin crystalline structure change in carbide transition from one formation into another. Appearance of a special carbide corresponds to large distortion of the second crystalline lattice order. In alpha and gamma phases, carbide separations are accompanied with granulations and a sudden distortion drop in the crystalline lattice of the second order. 3 ref. (N8a, M27c, 3-68, 2-64; AY, *Cr*)

10-N. (Russian.) Strain Relaxation in Nickel and Copper. M. G. Gaidukov and V. A. Pavlov. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 517-521.

Under load, the alloy undergoes an intensive diffusion process accompanied by vigorous strain relaxation. Experiments were carried out at 500 to 650° C. with an initial force of 2-4 kg. per sq. mm. At diffusion, during strain relaxation, an uneven atomic distribution occurs over the alloy mass, with complex atom formation; this is accompanied by reduced intensity of relaxing processes. 10 ref. (N1, N4, M25; Cu-b, Ni-b)

11-N. (Russian.) Determination of the Parameters of Diffusion for Iron and Chromium in Their Alloys. L. I. Ivanov and N. P. Ivanchev. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk*, Aug. 1958, p. 15-18.

Diffusion parameters for the alpha range for alloys with 26.17-82.50% Cr, 0.09-0.90% Al, 0.09-0.12% Si, 0.19-0.56% N, 0.016-0.03% P, 0.012-0.023% C. Tests were carried out at temperatures higher than the range of sigma phase precipitation. 12 ref. (N1c; Fe, Cr)

12-N.* Discontinuous Precipitation From Solid Solutions of Cadmium in Copper. Martii Sulonen. *Academiae Scientiarum Fennicae, Annales*, 1957, 68 p.

Structural changes in discontinuous precipitation and its kinetics. Metallographic methods used; microstructural changes and quantitative kinetic data. 66 ref. (N7b, N3m, N2g; Cu, *Cd*)

13-N.* Self-Diffusion in Silver During Plastic Deformation in Extension and Compression. J. B. Darby, Jr., C. T. Tomizuka and R. W. Balluffi, *University of Chicago, Institute for the Study of Metals*, Sept. 1958, p. 340-356.

Self-diffusion of Ag^{110} in single crystals subjected to simultaneous deformation at 800 and 900° C., using the sectioning technique. Crystals were orientated for duplex slip and deformed in extension and compression at constant strain rates. Recrystallization occurred in the initially single crystal specimens during diffusion-deformation under all conditions except tension at 800° C. Effect of straining on rate of diffusion was found to be small. 21 ref. (N1d, Q24; Ag, 14-61, 3-68)

14-N.* Stability Relationships in Cast Irons and Their Representation. W. A. Oates. *Australian Institute of Metals, Journal*, v. 3, May 1958, p. 76-83.

Factors affecting the occurrence of carbide and graphite in cast irons discussed in terms of thermodynamics and kinetics of precipitation reactions. Carbon potential-temperature diagrams. 25 ref. (N8s, E25n; CI)

15-N.* Diffusion of Hydrogen in Palladium. P. A. Silberg and C. H. Bachman, *Journal of Chemical Physics*, v. 29, Oct. 1957, p. 777-781.

Rate of flow of hydrogen through Pd measured in a range of 200 to 600° C. over the pressure range 10 to 70 cm. Hg. Flow rate is found insensitive to Pd wall thickness. Data not explainable in terms of existing theory. 20 ref. (N1a, N1b; Pd, *H*)

16 N.* Recrystallization of Tungsten Wires. G. L. Davis. *Metallurgia*, v. 58, Nov. 1958, p. 228-232.

Tungsten wires recrystallize first by formation of a columnar structure with good retention of strength and ductility. At higher temperatures secondary recrystallization occurs with embrittlement and lowered strength. Kinetics of the process. 30 ref. (N5f; W, 4-61)

17-N.* Growth of Crystal Whiskers. F. R. N. Nabarro and P. J. Jackson. Paper fr from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 14-101.

Proper whiskers are differentiated from whiskers grown from vapor, from the melt, from solutions and from those formed by chemical decomposition, under mechanical stress and by electrolysis. Current theoretical and experimental evidence. 250 ref. (N3r, 14-61)

18-N.* Growth of Metal Whiskers From the Solid. W. C. Ellis, D. F. Gibbons and R. G. Treuting. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 102-120.

Growth of Sn, Zn and Cd whiskers from the solid as a process of grain growth or recrystallization and growth entailing mass transport. A nucleating crystal of critical size grows from the surface to produce the whisker. Effect of strain and X-rays on growth; growth from vapor-plates on glass; observed growth directions, kinking and growth rates. 42 ref. (N3r; 14-61, Sn, Zn Cd)

19-N.* (German.) Recrystallization in Highly Heat Resistant Materials on a Nickel-Chromium and Cobalt-Nickel-Chromium Base. Werner Jellinghaus and Wilhelm Wink. *Archiv fur das Eisenhuttenwesen*, v. 29, Sept. 1958, p. 559-566.

Microscope, X-ray and hardness tests for recrystallization behavior. The recrystallization temperature were found to be around 760 to 1000° C., regardless of composition. 21 ref. (N5f, 2-60; Co, Cr, Ni, *Mo, V, W*)

20-N.* (Polish.) Recrystallization of Austenite in Structural Steel After Hot Plastic Deformation. Stanislaw Gorczyca. *Hutnik*, v. 25, July-Aug. 1958, p. 269-278.

Deformation in crystal structure, splintering in blocks of mosaic structure and crushing and deformation of grains in hot plastic deformation were found as process of recrystallization was investigated. Velocity of crystallization of austenite depends, to a high degree, on temperature and velocity of increase of new grains. Value of energy of activation approximates energy of activation of self-diffusion of Fe on boundaries of grains. Velocity of process of recrystallization depends on chemical composition of austenite. (N5f, N1d, 2-60, 3-68; ST)

21-N.* (Rumanian.) Cooling Curves for Nodular Graphite Cast Iron. L. Sofroni. *Studii şi Cercetări de Metalurgie*, V. 1, July-Dec. 1956, p. 241-259.

Cooling curves of nodular cast iron are different from those of gray iron in as much as the eutectic transformation takes place with supercooling (20-40%) while its duration is shorter. The difference is due to the fact that in iron with no nodular graphite the graphitization during the eutectic conversion is poorly developed in comparison with gray iron. As soon as the nodular form of the graphite changes to a foliated or interdendritic form (because of an insufficient quantity of Mg. the cooling curves of cast iron treated with Mg assume a character similar to

that of gray iron. An increase in the Mg and P content causes an increase in the degree of supercooling in the eutectic transformation; increase in C and Si reduces the degree of supercooling, while the duration of the eutectic transformation increases.) 23 ref. (N8q, M23r; CI-r, Mg, P)

22-N. Formation of Oil Pores in Nickel Electrodeposits. K. Sommer. *Metal Finishing Journal*, v. 4, Nov. 1958, p. 438-440.

5 ref. (N12d; Ni, NM-h)

23-N. Theory of Phase Transformations in Alkali Metals. M. A. E. Nutkins. *Physical Society, Proceedings*, v. 72, Nov. 1, 1958, p. 810-822.

Phase changes in Li and Na. 10 ref. (N-general; Li, Na)

24-N.* (French.) Relationships Between Allotropic Transformations and Substructures of Uranium. P. Lacombe. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p. 11-20.

Substructures forming at high temperatures (around 800° C.) in the transformation gamma—beta. Effect of impurities; cooling speed, internal friction. 17 ref. (N6p, 2-62; U)

25-N.* (French.) Comparison of Allotropic Transformations in Iron and Uranium. P. Lehr and J. F. Langeron. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p. 47-56.

The change from alpha to beta U as well as the change from alpha to gamma Fe seems to be governed by the formation nuclei from which the new grain develops. In the case of U, however, no connection appears between the orientations of the alpha and beta phases. In both metals, internal stresses developed in the structure transformation caused volume changes to the order of 1%. The recrystallization of U without previous cold working can be explained by those internal stresses. 17 ref. (N6p, 2-61; U, Fe)

26-N.* (French.) Competition Between the Recrystallization and the Polygonization of Aluminum and Solid Solution of Aluminum-Zinc. J. Montuelle. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p. 115-124.

Studies on pure (99.95 to 99.999%) Al and Al-Zn alloy with 6 to 15% Zn. In gradual heating of pure Al for stress-relieving a polygonization structure can be obtained. The presence of other elements (e.g., Fe) retards polygonization and recrystallization can take place. 15 ref. (N4, N5, 2-64, 2-60; Al-a, Al-b, *Zn*, 14-67)

27-N.* (German.) Oxygen and Strain Aging of High-Purity Iron. Walter Janiche and Herbert Beck. *Archiv fur das Eisenhuttenwesen*, v. 29, Oct. 1958, p. 643-651.

With increasing temperature, the hardness of high-purity Fe was affected by O in a manner similar to that of C and N. Strain aging is influenced by O and could be caused by O. 18 ref. (N7e, Q29n, 2-61; Fe-a, *O*)

28-N. Fatigue and Aging. F. Bollenrath. *North Atlantic Treaty Organization Advisory Group for Aeronautical Research and Development*, Report no. 157, Nov. 1957, 20 p.

Supersaturated solid solutions of Al alloys and steel have a fatigue strength considerably higher than the same material in the stable or equilibrium state. Aging is influenced by oscillating plastic strain; heat is generated by vibrational plastic strain. 14 ref. (N7a, Q7; Al-b, ST)

29-N.* Growth of Crystals of Pure Materials and of the Solvents of Solutions. Bruce Chalmers. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 291-309.

Crystal growth from solutions and crystal growth from the melt. Alloys of Ge and In; effect of crystal growth on composition and temperature; dendritic growth; origin of the perfections. 15 ref. (N12; Ge-b, In-b)

30-N.* Growth of Silicon Crystals Free From Dislocations. William C. Dash. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 361-385.

Sources of dislocations in all phases of the growth of Si crystals by the Czochralski method investigated by etching and Cu

decoration techniques. Poor epitaxy and surface damage in the seed are important sources at the commencement of growth. In the bulk of the crystal only plastic generation forms dislocations which propagate by growth. Segregation of some impurity, possibly silicon carbide, in the form of dendrites was found at the tip of most crystals. 25 ref. (N12, M26b; Si)

31-N.* (German.) Recrystallization Capacity of Copper After Deformation by Tension Followed by Compression. H. Borchers and A. Schafer. *Metall*, v. 12, Nov. 1958, 980-984.

Compression after tensile deformation increases the hardening and strengthening effects, as an additional tensile deformation does. The recrystallization capacity, however, does not reach the same value as with an additional tensile deformation. 19 ref. (N5, Q28, 3-68; Cu)

32-N.* (German.) Activation Energy and Grain Growth Speed in the Recrystallization of Copper. A. Schafer. *Metall*, v. 12, Nov. 1958, p. 996-999.

Constants for speed of growth as well as the activation energy were determined for deformations of 11, 14 and 16%. 10 ref. (N5f, N3m, P13a; Cu)

33-N.* (Ukrainian.) Spheroidizing, Coalescence, Graphitization of Cementite in Deformed Pearlite. K. P. Bunin, O. O. Baranov and E. N. Pogribhoi. *Dopovidi Akademii Nauk Ukrainskoi R.S.R.*, v. 9, 1958, p. 961-965.

Microscopic investigations of annealed and deformed pearlitic Si steel established that spheroidizing, coalescence and graphitization of cementite are greatly accelerated in the traces of slip and dislocations, especially at the point of their intersection. 15 ref. (N8q, N8s; AY, *Si*)

34-N. (French.) Relationship Between Deformation and Recrystallization Structures. T. J. Tiedema. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p. 21-32.

Cubic recrystallization structure thought to develop when there are true twin crystals present in the deformation structure. X-ray diagrams obtained by the methods of Guinier and Tennevin and Laue. Different theories of formation of cubic structure. 28 ref. (N5f)

35-N. (French.) Relationships Between Polygonization and Recrystallization and Problems Set by the Recrystallization Theories. R. W. Cahn. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p. 33-40.

22 ref. (N5f)

36-N. Dimensional Instability of Uranium. Pt. 3. R. Resnick, L. S. Castleman and L. Seigle. Sylvania Electric Products. U. S. Atomic Energy Commission SEP-249, June 30, 1958, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Anisotropy in the self-diffusion coefficient of U; effects of grain and subgrain size on growth characteristics of irradiated U. Magnitude of diffusion anisotropy in alpha-U single crystals determined by measurement of self-diffusion coefficients along principal crystallographic directions. (N1, P10d; U, 2-67)

37-N.* (French.) Influence of Heat Treatments in the Gamma Phase on the Appearance of Substructures in Uranium and Low Chromium Content Uranium-Chromium Alloys. A. Robillard, D. Calais and P. Lacombe. *Revue de Metallurgie*, v. 55, Sept. 1959, p. 815-828.

Conditions of gamma phase annealing of U followed by cooling which produce recrystallization substructures different from those due to polygonization of alpha U. Substructures are caused by concentration of impurities at dislocations induced by stresses accompanying allotropic beta→gamma or gamma→beta transformation. Similar heat treatments on 1.4% at. Cr U-Cr alloys in which beta phase can be stabilized by quenching at room temperature confirm that polygonization takes place in the gamma→beta direction. Former beta and gamma grain boundaries superimposed on the alpha phase can be distinguished. 20 ref. (N6p, 2-64; U-b, *Cr*)

38-N.* (French.) Comparative Study of the Allotropic Transformation of Iron and Uranium. P. Lehr and J. P. Langeron. *Revue de Metallurgie*, v. 55, Sept. 1958, p. 829-839.

Alpha ⇌ beta transformation in U takes place, as does alpha ⇌ gamma change in Fe, through a process of nucleation and

grain growth. However, change in volume which accompanies these transformations causes appearance during formation and development of nuclei of the new phase of stresses of sufficient magnitude to entail a true plastic deformation of the metal. Characteristics of this deformation and its structural consequences. 17 ref. (N6p; Fe, U)

39-N. (Translation.) Patenting Rope Wires. A. Rose, L. Rademacher and K. Schemmer. *Wire Industry*, v. 25, Nov. 1958, p. 1037-1039. (Previously abstracted from *Stahl und Eisen*), July 10, 1958.

40-N. (Translation-Brutcher, 4387.) Phase Composition of Austenitic Chromium-Nickel Steels With Titanium. V. I. Prosvirin. *Metallovedenie i Obrabotka Metallov*, Oct. 1958, p. 2-5.

Raising the hardening temperature from 900 to 1250° C. and holding it for 1 hr. does not bring about full solution of secondary phases. Number of secondary phases, after hardening, is greater in steels containing less Ti. Ni content in residual secondary phases, after heating to high temperature, is small and after hardening at 1250° C. is not present at all. Ti occurs in secondary phases, after hardening, at any temperature. In aging, Ti separations depend upon Ti content and temperatures. Ni in secondary phases is insignificant when aged at 700° C., but increases at 800° C. Fe and Cr atoms disappear from hard solutions when aging is at 800° C. Changes in dissolved alloying elements in austenite bring about changes in parameter of austenitic lattice. (N8, N7a, 2-60, 2-61, 2-64; SS, *Ti*)

41-N. (Translation-Brutcher, 4388.) Isothermal Transformation Diagram for Spheroidal Cast Iron During Heat Treatment. D. Rasheev. *Metallovedenie i Obrabotka Metallov*, Oct. 1958, p. 5-10.

Applicable to initially formed pearlite-ferrite structures. Useful to establish proper temperature range and time interval necessary for heat treating, tempering, normalizing. (N8g, 2-61, 2-64; CI-r)

46-N.* Ageing Characteristics of Two Commercial Alloys Based on the Aluminium-Zinc-Magnesium System. I. J. Polmear and P. Scott-Young. *Institute of Metals, Journal*, v. 87, Nov. 1958, p. 65-70.

Hardness/aging-time curves for 75S and D.T.D. 687 were determined in the range 20-200° C. and compared with those for a pure ternary alloy with similar Zn and Mg contents. Effect of prior cold work on the commercial alloys was also studied. Number of stages in the aging of the ternary alloys is not changed by the presence of Cu, Cr or Mn, although the first stage appears to be modified by the presence of Cu. 23 ref. (N7a, Q29n, 2-60; Al, Zn, Mg, *Cu, Cr, Mn*)

47-N.* Kinetics and Morphology of the Allotropic Transformation of Cobalt. Herve Bibring, Francois Sebilleau and Charlotte Buckle. *Institute of Metals, Journal*, v. 87, Nov. 1958, p. 71-76.

The orientation relationship between the two phases leads to the conclusion that the cubic phase may be twinned. Observations on twinning due to the beta-to-alpha transformation and detwinning during the reverse alpha-to-beta transformation throw light on the nucleation conditions in Co. Inhomogeneous stresses are

chiefly responsible for the initiation of the transformation. 6 ref. (N6p; Co)

48-N. Theory of Diffusion-Limited Precipitation. Frank S. Ham. *Journal of Physics and Chemistry of Solids*, v. 6, Sept. 1958, p. 335-351.

Time dependence of the unprecipitated fraction of the excess-solute for small spherical, spheroidal and cylindrical particles. 32 ref. (N7b)

49-N.* (Russian.) Influence of Irreversible Changes Arising in Structure During Plastic Deformation. S. Z. Bokshtein, T. I. Gudkov and A. A. Shukhobitskii. *Doklady Akademii Nauk SSR*, v. 121, no. 6, 1958, p. 1015-1018.

Influence of preliminary plastic deformation at high temperatures on diffusion of Sn in Ni. 10 ref. (N1, 3-68; Ni, *Sn*)

50-N.* (Russian.) Values of Self Diffusion Activation Energy in Liquid Metals. K. A. Osipov. *Doklady Akademii Nauk SSR*, v 121, no. 6, 1958, p. 1019-1020.

Self-diffusion in liquid metals, in contrast to solid metals, is connected with individual rather than group activation of atoms. Individual atom activation in solid metals during self-diffusion can only take place at grain boundaries with high values at disorientation angle. 11 ref. (N1d; 14-60)

51-N.* (Russian.) Peculiarities of Magnesium Distribution During Annealing of Magnesium Treated Iron. M. A. Krishtal, I. P. Fominykh and E. P. Rikman. *Liteinoe Proizvodstvo*, Aug. 1958, p. 10-11.

Magnesium is soluble in silicon iron. It diffuses in austenite during annealing of nitrided steel with Mg. The solubility of Mg in metal is increased by increasing the Si content. In low-Si iron the Mg atoms are weakly held in the matrix and during annealing, even at low temperatures, they migrate into the graphite. Si lowers the coefficient of Mg distribution between the graphite and the matrix. 7 ref. (N12, N1e, 2-60; CI-r, *Si*)

52-N.* (French.) Orientation Relationships Between Crystals Formed by Recrystallization and Deformation Bands in Alpha Uranium. D. Calais, N. Mandin and P. Lacombe. *Comptes Rendus*, v. 247, Aug. 11, 1958, p. 646-649.

Monocrystals of alpha U of certain orientations develop deformation bands under tensile stress. When annealed, these bands produce recrystallized crystals, the orientation of which with respect to original crystal is conditioned by crystallography of mode of deformation. 4 ref. (N5, Q24c; U)

53-N.* (French.) Self-Diffusion of Uranium in the Gamma Phase. Y. Adda and A. Kirianenko. *Comptes Rendus*, v. 247, Sept. 1, 1958, p. 744-746.

Study conducted on diffusion couples composed of natural U and U^{234}-enriched U. Coefficients of self-diffusion of gamma U, energy of activation and factor of frequency. (N1d; U)

54-N.* Ductility in High-Temperature Rupture Tests. J. Glen. *Iron and Steel Institute, Journal*, v. 190, Sept. 1958, p. 30-39.

Considers strain-age-hardening occurring during high-temperature tensile tests of carbon and alloy steels, hardening effects occurring during creep tests resulting in transition in creep rate. Influence of alloying elements; tentative hypothesis to account for results. 19 ref. (N7e, Q23p, Q3, 2-60, 2-62, 3-68)

55-N.* (German.) Effect of Additions on the Equilibrium of Nitrogen With Liquid Iron. Hermann Schenck, Martin G. Frohberg and Hans Graf. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 673-676.

With additions of Mo, Mn, Si, Cr and V, increased nitrogen is found in the melt. 36 ref. (N16m, 2-60; Fe, N, O, S, Co, Ni, *Cu, Sb, As, Sn, Mo, Mn, Si, Cr, V*, AD-q)

56-N.* (German.) Austenite-Martensite Transformation in Iron-Nickel Single Crystals Influenced by Tensile Stress. Albert Kochendorfer and Gerhard Otto. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 709-714.

Single crystals grown in a vacuum induction furnace from a melt. Martensite transformation point was at -30° C. Structure transformations at temperatures from +20 to -180 C. and under a tensile stress of 75% the ultimate strength studied. Tension favors an oriented martensitic structure. 5 ref. (N8p, 2-61, 3-66; Fe, *Ni*, 14-61)

57-N.* (German.) Shape of Epsilon Carbide Precipitated From Ferrite or Martensite During Tempering. Wolfgang Pitsch and Angelica Schrader. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 715-721.

Fiber-shaped epsilon carbide particles are precipitated forming a net in the {100} planes of the ferrite. In a similar way the alpha carbide precipitation from martensite takes place. 20 ref. (N8a, 2-61; Fe, ST, *C*, *Ni*)

58-N.* (German.) Annealing Kinetics of Martensite. Otto Krisement. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 723-729.

In annealing, carbon precipitation within the martensite needles as well as diffusion of carbon from the martensite into the retained austenite are assumed. The latter thought converted into carbide. 19 ref. (N8p; ST, *C*, *Si*, *Mn*, *P*, *S*, *Cr*, *Cu*, *Mo*, *Ni*)

59-N.* Initial Stages of Growth of Oriented Copper Nuclei on Single Crystal Surfaces of Silver. E. Grunbaum, R. C. Newman and D. W. Pashley. *Philosophical Magazine*, v. 3, Dec. 1958, p. 1337-1341.

Layers of metallic Cu of less than 1 Å in average thickness were deposited in a controlled manner on to smooth (111) surfaces of Ag inside an electron diffraction camera. An electron diffraction pattern from oriented Cu nuclei appears suddenly at some critical thickness. Possibilities for the initial structure of the deposit and for the change which occurs at the critical thickness; effect of substrate temperature. 4 ref. (N3, N2; Cu, 14-61, Ag)

60-N.* Transport Properties in Pure Liquid Metals. Norman H. Nachtrieb. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 49-55.

Viscous flow and diffusive properties of several liquid metals; theory of atomic movement in liquids. Inadequacies of the transition state theory and the concepts of holes or vacancies in describing movements of atoms in liquids. 12 ref. (N1c, N14, M25, P10f, 14-60)

61-N.* Nucleation in the Solidification of Metals. G. M. Pound. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 87-105.

Formal theory of heterogeneous nucleation in solidification; kinetics of crystalline, nucleus formation in supercooled liquid metals. Effect of nucleation catalyst. Heterogeneous nucleation of crystals from vapor using thermal beam method. Results indicate formal nucleation theory adequate for description of data in terms of contact angle theta; chemical factors are more important than lattice fit in determining potency in nucleation catalyst. 29 ref. (N2, N12)

62-N.* Mechanism of Growth. Kenneth A. Jackson. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 174-186.

Prediction of rates of crystal growth on the basis of surface nucleation theory, disclocation theory; calculating and measuring growth rates from growth from liquid, growth from vapor, rate of dendritic growth, changes in free energy of surface; mode of crystal growth including dendritic, faceted, diffusion control and intermediate forms. 21 ref. (N2g, N12b, N12c, N15g; 14-60)

63-N.* Imperfections Resulting From Solidification. J. W. Rutter. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 243-275.

Origin and properties of solidification structures in materials of metallurgical interest discussed in terms of variables, parameters and constants which govern solidification. Structural features include hexagonal cell structure, dendritic freezing, introduction of new grains during freezing, development of preferred orientations, occurrence of twins, striation structure and introduction of dislocations. 58 ref. (N2g, N12, M26)

64-N.* Polyphase Solidification. William A. Tiller. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 276-318.

Expressions relating to growth conditions and thermal and physical properties of binary alloying eutectics with the morphology of the solid phases. Mechanism of lamellae formations. Transitions of lamellae to rod and rod to globule; freezing anomalous autectics. Effect of ternary element on lamellar structure. Solidification of alloys of noneutectic composition. Formation of second-phase particles at grain boundaries during solidification of equiaxed grains. 30 ref. (N12p, N12q)

65-N.* Structure of Ingots and Castings. James L. Walker. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, 319-336.

Thermal conditions, characteristics of freezing in a mold and their influence on solidification kinetics and resulting structures. Rate of grain growth and nucleation in pure liquids and liquid containing solid impurities. Mechanism of nucleation catalysis. Thermal conditions during freezing in chill zone, columnar zone and equiaxed zone. Segregation, control of

grain size. 20 ref. (N2g, N3m, E25n, E25q; 4-51)

66-N.* (French.) Large Zirconium Crystals and Orientation of Zirconium Hydride Precipitations. J. P. Langeron and P. Lehr. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 901-906.

Crystals prepared by tensile strain and subsequent heating which gave crystals of several sq. mm. Crystals more than 1 sq. cm. in diameter were obtained by repeated cooling from the beta-phase at 150° C. per hr. and subsequent heating up to 820° C. during 90 hr. Hydrides found to be oriented in planes $\{10\bar{1}0\}$. 14 ref. (N3m, 2-61, 3-68; Zr-a)

67-N.* (French.) Deformation Structures of 18-10 Stainless Steel. Bernard Jaoul. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 976-992.

Deformation below room temperature caused the development of martensite; amount varies with stress applied; above room temperature, diffusion of carbon is possible and a bainitic-type transformation takes place. 20 ref. (N8m, N8p, 3-68, 2-61; SS-e)

68-N. Radiation Enhanced Diffusion in Solids. G. J. Dienes and A. C. Damask. *Journal of Applied Physics*, v. 29, Dec. 1958, p. 1713-1721.

Measurement of enhanced diffusion as a function of temperature can indicate the mechanism by which defects are removed from the lattice. Enhancement data for alpha-brass. (N1, 2-67, M26s; Cu-s)

69-N.* (Russian.) Low-Temperature Polymorphism of Metals. I. A. Gindin, B. G. Lazareva, Ya. D. Staraoubov and V. I. Chotkhe. *Zhurnal Experimental'noi i Theoreticheskoi Fiziki*, v. 35, Sept. 1958, p. 802-804.

Li, Na, Ce, Bi and Be were deformed at low temperatures to study the phenomenon of polymorphism, then the temperature of the deformed part was raised again and its dilatometric behavior observed. The experiments, as well as X-ray diagrams, show a wide distribution of low-temperature polymorphism. 6 ref. (N6p, M23b, P10d, 2-63, 3-68; Be, Bi, Ce, Ni, Na)

70-N. (Book.) Liquid Metals and Solidification. 348 p. 1958. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. $7.50.

Papers presented at a Seminar during National Metal Congress, Chicago, Nov. 1957. Papers abstracted separately. (N12, N14, P12, 14-60)

71-N. (Translation—AIP.) Sublimation of Tellurium. S. A. Semenkovich and N. N. Astashev. *Soviet Physics, Technical Physics*, v. 3, no. 4, 1958, p. 677-682.

Method for preliminary pruification before zone melting, designed to give yield of 0.3-0.7 kg. per hr. or 1.5-2.5 kg. per sublimation. 4 ref. (N15g; C22, Te)

72-N. (Translation-BISI, 627; Brutcher, 3902.) A Study of the Diffusion of Boron and Carbon in Some Transition Metals. G. V. Samsonov and V. P. Latysheva. *Fizika Metallov i Metallovedenie*, v. 2, no. 2, 1956, p. 309-312.

See item 172-N, 1957. (N1, B, C)

73-N. (Translation-BISI, 1060.) Calorimetric Investigations on the Kinetics of the Isothermal Breakdown of Austenite of 12% Manganese Steel. G. Collette. *Archiv fur das Eisenhuttenwesen*, v. 28, Apr. 1957, p. 229-235.

See item 289-N, 1957. (N8; AY, *Mn*)

74-N. (Translation-Columbia.) Investigation of Dissociation in an Ni-Be Alloy. N. N. Buinov, L. I. Podrezov and M. F. Komarova. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 9, 1957, p. 1210-1215.

Aging of Ni-Be alloy. The phase transition is accompanied by a large volumetric change, usually strong ordering, considerable changes in the magnetic properties and segregation of a nonferromagnetic beta phase. 12 ref. (N10b, N7a, P16; 2-64, Ni-b, *Be*)

75-N. (Translation—Columbia.) Kinetics of Superstructure Transformations of Fe_3Al Alloy. V. E. Rode. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 9, 1957, p. 1225-1228.

Variation of the different physical parameters of Fe_3Al in process of ordering and degree of order in the alloy as determined from the intensity of the superstructure lines in the X-ray patterns. 4 ref. (N10b, M22g; Fe-b, *Al*)

76-N.* Structure of Electrodeposited Nickel. B. C. Banerjee and A. Goswami. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 20-23.

Electron diffraction study of the crystal structure, orientation and mode of

growth of Ni deposits from sulphate-chloride-boric acid and chloride-boric acid baths. Effect of pH, temperature, concentration, current density, mechanical stirring, hydrogen peroxide, nickel nitrate and sodium chloride additions and polycrystalline substrates. 12 ref. (N12d; Ni)

77-N.* Self-Diffusion in Silver During Plastic Deformation in Extension and Compression. J. B. Darby, C. T. Tomizuka and R. W. Balluff. *Journal of Applied Physics*, v. 30, Jan. 1959, p. 104-112.

Self-diffusion of Ag^{112} in Ag single crystals subjected to simultaneous deformation at 800 and 900° C. Crystals were orientated for duplex slip. Recrystallization occurred in the initially single crystal specimens during diffusion-deformation under all conditions except tension at 800° C. The effect of straining on diffusion was small in all cases. Increases in diffusion rate due to the generation of point defects and short-circuiting paths during deformation were slight. (N1d, Q24, 3-68, N5; Ag, 14-61)

78-N.* (French.) Origin of the Cubic Texture in Rolled and Recrystallized Copper. W. G. Burgers. *Metallurgia Italiana*, v. 50, Oct. 1958, p. 447-452.

Theoretical analysis based on assumption that a pronounced recrystallization texture can be formed as result of cooperative transformation of certain domains of preceding deformation texture. In present case, such a transformation is produced by a shear parallel to planes (111) of the compact cubic lattice described by Rowland. 11 ref. (N5, M26c; Cu)

79-N.* (German.) Electrolytic Transfer of Carbon, Chromium and Nickel in an Austenitic Cr-Ni Steel. Friedrich Erdmann-Jesnitzer and Peter Hammer. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 699-707.

Armco iron wires welded to Cr-Ni steel wires and exposed to direct current. Transfer of carbon to the Armco iron proved by micrographs and hardness tests. 20 ref. (N1e, N1h, 2-61; Fe, ST, *C, Cr, Ni*)

80-N.* (Japanese.) Palmer's Effect in Malleable Cast Iron. Yoshisada Ueda. *Japan Foundrymen's Society, Journal*, v. 30, Oct. 1958, p. 799-803.

Relation between preheating and change of rate of nitrogen content in iron. Palmer's effect appears most strongly for a preheating temperature of 500 or 600° C., which may be caused by decrease of soluble nitrogen. (N15, 2-61; CI-s, *Mn, S, Si*, AD-p)

81-N.* (Russian.) Austenite Tension During Crystallization of Martensite. B. Ya. Lyubov and A. L. Roitburd. *Doklady Akademii Nauk SSSR*, v. 120, no. 5, 1958, p. 1011-1014.

Following properties can be calculated in austenite matrix—tension, deformation and resilient energy. Results can be applied in analyzing growth of martensite crystals. (N8p)

82-N.* (Russian.) Critical Transition Point of Polymorphous Cerium. E. G. Ponyatovskii. *Doklady Akademii Nauk SSSR*, v. 120, no. 5, 1958, p. 1021-1023.

On the basis of pressure-temperature diagram and thermographic analysis suggests explanation of phase transition. (N6p; Ce)

83-N.* (Russian.) Mechanics of Inter-Adjacent Transformation of Austenite. L. I. Kogan and P. I. Etin. *Izvestiya Akademii Nauk SSSR*, June 1958, p. 12-18.

Inter-adjacent transformation consists of redistribution of carbon, forming regions with either increased or decreased carbon concentrations. (N8)

84-N.* (Ukrainian.) Electro-Diffusion of Tungsten in Iron-Tungsten Alloy. I. M. Frantsevitch, D. F. Kalinovich, I. I. Kovenskii, V. V. Pen'kovskii and M. D. Smolin. *Dopovidi Akademii Nauk Ukrainskoi RCR*, no. 7, 1958, p. 736-738.

Tracer study of W migration in solid solution with Fe in a constant electric field. (N1, 1-59; W, Fe)

85-N. (Russian.) Oscillation and Resonance in Kinetics of Martensite Formation. H. V. Grum-Grshimailo. *Doklady Akademii Nauk SSSR*, v. 131, no. 5, 1958, p. 850.

Effect of chemical reaction on process of isothermal decomposition of austenite by calculating speed of reaction. Effect of ferromagnetic transformation is strongly evident in kinetics of austenite decomposition. (N8g, N8p)

86-N. (Russian.) Energy During Formation of Vacancies. K. A. Osipov. *Doklady Akademii Nauk SSSR*, v. 131, no. 5, 1958, p. 855-857.

Role of vacancies in process of self diffusion. 19 ref. (N1d, M26s)

87-N.* The Kinetics of Bainite Formation in a Plain Carbon Steel. P. Vasudevan, L. W. Graham and H. J. Axon. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 386-391.

Rate of isothermal decomposition of austenite in the 400-350° C. range for a 0.97% C plain carbon steel. Transformation was followed by a conventional dilatometer method and chemical analysis of combined C in partly or completely reacted specimens. A marked change in the kinetics of decomposition was observed at 350° C. Above 350° C. dilatometric and color-carbon measurements both give the same transformation/time characteristics. 21 ref. (N8m, M23b; CN)

88-N.* (Ukrainian.) Controlling Graphite Growth in Cast Iron. K. P. Bunin and A. V. Chernovoc. *Dopovidi Akademii Nauk Ukrain'skoi RSR*, no. 8, 1958, p. 831-834.

Effect of preliminary deformation on carbon diffusion rate compared with that of graphite growth. Deformation leads to acceleration of graphite growth with subsequent graphitization. (N8s, 3-68; CI)

89-N.* (Russian.) Structural Variations in Molten Aluminum With Changes in Temperature. V. M. Glazov and Yu. D. Chistyakov. *Izvestiya Akademii Nauk, SSSR*, July 1958, p. 141-143.

Data show absence of polymorphous transition in liquid Al, and substantial structural changes in a precrystallizing period. Solid and liquid Al crystals differ little from each other. (M12n, 2-61; Al-a)

90-N.* (Russian.) Effect of Surface-Active Agents on Diffusion Rate of Electrolytic Hydrogen Through Iron. A. N. Oshe. *Zhurnal Physicheskoi Khimii Akademii Nauk SSSR*, v. 32, July 1958, p. 1623-1631.

Effect of halide anions of organic additive agents of high molecular weight on the H_2 through Fe membranes during cathodic polarization in one normal sulphuric acid. (N1, P15, 2-66; Fe, H)

91-N.* (Ukrainian.) Effect of Plastic Deformation on Diffusion Rate in Nickel-Molybdenum Alloys. I. Ya. Dekhtyar and V. S. Mikhalenkov. *Ukrainskii Phizichnii Zhurnal Akademii Nauk, Ukrainskoi RSR*, v. 3, no. 3, 1958, p. 385-389.

Cobalt diffusion in Ni-Mo system in a range of 950-1150° C. in a single phase during plastic deformation. (N1, 3-68; Ni-b, Mo, Co)

92-N.* (Ukrainian.) Aging Mechanism of Lead Alloys. L. N. Larikov. *Ukrainskii Phizichnii Zhurnal Akademii Nauk, Ukrainskoi RSR*, v. 3, no. 3, 1958, p. 397-405.

Causes of stable state of Pb alloys aged at room temperature. (N7a; Pb-b, *Co*, Sn)

93-N.* Reduction of Passive Films by Hydrogen Diffusion Through Steel. R. T. Davis, Jr., and T. J. Butler. *Electrochemical Society, Journal*, v. 105, Oct. 1958, p. 563-568.

Diffusion of H through a steel specimen is followed by electrode-potential measurements. One surface is exposed to acid and the other to a sodium dichromate solution. Potential changes result from the reduction of the dichromate-produced passive film by diffused H. Effect of variations in steel composition and thickness, acid composition and concentration, and sodium dichromate concentration. 15 ref. (N1a; ST, *H*)

94-N.* Diffusion Into Silicon From Glassy Layers. J. E. Cline and R. G. Seed. *Electrochemical Society, Journal*, v. 105, Dec. 1958, p. 700-701.

Diffusion of B into Si from glassy layers containing the system K_2O-SiO_2-B_2O_3. Glassy layers were prepared by dehydration of aqueous solutions of silicates or borates of K. The penetration of diffusant was determined after each diffusion run by carefully lapping down the Si slices and taking electrical measurements. Position of p-n junctions determined by hot-probe measurements. (N1; Si, *Bi*, 14-62)

95-N.* Preparation and Some Characteristics of Single Crystal Indium Phosphide. T. C. Harman, J. I. Genco, W. P. Allred and H. L. Goering. *Electrochemical Society, Journal*, v. 105, Dec. 1958, p. 732-739.

Technique for purifying P, reacting elemental In and P, purifying the compound, InP, by directional recrystallization, and growing large crystals all in one glass tube. Electron mobility as a function of temperature is given for two single-crystal specimens. (N3r; In, P, 14-61)

96-N.* Preparation of Crystals of Pure Hexagonal SiC. D. R. Hamilton. *Electrochemical Society, Journal*, v. 105, Dec. 1958, p. 735-739.

Growth of SiC crystals in laboratory furnaces in environment dominated by radiative change of energy. Orientation and habit of crystals are greatly influenced by nature of the radiative losses in the environment. Under normal experimental conditions crystal growth is unlikely to proceed by a two-dimensional nucleation mechanism. (N3r; Si, C, NM-a35, 14-61)

97-N. Transformation Kinetics of Plutonium. Pt. 2. A Study of the Gamma-to-Beta-to-Alpha and Alpha-to-Beta-to-Gamma Transformations. R. D. Nelson. Hanford Atomic Products Operation. *U.S. Atomic Energy Commission,* HW-56843, July 18, 1958, 21 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.25.

Rates of formation of the alpha and beta phases from the gamma phase determined after gamma heat treating and allowing a sample to transform isothermally in the alpha and beta ranges. The T-T-T curve of the gamma→beta→alpha transformation was plotted together with the effect of the gamma heat treating time and temperature on the rate of transformation. (N7c, 2-64; Pu)

98-N. The Solid Solubilities of Iron and Nickel in Beryllium. S. H. Gelles, R. E. Ogilvie and A. R. Kaufmann. Nuclear Metals Inc. *U.S. Atomic Energy Commission* NMI-1207, July 29, 1958, 36 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.

Solid solubility limits between 850 and 1200° C. obtained by analysis of differential-type multi-phase diffusion couples, using an X-ray absorption technique. A previously unreported high-temperature phase which decomposes eutectoidally at 1065° C. is found to exist in the Be-Ni system at a composition of approximately 8 at. % Ni. 16 ref. (N12p, N9; Be-b, *Fe, Ni*)

99-N.* (English.) Mechanism of Carbon Diffusion Peak in F.C.C. Iron-Nickel Alloys. Wu Tzu-liang and Wang Chi-min. *Scientia Sinica,* v. 7, Nov. 1958, p. 1029-1053.

At a vibrational frequency of 1.4 cycles per sec., the peak occurs at about 500° K. This peak arises under the influence of an oscillating load from the preferential rotation of the axes of carbon pairs existing in the specimen. These carbon pairs were formed by the interaction between the substitutional carbon atoms and their neighboring interstitial carbon atoms. 23 ref. (N1e; Fe, Ni, *C*)

100-N.* High-Pressure, High-Temperature Growth of Cadmium Sulfide Crystals. W. E. Metcalf and R. H. Fahrig. *Electrochemical Society, Journal,* v. 1505, Dec. 1958, p. 719-723.

Process for growing CdS crystals of uniform size, shape and homogeneity from the melt in an argon atmosphere at 1500 psi. Controlled cooling to cause a solid-liquid interface to move from the bottom to the top of the vertical cylinder of CdS at a slow and controlled rate results in the formation of single crystals weighing in excess of 100 g. 10 ref. (N12, N3r, 2-62; Cd, S, Nm-a37)

101-N.* (French.) Study of Nucleation of Graphite and Kinetics of Graphitization in Prehardened White Cast Irons. Pt. 3. Discussion of Results. P. Laurent and M. Ferry. *Fonderie,* Aug. 1958, p. 351-361.

Review of published experimental data and critical evaluation of theories advanced by others. (To be continued.) (N2g, N8s; CI-p)

102-N.* (German.) Precipitation in an Alloy With 15% Cr, 16% Mo and 55% Ni. Martin Protzl. *Archiv fur das Eisenhuttenwesen,* v. 29, Dec. 1958, p. 745-756.

Alloy was melted, cast into ingots, forged, heated to 1230° C., water quenched and machined into samples. Precipitation at temperatures ranging from 500 to 1300° C. studied. Diagram showing precipitation mechanism of carbides prepared. 47 ref. (N7b, 2-61, 3-67; Ni-b, *Cr,* Fe, *Mo, C*)

103-N.* (German.) Austenite-Martensite Transformation in Iron-Nickel Single Crystals Under Tensile Deformation. Albert Kochendorfer and Gerhard Otto. *Archiv fur das Eisenhuttenwesen,* v. 29, Dec. 1958, p. 775-784.

X-ray diagrams were obtained from Fe-Ni single crystals with 30% Ni, exposed to a tensile load during the austenite-martensite transformation. It was found that the martensitic orientation is influenced by tensile deformation. (N8p, 8-66; Fe, *Ni,* 14-61)

104-N.* Recrystallization of Molybdenum. G. L. Davis and P. J. Burdon. *Metal Treatment and Drop Forging,* v. 25, Dec. 1958, p. 495-502.

Recrystallization behavior of Mo wires fabricated from ingots of cast metal and

ingots made by sintering pressed powder compacts. Strength and ductility of the two materials at room and elevated temperatures after similar heat treatments differ significantly. Fine Mo wires drawn from stock made by powder metallurgy techniques have, in general, superior properties. Resistance to softening by recrystallization is greater and annealing treatments leave the powder-metallurgy wires more ductile and capable of withstanding deformation. 25 ref. (N5; Mo, 4-61, 5, 6)

105-N. Recrystallization and Grain Growth of Nickel. D. A. Douglas and J. R. Weir. Oak Ridge National Laboratory. Nov. 20, 1958. *U. S. Atomic Energy Commission,* ORNL-2406, 29 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Effects of cold work, annealing time and initial grain size on the recrystallization temperature. Deformations of less than 20% do not appreciably refine the grain structure. When the material has a coarse grain size prior to deformation, a somewhat higher temperature for recrystallization is required. (N5, N3; Ni)

106-N.* (German.) Micrographs of Unalloyed Cast Steel. Hans Reininger. *Giesserei-Praxis,* Nov. 25, 1958, p. 437-445.

After solidification ferrite prevails with some pearlite present; after normalizing at 910° C. and slow cooling a fine-grained structure of ferrite and pearlite appears; after hardening at 880° C. and oil quenching the micrograph shows martensite. (N8, 2-64; ST, 5-60)

107-N.* (Russian.) Termomagnetic Treatment in Order-Disorder. Pt. 2. A. A. Glazer and Ya. S. Shur. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 52-59.

Process of ordering is slower in ferromagnetics annealed in magnetic field than in disordered alloys, indicating that the structures of specimens in disorder and those annealed in magnetic field are different. Structural condition produced by thermomagnetic treatment is that of ordered superlattice. (N10b, 2-64; SGA-n)

108-N.* (Russian.) X-Ray Investigation of Recrystallization of Electrolytic Chromium by Means of Fine Primary Beams. V. I. Arkharov and F. L. Shangareev. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 82-88.

Experiment was evaluated by photomicrographs of Debye's X-ray lines recorded during the electrolytic deposition of Cr. Increase in current density results in lowering temperature of recrystallization. This dependence is correlated with the quality of deposition. 13 ref. (N5, L17, 2-61; Cr)

109-N.* (Russian.) Investigation of Self-Diffusion in Silver by the Terminal Deposit Method. S. D. Gertsriken and D. D. Tsitsiliano. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 89-94.

Basic advantage of this method is provision for measuring small coefficient of diffusion by means of a relatively brief annealing period. 5 ref. (N1d; Ag)

110-N.* (Russian.) Effect of Preliminary Plastic Deformation on Martensitic Transformation in Fe-Cr-Ni Alloys. G. V. Kurdyumov, O. P. Maksimova, A. I. Nikonorova, Z. D. Pavlenko and A. M. Yampolskii. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 95-105.

Effect of degree of preliminary deformation, influence of heating on stability of deformed austenite and isothermal transformation. Different changes in the fine crystal structure of austenite produced either facilitate development of nascent martensite by subsequent cooling or impede its formation. 11 ref. (N8, 3-71; Fe-b, *Cr,* Ni)

111-N.* (Russian.) Effect of Rate of Heating on the Manifestation of Consequent Structure of Austenite in Prehardened Chromium Steel. V. G. Gorbach and V. D. Sadovskii. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 106-109.

Effect of Cr content on slowly heated, hardened and annealed, and on rapidly heated unannealed steels. Structure of austenite developing while heating previously hardened steel depends on rate of heating. Rate of heating required for development of grain is slower for higher Cr content. 9 ref. (N8f, 2-64; AY, *Cr*)

112-N.* (Russian.) Problem of Wave-Like Distribution of Admixtures Along Length of Growing Mono-Crystals. A. I. Landau. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 148-156.

Processes of crystal orientation in solutions. The curve of distribution of admixtures along the length of monocrystals is not smooth but wave-like. Nature of this phenomenon. 14 ref. (N12, 2-60)

113-N.* (Russian.) Selective Evaporation of Some Metals From Surface of Steels While Heated in Vacuum. S. F. Yurev and Z. I. Kusnitzina. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 157-166.

Experimental results of heating Cr-Mn and Cr-Ni-Mo steels at various temperatures. Method found to determine composition of emission by means of change in the composition of the steel's surface. 19 ref. (N16n, 1-73; SS, *Cr, Ni, Mo*)

114-N.* Sinking Under Bosses on Thin Plates. J. W. Dews and A. G. Fuller. *British Cast Iron Research Assoc., Journal*, v. 7, Dec. 1958, p. 392-400.

Variation during the course of the day in the number of eutectic cells in iron of approximately constant composition obtained from a continuously tapped hot blast cupola. Relationship between degree of eutectic nucleation and shrinkage defects. (N2, N12q, P10c; CI-n)

115-N.* Diffusion of Oxygen in Zirconium and Its Relation to Oxidation and Corrosion. J. Paul Pemsler. *Electrochemical Society, Journal*, v.105, June 1958, p. 315-322.

Diffusion in temperature range 400 to 500° studied by observing rates of dissolution of anodically deposited interference oxide films. Diffusion coefficient of O in Zr depends on the grain orientation and varies by the factor of two among different orientations. Oxidation and corrosion rates have a similar orientation dependence. 14 ref. (N1, R1h; Zr, *O*)

116-N.* Grain Growth and Flecking in Electroplated Copper Caused by Cyclic Stress. H. Okubo and N. Nozaki. *Electrochemical Society, Journal*, v. 105, July, 1958, p. 384-388.

Flecks are produced only when the grains constituting the plated metal develop in sufficient size to reach its surface and can never be produced when grain growth does not occur. Predominating stress producing the flecks is shearing stress, so that the physical change in the constitution of the plated metal can be attributed to the reversals of shearing strain. 4 ref. (N3; 8-62, Cu, 9-71, 3-66)

117-N.* Some Observations on the Effect of the Interaction of Tantalum With Oxygen, Nitrogen and Hydrogen. R. Bakish. *Electrochemical Society, Journal*, v. 105, Oct. 1958, p. 574-577.

The habit plane of the precipitation of oxide, nitride and hydride in Ta is {100} and these appear to be Ta_2O_5. TaN and beta-TaH respectively. {100} and {110} result from these gas-metal interactions. 11 ref. (N15; Ta, *O, N*, H)

118-N.* Effect of Rolling Unstable Austenitic 0.76% Carbon Steel at 220-300° C. P. R. V. Evans and Hugh O'Neill. *Iron and Steel Institute, Journal*, v. 191, Jan. 1959, p. 34-44.

Red hot steel strip quenched in salt bath and immediately rolled at reductions up to 50%, then either air cooled or held isothermally and cooled. Effect of these treatments and variations in rolling speed on final microstructure, impact resistance and hardness. Theoretical mechanism in accelerated breakdown of austenite. 24 ref. (N8, M27, Q29n, F23, 2-64, 3-68; CN-g)

119-N.* Kinetics of Formation of Bainite in High-Purity Iron-Carbon Alloys. S. V. Radcliffe and E. C. Rollason. *Iron and Steel Institute, Journal*, v. 191, Jan. 1959, p. 56-65.

Isothermal transformation of austenite to bainite at temperatures in the range of 200 to 450° C., studied by measurements of changes in electrical resistivity in fine wire specimens containing 0.65 to 1.2% carbon. Examination of structures of fully reacted specimens by light microscopy and X-ray diffraction at room temperature. 29 ref. (N8g, N8m, 2-61; Fe-b, *C*)

120-N.* Freezing of Aluminium and Its Alloys. R. M. Sergeant. *Metal Industry*, v. 94, Jan. 16, 1959, p. 43-45, 50.

In conditions of normal freezing in which growth of crystals takes place in the direction of increasing temperature, pure Al freezes with a smooth solidification front; a 2% Si alloy freezes dendritically. The only condition under which a pure metal can freeze dendritically is the unusual one when the crystals are growing into supercooled metal. (N12, 2-60; Al-a, Al-b, *Si*)

121-N. Recrystallization of Titanium. L. S. Castlemen, F. D. Rossi and L. L. Seigle. Sylvania Electric Products, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 121188, Sept. 1955, 44 p. $1.25.

Rates of nucleation and grain growth during the recrystallization of critically deformed sponge and iodide titanium.

Energy of activation for grain growth in sponge Ti was about 52,000 cal. per mol, and in iodide Ti 39,000 cal. per mol. (N5, N3, N2, P13b; Ti-b, 6-74)

122-N.* (Russian.) Structural Changes in Cast Iron Saturated With Magnesium in Zone of Eutectoid Temperature. P. I. Stepin. *Liteinoe Proizvodstvo*, Nov. 1958, p. 24-27.

Mechanism of graphite formation in cast iron when saturated with differing amounts of Mg at varying temperatures. Heating cast iron in contact with liquid Mg under pressure greatly increases solubility and diffusion of Mg. Heating the center of a metallic Mg object 1 hr. at 1100° results in spreading of Mg in concentric manner throughout entire object to depth of 12 mm. Within the center in radius of 3-5 mm. the Mg concentration reaches 0.3%. By raising temperature from 1000 to 1100° speed of diffusion increased 2.5 times. (N8q, E25q, 2-60, 2-61; CI-r, Mg)

123-N. Investigation of Germanium-Silicon Alloys. C. C. Wang. Sylvania Electric Products, Inc. *U. S. Office of Technical Services*, PB 131422, Feb. 1955, 48 p. $1.25

Isothermal solidification technique for preparing homogeneous Ge-Si alloys in polycrystalline form for all the compositions and in single-crystal form for the low-silicon alloys. Semiconductor devices made of Ge-Si alloys shown to operate at temperatures higher than those of Ge. (N12, N3r; Ge-b, Si, EG-j)

124-N. (Russian.) Problem of Possible Cause of Irregular Distribution of Alloying Elements in Crystallized Ingots. B. N. Aleksandrov, B. I. Berkin, I. M. Lifshitz and G. I. Stepnova. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 167-168.

Influence of air pressure and temperature on formation and decay of wustite. 7 ref. (N3m, 2-60, 3-74; Fe, O, NM-a34)

127-N. (Russian.) Susceptibility to Evaporation of Fe-Ni Alloys Within the 77-290° K. Range. N. Z. Miryasov. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 188-190. 4 ref. (N16n, 2-63; Fe-b, *Ni*)

128-N. (Czech.) Solidification Theory for Alloys. Marie Rysava. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1087-1092.

Theory of solidification, supersaturation and precipitation of a solid solution based on the equation of Clausius-Clapeyron. 23 ref. (N12p, 10-51)

129-N.* (Czech.) Precipitation of Carbides and Nitrides in the Tempering of Low-Carbon Chromium Steel. Jaroslav Koutsky and Jaroslav Jezek. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1098-1105.

Steel heat treated at 1000° C. for 2 hr. and oil quenched. Martensitic structure with more or less delta ferrite resulted Then samples were heat treated at 750° C. for 2 hr. or alternated at 450 and 550° C. for up to 1000 hr. 22 ref. (N7b, 2-64; SS, *Cr*)

130-N.* (German.) Review of Present-Day Position of Recrystallization Research. H. Borchers, H. Jordan and R. Schwarzwalder. *Metall*, v. 13, Jan. 1959, p. 12-19.

Reference to conventional recrystallization theories. More recent perspective, particularly regarding recrystallization in situ, the high energy block hypothesis and secondary recrystallization. Convenient recrystallization diagrams and practical applications. 104 ref. (N5f)

131-N.* (German.) Particular Properties of Metal Whiskers. F. Blaha. *Metall*, v. 13, Jan. 1959, p. 20-25.

Historical review dating back 200 years. More recent research results regarding spontaneous and influenced growth of Fe, Cu and Zn whiskers, also nonmetallic ones. Tensile strength for iron whiskers found to be 1340 kg. per sq. mm. max., for graphite 350. Production methods, applications, outlook. 50 ref. (N3r, Q27a, A2; Fe, NM-k36, 14-61)

132-N.* (Russian.) Diffusion Shift Peculiarities in Phase Boundary of Complex Alloys. A. A. Popov. *Fizika Metallov i Metallovedenie*, v. 6, no. 4, 1958, p. 643-649.

Process of interphase divided surface shifting depends on definite boundary components which are determined by the character of isothermal section of ternary phase diagram through two-phase region

of adjacent phases, and by correlation of the intensity of diffusion process of various elements in adjacent elements. 5 ref. (N1e)

133-N.* (Russian.) Investigation of Phase Transformation in Some Iron Alloys. S. A. Eliseev and B. G. Livshits. *Fizika Metallov i Metallovedenie*, v. 6, no. 4, 1958, p. 657-661.

Measurement of specific electroresistance, hardness, magnetic saturation and microstructure at 350-650° C. Dilatometric curves of thermal expansion taken during continuous heating and cooling. 11 ref. (N-general, J-general, P15g; Fe-b, *V, Mo*)

134-N.* (Russian.) Effects of Preliminary Heat Treatment on the Kinetics of Pearlite-Troostite Dissociation in Supercooled Austenite. V. G. Gorbach and V. D. Sadovskii. *Fizika Metallov i Metallovdenie*, v. 6, no. 4, 1958, p. 665-672.

Austenitic structure depends on heat treatment which determines degree of carry-over of austenite structure. Difference is in grain sizes. 12 ref. (N8h, 2-64; SS-e)

135-N.* (Russian.) Aging of Spring Alloys. M. M. Borodkina. *Fizika Metallov i Metallovedenie*, v. 6, no. 4, 1958, p. 700-705.

Boundary lines of phase regions on Fe-Ni-Ti diagram. Al and Cr additions and deformation before tempering. Epsilon phase separated during aging of Fe-Ni alloys and steels. 4 ref. (N7a, 2-60, 3-68; SGA-b, ST, Fe-b, *Ni, Ti, Al, Cr*)

136-N.* Inhomogeneities of Deformation as They Affect Recrystallization in Zinc. G. Brinson and M. E. Hargreaves. *Institute of Metals, Journal*, v. 87, Dec. 1958, p. 112-119.

Microscopic observations using polarized light and with the specimen on a hot stage allow direct study of recrystallization in deformed, polycrystalline Zn (99.998%). Strain markings produced by 7.5 compression are related to the behavior during recrystallization. New grains appear and grow rapidly only near grain boundaries and in heavily twinned regions. 19 ref. (N5, N3, 3-68; Zn)

137-N. (Book.) Preparation of Single Crystals. W. D. Lawson and S. Nielson. 255 p. 1958. Academic Press, Inc., 111 Fifth Ave., New York 3, N. Y. $8.80.

Growing crystals, purifying and preparing materials; mechanism of crystal growth. (N3; 14-61)

138-N. (Translation—AIP.) Influence of Cr, Mo and W on the Self-Diffusion of Iron in Dilute Alpha Solid Solutions. I. B. Borovskii, K. P. Gurov, and Iu. G. Miller. *Soviet Physics Doklady*, v. 3, Jan-Feb. 1958, p. 147-150.

Determined by method of alternate mechanical removal of layers and anodic solution of thin layer of active surface. 8 ref. (N1d; Fe, *Cr, Mo, W*, 3-69, 14-67)

173-N. Structural Effects of the Diffusionless Phase Transformations in Au-Cd Alloys. Howard K. Birnbaum. *University of Chicago, Institute for the Study of Metals, Quarterly Report*, no. 51, Dec. 1958, p. 357-358.

Line broadening and order charges; suggested mechanism. 5 ref. (N6b; Au-b, *Cd*)

174-N. Self-Diffusion in Liquids and Crystalline Solids. Norman H. Nachtrieb. *University of Chicago, Institute for the Study of Metals, Quarterly Report*, no. 51, Dec. 1958, p. 490-496.

Radioactive tracer study of effects of temperature and pressure. 7 ref. (N1d, 1-59, 2-61, 3-74)

175-N.* (Russian.) Intercrystalline Segregation of Silicon in Gray Cast Iron. Ya. N. Malinochka. *Liteinoe Proizvodstvo*, Jan. 1959, p. 32-36.

The austenite formed at the beginning of eutectic crystallization is richer in Si than the austenite formed at the end of solidification. In hypo-eutectoid, FeSi segregation can occur in the branches of primary austenite, more along the axes than along the periphery. 10 ref. (N12q, N8; CI-n, Si, 9-69)

176-N.* Study of Grain Boundary Diffusion in Metals. V. T. Borisov, V. M. Golikov, B. Y. Ljubov and G. V. Shtsherbedinsky. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 212-231.

Measurements of the integral activity of the specimen are taken continuously during the diffusion process, the specimen being previously covered with a thin radioactive layer. Determination of both diffusion coefficients from the data of a single experiment. Comparatively short diffusion annealing is sufficient and the method is nondestructive. 12 ref. (N1, 1-59)

177-N.* Effect of Metal Composition and Structure on Grain Boundary Diffusion. S. Z. Bokstein, S. T. Kishkin and L. M. Moroz. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 232-248.

Boundary diffusion prevails not only at low, but also at rather high temperatures: up to 1200°C. (self-diffusion of Fe, diffusion of Sn in Ni), and at least up to 1350°C. (self-diffusion of Cr). Consequently, a significant difference in the

structure of grain boundary and grain body persists up to high temperatures. Preferential grain boundary diffusion is observed in various metals irrespective of the type of crystal lattice. 11 ref. (N1a, M27f, 2-60, 2-61, 1-59; Fe, Sn, Ni, Cr)

178-N.* Investigation Into Carbon Atoms Mobility and Atomic Interaction. P. L. Gruzin, Y. F. Babikova, Y. A. Polikarpov and G. B. Fedorov. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 249-269.

Radiometric method reveals effect of C transport in Fe and Ni under the influence of the electric field. C atoms in Fe and Ni shown to be in cation state. 19 ref. (N1, R2a, 1-59; Fe-b, *C, Ni, Mo, S*)

179-N.* Application of Radioactive Isotopes in Solving Diffusion Problems in Metal Theory. A. A. Zhukhoyitsky, M. E. Janitskaya and A. D. Sotskov. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 279-301.

Studies of thermodynamic characteristics and self-diffusion coefficients of solvent Ag with positive and negative deviations from Raoult's law (Ag-Cu and Ag-Sn). 16 ref. (N1, 1-59, 2-60, 2-63; Ag-b, *Cu, Sn*)

180-N.* (Russian.) Eutectoid Transformation of Austenite in Malleable Iron. K. P. Bunin, S. L. Voitselenok and C. A. Fedorova. *Liteinoe Proizvodstvo*, Jan. 1959, p. 43-44.

Microscopic studies at 755-760° establish time necessary for commencement of cementite and ferrite separation; time required for completion of austenite structure and time to complete graphitization of eutectic cementite. 5 ref. (N8; CI-s)

181-N.* (French.) Physico-Chemical Reactions Occurring in 18% Chromium Steels Containing 2, 4 or 6% Nickel. P. Bastien and A. Sulmont. *Revue de Metallurgie*, v. 56, Jan. 1959, p. 40-48.

Tempering, martensite formation and decomposition; composition of alpha and gamma phases; diffusion of Cr and Ni and role of this diffusion in alpha-gamma transformation. 7 ref. (N-general; N1, N8p; SS)

182-N.* Diffusion of Oxygen in Alpha and Beta Zircaloy-2 and Zircaloy-3 at High Temperatures. M. W. Mallett, W. M. Albrecht and P. R. Wilson. *Electrochemical Society, Journal*, v. 106, Mar. 1959, p. 181-184.

Diffusion coefficient determined at 1000-1500° C. 9 ref. (N1; Zr-b, *O*)

183-N.* Crystal Growth of Electrodeposited Zinc. Ryoitiro Sato. *Electrochemical Society, Journal*, v. 106, Mar. 1959, p. 206-211.

In initial stage of deposition, the Zn layer always consists of fine-grained cyrstallites oriented at random. For relatively thick Zn layers deposited under influence of hydrogen and/or organic colloids, the orientation and texture are interpreted from standpoint of crystal growth. 24 ref. (N12d, M26c; Zn)

184-N. Diffusion in Multicomponent Metallic Systems. Pt. 4. A General Theorem for Construction of Multicomponent Solutions From Solutions of the Binary Diffusion Equation. J. S. Kirkaldy. *Canadian Journal of Physics*, v. 37, Jan. 1959, p. 30-34.

8 ref. (N1c)

185-N. (Russian.) Determination of the A_1 Critical Range in Malleable Iron. G. F. Tikhonov. *Liteinoe Proizvodstvo*, Jan. 1959, p. 42-43.

Critical interval of A_1 is in the region of 730-780° C. ± 10° C. A series of dilatometric curves shows austenitizing in the temperature range 730-800°. (N8g; CI-s)

186-N.* Titanium Alloys Today. Paul D. Frost. *Metal Progress*, v. 75, Mar. 1959, p. 95-96, 96-B, 97-98.

Ti is definitely being established as a useful structural material. It is light, strong and temperature resistant. Through alloy additions, either alpha or beta phase can be stabilized. Heat treatments, much like those used for steels, enhance the mechanical properties, particularly those of the alpha-beta and beta alloys. (N-general, Q-general, J-general; Ti-b)

187-N.* Treatment of Nimonic Alloys. W. Betteridge. *Metal Treatment and Drop Forging*, v. 26, Feb. 1959, p. 45-52.

Increased elongation before creep fracture can be obtained by the inclusion of an overaging treatment in the region of 850-900° C., depending on the particular alloy. For service at 500° C.appreciably improved strength can be obtained by an

appropriate combination of lattice distortion and precipitation hardening. The lattice distortion can be introduced either by hot working or by cold working of the previously solution-treated material. 4 ref. (N7, Q3; Ni-b)

188-N. (Book—Translation.) Dendritic Crystallization. D. D. Saratovkin. 126 p. 1959. Consultants Bureau, Inc., 227 W. 17th New York 11, N. Y. $6.

Russian work on eutectics in metals and crystallization of steel castings. 127 ref. (N12b, N12q; CI, ST, Cd-b, Pb-b, Bi-b, Cu-b, Sn-b, 5, 14-67)

193-N. (Translation—Brutcher no. 4474.) Abnormal Changes in Properties of Steel and Alloys During Phase Transformation. M. E. Blanter and A. K. Mashkov. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 6-10.

Increase in electrical conductivity and lowered resistance to plastic deformation during phase transition. These changes are characterized by a weakening of the interatomic bond and acceleration of the process of plastic deformation, together with migration of electrons. 4 ref. (N8g, P15g, Q24, M25h; ST, *C, Cr, Mn, Si*)

194-N. (Translation—Brutcher no. 4476.) Deformation of Technical Iron Under Cyclic Temperature Fluctuations. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 15-19.

Technical iron, within certain conditions of heating-cooling, manifests a sharp lowering of resistance to deformation, caused by action of stresses. The resulting reconstruction of the cyrstal lattice upsets the coherent atomic bonds and helps to promote a sharply reduced resistance to deformation only in carbon-enriched grain regions. 6 ref. (N8g, M26, 2-61, 3-66; Fe)

195-N. (Translation—Brutcher no. 4477.) Ferrite Grain Boundary Structure. V. N. Gridnev. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 19-25.

Defects and distortions in the crystal lattice form grounds for redistribution of diffused elements and formation of non-uniform structure. Laminae in technical iron (0.1% C) around ferritic grain are formed at temperatures where diffusion rate of surface-active additions is sufficiently high. 7 ref. (N1h, M27f; Fe, AY, *Cr, Cb, Mn, Mo, P, Si*)

196-N. (Translation—Brutcher no. 4479.) Effect of Elastic Vibrations of Sonic and Ultrasonic Frequency Upon Transformations in Metals and Alloys. E. A. Al'ftan. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 31-39.

Elastic vibrations aid magnetization and demagnetization of metals, considerably accelerate allotropic transformation of Sn, raise the cooling capacity of quenching media and increase the hardness in nitriding. 28 ref. (N6p, J28k, 1-74; Sn, ST, *Cr, Ni, Mo*)

197-N. A Study of the Rates of Crystallization of Iron From Liquid Bismuth Solutions. D. H. Kerridge. *United Kingdom Atomic Energy Authority*, AERE M/R 2579 (a), Oct. 1958, 4 p.

Shape of the crystallized Fe particles and variation of initial growth rates with crystallization temperature and supersaturation indicate that the dislocation mechanism of crystal growth is operative and that diffusion of Fe through the liquid

Bi is the rate controlling step in the process. 6 ref. (N12, N3; Fe, *Bi*)

198-N. Recovery of Lattice Expansion of Irradiated Molybdenum. D. L. Gray. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission, HW-57903,* Nov. 1, 1958, 16 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Upon annealing the lattice expansion, three thermal recovery processes occur up to 800° C.—one at 100-200° C., one near 400° C., and one from 500-800° C. The first process is grossly characterized by first-order kinetics and the total decrease in radiation-induced lattice expansion is independent of temperature. The 100-200° C. process possibly represents the trapping of interstitials at small impurity atoms. (N4, 2-67, 2-64; Mo)

199-N.* (English.) Contraction During the Solidification of Cast Iron as Influenced by Magnesium. L. Sofroni, R. P. Todorov and G. I. Koshovnik. *Revue de Metallurgie (Bucharest),* v. 3, no. 3, 1958, p. 61-72.

Experiments with Fe-C, Fe-C-Si and with Ni-C, Ni-C-Si and Co-C alloys reveal that during solidification the initial expansion is caused by graphitization in the cementite decomposition, while shrinkage is determined by graphitization in the eutectic transformation. 4 ref. (N8k, N8s, P10c, N12q, 2-60; CI, Mg, Ni, C, Si, Co, Fe)

200-N.* (German.) Precipitation and Intercrystalline Corrosion in Heat Resistant Cb-Stabilized Steel (16% Cr, 13% Ni, Mo and V) as Influenced by the Degree of Stabilization. Karl Bungardt and Gustav Lennartz. *Archiv fur das Eisenhuttenwesen,* v. 30, Jan. 1959, p. 23-29.

Precipitation behavior of nitrogen-containing alloy steel investigated by chemical and X-ray testing of isolated residues. A compound carbonitride (Cb, V) (C, N) exists in the quenched state. V content in the nitrides increases with growing Cb content and quenching temperature. Cold working prior to annealing increases precipitation speed. 10 ref. (N7, R2h; SS, *Cr, Ni, Mo, V*)

201-N.* (German.) Influence of Direct and Alternating Current on Quench and Strain Aging of Soft Iron. Friedrich Erdmann-Jesnitzer, Ditmar Mrowka and Klaus Ouvrier. *Archiv fur das Eisenhuttenwesen,* v. 30, Jan. 1959, p. 31-33.

Direct-current flow increases speed of aging process, low-frequency (50 cycles) alternating current having no effect in this respect. 12 ref. (N7e; Fe)

202-N.* (German.) Investigation of Stable and Metastable Equilibriums of Fe-C-Alloys. Theo Heumann and Joseph Grosse-Wordmann. *Archiv fur das Eisenhuttenwesen,* v. 30, Jan. 1959, p. 35-39.

Solubility limits between gamma compound crystals and secondary cementite or graphite for the two equilibriums in the Fe-C systems; tendency of cementite to decomposition. 19 ref. (N8k; Fe-b, *C*)

203-N.* (German.) Self-Diffusion of Pure Chromium. Harold W. Paxton and Ewald G. Gondolf. *Archiv fur das Eisenhuttenwesen,* v. 30, Jan. 1959, p. 55-60.

Specimens of radioactive Cr applied on pure Cr heated for various periods in the 950 to 1250° C. range. Surface radioactivity is reduced as a result of partial diffusion of the radioactive Cr into the base material. 14 ref. (N1d, 1-59; Cr)

204-N. Stability of Microstructures and Related Physical Properties at Elevated Temperatures. Wolfgang H. Steurer. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D. C., p. 70-89.

Relationship between stability and degree of strengthening in strain hardened, precipitation hardened and heat treated structures. Effects of grain growth, recrystallization and recovery on hardness and microstructure. 18 ref. (N7, N3, N5, M27, 2-62)

205-N.* (Italian.) Formation and Stability of the Epsilon Phase in Nitrided Iron. A. Burdese. *Metallurgia Italiana,* v. 50, Dec. 1958, p. 529-537.

Morphology, mechanical properties and speed of formation of nitrided layers as function of temperature, duration and other treatment conditions. Distribution of nitrogen in surface layers; effect of hardening and tempering on stability of nitrides, particularly in epsilon phase. 15 ref. (N9, J28k; Fe, *N*)

206-N.* (Rumanian.) Effects of Nitrogen Content in Steels. S. Bercu, A. Kathrein and R. Fischgold. *Studii si Cercetari de Metalurgie,* v. 3, no. 3, 1958, p. 385-396.

Iron with varying alloy additions heated to 600-750° C. in a current of NH_3 to study the influence of nitrogen on structure and

properties. As an alloying element, nitrogen retards martensitic transformation and intercrystalline corrosion in Cr-Ni and Cr-Mn steels and causes grain reduction in high Cr steels. 16 ref. (N8p, R2h, 2-60; CN, SS, *Cr, Ni, N*)

207-N. (German.) Growth Phenomena of Germanium Crystals. G. Zielasek. *Zeitschrift fur Naturforschung,* v. 13a, Dec. 1958, p. 1097-1098.

Semiconductor crystals grown by the Czochralski method have grooves due to the rotation. Fine grooves and cavities are related to lattice imperfections and impurities. (N3r, M26s; Ge)

208-N.* (German.) Formation of Austenite in Unalloyed and Low-Alloy Steels. Eugen Schmidtmann and Helmut Brandis. *Archiv fur das Eisenhuttenwesen,* v. 30, Feb. 1959, p. 83-89.

Structure of CK15, CK35, CK60, 24CrMo5, 36CrNiMo4 steels and of steel containing 0.8% Cr and 3.5% Ni subsequent to annealing. (N8f; AY, *Cr, Ni, Mo*)

209-N.* (German.) Phase Changes in Iron-Vanadium Alloys. Karl Bungardt and Wolfgang Spyra. *Archiv fur das Eisenhuttenwesen,* v. 30, Feb. 1959, p. 95-102.

Phases present in the temperature range of 350-1100° C. In alloys with 27 and 45% V a sigma phase developed, the formation of which depends on the temperature and time of heat treatment. Below 700° C. embrittlement was observed, explained by ordering processes. (N6p; Fe-b, V)

210-N.* Orientation of Recrystallized Grains in Strained Aluminum Single Crystals. H. Yoshida, B. Liebmann and K. Lucke. *Acta Metallurgica,* v. 7, Jan. 1959, p. 51-56.

Recrystallization started at cut end with fine grains. After further heating most of grains disappeared and a few large crystals were left. Preferred orientation of final crystals originates in growth selection. 10 ref. (N5, M26c; Al, 14-61)

211-N.* (Czech.) Diffusion of Zinc in Nickel. Stevo Trajkov. *Hutnicke Listy,* v. 14, Feb. 1959, p. 139-141.

At temperatures from 300 to 700° C., a gamma phase ($NiZn_3$) develops on the contact surfaces of the two metals by chemical reaction. Later an epsilon phase ($Zn_{15}Ni_2$) and a beta phase (ZnNi) are formed where the gamma phase touches the Zn and the Ni. (N1h, M24b; Ni, *Zn*)

212-N.* (Hungarian.) Dimensional Changes in Bearing Races During Aging and Age Hardening. Pt. 2. Pal Prokay. *Kohaszati Lapok,* v. 91, Oct-Nov. 1958, p. 501-503.

Influence of quenching agent on relative amount of retained austenite. Hardness of the steel depends on tempering temperature. Satisfactory dimensional stability obtained by combined oil and water quenching. 9. ref. (N7a, P10d, T7d; ST, SGA-c)

213-N.* (Slovakian.) Structure of Pearlite Formed in the Continuous Decomposition of Austenite. Ivan Hrivnak. *Hutnicke Listy,* v. 14, Feb. 1959, p. 133-139.

Nonlaminar tertiary cementite and nonhomogeneous pearlitic cementite with growth defects can form in addition to the pearlitic cementite. Nature of cementite and pearlitic structure is influenced by the carbon, Cr or Mo content. 18 ref. (N8h, 2-60; CN-b, AY, *Cr, Mo*)

215-N. (German.) Calorimetric Proof of Long-Range Order in Nickel Brass. A. Kussmann and H. Wollenberger. *Naturwissenshaften,* v. 45, Nov. 1958, p. 541.

Specific heat as function of temperature for various Ni contents. Short-range order characteristics for solid solutions containing less than 20% Ni and long-range order characteristics for higher Ni contents. 4 ref. (N10; Cu-b, *Zn, Ni,* 14-67)

216-N.* Self and Interdiffusion in Aluminum Zinc Alloys. J. E. Hilliard, B. L. Averbach and Morris Cohen. *Acta Metallurgica,* v. 7, Feb. 1959, p. 86-92.

Self-diffusion rate of Zn increases as the Zn content is raised while the thermodynamic driving force decreases with increasing Zn content until a minimum is reached at 38% Zn. Interdiffusion rate changes little with content. 17 ref. (N1d, N1h, 2-60; Al-b, *Zn*)

217-N.* Stress-Ordering Effect on Thermal Expansion of CuAu Single Crystals. Makoto Hirabayashi. *Physical Society of Japan, Journal,* v. 14, Feb. 1959, p. 149-152.

On cooling from above the transition temperature under compressive stress in the longitudinal direction, the c-axes of the ordered phase is aligned in one of the cubic axes nearest the stress direction. 4 ref. (N10; Cu-b, Au, 14-61)

218-N.* (French.) Pseudo-Martensitic Transformation in Zirconium Hydride. D. Whitwham, Melle A. Huber and J. Herengual. *Acta Metallurgica*, v. 7, Feb. 1959, p. 65-68.

Existence in ZrH_2 alloys of two different hydride phases. 5 ref. (N6q, Zr-b, *H*)

219-N.* (French.) Precipitation in Several Nickel-Base Alloys. J. Manenc. *Acta Metallurgica*, v. 7, Feb. 1959, p. 124-130.

Ni-Al, Ni-Al-Ti, Ni-Cu-Al, Ni-Si, Ni-Cu-Si, Ni-Mo-Si alloys precipitate an ordered fcc. phase. Preprecipitation and aging sequence given. 28 ref. (N7; Ni-b, *Al, Ti, Cu, Si, Mo*)

220-N.* (French.) Effects on Resistivity of the Diffusion of Protons in Steel After Charging in Acid Medium and Plastic Deformation. E. Herzog and M. Hugo. *Comptes Rendus*, v. 248, Jan. 19, 1958, p. 408-410.

Hydrogen was introduced into specimens of killed, mild and openhearth steel by cathodic charging or by immersion in saturated solution of H_2S, with and without simultaneous or subsequent application of tensile stresses. Considerable increase of resistivity in specimens partially charged with hydrogen occurs if rate of charging is sufficiently high. When saturation is reached, phenomena vary according to mode of introduction of hydrogen. Partial or total saturation of steel by hydrogen modifies its aptitude for plastic deformation. (N15e, 3-68, P15g; ST, *H*)

221-N.* (French.) Influence of Conditions of Heat Treatment on the Exaggerated Growth of Soft Iron. P. Coulomb. *Comptes Rendus*, v. 248, Feb. 2, 1959, p. 682-685.

Exaggerated grain growth is due to elimination of impurities by hydrogen. Its appearance depends on chemical composition and rolling conditions, but also on natural aging before annealing and conditions of gas-metal exchange (thickness of sheet and temperature). (N3, 2-64, 3-69; Fe)

222-N.* (French.) Presence of Free Crystals in Alloys During Solidification and Formation of the Cone of Inverse Segregation in Commercial Ingots. A. Kohn and M. Olette. *Comptes Rendus*, v. 248, Feb, 9, 1959, p. 797-800.

Autoradiographic examination of iron alloys containing S, P or As revealed presence of free dendritic crystals, poor in element studied, which tend to collect near base of ingot. Confirms theory that cone of inverse segregation is result of drop of free crystals formed during cooling. 6 ref. (N12b, M23q; Fe-b, *S, P, As*, 5-59, 9-69)

223-N.* (French.) Secondary and Tertiary Recrystallization of Work-Hardened, Hydrogen-Annealed Soft Iron. P. Coulomb and P. Lacombe. *Comptes Rendus*, v. 248, Feb. 16, 1959, p. 964-966.

Secondary texture is characterized by absence of crystals (100) parallel to plane of sheet. This texture is composed of grains (110), (111) and (112) and is replaced by a tertiary texture composed of large grains (110) (001). 10 ref. (N5; M26c, Fe)

224-N.* (French.) Polygonization of Aluminum of Different Degrees of Purity. Jean Montuelle. *Comptes Rendus*, v. 248, Feb. 23, 1959, p. 1174-1177.

Diversity of shapes, orientations and sizes assumed by substructures of polygonization depends on modes of deformation and annealing used to provoke appearance of this phenomenon. 7 ref. (N5, 3-68, 2-64; Al)

225-N. General Theory, Mechanism and Kinetics. J. B. Newkirk. Paper from "Precipitation From Solid Solution". American Society for Metals, Cleveland, 1959, p. 6-149.

Concepts of precipitation process; clustering; nucleation; changes in mechanical, physical and chemical properties; Al, Ni, Cu and Fe alloys. 379 ref. (N7, P-general, Q-general, 2-65, 3-68; Al-b, Ni-b, Cu-b, Fe-b, SS, 14-67)

226-N. Precipitation Reactions in Irons and Low-Alloy Steels. H. W. Paxton. Paper from "Precipitation From Solid Solution". American Society for Metals, Cleveland, 1959, p. 208-243.

227-N.* (Japanese.) Kinetics of the Thermal Decomposition of Cementite. Hiroya Kaieda. *Kyushu University, Faculty of Engineering, Memoirs*, v. 17, May 1958, p. 164-221.

Transformation, graphitization and heat treatment of steel and cast iron. 60 ref. (N-general, J-general; ST, CI)

228-N.* (Russian.) Grain Refining by Vibration of a Crystallizing Melt. I. I. Novikov, G. A. Korol'kov, V. V. Solov'eva and A. Freilikh. *Litinoe Proizvodstvo*, Feb. 1959, p. 42.

Vibrating the melt near the crystallizing front breaks up the microstructure to a great extent. If the vibration is discontinued when the crystallizing front is at some distance from the melt surface the upper part of the casting exhibits a zone of coarse grain. The boundary between the coarse and finegrained zones is quite sharp. 5 ref. (N12, M27c; AD-p35)

229-N.* (German.) Recrystallization in 6% Tin Bronze. Heinz Borchers and Hans Jordan. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 75-80.

Recrystallization behavior after cold deformation by upsetting and subsequent heating. (N5; Cu-s, *Sn*)

230-N.* (Russian.) Austenite Decomposition as Affected by Thermal Cycling During Welding. N. N. Prochorov, E. L. Makarov and V. I. Gospodarevskii. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 164-166.

Austenite decomposition during two temperature cycles is determined for 15 types of steel. Resistance to cracking remarkably decreases when the austenite decomposition is completed at a temperature below 300° C. (N8, K1a; AY)

231-N. Calorimetric Determination of Ordering in the U-Mo System. R. F. Boyle and E. K. Halteman. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 101-111. U. S. Office of Technical Services, Washington 25, D. C.

Callorimetric and X-ray spectrometer measurements used to verify the presence of an order-disorder reaction. Results are in good agreement with order-disorder theory. A slight readjustment of previously accepted phase boundaries is indicated. 11 ref. (N10, M24b; U-b, *Mo*)

232-N.* (German.) Physical Structure and Metallography of Aluminum. D. Altenpohl and Z. Z. Jackson. *Metall*, v. 13, Mar. 1959, p. 179-183.

Increase in Cu content from 0.0002 to 0.002% considerably affects the recrystallization of pure Al while further increase of Cu has no effect. Heat treatment at 50-130° C. shows little, or no change in strength value. 21 ref. (N5, M-general, 2-60; Al-a, *Cu*)

233-N.* (German.) Effect of Warm Forming Upon Discontinuous Grain Growth in Aluminum Sheets. H. Hug and H. Bichsel. *Metall*, v. 13, Mar. 1959, p. 188-192.

Discontinuous growth in crystals may be influenced by proper choice of warm forming so that coarse grain appears either quickly or only after long heating. 11 ref. (N3; Al, 4-53)

234-N.* (German.) Precipitation and Dissolving Processes in Copper-Iron Alloys. Volker Schumacher. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 81-86.

Wires with a higher Cu than Fe content are heated and then quenched from different temperatures. Changes in conductivity and thermo-electric force are measured to determine precipitation and dissolution data. 21 ref. (N7b, N1e; Cu-b, *Fe*)

235-N.* (German.) Discontinuous Precipitation in Copper-Indium Alloys. Horst Bohm. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 87-93.

Laminar discontinuous precipitation studied in samples containing 4-15% In in the range 200-480° C. Activation energy of the diffusion occurring on the boundaries and transition temperature from discontinuous to continuous precipitation depends on the In concentration. 15 ref. (N7b, N1e, 2-60; Cu-b, *In*)

236-N.* (Russian.) Structural Stability and Properties of Chromium Steels. A. V. Merlina and A. M. Bozoyka. *Stal'*, Feb. 1959, p. 160-165.

Investigation of properties of heat resisting steels (3%, 5-6% and 12% Cr content) alloyed with Mo, W, V and Cb revealed that heat resistance for conditions of long-time service is related to the thermal stability of the carbide phase and the strength of the solid solution. 5 ref. (N8r, Q27a, 2-61; AY, *Cr, Mo, V, W, Cb*)

237-N. Kinetic Study of Irradiation Induced Phase Changes in Uranium-9 w/o Molybdenum Alloy. M. L. Bleiberg. *Nuclear Science and Engineering*, v. 5, Feb. 1959, p. 78-87.

U-Mo alloys shown to transform from stable to metastable phase due to neutron bombardment. This is explained on the basis of the smoothing out of concentration gradients due to the action of "displacement spikes" or "thermal pulses" generated within the sample. 9 ref. (N6p, 1-59; U-b, *Mo*)

238-N. (Russian.) Instrument for Tests on the Martensite Formation Under Plastic Deformation. P. V. Novichkov. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 166-170. (N8p, 1-53)

239-N.* (German.) Calorimetric Investigations of Ordering Processes in Alpha-Brass and in German Silver. Albrecht Kussmann and Heinrich Wollenberger. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 94-100.

Thermal analyses performed with samples of various composition in the homogenized and annealed state prove the short-range ordering hypothesis for alpha-brass. In the alpha range of german silver long-range ordering of the type Cu_2NiZn is assumed. 26 ref. (N10b; Cu-n, Cu-b, *Zn, Ni*)

240-N.* (Japanese.) Recrystallization of Al-Zr-Cd Alloy. Motoyuki Nakamura, Shigeru Matsuo and Masaaki Yanagisawa. *Nagoya Government Industrial Research Institute, Reports*, v. 7, Mar. 1958, p. 185-189.

Recrystallization during rolling and heating. (N5; Al-b, *Zr, Cd*)

241-N.* (Japanese.) Process of Precipitation in Al-Bronze Containing Ni and Co. Shizuo Suzuki. *Nagoya Government Industrial Research Institute, Reports*, v. 8, Mar. 1959, p. 191-195.

Hardening and softening begins sooner at the grain boundary than at the center of the grain; there are two types of precipitates at the grain boundary; parallel side-plates and preferentially grown precipitates along the grain boundaries. 10 ref. (N7, N3; Cu-s, *Al, Co, Ni*)

242-N. (Book.) Precipitation From Solid Solution. R. F. Mehl, J. B. Newkirk and W. A. Anderson. 517 p. 1959. American Society for Metals, 7301 Euclid Ave., Cleveland 3. $10.

Series presented at National Metal Congress and Exposition, Chicago, Nov. 1957. General concepts, mechanism and kinetics, property changes, precipitation-hardening base alloys. Lectures abstracted separately. 854 ref. (N7, J27)

243-N. (Translation—BWRA.) Problem of Primary Weld Crystallization in Fusion Welding. M. I. Razikov. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 57-59.

In the welding of steel the fused grains of austenite along the fusion line are the bases for the growing columnar dendrites of weld metal. Weld metal grain size therefore largely depends on the grain size of the parent metal at the fusion line. Effective methods of reducing the dimensions of the weld metal dendrites in fusion welding are those which minimize grain growth in the parent metal at the fusion line. 4 ref. (N12, K9n, 2-59; 7-51, SS)

244-N.* Factors Which Influence the Structure of Electrodeposits. A. M. Max. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 73-80.

Plating of a metal by an electric current involves the transfer of the metal ion from a solution to a position in a crystal lattice. Whether deposits will tend toward a finer or a coarser grain depends on the ratio of the number of ions striking the surface to the number remaining, and the ease with which an ion can move laterally. 15 ref. (N12d)

245-N.* (English.) Grain Boundary Hardening Due to Piled-Up Dislocations. Jin-ichi Takamura and Sei Miura. *Physical Society of Japan, Journal*, v. 13, Dec. 1958, p. 1421-1423.

Hardening in alpha brass. 6 ref. (N7e, M26b; Cu-n)

246-N.* (German.) Austenite Transformation Occurring in the Cases and Cores of Carburized Steel. Hermann Schenck, Eugen Schmidtmann and Peter Schmithals. *Archiv fur das Eisenhuttenwesen*, v. 30, Mar. 1959, p. 153-160.

The carburized zone shows a transformation behavior different from that of a steel of the same composition as the zone but homogeneously distributed over the whole section. The discrepancy is explained by expansion differences between case and core and resulting stresses. 16 ref. (N9g, 3-66, J28g; CN-r, CN-g)

247-N.* (German.) Strength Properties of Carbon Steel With Widmannstatten Structure. F. Erdmann-Jesnitzer and B. Schellhorn. *Industrieblatt*, v. 59, Mar. 1959, p. HT19-HT23.

Micrographic, electron-optical and fractographic study of the impact brittleness which is characteristic of the Widmannstatten structure. Several unalloyed cast steels were investigated with and without heat treatment. Influence of grain structure and stresses on the cracking. (To be continued.) (N8, Q26s, 3-66; CN, 5)

248-N.* (Russian.) Effect of Small Additions of Silver and Zinc on the Aging of Aluminum-Copper Alloys. Pt. 5. V. I. Arkharov and L. M. Magat. *Fizika Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 804-808.

Addition of 0.05-0.5% Ag and 0.2% Zn to Al-Cu alloy has a retarding effect on

the disintegration of over-saturated solid solution of Cu in Al at the start of aging at 245° C. Introduction of Ag and Zn causes an increase of Cu diffusion. 7 ref. (N7a, 2-60; Al-b, *Cu, Ag, Zn,* AD-p)

249-N.* (Russian.) Effect of Cadmium, Silver or Zinc on the Aging of Aluminum-Copper Alloys. Pt. 6. V. I. Arkharov and L. M. Magat. *Fizika Metallov i Metallovedenie,* v. 6, no. 5, 1958, p. 809-811.

Addition of 0.05% Cd has an accelerating effect on aging at 245° C. The further addition of Ag reduces the effect of Cd. 8 ref. (N7a, 2-60; Al-b, *Cu, Cd, Ag, Zn*)

Diffusion pattern in a polycrystal body. The pattern of diffusion is close to that accepted in the theory of heat transmission and mass transmission. 14 ref. (N1h)

286-N.* (German.) Superstructure and "K-State" in the Nickel-Chromium System. Hans Gunter Baer. *Zeitschrift fur Metallkunde*, v. 49, Dec. 1958, p. 614-622.

An ordered phase Ni_2Cr is found in alloys with 25-36 at.% Cr. Its critical temperature is at 580° C. for an alloy with 33.7 at.% Cr. By an increased temperature of preliminary heating (for example, from 800-1200° C.), on previous cold deformation the ordering process is accelerated. The ordered state is destroyed by cold deformation. Low Cr-alloys can pass into the K-state, which is characterized by an increase of electric resistance, after by heat treatment and by a decrease of resistance as a result of deformation. 22 ref. (N10a, 2-64, 3-68; Ni-b, *Cr*)

287-N.* (Hungarian.) Determination of the Sizes of Crystal Nuclei. Sandor Gardonyi. *Kohaszati Lapok*, v. 92, Jan. 1959, p. 23-28.

Calculation of the dimensions and expected growth pattern of crystal nuclei based on laws of thermodynamics. Solid impurities in the metal melt stimulate formation of crystal nuclei. Speed of crystal growth in a direction normal to the face is related to surface adhesion on the crystal faces. 5 ref. (N2, N3, 3-69)

288-N.* Normal Grain Growth in Zone-Refined High-Purity Metals. E. L. Holmes and W. C. Winegard. *Canadian Journal of Physics*, v. 37, Apr. 1959, p. 496-498.

A model is proposed for the mechanism of grain-boundary migration based on the assumption of a single-atom process. 12 ref. (N3m, Pb-a, Sn-a)

289-N.* Recrystallization of Lead During Creep. R. C. Gifkins. *Institute of Metals, Journal*, v. 87, Apr. 1959, p. 255-261.

Acceleration of creep associated with recrystallization is shown to result from primary creep of the new grains and not from the actual process of recrystallization. Although recrystallization appeared to consist of nucleation and growth, its characteristics were predominantly those of marked grain growth. 33 ref. (N3m, N5f, Q3; Pb)

290-N.* Removal of Hydrogen by Diffusion From Large Masses of Steel. J. D. Hobson. *Iron and Steel Institute, Journal*, v. 191, Apr. 1959, p. 342-352.

Theoretical calculation of the loss of hydrogen during forging, annealing and heat treatment of large masses of alloy steel. Comparison of calculated and observed values. (N1; AY, *H*)

291-N.* Effect of Austenitizing Treatment on Formation of Lower Bainite in a Plain Carbon Steel. L. W. Graham and H. J. Axon. *Iron*

and Steel Institute, Journal, v. 191, Apr. 1959, p. 361-365.

Metallographic and dilatometric study of influence of solution treatment, temperature and time on kinetics of austenite-bainite reaction in 0.97% carbon steel. 13 ref. (N8g, N8m, 2-64; CN-p)

292-N.* Electrical Resistivity and Superstructure of $CuAu_3$. Makoto Hirabayashi. *Physical Society of Japan, Journal,* v. 14, Mar. 1959, p. 262-273.

Study of superlattice formation with electrical resistiveity measurements. 29 ref. (N10a, P15g; Ag-b, *Cu*)

293-N.* (German.) Strength Properties of Carbon Steel With Widmannstatten Structure. F. Erdmann-Jesnitzer and B. Schellhorn. *Harterei-Technik und Warmebehandlung (Supplement to Industrieblatt),* v. 5, Apr. 1959, p. 25-31.

Effect of various annealing temperatures on the impact strength of cast steel with 0.46% carbon. Brittle behavior under impact is thought to be caused by the position of ferrite needles and by carbon layers in the ferrite. 39 ref. (N8j, Q26; CN, 5-60, 3-71)

294-N.* (German.) Formation of the Omega-Structure in Titanium-Vanadium and Titanium-Molybdenum Alloys. Karl Lohberg and Herbert Westphal. *Zeitschrift fur Metallkunde,* v. 49, Sept. 1958, p. 449-455.

Effects of heat treatment and artificial aging on formation of omega-structure after plastic deformation. (N7c, Q24, 2-64, 2-65; Ti-b, *V, Mo*)

295-N. The Free-Energy Changes Attending the Martensitic Transformation in the Iron-Chromium and Iron-Chromium-Nickel Systems. Larry Kaufman. *Metallurgical Society of AIME, Transactions,* v. 215, Apr. 1959, p. 218-223.

An equation is derived which relates the difference in free energy between austenite and martensite to temperature and composition in the Fe-Cr and Fe-Cr-Ni systems. The equation is used to calculate the difference at M_S for low-carbon stainless steels. A method for utilizing the energetic equations to calculate M_S in stainless steels is suggested. 33 ref. (N8p, M24c, P12; SS, *Fe, Cr, Ni*)

296-N. Heat Treatment, Transformation Reactions and Mechanical Properties of Some High-Strength Zirconium-Base Alloys. H. A. Robinson, J. R. Doig, M. W. Mote and P. D. Frost. *Metallurgical Society of AIME,* v. 215, Apr. 1959, p. 237-245.

The Zr alpha-beta alloys respond to heat treatment much as Ti alpha-beta alloys, showing both the epsilon and the alpha-prime aging reactions, depending on composition and heat treatment history. Data are presented for Zr-Mo-Sn and Zr-Nb-Sn alloys, which produce strengths as high as 190,000 psi. with reasonable ductility. 14 ref. (N-general, Q-general, 2-64, 2-60; Zr-b, *Mo, Sn, Cb,* SGB-a)

297-N. Freezing of Liquid Metal in a Mold. G. Harvay and J. G. Henzel. *Metallurgical Society of AIME, Transactions,* v. 215, Apr. 1959, p. 258-273.

Nomograms and charts permit rapid determination of the mold-casting interface temperature and the speed of solidification when a semi-infinite ingot is cast into a semi-infinite mold. The physical properties of the mold, the frozen metal and the liquid metal are not assumed to be equal, but they are assumed to be temperature independent. 15 ref. (N12)

298-N. Diffusion of Zinc From the Vapor Phase Into Copper-Zinc and Silver-Zinc Alloys. A. G. Guy. *Metallurgical Society of AIME, Transactions,* v. 215, Apr. 1959, p. 279-282.

Zinc vapor from a reservoir of liquid Zn maintained at lower temperatures was diffused into sets of Cu-Zn alloys at 759 and 870° C. and into sets of Ag-Zn alloys at 650 and 700° C. Natural markers at the initial surfaces of the specimens were "trapped" under a thin electroplate and their depth of burying was measured after diffusion. 20 ref. (N1; Cu, Ag, *Zn*)

299-N. Retrogression in Age Hardening. L. F. Mondolfo. *Metallurgical Society of AIME, Transactions,* v. 215, Apr. 1959, p. 289-294.

An Al-Cu alloy 4% Cu aged at room temperature for times increasing up to 78,000 hr. was annealed at 170° C. and the hardness and electrolytic potential determined during retrogression and subsequent aging. A change of behavior with increasing time of aging at room temperature indicates that, given sufficient time, retrogression disappears and the room-temperature aging tends to progress directly into the high-temperature aging. 78 ref. (N7a; Al-b, *Cu*)

300-N. A Proposed Mechanism for the Strengthening of SAP-Type Alloys. G. S. Ansell. *Metallurgical Society of AIME, Transactions,* v. 215, Apr. 1959, p. 294-295.

SAP-type alloys are not truly dispersion-hardened alloys in the normal sense, since the dispersed second phase acts only to prevent the production of dislocations, whereas in the dispersion-hardened alloy the dispersion acts to hinder dislocation movement. SAP-type alloy should be treated as a distinctive type of dispersion-hardened metal. (N7; Al-b, 6-68)

301-N.* Microstructure of Age-Hardenable Alloys. J. R. Mihalisin and K. G. Carroll. Paper from "Symposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 68-72.

Microstructure of a Ni-Ce-Fe-Al-Ti-Cb alloy after solution and double aging treatments and of a Ni-Cr-Fe-Mo-Ti-Al alloy following creep rupture tests at 1350° F. 5 ref. (N7a, N7e; M27, Ni-b, *Cr, Fe, Al, Ti, Cb*)

302-N.* An Electron Metallographic Study of the Precipitation-Hardening Process in Commercial Nickel-Base Alloys. W. C. Bigelow, J. A. Amy, C. L. Corey and J. W. Freeman. Paper from "Symposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 73-87.

Development of gamma-prime phase in Inconel X, Waspaloy, M-252 and Udimet-500 during aging at 1400 and 1600° F. for periods up to 100 or 1000 hr. 11 ref. (N7a, N7b, M21e; Ni-b, *Cr, Co, Mo, Fe, Al, Ti, Cb, Mn*)

303-N.* Application of Electron Diffraction and Electron Microscopy in Studies of Minor Phases of Heat-Resistant Alloys. W. C. Bigelow, L. O. Brockway and J. W. Freeman. Paper from "Sumposium on Advances in Electron Metallography". American Society for Testing Materials, STP no. 245, 1958, p. 88-99.

Etched surfaces of 16-25-6 Cr-Ni-Mo steel, Inconel X, S816 Co-base alloy and N-155 alloy after solution treatment and aging for various times at 1200 to 1600° F. Identity and distribution of precipitated phases. Surface preparation techniques. 19 ref. (N7a, M20, M22h, M21e; SS, Co-b, Ni-b, SGA-h)

304-N.* (English.) The Casting of Special Steel Ingots. *Aciers Fins & Speciaux*, no. 31, Mar. 1959, p. 22-28.

Liquid metal-solid metal contraction; segregation; mold walls; solidification; columnar and equiaxed crystallization; properties of rimming, interupted rimming or capped, semikilled and killed steel. 5 ref. (N12, P10d; 9-69, ST, 5-59)

305-N. A Study of the Peritectoid Transformation. R. D. Reiswig and D. J. Mack. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 301-307.

Six peritectoids selected were those reported at 7.02% Al-Ag, 26.0% Sb-Cu, 30.5% Sb-Cu, 32.3% Sn-Cu, 8.35% Si-Cu, and 21.2% Al-Cu. Peritectoid transformation takes place ideally by the formation of a peritectoid wall of the low-temperature phase at the interface separating the high-temperature phases and the lateral growth of this wall at the expense of the high-temperature phases. 11 ref. (N11g; Cu-b, *Sb, Sn, Si, Al*, Ag-b)

306-N. Observations on the Recrystallization of a Silicon-Iron Crvstal in a Polygonized Matrix. Hsun Hu. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 320-326.

Recrystallization tendency of the deformed crystal is much weakened by the polygonization of the matrix. Complete recrystallization in such specimens is achieved by the growth of recrystallized grains of sufficient size and of the right orientations in relation to the matrix. 15 ref. (N5, 3-68; Fe-b, *Si*, 14-61)

307-N. An Investigation of the Effects of Variables on the Stored Energy of Cold Work. A. L. Titchener and M. B. Bever. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 326-335.

Stored energy of cold work in drawn Au-Ag wires investigated by tin-solution calorimetry as a function of strain, strain rate, initial grain size and temperature of deformation. The energy expended in the deformation process was measured. 29 ref. (N7e, P12, 3-68, 2-61, 2-59; Au-b, *Ag*, 4-61)

308-N. Diffusion of Bismuth in Copper Grain Boundaries. S. Yukawa and M. J. Sinott. *Metallurgical Society of AIME, Transactions*, Apr. 1959, p. 338-340.

Use of high-resolution autoradiography to detect the presence of Bi in Cu polycrystalline and bi-crystal specimens. 5 ref. (N1, M23q; Cu, *Bi*)

309-N. Nonmetallic Dispersions in Cobalt. E. F. Adkins, C. T. Sims and R. I. Jaffee. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 344-352.

Effect of oxide dispersions on mechanical properties of Co and Co-base powder

metallurgy alloys. Oxide dispersions added to pure Co greatly improve the high-temperature creep resistance of the metal. Dispersions in powder metallurgy Co alloys are much less effective. 4 ref. (N7, Q-general, 2-60, 2-62; Co-b, NM-a34, 6)

310-N.* (English.) The Influence of Annealing on the Pearlitic Structure of a Eutectoid Carbon Steel. H. Modin. *Jernkontorets Annaler*, v. 143, no. 2, 1959, p. 76-116.

Pearlite formed at 700 and 650° C. is lamellar and the cementite in the pearlite has the form of deep jagged plates perforated by numerous holes. The perforated and jagged shape of the cementite particles is formed at the time of formation of the cementite and not in consequence of the continued annealing. 5 ref. (N8h, J23; CN)

311-N. (German.) Physical Properties of Superstructures With Shifting Atomic Structure. Werner Koster and Walter Lang. *Zeitschrift fur Metallkunde*, v. 49, Sept. 1958, p. 443-449.

In Cu_3Au-Zn_3Au, Pd_3Cu and CuAu-Zn systems, the electrical resistivity and Young's modulus are higher and the Hall constant is more negative in superstructures with shifting atom blocks than in nondisturbed superstructures. 17 ref. (N10a, M25, P15, Q21a; Cu-b, *Au, Zn, Pd*)

312-N. (German.) Crystal Structures of AuZn (r), Au_3Zn_5 and Some Related Variants. Manfred Wilkens and Konrad Schubert. *Zeitschrift fur Metallkunde*, v. 49, Dec. 1958, p. 633-646.

The structures are understood as superstructures of the LI_2-type showing the phenomenon of atomic shifting. 18 ref. (N10a, M26; Au, Zn)

313-N. (Ukrainian.) Eutectic Structure of Cast Iron. K. P. Bunin and L. T. Kalinina. *Dopovidi Academii Nauk Ukrain'skoi SSR*, no. 2, 1959, p. 156-159.

Crystallization of eutectic case iron with both low and high Si content during continuous cooling at a varying rate. (N12q, CI)

314-N.* (French.) Influence of Some Addition Elements on the Stability of Stellite. K. Lobl, J. Jezek and H. Tuma. *Revue de Metallurgie*, v. 56, Apr. 1959, p. 324-330.

Structural changes caused by long-term annealing of Co-Cr-W type alloys; comparison with Co alloys containing small additions of Ti, Mo, Cb, Zr, B and Fe. (N7c, J23q; SGA-h, Co-b, *Cr, W, Cb, Ti, Mo, B, Fe, B, Zr*)

315-N.* (French.) Nature of Microconstituents Formed in Zinc-Rich Brasses Containing Iron and Aluminum. A. R. Weill. *Revue de Metallurgie*, v. 56, Apr. 1959, p. 371-379.

Two commercial beta brasses studied by optical microscopy, electron diffraction and Castaing's electron probe microanalyzer. Specimens containing Fe, Al and Mn have homogeneous precipitates formed by a solid solution of Fe-Mn-Al. When brass also contains Ni, dendritic precipitates are two-phased, consisting of an Fe-Mn-Al matrix and Ni-Fe-Al branches. Latter solidx solution is ordered. 16 ref. (N12b, M27, Cu-n, *Fe, Al, Mn, Ni*, 14-67)

316-N.* (French.) Study of Segregation of Arsenic and Copper by Autoradiagraphy and Quantitative Examination by Means of the Castaing Microprobe. *Revue de Metallurgie*, v. 56, Apr. 1959, p. 395-406.

Effect of carbon content, mode of crystallization, forging and rolling on dendritic segregation of As in pure alloys and commercial steels. A particularly high concentration of As occurs in interdendritic spaces in as-cast metal while this heterogeneity is partly reduced by forging. 11 ref. (N12b, M23q, 3-70; 9-69, CN, AY, *As, Cu*)

317-N.* (German.) Development of Ears in Aluminum Single Crystals. G. Siebel. *Aluminium*, v. 35, Apr. 1959, p. 186-188.

It was possible to grow single crystals in Al sheet by recrystallization after critical deformation. Disks of 55 mm. diameter and 1 mm. thick were stamped for cupping tests. With (100) (001), (110) (001), and (110) (110) textures, ears at 0 and 90° to the rolling direction appeared, while (100) (110), (110) (111), (110) (112) and (112) (111) textures gave 45° ears. (N3r, N5, M26c; Al)

318-N.* (Polish.) Effect of Phosphorus on the Aging of Steel. Fr. Erdmann-Jesnitzer and W. Dehnke. *Hutnik*, v. 26, Jan. 1959, p. 1-8.

Increase in plasticity and hardness observed after deformation and age hardening. Age hardenability decreases with the phosphorus increase from 0.006 to 0.073%. 15 ref. (N7a, 2-60; CN-g, *P*)

319-N.* (Russian.) Colloidal State of Solid Solutions in Metallic Systems of Binary Phase

Alloys. V. M. Glozov and V. N. Vigdorovich. *Kolloidnyi Zhuranl,* v. 21, no. 1, 1959, p. 18-23.

Microhardness studies of crystals of binary phase solid solution of a number of binary systems. The kinetics of the transition of heterogeneous crystals of a solid solution from a metastable to a stable state was examined. The transition occurred in two stages. 4 ref. (N11h; 14-67)

320-N.* (Russian.) Carbon Distribution in Weld Zone and Weld Metal. K. V. Lyubavskii and M. A. Studnits. *Svarochnoe Proizvodstvo,* Apr. 1959, p. 7-12.

Stabilization of E1257 stainless steel welded joints at 800° C. for 20 hr. results in a noticeable carbon redistribution caused by its migration from the base metal into the weld metal. Aging of heat-treated steel samples (austenitizing or stabilizing) at 580-600° C. for 1000 hr. under stressed and stress-free conditions does not change the carbon distribution in the melting zone. (N1, J22, J23q; 7-51, C, SS)

321-N.* (Russian.) Effect of Chemical Composition of Austenite Weld Metal on Gamma-Sigma Transformation. B. I. Medovar and Yu. B. Malevskii. *Svarochnoe Proizvodstvo,* Apr. 1959, p. 12-16.

Austenitic welded seams of Type 25-20, welded with Sv-KH25N20 rods, are susceptible to intensive brittleness because of gamma-sigma transformations during prolonged heating at 650-870° C. The response of the metal to sigma phase transformation depends upon its chemical composition. 11 ref. (N6p, Q23r, 2-60; SS, 7-51)

322-N.* (Russian.) Phase Diagrams in the Chromium-Tantalum System. T. Grigor'ev, V. V. Kuprina and N. A. Nedumov. *Zhurnal Neorganicheskoi Khimii,* v. 4, no. 3, 1959, p. 650-654.

A chemical compound, Cr_2Ta, formed at 2020° C. during melting, without decomposition, has a transition point at 1800° C. In a solid solution of Cr in Ta, the Cr_2Ta forms a eutectic mixture, the eutectic point being at 75% Ta and eutectic temperature at 1980° C. (N11h, M24b; Cr-b, *Ta*)

323-N.* Carbon Flotation in Ductile Iron. A. H. Rauch, J. B. Peck and G. F. Thomas. *Modern Castings,* v. 35, May 1959, p. 61-64.

In hypereutectic ductile iron castings, carbon in excess of that necessary to maintain a carbon equivalent of 4.55% was found to be precipitated during the solidification period. (N12, 2-60; CI-r, 9-71)

324-N.* Diffractometric Study on Formation of Ferrite in Cold Worked 18-8 Stainless Steel. Gunji Shinoda and Tadashi Kawasaki. *Osaka University, Technology Reports,* v. 8, Oct. 1958, p. 363-371.

Effect of cold working and annealing on the transformation of stainless steel. (N8j, M22g, 2-64; SS)

325-N. The Compatability of a Number of Metals With Graphite. Arnold F. Gerds and Manley W. Mallett. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-1261, Apr. 14, 1958, 28 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Materials were tested at 1650° C. and 1850° F. in 1000-hr. tests. Cu is the material most resistant to attack by carbon, Ni is only slightly more reactive than Cu in the 250-hr. test. Of the alloys studied Inconel X appears least affected by reaction with carbon when heated in contact with graphite. Alnico is less resistant than Inconel X but better than Nichrome V, Inconel, and types 316 and 318 stainless steel. (N1; Cu, Ni-b, SS, *C*)

326-N. Corrosion and Decarburization of the Ferritic Chromium-Molybdenum Steels in Sodium Coolant Systems. W. C. Hayes and O. C. Shephard. Atomics International. *U. S. Atomic Energy Commission,* NAA-SR-2973, Dec. 1, 1958, 33 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

The rate-controlling step in the decarburization reaction appears to be the diffusion of carbon in the ferritic steels where the austenitic-to-ferritic ratio is high. Steel containing 5% Cr with Ti, and the 7 and 9% Cr steels are approximately neutral in carbon activity, with respect to 304 stainless steel in a loop containing Na which is not contaminated with C. 8 ref. (N1, R-general; SS-d, *Cr, Mo, C, Ti*)

327-N.* (German.) Austenite Formation. Adolf Rose. *Harterei-Technische Mitteilungen,* v. 13, no. 1, 1958, p. 46-76.

Austenite formation and connected phase changes in unalloyed and low-alloy structural steels, and in toolsteels. Dimensional changes in isothermal transformations. Martensite point and hardness as influenced by the holding time in austenitizing. 8 ref. (N8f; CN, AY, TS)

328-N. (Russian.) Effect of Ordering in Solid Solutions. A. M. Evseev. *Zhurnal Fizicheskoi Khimii,* v. 33, Jan. 1959, p. 112-118.

A procedure is proposed to account for the "effect of ordering" in liquid metallic systems. 12 ref. (N10, 14-67)

329-N. (Russian.) Iron-Nickel Alloys Obtained by Electrolytic Precipitation. V. V. Sysoeva. *Zhurnal Prikladnoi Khimii,* v. 32, Jan. 1959, p. 128-132.

Electrolyte composition, temperature control and current density. 18 ref. (N12e; Fe-b, Ni)

330-N. Electron Metallographic Studies of Nickel-Base Heat-Resistant Alloys. W. C. Bigelow and J. A. Amy. University of Michigan. *Wright Air Development Center,* Technical Report no. 58-406, Aug. 1958, 49 p.

Changes in microstructure of the commercial alloys Inconel-X, Waspaloy, M-252 and Udimet-500 during aging at 1400 and 1600° F. Favorable high-temperature properties result largely from the precipitation of the intermetallic gamma' phase during exposure to high temperature. Electron diffraction studies show that the gamma' phase has an ordered structure and precipitates with a preferred orientation in the matrix. 33 ref. (N7, J27d, M27, M26c; Ni-b)

331-N.* (French.) Effects of Copper, Zinc and Silver on Recrystallization of Aluminum. J. C. Blade. *Revue de Metallurgie,* v. 56, Mar. 1959, p. 229-236.

An explanation is proposed for the effect of additions of Cu, Ag and Zn on the recrystallization rate of super-purity Al. 7 ref. (N5, 2-60; Al-a, *Cu, Zn, Ag*)

332-N.* (French.) Recrystallization of Zone Melted Aluminum. O. Dimitrov and Ph. Albert. *Revue de Metallurgie,* v. 56, Mar. 1959, p. 267-271.

Low-temperature recrystallization of high-purity Al as revealed by X-ray diffraction and electric conductivity measurements. Special methods of electrolytic polishing and anodic oxidation were developed to permit micrographical studies at subzero temperatures. 4 ref. (N5, L13p, M22g; Al-a)

333-N.* (French.) Cinemicrographic Investigation of Allotropic Transformation of Cobalt and Cobalt-Nickel Alloys. Herve Bibring, Gabriel Lenoir and Francois Sebilleau. *Revue de Metallurgie,* v. 56, Mar. 1959, p. 279-287.

The allotropic transformation of Co studied by hot stage microscope equipped with a camera. Appearance of martensitic platelets and the effect of stress on grain boundaries are analyzed by using slow motion (6000 exposures per sec.) Binary Co-Ni alloys show only one spontaneous transformation during heating when the Ni content is in excess of 30%. (N6p, 2-60, 3-66; Co-b, *Ni*)

334-N.* (Russian.) Relationship Between Surface Structure of Electrodeposits of Alloys and Their Phase State. Yu. M. Polykapov and V. V. Bondar'. *Doklady Akademii Nauk,* v. 123, no. 4, 1958, p. 719-721.

Formation of supersaturated solid solution shows a considerable effect on the structure of electrodeposited layers, helping the formation of fine crystalline deposits. Since no relation exists between orientation and the lattice of the deposited metal, formation of phase nucleus in the more negative metals is difficult. 11 ref. (N12d; Cu-b, *Bi,* 14-67)

335-N.* (Russian.) Formation of Solid Solutions in Metallic Systems. A. N. Kcrstovnikov and V. N. Vigdorovich. *Zhurnal Fizičheskoi Khimii,* v. 33, Jan. 1959, p. 79-82.

Materials analyzed from the standpoint of the nature of electronic structure of the atoms. (N12p, M25)

336-N.* (Russian.) Phase Diagram for the Chromium-Cerium System. E. M. Savitskii, V. F. Terekhova and A. V. Kholopov. *Zhurnal Neorganicheskoi Khimii,* v. 6, Feb. 1959, p. 435-438.

Data for constructing Cr-Ce diagram with Cr as a base (Ce up to 30% by wt.) A large region of Ce scattering, in a liquid state, stretches from 10 to 90% Ce at a monotectic temperature of 1780° C. Solubility of Ce in Cr in solid solution at 1700° C. is about 6%, and at reduced temperature (20° C.) falls off to 1.5-2.0%. Addition of Ce to Cr breaks up its structure. 7 ref. (N12s, M24b; Cr-b, *Ce*)

Cold working followed by annealing and resulting structures. 14 ref. (N3, P16, 2-64, 3-68; ST-d, 4-53)

341-N.* (Japanese.) Diffusion of Electrodeposited Chromium in Carbon Steel. Shigetomo Ueda and Tohru Kurauchi. *Metal Finishing Society of Japan, Journal*, v. 10, Feb. 1959, p. 66-67.

Diffusion coefficient and activation energy of 0.59% carbon steel plated and heated at 1000-1300° C. in vacuum. (N1; CN, *Cr*)

342-N.* (Russian.) Effect of Ultrasonic Waves on Nickel-Chromium-Titanium Alloy. E. A. Al'ftan and V. S. Ermakov. *Akusticheskii Zhurnal*, v. 4, no. 4, 1958, p. 307-314.

Ultrasonic waves of 20-26 Kilohertz accelerates aging of Ni-Cr-Ti alloy. Doubling the ultrasonic energy considerably increases its effect on aging, reducing the aging duration 40-50 times as compared with standard conditions. (N7a, 1-74; Ni-b, *Cr, Ti*)

343-N.* (Russian.) Effect of Surface Active Agents on Crystal Shape and Texture of Zinc Deposits. K. M. Gorbunova and K. P. Lebedeva. *Zhurnal Fizicheskoi Khimii*, v. 33, no. 3, 1959, p. 669-676.

Growth of base and prism faces of Zn single crystal from $ZnSO_4$ solution without addition of surface-active substances and with addition of tetra-butyl-ammonia and n-octyl alcohol. Addition of surface active agents to the $ZnSO_4$ solution changes the initial rates of the growth rates of faces and hence the shape of crystal. (N3r, M26c; Zn)

344-N.* (Russian.) Phase Diagram of the Rhenium-Molybdenum System. E. M. Savitskii, M. A. Tylkina and K. B. Povarova. *Zhurnal Neorganicheskoi Khimii*, v. 4, Feb. 1959, p. 424-434.

A peritectic type of diagram is shown with two peritectics at 2570° beta $\rightleftharpoons$ sigma, 2500° sigma $\rightleftharpoons$ alpha and peritectic transformation at 1850° sigma beta $\rightleftharpoons \chi$ (sigma + beta $\rightleftharpoons$ chi). There is formed in the system a large region of solid solutions of Re in Mo. 11 ref. (N12r, M24b, Rh-b, *Mo*)

345-N.* (Ukrainian.) Phase Changes in Steel During Annealing. V. N. Gridnev and V. I. Trefilov. *Ukrainskii Fizicheskii Zhurnal*, v. 3, no. 6, 1958, p. 796-800.

High heating rates during the annealing of carbon steel cause considerable changes in the mechanism of the annealing process. The mechanism is related to the separation of carbon from the martensite. Disintegration of residual austenite during heating was not detected from 300-670° C. 12 ref. (N8p, N8n, J23n; CN)

346-N.* Retained Austenite in Precipitation Hardening Stainless Steels. G. Krauss, Jr., and B. L. Averbach. *American Society for Metals, Transactions*, v. 52, Preprint no. 134, 1959, 25 p.

Retained austenite contents measured by X-ray diffraction technique in 17Cr-7Ni-1Al and 17Cr-4Ni-3Mo stainless steels after various hardening and aging treatments. Hardening mechanisms. 9 ref. (N7a, N8n, N8p, 2-64; SS-e, *Cr, Ni, Al, Mo*)

347-N.* (German.) Binary and Complex Copper-Silicon and Copper-Nickel-Silicon Alloys Used for Screws and Nuts. *Draht*, v. 10, Apr. 1959, p. 153-159.

Structural changes in recrystallization and during artificial aging; corrosion behavior in the presence of organic and inorganic substances; determination of tensile strength, elongation, reduction in area and bending angles. 14 ref. (N5, J27d, R-general, Q-general; Cu-b, *Si, Ni*)

348-N.* The Growth of Temper Carbon Nodules. J. Burke. *Acta Metallurgica*, v. 7, Apr. 1959, p. 268-274.

Equations relating the radius of a temper carbon nodule to the time of annealing during first-stage graphitization are presented for each of the possible controlling mechanisms, and compared with experimental growth curves. The rate of solution of cementite determines the rate of growth of graphite, except during the very early stages of the reaction. 17 ref. (N8s, 2-64; Fe-b)

349-N.* Aging in Au-Ni Alloys. J. Silvertsen and C. Wert. *Acta Metallurgica*, v. 7, Apr. 1959, p. 275-282.

Changes in some physical properties of quenched alloys of 70% Au-30% Ni when annealed at low temperatures. Changes in the electrical resistance, volume and Young's modulus indicate that there is at least one metastable precipitate formed on low-temperature annealing. The low-temperature phase seems to be either clusters of Au-rich or Ni-rich atoms or regions of high geometrical order. Quenched-in vacancies are presumed to control the rate of the reaction but the precipitate is not thought to be simply clusters of vacancies. 6 ref. (N7a, J23, 2-63, M26s, Au-b, *Ni*)

350-N. The Release of Fission Product Rare Gas From a Uranium/Zirconium Alloy During Irradiation in the BEPO Reactor. F. J. Stubbs and C. B. Webster. *United Kingdom Atomic Energy Authority*, AERE C/M 372, Feb. 1959, 12 p.

Release rate is small and can be attributed to fission recoil from the surface, of the gas atoms or their precursors. Above 600° C. the release rate increases sharply and becomes highly temperature dependent. At high temperatures the emission is attributed to a diffusion process in addition to recoil and over the range 700-900° C. diffusion coefficients are calculated. (N1, 2-67; U-b, *Zr*)

351-N.* Mechanical Properties of Iron and Some Iron Alloys While Undergoing Allotropic Transformation. M. De Jong and G. W. Rathenaw. *Acta Metallurgica*, v. 7, Apr. 1959, p. 246-253.

Plasticity during the allotropic transformation of pure Fe, Fe + 0.08% N and Fe + 0.2% C. Elongation is a linear function of the applied stress when the crystals of the new phase grow in arbitrary directions. The external stress works upon a material with vanishing yield point. Results are discussed by assuming a tendency for the mean macroscopic dilatation to be zero along the phase boundary, as in the case of diffusionless transformations. 16 ref. (N6p, Q-general, 3-66; Fe-b, *N, C*)

352-N.* Surface Growths and Whiskers on an Aluminum-Magnesium Alloy. P. J. E. Forsyth, P. G. Partridge and D. A. Ryder. *Philosophical Magazine*, v. 4, Apr. 1959, p. 447-450.

Development of whiskers and surface growths along grain boundaries on surface of 7% Mg-Al alloy during vacuum heat treatment at 450 to 520° C. Growth mechanism. (N3s, N3r, 2-64, 1-73; Al-b, *Mg*)

353-N.* A Possible Determination of the Activation Energy for Self-Diffusion in Aluminum. T. Federighi. *Philosophical Magazine*, v. 4, Apr. 1959, p. 502-510.

Calculation of activation energy from decrease of quenched-in resistivity of of 99.995% Al with annealing time in the range of 130 to 170° C. Agreement between value determined and expected activation energy for self-diffusion in Al. 8 ref. (N1d, N4, P15g; Al)

354-N. Development of High Strengths and High Recrystallization Temperatures in Molybdenum-Base Alloys. M. Semchyshen, Gordon D. McArdle and Robert Q. Barr. Climax Molybdenum Co. of Michigan. *Wright Air Development Center*, Technical Report no. 58-551, Feb. 1959, 116 p.

Alloy castings were converted to bar stock and evaluated from standpoint of recrystallization temperature, grain growth and embrittlement tendencies, tensile and creep-rupture strength and brittle-to-ductile transition. The most outstanding Mo-base alloy contained 0.46% Ti, 0.08% Zr and 0.08% carbon and required 1 hr. at 2950° F. for complete recrystallization. (N5, N3, Q3, Q23r; Mo-b, *Ti, Zr, C*)

355-N. Transformations in Uranium Alloys With High Solute Solubility in the B. C. C. Gamma Phase. Pt. 1. Preliminary Observations on the "Banded Structures" Produced by Non Equilibrium Transformations in Uranium Alloys. A. G. Harding and M. B. Waldron. *United Kingdom Atomic Energy Authority*, AERE M/R 2673, Sept. 1958, 15 p.

High-temperature body centered cubic gamma phase in uranium alloys with approximately 10% Ti, Cb, Zr or Mo can be rendered metastable under critical cooling conditions, and can be transformed

by a shear mechanism to form a characteristic banded structure or by a nucleation and growth process to equiaxed grains. Formation of these metastable structures seems dependent on composition, cooling rate and the effect of the solute element on the incubation period and decomposition rate of the metastable gamma phase. (N2, N3; U-b, *Ti, Cr, Zr, Mo*)

356-N.* (French.) Characteristics of a Martensitic Phase Obtained in Uranium-Molybdenum Alloys. Jeanne Lehmann. *Comptes Rendus*, v. 248, Apr. 6, 1959, p. 2098-2100.

Uranium alloys with 2-3% and 4% content. The conditions of martensitic phase, developed from the solid solution of gamma-uranium are determined. The structure of this phase designated alpha-prime$_b$ is monoclinic. 6 ref. (N6q; U-b, *Mo*)

357-N.* (Polish.) Growth of Large Metal Single Crystals. Antoni Modrzejewski, Bronislaw Buras and Roman Czarnecki. *Archiwum Hutnictwa*, v. 4, no. 1, 1959, p. 81-89.

Large single crystals of Zn, Pb, Al and Cu were obtained by slow cooling of the melt. Single crystals were oriented by X-rays cut mechanically and chemically etched. 6 ref. (N3r; M26c, Zn, Pb, Al, Cu)

358-N.* (Japanese.) Studies of Ultra-High-Strength Steel. Pt. 1. Kohji Tasaka and Takayasu Okada. *Sumitomo Metals*, v. 10, Oct. 1958, p. 224-230.

Transformation behavior and tempering characteristics of 0.4% C-2.5% Si-Mn-Cr-Mo-Steel. The isothermal and continuous cooling transformation diagrams consist of two separated regions—an upper region (pearlite) and a lower region (bainite). Considerable amounts of retained austenite may be developed during slow continuous cooling and lower temperature isothermal transformation due to the lowering of the Ms point which is apparently due to Si content. (N8n, J29; AY, C, Si, Mo, Mn, Cr)

359-N.* (Japanese.) High-Strength Copper-Titanium Alloys. Keichi Mizuno. *Sumitomo Metals*, v. 10, Oct. 1958, p. 246-257.

Age-hardening of binary alloys and effects of small Al and Cr additions. The age hardenability is increased by adding 0.2 to 0.3% Cr. Grain growth is suppressed by adding 0.8% Cr or 2% Al at high temperature. (N7a, 2-60; Cu-b, Ti, Cr, Al, SGB-a)

360-N. Growth of Metal Single Crystals. *National Bureau of Standards*, STR-2630, May 1959, 3 p.

Equipment has been developed to grow preferentially oriented metal monocrystals in practically any cross-sectional shape. These crystals, having an ordered atomic arrangement, are particularly useful in studying the influence of crystal structure on corrosion. A pre-selected crystallographic orientation is obtained with a technique known as "seeding," and the desired cross-sectional shape is produced by growing the crystals in a vertical furnace. (N3r, M26c)

361-N.* (German.) Effect of Time on Pearlite Transformation. Erich Greulich. *Archiv fur das Eisenhuttenwesen*, v. 30, Apr. 1959, p. 219-225.

Mechanism of pearlite formation is isothermal transformation of two steels containing 0.7% C and 0.65% Ni, after austenizing at 840-1050° C., holding at 540° C. and quenching. Average distance among the centers of pearlite grains was measured statistically and by electron microscopy. 13 ref. (N8h, 3-67; CN)

362-N.* (German.) Mathematical Description of the Relationship Between Martensite and Austenite Orientation in Iron-Nickel Single Crystals. Albert Kochendorfer and Gerhard Otto. *Archiv fur das Eisenhuttenwesen*, v. 30, Apr. 1959, p. 227-232.

Relationship observed differs from the transformation matrices given by Kurdjumow-Sachs and Nashiyama. The axes of of rotation D_{Mo} as well as in the azimuths differ by amounts of 1 to 2° from those estimated by Nashiyama. The planes and orientations of the austenite and martensite lattices are not quite parallel. 17 ref. (N8f, N8p, M26c; Fe-b, *Ni*, 14-61)

363-N.* (German.) Critical Strain and Coarse Grain Formation in Zinc With Alloy Trace Additions. Friedrich Erdmann-Jesnitzer and Guenther Wieghardt. *Neue Hutte*, v. 4, Mar. 1959, p. 152-158.

Zn alloyed with small quantities of Cu, Al, Cd, Hg, Li and Mg. Specimens were homogenized, cold rolled and heat treated. Recrystallization, recovery, substructures, formation of solid solutions and coarse grain structures. 24 ref. (N5, 2-60; Zn, *Cu, Al, Cd, Hg, Li, Mg*)

364-N.* (German.) Dependence of Intermediary Structure Change on Preliminary Treatment in the Recrystallization of Bronze. Heinz Borchers and Alfred Schaefer. *Zeitschrift fur Metallkunde,* v. 50, Jan. 1959, p. 24-37.

Structure refining during the recrystallization of alpha bronze (Cu, 6.36 -6.50% Sn, 0.04% P). 4 ref. (N5f, Cu-s)

365-N.* (German.) Nucleation in Medium Concentration of a Binary System With Miscibility Gap. Hans Stadelmaier and Leo J. Huetter. *Zeitschrift fur Metallkunde,* v. 50, Jan. 1959, p. 41-44.

Conditions under which nucleation takes place. 11 ref. (N2)

366-N.* (German.) Germanium Single Crystal Growth by the Floating Crucible Technique. Jan Goorissen and Frithjof Karstensen. *Zeitschrift fur Metallkunde,* v. 50, Jan. 1959, p. 46-50.

Single Ge crystals with homogeneous inpurity concentration can be prepared if the correct quantity of impurities is supplied. A small crucible from which the crystal is pulled floats in molten Ge in a larger outer crucible. Access between the two crucibles is made possible by a capillary permitting a continuous replacement of Ge lost by crystallization. 13 ref. (N3r; Ge)

367-N.* Grain Refinement of Solidifying Metals by Vibration. R. G. Garlick and J. F. Wallace. *Modern Castings,* v. 35, June 1959, p. 86-94.

Explains refinement by alternate high and low-pressure waves which increase nucleation rate of the solidifying phase. Mechanism of refinement during solidification of pure metals, solid solutions and anomalous eutectics. 16 ref. (N12)

368-N. (English.) Superstructure of the Ordered Alloy Cu_3Pd. Pt. 3. High Temperature Electron Diffraction Study. Denjiro Watanabe. *Physical Society of Japan, Journal,* v. 14, Apr. 1959, p. 436-443.

Using a high-temperature electron diffraction camera, Cu_3Pd alloys were investigated in thin oriented, evaporated films at temperatures below and above the critical point of order-disorder. 14 ref. (N10; Cu-b, *Pd*)

369-N.* The Kinetics of the Allotropic Transformation in Iron and Binary Iron Alloys. J. W. Spretnak. Ohio State University Research Foundation. *Wright Air Development Center,* Technical Report no. 58-563, Sept. 30, 1958, 24 p.

Transformation characteristics in zone-refined Fe, 0.71% Mo-Fe alloy and 0.21% Cr-Fe alloy. The transformation front travels in discreet jumps, confirming the conclusion that the gamma-alpha transformation occurs by a cooperative shearing mechanism (martensitic type). Increasing the purity of Fe decreases the mean shear path and the mean rest period. (N6p; Fe-a, Fe-b, *Cr, Mo*)

370-N.* (German.) Diffusion of Some Metals in Liquid Solution. E. Pelzel. *Galvanotechnik,* v. 50, Apr. 15, 1959, p. 211.

Surface of a Pb melt is exposed to air at 400-500° C. An oxide layer with increasing thickness appears, accompanied by a change in color. Structure and color of the oxide layer are considerably affected by the slightest traces of alloying components and permit study of diffusion of Zn, Cd, Sn, Sb, Na, Li and As in Pb. (N1a; Pb, Zn, Cd, Sb, Na, Sn, Li, As, 14-60)

371-N. (Ukrainian.) Effect of Over-All Pressure on the Parameter of Iron Diffusion in Iron Alloys With Minute Quantities of Aluminum. S. D. Gertsiken and M. P. Pryanishnikov. *Ukrainskii Fizicheskii Zhurnal,* v. 3, no. 5, 1958, p. 651-657.

The diffusion coefficient is high with increasing pressure. The effect of overall pressure is explained by the presence of local plastic deformation which brings about defects and accelerates the diffusion. With elevated temperature, the rate of heat flow that "remedies" these defects progressively increases, and at a given temperature, completely compensates for the pressure effect. 6 ref. (N1d, P13a, 3-74; Fe-b, *Al*)

372-N. (Ukrainian.) Determination of Recrystallization Temperature of Metals. L. N. Larikov. *Ukrainskii Fizicheskii Zhurnal,* v. 3, no. 5, 1958, p. 664-668.

Time at which various microscopic and X-ray centers of recrystallization appear at a given temperature and deformation is equal to the time necessary for the formation of the most distorted regions of initial nucleus within the undistorted lattice plus the time necessary for the growth of the nucleus to a certain diameter. 7 ref. (N3, N5, 2-61, 3-67)

373-N. (Ukrainian.) Atom Mobility in Metals in the Recrystallization Temperature Region. L. N. Larikov. *Ukrainskii Fizicheskii Zhurnal,* v. 3, no. 5, 1958, p. 668-671.

Relationship of linear growth of recrystallization centers and effective coefficient of self-diffusion of atoms in strongly distorted regions of metal. Comparison of the self-diffusion coefficient of atoms with the self-diffusion coefficient for both volume and boundary self-diffusion of the same metals at identical temperature reveals that the order of magnitude of atomic mobility is the same as that at the boundary diffusion. 20 ref. (N1d, N3, N5f)

374-N. (Ukrainian.) Nature of Short-Range Order of Iron-Chromium Alloys. P. D. Suprunenko. *Ukrainskii Fizicheskii Zhurnal*, v. 3, no. 5, 1958, p. 673-676.

With preliminary annealing at high temperature the Curie temperature of Fe-Cr alloys (45, 47 and 49% Cr) is increased, together with the relative electrical resistance in the entire temperature region. Results discussed on basis of formation of a negative short-range order. 9 ref. (N10a, N8j, 2-64; SS)

375-N. (Japanese.) Growth of Silicon Single Crystals by the Pulling Technique. Y. Matsukura and M. Adachi. *Laboratory of Electric Engineering, Journal*, v. 22, Dec. 1958, p. 940-947.

Equipment and practice. (N3r)

376-N.* (French.) New Determination of Self-Diffusion Constants of Cubic Centered Iron. C. Leymonie, Y. Adda, A. Kirianenko and P. Lacombe. *Comptes Rendus*, v. 248, Mar. 9, 1959, p. 1512-1515.

Method consists of progressive machining of polycrystalline Fe cylinder covered with radioactive Fe and submitted to diffusion heat treatment from 580 to 616° C. 7 ref. (N1d, 1-59; Fe)

377-N.* (Japanese.) Age-Hardening of Copper-Titanium Alloys. M. Tanaka and E. Sakuma. *Laboratory of Electric Engineering, Journal*, v. 22, Dec. 1958, p. 881-886.

Strength increases in proportion to higher Ti content and increased cold forming. Annealed at 450-500° C., the alloys show minimum electric resistivity and maximum mechanical strength. (N7a, P15, Q27a, 2-60; Cu-b, *Ti*)

378-N. (Japanese.) The Effect of Magnesium on the Recovery of Aluminum-Magnesium Alloys. J. Wada, M. Sasagawa and S. Kobayashi. *Light Metals*, v. 9, Jan. 1959, p. 20-27.

Work hardening of Al-Mg alloys at low temperature is not so dependent on temperature as in pure Al. Recovery of Al-Mg alloys is less then pure Al because of the interaction between Mg atoms and vacancies or interstitial atoms, while the thermal equilibrium state is retained during plastic deformation. (N4, 2-63; Al-b, *Mg*)

379-N.* (Japanese.) The Effects of Calcium on the Decomposition Rate of Carbide in Iron-Carbon-Silicon Alloys. Masuteru Maruyama and Mitsuru Itoh. *Japan Foundrymen's Society, Journal*, v. 31, Mar. 1959, p. 172-178.

Decomposition rate of carbides in alloys treated with Ca-Si is considerably higher than that of carbides in alloys treated with Si. Decomposition rate has its maximum value with carbon content a little higher than that of carbon-saturated austenite. (N8r; Fe-b, *C, Si*, AD-p)

See item 57-N, 1959. (N8a, 2-61; Fe, ST, C, Ni)

384-N. (Translation—BISI no. 1158.) Kinetics of Tempering of Martensite. Otto Krisement. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 723-729.

See item 58-N, 1959. (N8p; ST, *C, Si, Mn, P, S, Cr, Cu, Mo, Ni*)

385-N. (Translation—ConBur.) Recrystallization of Uranium by the Action of Cyclic Heat Treatment. A. A. Bochvar, G. I. Tomson

and N. T. Chebatarev. *Soviet Journal of Atomic Energy*, v. 4, June 1958, p. 729-733.

Variation in microstructure of uranium, quenched from the gamma-phase, uranium annealed in the gamma-phase region and cast in the process of cyclic heat treatment in the temperature range 100-550° C. with 50-sec. cycles. 6 ref. (N5, M27, 2-64; U)

386-N. (Russian.) Effect of Silicon, Aluminum, Nickel, Copper and Phosphorus on the Form of Temper Carbon. K. P. Bunin and A. K. Repin. *Liteinoe Proizvodstvo*, Apr. 1959, p. 24-30.

In a pure Fe-C-Si system various amounts of Si affect in various ways the rate of graphitization growth and the amount of graphite inclusions. Usually both are increased with increasing Si content; Al affects the system in a similar manner while Ni affects graphitization to a lesser degree. Cu acts similarly to Ni and P. 20 ref. (N8s, 2-60; Fe-b, *C, Si, Al, Ni, P*, Cu)

387-N. (Russian.) Nonuniform Distribution of Elements in White Cast Iron. I. E. Lev. *Liteinoe Proizvodstvo*, May 1959, p. 36.

Alloying elements in white cast iron are nonuniformly distributed between separate phases and between micro-areas of the matrix. Rate of structure formation in many cases is determined by diffusion of the alloying elements and not by diffusion of carbon. (N1; CI-p)

388-N.* Kinetics of Bainite Formation in a Plain Carbon Steel. P. Vasudevan, L. W. Graham and H. J. Axon. *Iron & Steel*, v. 32, May 22, 1959, p. 229-232.

At about 350° C. a change occurs in kinetics of austenite-bainite transformation in a 0.97% plain carbon steel. Above 350° C. the product may be identified as upper bainite, which forms with activation energy of 34,000 cal. per mole and the controlling factor is probably rate of diffusion of carbon in austenite. Below 350° C. product may be identified as lower bainite forming with activation energy of 14,000 cal. per mole, while the controlling factor in this case is the rate of diffusion of carbon in supersaturated ferrite. (N8m; CN-r)

389-N.* Kinetics of Bainite Formation in High-Purity Iron-Carbon Alloys. S. V. Radcliffe and E. C. Rollason. *Iron & Steel*, v. 32, May 22, 1959, p. 232-237.

Effects of temperature and carbon content on kinetics of isothermal formation of bainite. Progress of transformation at temperatures in range 200-450° C. was followed by high-speed measurements of change of electrical resistivity of fine wire specimens containing 0.65-1.2% C. Fully reacted specimens were examined by light microscopy and X-ray diffraction at room temperature. (N8m; CN-r, Fe-b, *C*)

390-N.* Effect of Austenitizing Treatment on Formation of Lower Bainite in a Plain Carbon Steel. L. W. Graham and H. J. Axon. *Iron & Steel*, v. 32, May 22, 1959, p. 237-239, 294.

Influence of austenitizing temperature on lower bainitic transformation of a plain carbon steel for conditions in which all the carbon is in solid solution in macroscopically homogeneous austenite of standardized grain size. (N8m, 2-64; CN-r)

391-N.* Diffusion of Hydrogen in Steel at Temperatures of -78 to 200° C. J. D. Hobson. *Iron & Steel*, v. 32, May 22, 1959, p. 240-243.

Effects of specimen size, temperature and composition on diffusion constants, rates of diffusion and evolution and times required to reach various values of residual hydrogen in a number of alloy steels and one low-carbon steel. (N1, 2-60, 2-61; AY, CN-g, *H*)

392-N.* Precipitation Process in Copper-Chromium Alloys. Robin O. Williams. *American Society for Metals, Transactions*, v. 52, Preprint no. 136, 1959, 26 p.

Changes in sample length, X-ray diffraction patterns and tensile properties in Cu alloys containing up to 1.3% Cr with aging time at 400-500° C. Precipitation mechanisms. 19 ref. (N7b, N7a; Cu-b, *Cr*)

393-N.* The Martensite Transformation in Thin Foils of Iron-Nitrogen Alloys. W. Pitsch. *Philosophical Magazine*, v. 4, May 1959, p. 577-584.

Martensite consists of very thin fiber crystals which are twin orientated. Difference from all orientation relationships found in bulk materials is due to the fact that in foils the transformation mechanism is less hampered by the surrounding parent lattice than in bulk materials. A simple transformation mechanism is reduced, consisting of a pure distortion and a half twin shear. 10 ref. (N6q, M26c; Fe-b, *N*, 4-56)

394-N.* The Atomic Diffusion of Chromium in the Titanium-Chromium System. A. J. Mortlock and D. H. Tomlin. *Philosophical Magazine*, v. 4, May 1959, p. 628-643.

Diffusion rates of Cr in the body-centered cubic phase of the Ti-Cr system

measured by an autoradiographic tracer technique using the radioactive isotope Cr^{51}. The activation energy for tracer diffusion at zero solute concentration is very much lower than that expected for self-diffusion in pure Ti. 10 ref. (N1, 1-59; Ti-b, *Cr*)

395-N.* (German.) Martensite in Titanium Alloys. Ulrich Zwicker. *Zeitschrift fur Metallkunde*, v. 50, May 1959, p. 261-268.

Effect of martensite upon age hardening and the influence of nonstable preparatory modifications of the alpha-phase on martensite formation and mechanical properties. Investigation of Ti-Mo and TiV16A13 alloys shows a dependence of Young's modulus on internal stress, hydrogen content and deformation. 15 ref. (N6q, N7a; Ti-b, *V, Al, Mo, Cr, H*)

396-N.* (German.) Plastic Flow at the Yield Point in Zirconium-Tin Alloys. Lother Bangert. *Zeitschrift fur Metallkunde*, v. 50, May 1959, p. 269-274.

Tensile strength of Zircaloy-2, ultimate elongation and plastic flow at the yield point after age hardening and strain aging. Results indicate scarcely any tendency towards embrittlement by either age hardening or strain aging. (N7a, N7e, Q-general; Zr-b)

397-N.* (German.) X-Ray Examination of Diffusion in the Tin-Mercury System. Fritz Guenther and Guenter Jehmlich. *Zeitschrift fur Metallkunde*, v. 50, May 1959, p. 288-293.

Diffusion of Hg in Sn was tested with thin rolled foils (30 micron) and sheets (2 mm.) by micrographical and graphical methods. 5 ref. (N13; Hg, Sn, 4-53, 4-56)

398-N. Transport Processes in Liquid Alloys. Pt. 1. Transport Cell for Liquid Alloys. Paul C. Mangelsdorf, Jr. *Journal of Chemical Physics*, v. 30, May 1959, p. 1170-1179.

An electrolysis cell was devised, using a thin ribbon-shaped capillary, which permits the measurement in a single experiment of the resistivity, electrolytic mobility and diffusion rate in a single sample of liquid alloy. (N1, 1-53; 14-60)

399-N. (Russian.) New Method of Studying the Solidification Process. G. F. Zasetskii and V. A. Shakhtovich. *Liteinoe Proizvodstvo*, Apr. 1959, p. 34-35.

When sulphur is introduced into the liquid phase of structural steel at various stages of solidification, diffusion rate of sulphur differs in the liquid and solid stages. This difference and the reaction of crystalline sulphur with the Fe makes it possible to fix, at any given point during solidification, the thickness layer of the solid phase, as marked by the sulphur demarcation line. (N12; ST, *S*, 14-60)

400-N.* Self-Diffusion in Indium. J. E. Dickey. *Acta Metallurgica*, v. 7, May 1959, p. 350-353.

Self-diffusion coefficients parallel and perpendicular to the tetragonal axis were measured in paired samples of single crystal In in the range from 44 to 144° C. Mosaic boundaries observed in the single crystals may possibly have been responsible for a component of fast diffusion which contributed to the uncertainties of the measured values. 11 ref. (N1d; In, 14-61)

401-N.* A Simplified Derivation of the Quasichemical Approximation in Order-Disorder Theory. J. M. Honig. *Acta Metallurgica*, v. 7, May 1959, p. 354-356.

Following the procedure of Hijmans and de Boer, the lattice consisting of A and B units is decomposed into representative arrays of "bonds" and "points"; the energy, entropy and free energy for this system of arrays is then found in terms of probabilities of encountering the possible configurations AA, AB, BB, B or A. (N10)

402-N.* (French.) Thermal Analysis of Allotropic Transformations in Plutonium. R. Pascard. *Acta Metallurgica*, v. 7, May 1959, p. 305-318.

Successive transformations, including fusion, of metallic Pu are studied by differential thermal analysis. Heating and cooling curves. Comparison with metallic standards of known heats of fusion give a first set of heats of transformation with a precision of about 20%. 12 ref. (N6p, M23r; Pu)

403-N.* (German.) Age Hardening of AlMgSi Alloys. Konrad Loestlin and Otto Schaaber. *Industrieblatt*, v. 59, May 1959, p. 211-217.

Mn or Cr additions increase the susceptibility to delayed quenching. The isothermal curves of hardness are determined between 0 and 300° C. Characteristic values for cold and elevated-temperature age hardening are shown by TTT curves and time-temperature-hardness diagrams. 10 ref. (N7a, 2-60; Al-b, *Mg, Si*)

418-N.* Nitrogen and Hydrogen in Iron and Steel. L. S. Darken. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 11 p.

Role of nitrogen and hydrogen as interstitial atoms, as gas in external atmosphere or in voids, blisters or cracks, as associated with foreign atoms and in dislocations or subgrain boundaries. 12 ref. (N15d; Fe, ST, *N, H*)

419-N.* (German.) Surface Diffusion of Silicon and Titanium From a Gaseous Phase Into Iron, Nickel and Copper. A. Schneider, J. Siegfriedt. *Metall*, v. 13, June 1959, p. 546-551.

Weight changes in samples permit accurate study of diffusion processes. Temperature, pressure and rate of reaction are important parameters. 10 ref. (N1; Fe, Ni, Cu, *Ti, Si*)

420-N.* (Ukrainian.) Effect of Phosphorus on the Shape of Temper-Carbon Inclusions. K. P. Bunin and A. K. Repin. *Dopovidi Akademii Nauk Ukrainskoi R.S.R.*, v. 3, Mar. 1959, p. 277-280.

Increase of phosphorus content in white cast iron accelerates graphitization at 1000° C. and retards it at 900° C. When graphitization occurs in a matrix containing molten phosphide eutectic, growth occurs in the laminar graphite inclusions. (N8s, 9-69, 2-60; CI-p, *P*)

421-N. (German.) High-Frequency Testing of Phase Changes in Metal Alloys and Salt Mixtures. Th. Weber, K. Cruse. *Fresenius' Zeitschrift fur Analytische Chemie*, v. 166, no. 5, 1959, p. 233-356.

Apparatus and testing methods. 36 ref. (N14, N6p, 1-53)

422-N.* (Czech.) Kinetics of the First Step in the Graphitization of Malleable Cast Iron. Stanislav Drapal. *Hutnicke Listy*, v. 15, June 1959, p. 501-507.

In the decomposition of ledeburitic cementite, graphite nuclei form and grow, particularly at the boundaries between austenite and cementite. 39 ref. (N8s; CI-s)

423-N.* (German.) The Recrystallization of Zinc. Pt. 1. Primary Recrystallization. Heinz Borchers and Rainer Schwarzwalder. *Zeitschrift fur Metallkunde*, v. 50, June 1959, p. 315-323.

High-purity Zn was deformed and stored at room temperature, at elevated temperatures (50-100° C.) or exposed at 280-380° C. for several seconds. Recrystallization starts soon after deformation. Grain growth is avoided by short-time annealing at high temperatures. Recrystallized spelter shows banded structures caused by impurities. 22 ref. (N5, N3, 2-61, 3-68, 3-69; Zn-a)

424-N.* (German.) The Recrystallization of Zinc. Pt. 2. Secondary Recrystallization. Heinz Borchers and Rainer Schwarzwalder. *Zeitschrift fur Metallkunde*, v. 50, June 1959, p. 324-327.

Heating temperature and time and degree of deformation necessary for secondary recrystallization vary with heating velocity. Growth velocity of secondary grain decreases with time while the size is reduced at higher annealing temperatures. 4 ref. (N5, N3, 2-61, 3-67, 3-68; Zn)

425-N.* (German.) Growth Mechanism in Tin Crystals. Ilias Anastasiadis. *Zeitschrift fur Metallkunde*, v. 50, June 1959, p. 328-338.

Sn crystals are prepared by precipitation from aqueous solutions of stannous chloride. Growth mechanism is influenced by the degree of concentration. 28 ref. (N12e; Sn)

426-N.* The Tempering of Martensite in Copper-Aluminium Alloys. R. G. Cope. *Institute of Metals, Journal*, v. 87, June 1959, p. 330-336.

Decomposition of the martensite phase in the Cu-Al system was investigated at temperatures below that of the eutectoid transformation beta $\rightarrow$ alpha + gamma$_2$.

Microstructures of etched specimens were examined and plotted on TTT diagrams. Hardness measurements and X-ray diffraction photographs were used to aid the interpretation of the microstructures. 10 ref. (N6q, M27; Cu-b, *Al*)

427-N.* The Solid Solubility of Lithium in Aluminium. W. R. D. Jones and P. P. Das. *Institute of Metals, Journal*, v. 87, June 1959, p. 338-340.

The mazimum solid solubility of Li in Al was found, by micrographic methods, to be 4.2 wt.% at the eutectic temperature just above 600° C.; the solubility falls to 1.7% at 400° C. and 0.4% at 200° C. 7 ref. (N12p, M24b, Al, *Li*)

428-N. (Book.) The Physical Chemistry of Metallic Solutions and Intermetallic Compounds. v. 2. 300 p. 1959. Her Majesty's Stationery Office, London, £1. 17s. 6 d. for two volumes.

Proceedings of symposium held June 1958 at National Physical Laboratories. Papers abstracted separately. (N-general, P-general; 14-60, 14-68)

429-N.* (Translation—Brutcher no. 4521.) Diffusion Process Occuring During Heat Treatment in Steel-Aluminum Alloy Bimetal. A. O. Kuritsyna, F. V. Korolev and K. N. Korsunskaya. *Metallovedenie i Obrabotka Metallov*, v. 5, Feb. 1959, p. 2-7.

Diffusion in the joint of a bimetallic Fe-Al alloy and ASS-6-5 strip depends upon temperature and heating time. The diffusion process occurs in four stages. The first consists of migration of Fe and Al atoms; in the second stage additional zones of interaction form, with a somewhat greater displacement of the atoms than in the first stage. The third stage is caused by the rapid rate of diffusion of Al while the fourth stage is on the boundary line. 8 ref. (N1e, J-general; AY, Fe-b, *Al* 4-53)

430-N. (Translation—Brutcher no. 4522.) Cooling of Forgings of Flake-Susceptible Steel. E. S. Tovrenets. *Metallovedenie i Obrabotka Metallov*, v. 5, Feb. 1959, p. 7-13.

Cyclic cooling at 100-150° C. accelerated the transition of supercooled austenite, started its disintegration in an area of intermediate temperatures and completed the disintegration at higher temperatures. Dissolved hydrogen was removed at elevated temperature while the homogeneity of microstructure was improved. 12 ref. (N8, J26p; 9-70, CN, 4-51)

431-N. (Translation—Brutcher no. 4524.) Carbide Formation During Isothermal Decomposition of Alloyed Austenite in Hypereutectic Steels. I. S. Anitov. *Metallovedenie i Obrabotka Metallov*, v. 5, Feb. 1959, p. 19-22.

In mono-alloyed steels of 0.09% Carbon with Ni, Mn, Cr, W, Mo or V, transition of carbide-forming elements from solid solution into a carbide phase takes place before and during basic transformation. The intensity of migration from austenite into the carbide phase at 600 C. progesses in the order of Ni, Mn, Cr, W, V, Mo. 3 ref. (N8r, N8g, 2-60; AY, *Ni, Mn, Cr, W, Mo, V*)

432-N. (Translation—Brutcher no. 4525.) Radioisotope Study of the Redistribution of Carbon in Chromium-Nickel Steels. B. I. Bruk and C. C. Nyrkovskaya. *Metallovedenie i Obrabotka Metallov*, v. 5, Feb. 1959, p. 22-28.

Stainless steel annealed at 900° C., cooled at a rate of 50° per hr. and soaked at 600° C. causes formation of carbon-enriched zones along the boundary of austenite grain of the size 2×10^{-5} mm. Increased soaking time at 600 causes a more intensive carbon diffusion. The presence of Ti in the steel, in the amount of not more than four times that of carbon, produces a sharp retarding of carbon diffusion. 5 ref. (N1e, 2-64, 2-60, 1-59; SS-e, *Ti, C*)

433-N. (Translation—Brutcher no. 4528.) Crystallization of Strontium-Inoculated Cast Iron. A. V. Chernovol. *Metallovedenie i Obrabotka Metallov*, v. 5, Feb. 1959, p. 37-39.

The graphite form in Sr-inoculated cast iron is changed from a bifurcated crab-like shape to a more compact one. Cast iron with 0.068-0.072% Sr does not produce a globular form during solidifaction or annealing and up to 0.8% does not assure a spheroidal graphite, so that Sr is not a substitute for Mg. 6 ref. (N12, E25q, 2-60; CI-r, *Sr*, AD-p36)

434-N. (Translation—Brutcher no. 4537.) Kinetics of Austenite Decomposition in Steels During Welding. N. N. Prokhorov, E. L. Makarov and V. I. Gospodarevskii. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 13-16.

Medium carbon steels and low alloy steels such as CrNi, CrMnSi, CrAl, CrV and a variety of other alloy steels form cold cracks during welding as a result of austenite decomposition. Steels having a

welding temperature below 300° C. have a greater tendency to cold cracks. 3 ref. (N8, K-general, 2-61; CN-p, AY, 9-72, *Cr, Ni, Mn, Si, Al, V*)

435-N. (Translation—Brutcher no. 4538.) Effect of Alloying on Hardening and Softening of Heat Resistant Iron Base Alloys. D. F. Zhirnov. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 17-19.

13-8-8 alloy (13% Cr, 8% Ni and 8% Mn) with various quantities of V, Al, Mo, W, and Cb additions, hardened at 1180° C. and water quenched. Analysis of microstructure established a relationship between hardness changes during annealing and recrystallization temperature, and indicated the effect of alloying elements on recrystallization. (N5, J23c, 2-60; SS, *Mn, V, Al, Mo, W, Cb*)

436-N. (Translation—Brutcher no. 4542.) Effect of Inoculants on Crystal Structure and Sulfur Distribution in Austenitic Cast Steel. N. S. Kreshchanovskii and I. E. Zabludovskii. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 33-37.

Zn in the amount of 0.2% in high Cr-Ni alloy steel hardened at 1555-1560° C. affects the character of crystallization. Sulfur is uniformly distributed in the form of sharp inclusions in the dendritic axis. 0.3% Ce in Cr-Ni austenitic steel showed no noticeable effect on crystallization; sulphur, with the exception of areas where it is more concentrated, is usually equally distributed. 0.5% Ca has a great effect on primary crystallization. (N12, E25q, M26; SS-e, 9-69, AD-p, *Zn, S, Ce, Ca*)

437-N. (Translation—Brutcher no. 4563.) Grain of Solidifying Metal Refined by Vibration. I. I. Novikov. *Liteinoe Proizvodstvo*, Feb. 1959, p. 42.

See item 228-N, 1959. (N12, M27c; AD-p35)

438-N. (Translation—Brutcher no. 4565.) Accelerated Recrystallization of Low-Carbon Steels. G. K. L'vov. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, April 1959, p. 8-14.

During aging there is a breaking up of structural blocks in a solid solution or an increase in their disorientation. The differentiation in block structure is an important cause of strengthening during aging. 8 ref. (N7a, M26s, Ni-b, *Cr*, 14-67)

452-N.* (Russian.) Structural Changes in Nickel-Beryllium Alloy After Aging and High-Temperature Annealing. N. N. Buinov. *Izvestiya Akademii Nauk, Seriya Fizicheskaya*, v. 23, May 1959, p. 648-649.

In an aged Ni-Be or Cu-Be alloy, by high-temperature annealing, there is a restoration of primary crystalline particles with a disturbance which shows up in X-ray analysis. This restoration proceeds even when they are broken up into inelastic disoriented blocks. (N7c, 2-64, 2-65, 2-62; Ni-b, Cu-b, *Be*)

453-N.* Theory of Order in Ternary Alloys. Pt. 2. K. F. Wojciechowski. *Acta Metallurgica*, v. 7, June 1959, p. 376-379.

Statistical theory of the order-disorder transformations for ternary alloys of arbitrary composition and crystal structure. For ternary alloys each short-range order parameter is represented by several long-range order parameters; in the case of binary alloys there is synonymous dependence of long and short-range order parameters. 7 ref. (N10)

454-N.* The Diffusion of Carbon During Precipitation in Alpha-Iron. R. H. Doremus. *Acta Metallurgica*, v. 7, June 1959, p. 399-402.

The activation energy for precipitation of carbon from alpha-Fe was measured to be 17.1 ± 0.5 k-cal. per mole by starting the precipitation at one temperature and finishing it at another. The activation energy was the same within

experimental error for aging temperatures from 0 to 170° C., for samples strained up to 4%, and for samples of different concentration. 13 ref. (N1, N7; Fe, C)

455-N.* A Correlation of Data on Diffusion of Solutes in Face-Centered Cubic Metals. D. Turnbull and R. E. Hoffman. *Acta Metallurgica*, v. 7, June 1959, p. 407-410.

The activation free energy for solute diffusion seems to correlate with the binding energy of the solute in solution inferred from the heat of solution. 27 ref. (N1, P13a)

456-N.* The Hardening and Embrittlement of Mild Steel by Cyclic Stressing at the Fatigue Limit. J. Holden. *Acta Metallurgica*, v. 7, June 1959, p. 380-388.

The dependence of yield stress at 20° C. and fracture stress at -196° C. upon grain size is investigated for a mild steel before and after prolonged cyclic stressing at the fatigue limit. After cyclic stressing the initial slip is coarse, and restricted to planes which are active in cycling; consequently the hardening revealed by yield and fracture observations is characteristic of the regions of fatigue damage. 20 ref. (N7e, 3-68, 2-59, Q27; Cn)

457-N.* Grain Growth in Zone-Refined Tin. E. L. Holmes and W. C. Winegard. *Acta Metallurgica*, v. 7, June 1959, p. 411-414.

Grain growth experiments with zone-refined Sn of very high purity. A single growth law was obtained over the range of temperatures 167-220° C. The activation energy for grain growth was calculated to be 6.0 ± 0.6 K-cal per g-atom. 20 ref. (N3, C28k; Sn-a)

458-N.* (Czech.) Influence of Molybdenum and Vanadium as Carbide-Forming Alloying Elements in the Precipitation and Diffusion of Carbon in Ferrite. Jan Rusina. *Hutnicke Listy*, v. 14, July 1959, p. 608-610.

Determination of the damping properties of two low-alloy steels after annealing at varying temperatures following quench hardening. The damping properties do not always permit conclusions to be drawn as to the precipitation and diffusion of carbon. (N7b, N1, Q8, 2-64, N8; AY, C)

459-N.* (Czech.) Separation of an Ingot From Ingot Molds. Frantisek Havlicek. *Hutnicke Listy*, v. 14, July 1959, p. 610-611.

In solidification, the mechanism of spontaneous separation is determined by the shape and type of mold. (N12, W19c, 3-73; 5-59)

460-N.* (Russian.) Evaporization of Electrodes in Short Electric Discharges of High Intensities. Vladimir Hermoch. *Czechoslovak Journal of Physics*, v. 9, no. 2, 1959, p. 221-228.

Experiments performed with electrodes of various compositions show that the transportation velocity of vapors depends on the electrode material. 12 ref. (N16n)

461-N.* The Effect of Torsional Strains on Self-Diffusion in Silver Single Crystals. C. H. Lee and R. Maddin. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 397-401.

Diffusion rates of Ag^{110} in cylindrical single crystals of 99.99% pure Ag, which were twisted to a total surface strain of 0.91 during the diffusion anneal at temperature of 700, 750 and 800° C., were measured by sectioning and counting as a function of the strain rates. The enhancement of diffusion by straining is inversely proportional to the temperature at which diffusion occurs. 10 ref. (N1d, 2-64, 2-61, 3-68; Ag, 14-61)

462-N.* The Third Stage of Work Hardening in Aluminum Crystals Deformed at 196° K. S. Sato and A. Kelly. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 413-420.

The resolved shear stress when the stress-strain curve becomes concave to the strain axis depends on orientation, being always higher for crystals with an initial orientation close to the sides of the unit triangle. Marked cross-slip is first seen when the stress-strain curve becomes concave to the strain axis. The lengths of the slip lines vary inversely as the flow stress for all crystals, independent of crystal orientation. 20 ref. (N7e, Q24, 3-72; Al, 14-61)

463-N.* The Origin of the Preferred Orientation in the Columnar Zone of Ingots. D. Walton and B. Chalmers. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 447-456.

The preferred orientation present in the columnar zone of castings is due to dendritic growth ay some time during solidification. The dendritic growth may either be due to thermal supercooling or constitutional supercooling. Thermal

supercooling must be present because of the necessity for providing a driving force before nucleation can occur. 8 ref. (N12b, M26c; 5-59)

464-N.* Tertiary Recrystallization in Silicon Iron. J. L. Walter and C. G. Dunn. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 465-471.

High-purity Si iron may secondarily recrystallize to a cube texture. On prolonged heating this texture may be replaced by a (110) [001] texture. This phenomenon is called tertiary recrystallization. A difference in surface energy between (100) and (110) surfaces provides a driving force for growth of tertiary grains. 21 ref. (N5, M26c; Fe-b, *Si*)

465-N.* A Method for Growing Bicrystals of Copper. J. Intrater and E. S. Machlin. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 471-472.

Single crystals of two different orientations were grown from the melt in one-half of a split graphite mold. Two such crystals were then placed in contact with each other in another split mold, using tapered inserts. The pair of crystals was then remelted, starting 2 in. from the top to insure that the whole top portion of the crystals was maintained molten. By moving the induction cell vertically upward at a speed of 1 in. per hr. a bicrystal was obtained. (N3r; Cu)

466-N. Recrystallization of Heavily Cold-Rolled Uranium Sheet. W. R. Yario and L. T. Lloyd. Argonne National Laboratory. *U.S. Atomic Energy Commission,* ANL-5966, May 1959, 40 p. (Available from U.S. Office of Technical Services, Washington 25, D.C.) $1.25.

Changes in mean expansion coefficients upon annealing uranium sheet rolled to 80% reduction in thickness at room temperature indicate that three different preferred orientations can be developed upon recrystallization. One preferred orientation, which is essentially the same as that of the as-rolled material, results from annealing for long times at 360° C.; a second type results from annealing between 400 and 600° C.; while a third accompanies grain coarsening at 650° C. 12 ref. (N5, M26c, 2-64; U, 4-53)

467-N.* (French.) Mottled Structure of Condensed Metal Vapors on the (111) Face of a Copper Single Crystal. Lucien Lafourcade, Paul Larroque and Nguyen Quat Ti. *Comptes Rendus,* v. 249, July 15, 1959, p. 230-232.

The crystal surface is cleaned and prepared by ion bombardment with Au or Cu vapors then being deposited. The structure parameters of deposits with reference to crystal lattice and their relationship to the angle of vapor jet with the (111) plane are studied. (N15g, M26; Cu, 14-61, *Au*)

468-N.* (French.) Effect of Small Copper Additions on the Recrystallization of Aluminum Refined by Zone Melting. Omourtague Dimitrov. *Comptes Rendus,* v. 249, July 15, 1959, p. 265-267.

After a deformation of 97% at the temperature of liquid nitrogen, samples with various Cu content were kept at temperatures from — 38 to +87° C. Effects of Cu on nucleation, grain growth and recovery. (N5, N2, N3, Q22n, 3-68, 2-60, 2-63; Al, *Cu*)

469-N.* (German.) Effect of Stabilization Degree on Precipitation Processes in Austenitic Chromium-Nickel and Chromium-Nickel-Molybdenum Steels. Karl Bungardt, Gustav Lennartz and Karlernst Wetzlar. *Archiv fur das Eisenhuttenwesen,* v. 30, July 1959, p. 429-434.

Precipitation occurring after austenitization and water quenching during heat treatments at 700° C. and for various times up to 5000 hr. Effects of Mo, Ni, Si and Mn on precipitation and precipitate composition. 20 ref. (N7, 2-60, 2-64; SS, *Mo, Si, Mn*)

470-N.* (German.) Polygonization and Recrystallization Behavior of Pure Iron With Reference to the Preparation of Single Crystals. Albert Kochendorfer and Hans Ewertz. *Archiv fur das Eisenhuttenwesen,* v. 30, July 1959, p. 441-445.

No single crystals could be grown when starting from structures following gamma ⟶ alpha transformation, then subjecting the samples to tensile deformation and heat treatment after each 2% deformation. When, however, the starting material showed a structure resulting from recrystallization after strong deformation, single crystals, though contaminated by inclusions, were obtained after 4% deformation and recrystallization. (N4, N5, N3r, 3-71, 3-68, 2-64; Fe)

471-N.* Aluminum Grain Boundary Attack by Liquid Gallium. C. Elbaum. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 476-477.

Liquid Ga, possibly saturated with Al, replaces an Al grain boundary. This phenomenon is probably controlled by diffusion in the liquid rather than by diffusion in the grain boundary. This situation arises if the saturation concentration of Al in liquid Ga with respect to a general Al surface is lower than with respect to a high-angle Al grain boundary. 4 ref. (N1; Ga, Al, 14-60)

472-N.* Solid-Solution Strengthening of Magnesium Single Crystals at Room Temperature. E. D. Levine, W. F. Sheely and R. R. Nash. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 521-526.

Constant loading-rate and constant elongation-rate tensile tests were performed at room temperature on single-crystal binary alloys of Mg with In, Cd, Tl, Al and Zn. A correlation of solute strengthening effects with the degree of incompatibility between solute and solvent indicated that a minimum degree of incompatibility must be exceeded to produce significant strengthening. The interaction of solute atoms with substructural boundaries is of prime importance in solution strengthening. 21 ref. (N7; Mg, 14-61, *In, Cd, Tl, Al, Zn,* 14-67)

473-N.* Anomalous Kinetics of the Bainitic Transformation Just Above the Martensitic Range. M. F. Smith, G. R. Speich and Morris Cohen. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 528-530.

The acceleration of the isothermal transformation just above the Ms temperature seems to stem from the formation of martensite which is activated or stress-induced by the very start of the bainitic transformation. This causes a transformation product (which more or less resembles bainite after tempering at the transformation temperature) to appear in the microstructure considerably sooner than would be possible from the growth of bainite itself. (N8m)

474-N. (Translation—BWRA.) Radiographic Investigation of the Phase Composition of Austenitic-Ferritic Weld Metal. N. Ya. Karasik. *Avtomaticheskaya Svarka,* v. 66, Jan. 1959, p. 71-76.

X-ray structural analysis of phase changes in three compositions of stainless steel weld metal due to austenitizing, tempering and aging treatments. (N6p, 2-64, M26q, N8r; SS, 7-51)

475-N.* Freezing of a Growing Liquid Column. G. Horvay. *American Society of Mechanical Engineers,* Paper no. 59-HT-11, 1959, 11 p.

Theoretical heat flow and solidification process in a column of liquid metal being fed from the top with new liquid metal is computed for conditions where the temperature measured at the bottom exceeds, or is below, fusion temperature. (N12, P11k; 14-60)

476-N.* Austenitizing Behavior and Rapid Life Test of Drawn Wires for Ball Bearings. Manabu Ueno. *National Research Institute for Metals, Transactions,* v. 1, no. 1, 1959, p. 22-26.

Variation in hardness, bending stress and retained cementite and austenite with austenitizing temperature for low-alloy chromium steels. Effect of different raw materials and vanadium addition and bearing life. (N8n, N8k, Q-general, 2-60; AY, SGA-c, V, 2-64, 3-69)

477-N.* Studies on Nonmetallic Inclusions in Steel. Pt. 1. Carbide in Titanium Steel. Tadashi Yanagihara, Hirozo Kimura and Minoru Chiba. *National Research Institute for Metals, Transactions,* v. 1, no. 1, 1959, p. 76.

X-ray, electron microscope and chemical analysis of electrolytically extracted inclusions. (N8r; AY, *Ti, C,* 9-69)

478-N. Research on the Recrystallization of Aluminum Single Crystals. H. P. Leighly, Jr., Robert A. McCune and Frank C. Perkins. *Wright Air Development Center,* Technical Report no. 58-634, Dec. 1958, 79 p.

Rate of recrystallized grain growth is linear, then slowly decreasing. Simultaneous polygonization hinders of rompletely inhibits recrystallization. 18 ref. (N5; Al-a, 14-61)

479-N.* (French.) Annealing of High Speed Toolsteel. Andre-Heuri Michel. *Chimie & Industrie,* v. 81, Apr. 1959, p. 515-519.

Dilatometry above 450° C. of 18-4-1 high speed toolsteel quenched from 1280° C. by rape oil or liquid air reveals four transformation stages as the temperature is increased. The first stage occurs by expansion ascribed to precipitation from martensite; the second, by shrinkage attributed to precipitation from retained austenite; the third, by expansion resulting from the transformation of retained austenite into a complex of ferrite plus carbide; while the fourth stage is probably

related to precipitation from ferrite. 12 ref. (N8, J26n, M23b; TS-m)

480-N.* (Japanese.) Recrystallization of Aluminum Alloys. Isamu Igarashi and Tamotsu Igarashi. *Light Metals*, v. 9, Mar. 1959, p. 15-22.

Recrystallization of Al-Zn, Al-Mg, Al-Mn, Al-Cr, Al-Cd, Al-Ni, Al-Sb and Al-Pb alloys studied by X-ray diffraction; effect of Mg, Cr, Cd and Mn on recrystallization temperature. (N5, 2-60; Al-b, *Zn, Mg, Mn, Cr, Cd, Ni, Sb, Pb*)

481-N.* (Japanese.) The Effect of Preheating on the Structure of Recrystallized 3S Alloy. Takashi Ikeno and Kizoh Shibata. *Light Metals*, v. 9, Mar. 1959, p. 23-28.

Differences in grain size in sheet rolled from preheated and nonpreheated ingots. In the case of slowly cooled ingots recrystallized grains are not changed greatly when rolled, regardless of preheating, while in the case of rapidly cooled ingots, if preheated, the grains become fine in the outer region where the surface is columnar, and coarser in the inner region where the crystals are granular. (N5, M27c, F23; 5-59, 4-53)

Theoretical study of mechanisms of transformations and resulting structures. 10 ref. (N12, E25n; CI-n)

486-N.* (Czech.) Effect and Contribution of Arsenic Upon Structure, Graphitization and Properties of Cast Iron. Ivan Pavlik. *Slevarenstvi*, v. 7, Apr. 1959, p. 159-166.

Arsenic does not influence the amount of precipitated graphite although the form is changed. The structure in the presence of As is pearlitic. If the As content exceeds 0.27% a new structural component is formed together with phosphorus and it is assumed that this is formed in the Fe-As-P phase as cementite. Corrosion and wear resistance improve with increasing As content. (N8s, 2-60; CI, *As, P*)

487-N.* Grain Size Control During Ingot Solidification. W. A. Tiller. *Journal of Metals*, v. 11, Aug. 1959, p. 512-514.

Columnar ingots are produced if the alloy is cast with a large superheat and if catalysts are eliminated from the melt. Fine-grained equiaxed ingots are produced by casting with a low superheat, by adding an effective catalyst or an appropriate solute element to the melt. 10 ref. (N12, M27c; 5-59)

488-N. Development of New Mechanisms and Techniques for Obtaining Steels in the Ultra-High Strength Range. D. Gullotti, E. Eichen and J. W. Spretnak. Ohio State University Research Foundation. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131238, May 1957, 56 p. $1.50.

Two possible methods of obtaining steels in the high strength range are the superimposition of plastic deformation on the transformation of austenite to martensite and the production of high-nitrogen low-carbon (0.25% max.) martensite. Increases in tensile strength up to 10% and in elastic limit up to 30% were obtained in the deformation of austenite prior to transformation. In steels having a base composition 0.20% C, 1.60% Si, 0.75% Mn, 1.40% Cr, increasing the nitrogen content from 0.004 to 0.009% increased the 0.2% offset yield strength about 6% and the tensile strength about 3-1/2%. (N8, Q27a, 3-68; AY, SGB-a, *Si, Mn, Cr*)

489-N.* (English.) Grain Behavior in 70-30 Brass Plate Rapidly Heat Treated at High Temperatures. Osamu Izumi and Tadatsugu Yoshiki. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, June 1959, p. 161-167.

Grain growth in brass specimens annealed at 850° C. Influence of impurities, final cold reduction and ready-to-finish grain size. 4 ref. (N3n, N5, 3-69, 3-68; Cu-n)

490-N.* (Japanese.) Study on Black-Heart Malleable Cast Iron Treated With Acid. Yoshifumi Mima. *Metal Finishing Society of Japan, Journal*, v. 10, May 1959, p. 199-205.

Determination of the rate of diffusion of hydrogen atoms from acid through 3-mm. sections of black-heart cast iron in a vacuum. The rate is dependent on acid normality and temperature and on structure. (N1; CI-s, *H*)

491-N.* (German.) Nuclei Formation During the Precipitation of $CuAl_2$. Ulrich Dehlinger and Hans Pfleiderer. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 407-409.

Formation of a $CuAl_2$ lattice that shows only slight differences with regard to the matrix. The nuclei are stabilized against the distortion energy (elastic energy + surface energy) by short range ordering complexes of the solid solution. 8 ref. (N2g, N7, N10b; Al-b, *Cu*)

492-N.* (German.) Vapor Pressure of Liquid Cadmium-Antimony Alloys. Erich Scheil and Hans Baach. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 386-392.

Vapor pressure measurements lead to the assumption that the melt is in a state of ordering at temperatures near the melting point. CdSb crystals are thought to form when a melt solidifies from a stable ordering state, while solidification from a metastable state creates Cd_3Sb_2 crystals. 9 ref. (N12, M27d, P12c; Cd-b, Sb, 14-60)

493-N.* (German.) Investigation of Ordering Processes in Copper Alloys Based on Measurements of the Thermo-Electric Voltage Against Copper. Otto Dahl and Eberhard Starke. *Zeitschrift fur Metallkunde*, v. 50, July 1959, p. 410-412.

The thermo-electric voltage of Cu-Zn, Cu-Ni, Cu-Ni-Zn and Cu-Au alloys measured on test wires after quenching from 500-700° C. after slow cooling or for the tempered state. Differences in results are thought to be caused by ordering processes. 7 ref. (N10b, P15j, 2-61, 2-64; Cu-b, *Zn, Ni, Au*)

494-N.* Diffusion of Ruthenium in Single Crystals of Silver. C. B. Pierce and D. Lazarus. *Physical Review*, v. 114, May 1, 1959, p. 686-687.

Measurement of diffusion coefficients at 793 to 945° C. using precision sectioning technique and Ru_{103} and Ru_{106} tracers. 7 ref. (N1, 1-59; Ag, 14-61, *Ru*)

495-N.* (German.) Grain-Boundary Migration in Aluminum. Martin May and Friedrich Erdmann-Jesnitzer. *Zeitschrift fur Meiallkunde*, v. 50, July 1959, p. 434-438.

Migration of grain boundaries is influenced by the orientation difference between individual grains, tensile stress and by temperature. 19 ref. (N3, M27f, 3-72, 3-66, 2-61; Al)

496-N.* The Structure of Beryllium, With Particular Reference to Temperatures Above 1200° C. A. J. Martin and A. Moore. *Journal of the Less-Common Metals*, v. 1, Apr. 1959, p. 85-93.

Investigation by electrical resistance measurements, thermal analysis and X-ray lattice parameter measurements; heating and cooling curves for Be specimens of varying impurity content, including commercial purity metal, the pure and impure portions of a zone refined bar, and the condensate and residue from a vacuum distillation process. No evidence of a solid-state change between 25 and 1200° C. was detected. A study of the traces above 1200° C., however, revealed the double thermal arrest in the region of the melting point. 11 ref. (N6p, 2-62; Be)

497-N.* Solid State Transitions in Manganese and Iron Solid Solutions. A Hellawall. *Journal of the Less-Common Metals*, v. 1, Apr. 1959, p. 110-112.

At elevated temperatures many of the transition metals show allotropic modifications, and in particular in Mn and Fe there occur the gamma (f.c.c.) and delta (b.c.c.) allotropes in the same sequence with ascending temperature. Concentrating only upon the f.c.c.-b.c.c. transition temperature, and its elevation or depression by solute elements, it is possible to classify elements as b.c.c. or f.c.c. favoring. 6 ref. (N6p, M26, 2-62; Mn, Fe, 14-67)

498-N.* The Action of Molten Uranium on Graphite. E. L. Swarts. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 553-554.

When molten uranium contacts graphite, a continuous carbide layer clads the graphite. This layer probably protects the graphite against more rapid corrosion, but is itself not stable toward molten uranium. 4 ref. (N12, R6m; U, NM-k36)

499-N.* The Use of Controlled Solidification in Equilibrium-Diagram Studies. W. A. Tiller. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 555-559.

The use of controlled solidification enables the determination of liquidus and solidus surface plus tie-lines for a polycomponent alloy. New experimental techniques for stirring the liquid must be devised before the method can be utilized to best advantage. 7 ref. (N12; M24)

500-N.* Self and Interdiffusion in Liquid Zinc Amalgams. H. W. Schadler and R. E. Grace. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 559-566.

The applicability of Darken's theoretical relation between self and interdiffusion coefficients to diffusion in binary liquid-metal systems is verified for dilute Zn amalgams. The capillary reservoir technique and standard tracer methods were used to measure the self-diffusion coefficients of Hg and Zn and the interdiffusion coefficients as a function of composition and temperature; and electromotive force techniques were used to determine the thermodynamic activity of Zn in dilute An amalgams at 30° C. 11 ref. (N1, 2-60, 2-61; Hg, Zn, 14-60)

501-N.* Influence of Thermal History on Preferred Orientations in the Recrystallization of Commercially Pure Aluminum. R. E. Gree, Jr., B. G. Liebmann and H. Yoshida. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 610-613.

Influence of the state of impurities (precipitated or in solid solution) on recrystallization of strained Al single crystals. 10 ref. (N5, M26c, 3-70; Al-a, 14-61)

502-N.* Solubility and Diffusion of Titanium in Iron. Sheldon H. Moll and Robert E. Ogilvie. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 613-618.

The maximum solubility of Ti in gamma Fe was found to be 0.65% at 1100° C. Interdiffusion coefficients for the alpha phase were determined from observations of the rate of movement of the alpha-gamma interface. A Matano analysis of the concentration gradients yielded reasonable values for the interdiffusion coefficients of the gamma phase. 19 ref. (N1, P12e; Ti, Fe)

503-N.* Order-Disorder Transformations in Iron-Aluminum Alloys. H. J. McQueen and G. C. Kuczynski. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 619-922.

The portion of the equilibrium diagram between 20 and 30 at.% Al in Fe was revised on the basis of dilatometric data. Alloys below 23 at.% Al transform from disordered solution to ordered Fe_3Al structure; whereas those above 23 at.% Al transform first to FeAl structure, and then to Fe_3Al structure. 11 ref. (N10; Fe-b, *Al*)

504-N.* Phase Changes in Precipitation Hardening Nickel-Chromium-Iron Alloys During Prolonged Heating. C. C. Clark and J. S. Iwanski. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 648-651.

Microstructural changes in two commercial high-temperature alloys, Inconel "X" and Incoloy "901". During protracted creep-rupture tests, precipitation phases undergo marked changes. Equilibrium structure was not attained at 1500° F. after 35,000 hr. during which time the principal age-hardening phase changed from f.c.c. to hexagonal. Possible mechanisms for the transformation. 8 ref. (N7, J27, M27, Q3q, 2-62; Ni-b)

505-N.* Controlling Grain Boundary Position in Growth From the Melt. R. L. Fleischer and R. S. Davis. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 665-666.

Technique of seeded growth from the melt in milled graphite boats. Projections are machined on the bottom and cover of the boat, so that the specimen produced will have long grooves on two opposite sides along its length. The grain boundary minimizes its area and hence, normally, its free energy by following the grooves. 10 ref. (N3r, M27f)

506-N. Research on Strain Aging Effects in Titanium. Harold S. Gurev and William M. Baldwin, Jr. Case Institute of Technology. *Wright Air Development Center*, WADC Technical Report 59-223, May 1959, 63 p.

Effects of varying interstitial element content (oxygen, carbon and nitrogen) on the tensile properties of an alpha-beta Ti alloy, Ti-140A, at test temperatures ranging from room temperature to above 1000° F. and at strain rates from 0.05 to 18,000 in. per in. per min. Stress-rupture properties of such alloys and similar interstitial bearing modifications of an alpha alloy, A-110AT, were also determined between 400 and 1000° F. Manifestations of strain aging occur in these alloys, but correlation

of occurrence of yield points and high-temperature embrittlement is lacking. (N7e, Q27a, Q3q, 2-60, 2-62; Ti-b)

507-N.* (German.) Aging of Aluminum-Magnesium Alloys. Leopold J. G. van Ewijk. *Giesserei*, v. 46, Aug. 13, 1959, p. 465-471.

Samples were cast, cold deformed (4%), homogenized and aged at temperatures below 0° C., at room and at elevated temperatures. Influence of various aging conditions on tensile strength, elongation, elastic limit, impact strength and hardness. 25 ref. (N7a, J27d, Q27a, Q23p, Q21e, Q6n, Q29n, 3-68, 2-61; Al-b, *Mg*)

508-N. The Association of Oxygen Atoms in Interstitial Solid Solution in Tantalum. R. W. Powers and M. V. Doyle. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 655-665.

Mechanical relaxation data are interpreted to show that an equilibrium exists in interstitial solid solutions of Ta between groupings of two oxygen atoms and those oxygen atoms which are not so bound together. 13 ref. (N10; Ta, 14-67, *O*)

509-N.* Edge-Nucleated, Growth Controlled Recrystallization in Aluminum. R. A. Vandermeer and Paul Gordon. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 577-588.

Recrystallization nuclei form colonies of grains strung along matrix grain edges, and only a small fraction of the total number of matrix edges produce colonies. The colonies are all present at virtually zero annealing time, each extending along essentially the full length of its matrix edge. The isothermal kinetics of the recrystallization are controlled by the two-dimensional growth of the colonies in the directions orthogonal to the nucleating edges. 15 ref. (N5; Al)

510-N.* Comparison of the Thermal Stability of Some Precipitation-Hardened and Dispersion-Hardened Nickel-Base Alloys. D. H. Feisel and A. Cochardt. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 608-613.

Ni alloy matrices hardened by precipitates of Ni_3Al, Ni_3Ti, or TiC over-age rapidly at temperatures of 1340° F. (727° C.) and above. Ni-base alloys hardened by finely dispersed particles of Al oxide retain their high hardness of 250 to 400 Dph. for very long times at 1340° F. (727° C.). They do not appreciably over-age within 16 hr. at temperatures as high as 2000° F. (1093° C.) 10 ref. (N7, Q29n, 2-61; Ni-b, Al, Ti, C, 14-68)

511-N.* Correlation of Transformation Behavior With Mechanical Properties of Several Titanium-Base Alloys. A. J. Griest, J. R. Doig and P. D. Frost. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 627-632.

Hardness, tensile and X-ray diffraction data were compiled to follow the course of aging in the nominal alloys Ti-8Mn, Ti-8Mn-2Al, Ti-4Mn-4Al, Ti-6Al-4V and Ti-4Fe. The Ti-Mn and Ti-Mn-Al alloys were embrittled after quenching from the alpha-beta field and aging for short times at 800 or 900° F. Omega phase patterns at this time were strong for the Ti-8Mn alloy, weaker and more diffuse for the Ti-8Mn-2Al alloy and were not detected positively for the Ti-4Al-4Mn specimens. 18 ref. (N7a, Q29n, Q27a; Ti-b, *Mn, Al, V, Fe*)

512-N.* Growth of Single Crystals of Stainless Steel. R. D. Leggett, R. E. Reed and H. W. Paxton. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 679-680.

Techniques for growing monocrystals and bicrystals of 20 Cr, 20-20 Cr-Ni, and 18-8 alloys by both the strain-anneal and the Bridgeman techniques. (N3r; SS)

513-N.* The Solid Solubilities of Iron and Nickel in Beryllium. S. H. Gelles, R. E. Ogilvie and A. R. Kaufmann. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 695-702.

Solid solubility limits of Fe in Be were determined between 850 and 1200° C. by analysis of differential type multiphase diffusion couples, using an X-ray absorption technique. The maximum value of the solubility limit was found to be 0.92 $\pm$ 0.02 at.% (5.46 wt.%) at the eutectic temperature, 1225° C. The solubilities of Ni and Be were determined between 900 and 1200° C. and the maximum solubility was found to be 4.93 $\pm$ 0.01 at.% (25.2 wt.%) at the eutectoid temperature, 1065° C. 16 ref. (N12p; Be, *Fe, Ni*)

514-N.* Influence of Cobalt on the Transformation of a Chromium Alloyed Austenite. P. Nicolaides, D. Coutsouradis and L. Habraken. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 702-705.

The TTT-curves of 0.1% C, 13% Cr steels containing up to 12% Co were determined in order to establish whether the effect of Co is similar to that observed in

plain carbon steels. Co increases the incubation time and decreases the transformation rate, though not in a uniform way. The bainitic transformation is displaced to lower temperature and overlaps partially the martensitic zone. 12 ref. (N8, 2-60; AY, *Co*)

515-N.* The Iron-Carbon Eutectoid Temperature. R. P. Smith and L. S. Darken. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 727-728.

The eutectoid temperature is taken as the temperature corresponding to the maximum rate of change of the austenite decomposition products. Results indicate that the lutectoid temperature is 727.2° ± 0.5° C. This is higher than the generally accepted value 723° + 2° C. previously determined. (N8; Fe-b)

516-N.* Note on the Change in Stored Energy Produced by Reversed Deformation. A. S. Iyer and Paul Gordon. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 729-730.

Small compressions soften, rather than harden, the prestretched Cu and at the same time decrease the amount of stored energy. The maximum decrease occurs between 5 and 10% compression; compressions greater than about 15% begin to add stored energy again. (N7e, 3-68; Cu)

517-N.* (German.) Strain Hardening and Recovery of Aluminum and Its Alloys. F. Erdmann-Jesnitzer and H. Hadamovsky. *Aluminum*, v. 35, May 1959, p. 248-257.

Effects of deformation degree, deformation temperature and various heat treatments on hardness and structure. 5 ref. (N7e, N4, Q29n, 2-61, 2-64, 3-68; Al)

518-N.* (German.) Structural Changes Caused by Neutron Irradiation of a Uranium-Molybdenum Alloy. S. T. Konobevskii, N. F. Dravdyuk, K. P. Dubrovin, B. M. Levitskii, L. D. Panteleev and V. M. Golianov. *Nuclear Energy*, v. 9, June 1959, p. 75-89.

The electrical resistance of a 9% Mo uranium alloy was measured and the structure examined by X-ray diffraction and metallographic techniques. The rate of homogenization was inversely proportional to the square of the thickness of the laminae in the eutectoid. Size of the thermal spike and the dissipated energy were found to be smaller than previously determined. (N-general, P15, 2-67; U-b, *Mo*)

519-N. On the Influence of Volume Effects on Order-Disorder Transition. V. W. Ross and D. Ter Haar. *Physica*, v. 25, May 1959, p. 343-356.

Simplified model of a binary substitutional alloy. The influence of the differences in atomic radii of the constituent atoms and in potential energies of the various possible pairs of atoms. 36 ref. (N10)

520-N.* Effect of Pressure on Self-Diffusion in Lead. N. N. Nachtrieb, H. A. Resing and S. A. Rice. *Journal of Chemical Physics*, v. 31, July 1959, p. 135-138.

Data on the self-diffusion of Pb as a function of temperature from 174 to 322° and for pressures from 1 to 8000 atmospheres. The decrease in the self-diffusion coefficient with pressure depends on the melting point, the zero pressure activation energy and the activation volume. (N1d, 2-61, 3-74; Pb)

521-N.* (English.) Theory of Order in Fe_3Al Alloy. K. F. Wojciechowski. *Acta Physica Polonica*, v. 18, no. 1, 1959, p. 15-20.

Statistical theory of order and disorder transitions. Interactions produce further interactions of atoms. Determination of more accurate temperature transitions from order to order was carried out. The interaction energy of the third order is approximately 1/2 of the interaction energy of the second order. (N10; Fe-b, *Al*)

522-N.* (English.) Autoradiographic Investigation of the Diffusion of Chromium in Titanium. A. J. Mortlock. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 13-16.

Interfacial diffusion between Ti and a Ti-Cr alloy was traced with the help of radioactive Cr. The concentration distribution is computed from the self-diffusion activation energy and from the diffusion constant measured for varying holding times at 1000-1115° C. (N1h, M23q, 1-59, 2-61, 3-67; Cr, Ti)

523-N.* (English.) The Diffusion and Precipitation of Helium Injected Into Metals. R. S. Barnes. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 57-64.

Exposure of Be, Cu and Al to an alpha-particle beam causes the formation of He atoms that take interstitial positions in the crystal. When sufficient vacancies are available, the He atoms accumulate, forming small bubbles. (N1c, N15d, 2-67; Be, Cu, Al, *He*)

524-N.* (French.) Short Distance Diffusion in Alloys. R. Graf and A. Guinier. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 17-20

Quench aging of Al alloys. Hardness as a function of time elapsed after quenching. Aging effect is explained by the formation of zones containing an excess of dissolved atoms. 20 ref. (N1e, N7a, Q29n, 3-67; Al-b)

525-N.* (French.) Study of Intermetallic Diffusion by Microhardness Measurements. H. Buckle. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 21-31.

Microhardness as a function of concentration. Diffusion between steel and Cr in Cr-plated steel, and of Cu, Mg, Mn and Si into Al studied by microhardness measurements. 4 ref. (N1h, Q29q; ST, *Cr, Al, Cu, Mg, Mn, Si*)

526-N.* (French.) Radioactive Tracer Study of Self Diffusion. Claude Leymonie and Paul Lacombe. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 33-39.

Various testing techniques such as sectioning and irradiation absorption. Use of F^{59} isotopes for measuring the self-diffusion coefficient of Fe. (N1d, 1-59)

527-N.* (French.) Diffusion in Thin Films Obtained by Vaporization. Pierre Michel. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 41-44.

Some binary alloys can be prepared by vaporization of one component over the other, allowing the alloy to form by solid state diffusion at higher temperatures or, in some cases, at room temperature. 10 ref. (N1c, N15g; Ag, Zn, Sn, Au, *Cu, Mn,* Al, *Cu, Sb,* In, 14-62)

528-N.* (French.) Diffusion in Alpha-Brass, Tested by Zinc Evaporation or Condensation Methods. A. Accary. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 45-55.

Solid-state diffusion is influenced by any Sb, As, P or Si in Al present. 15 ref. (N1, N16n, N16p, 2-60; Cu-n)

529-N.* (French.) Diffusion of Oxygen in Zirconium. G. Sainfort, R. Jacquesson and P. Laurent. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 79-84.

Study of the diffusion mechanism, based on X-ray diffraction, microhardness measurements and micrographs. Diffusion along the grain boundaries takes place at temperatures around 770° C. Three-dimensional diffusion was observed near 980° C. 9 ref. (N1c, R2s, 2-61; Zr, *O*)

530-N.* (French.) Brittleness in the Diffusion Zone Uranium-Zirconium. A. Winogradzki and N. Azam. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 85-94.

Heat treatment of uranium fuel elements manufactured by co-extrusion, together with their Zr sheaths. Annealing at approx. 600° C. causes brittleness of the diffusion layer. No embrittlement was observed after annealing at higher temperatures, although if heating is extended over too long a period pores form during diffusion. (N1c, Q26s, T11g, 2-64, 9-68; U-b, *Zr*)

531-N.* (French.) Uranium-Titanium Diffusion. Y. Adda and J. Philibert. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 103-109.

U and Ti samples are pressure welded together at 600° C., and in a vacuum. During subsequent vacuum heating at temperatures up to 1075° C. diffusion occurs that can be tested by micrographs. 8 ref. (N1c, K5k, 2-64, 1-73; U, Ti)

532-N.* Solidification and Heat Treatment. Gray Iron. Ralph A. Clark. *Foundry*, v. 87, Sept. 1959, p. 108-115.

Fe-C-Si system; carbon equivalents; solidification phenomena; effect of inoculation, phosphorus content and heat treatment on structure. (N12, E25n, E25q, 2-64; CI-n)

533-N.* Solidification and Heat Treatment. Steel and Malleable Iron. B. C. Yearley. *Foundry*, v. 87, Sept. 1959, p. 116-121.

Influence of shape and molding medium on heat removal from solidifying castings. Direction and rate of freezing; design of feeders; heat treatment. 5 ref. (N12, E25n, J-general, 3-73; ST, CI-s)

534-N.* (Czech.) Diffusion of Zinc and Cadmium Into Antimony. Stevo Trajkov. *Hutnicke Listy*, v. 14, Aug. 1959, p. 670-673.

During the diffusion of Cd into Sb at 280-420° C., the gamma-phase (CdSb) forms. In the diffusion of Zn into Sb at 340-480° C., the presence of ZnSb is observed. The epsilon-phase (Zn_3Sb_2) appears at 510° C. 7 ref. (N1h, 2-61; Zn, Cd, Sb)

535-N.* (Czech.) Effect of Changes in the Composition of Malleable Cast Iron on Primary Graphitization. Stanislav Drapal. *Hutnicke Listy*, v. 14, Aug. 1959, p. 680-688.

By an increased carbon content, the isothermal decomposition of ledeburitic cementite and the formation of graphite nuclei are retarded, while an excess of Si accelerates both phenomena. A retarding effect on both processes takes place when the ratio Mn:S= 3:4 is disturbed. 28 ref. (N8s, 2-60; CI-s)

536-N.* (Czech.) Distribution of Precipitates in Austenitic Stainless Steel. Vladimir Cihal and Jaroslav Jezek. *Hutnicke Listy*, v. 14, Aug. 1959, p. 695-700.

Precipitation of carbides in annealing after water quenching from 1250° C. Influence of carbide precipitation on the intergranular corrosion. (N7b, N8r, R2h, 2-64; SS-e)

537-N.* (French.) Diffusion of Aluminum in the Solid State UAl_3-UAl_4 Transformation. R. Boucher. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 111-117.

U-Al alloys with 35.40% U are held at 1050° C. through 15 min., slowly cooled to 750° C. and then quenched. The transformation UAl_3-UAl_4 occurring in subsequent heating and holding at 60° C. (thought to be caused by the diffusion of Al through the UAl_4) is studied by micrographs. Retarding effect of Si. (N1e, 2-60, 2-64; Al-b, *U, Si*)

538-N.* (French.) Ionization of Hydrogen During Diffusion Into a Metal. Albert Herold. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 133-135.

Hydrogen diffuses into Pd or Fe in at least a partly ionized state. This is proved by a simple apparatus. (N1c, N15d, 2-62; Fe, Pd, 4-61, *H*)

539-N.* (French.) Diffusion of Cathodic Hydrogen Into Iron as Influenced by the Presence of Sulphur. Simone Besnard and Jean Talbot. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 147-155.

Armco Fe and electrolytic Fe, with or without zone melting, are charged with hydrogen by exposure to a current in diluted H_2SO_4. To study the effect of sulphur, various amounts of Na_2S are added to the electrolyte. Effect of H and S on elongation; influence of S on grain boundaries. Solubility of H is increased by impurities and by the presence of Na_2S. (N1, R1a, Q23p, M27f, 3-69, 2-66; Fe, *H, S*)

540-N.* (French.) Preferential Location and Diffusion of Hydrogen in Iron. Jacques Plusquellec, Pierre Azou and Paul Bastien. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 157-162.

Position of hydrogen in the alpha iron lattice. Based on X-ray patterns obtained at various testing temperatures and degree of deformation and stress relief of hydrogen charged steel, the octahedral position is assumed. 9 ref. (N15e, 3-68, 2-61, 2-64; Fe, *H*)

541-N.* (French.) Diffusion in a Polyphase System. J. Philibert and Y. Adda. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 163-175.

Diffusion between U and Zr, U and Mo, U and an U-Mo alloy, is investigated at temperatures between 650 and 1000° C. Diffusion coefficient and Kirkendall effect are influenced by temperature and concentration. 10 ref. (N1, 2-61, 2-60; U-b, Zr, Mo)

542-N.* Dimensional Stability of a Precision Ball Bearing Material. E. B. Mikus, T. J. Hughel, J. M. Gerty and A. C. Knudsen. *American Society for Metals, Transactions*, v. 52, Preprint no. 154, 1959, 9 p.

Dimensional stability of various hardened structures of 52100 steel. Four structures were studied which contained from 0 to 15% retained austenite. Testing over a range of temperatures from -30 to +165° F. and at stresses up to 20,000 psi. revealed that both stress and temperature influenced the dimensional stability of 52100 steel. The presence of more than 1.5% retained austenite in the structure resulted in pronounced instability. 4 ref. (N8n, P10d, 3-66, 2-61; ST, SGA-C)

543-N.* Diffusion of Oxygen in Alpha and Beta Titanium. William P. Roe, Howard R.

Palmer and William R. Opie. *American Society for Metals, Transactions*, v. 52, Preprint no. 159, 1959, 8 p.

Diffusivities were determined using microhardness data as measures of oxygen content for Ti75A cylinders oxidized in TiO_2 powder at temperatures of 700-1150° C. 10 ref. (N1, Q29q; Ti, *O*)

544-N.* (English.) Electrical Resistance During the Isothermal Aging of Quenched Al-Zn Alloys. V. Houl and Y. Erling. *Annales Academiae Fennicae Scientiarum*, Series A, v. 6, no. 20, 1959, p. 2-11.

The existence of two independent aging mechanisms is indicated. The measured values confirm the relation between low-temperature aging and the appearance of Guinier-Preston zones. (N7a, P15g; Al, Zn)

545-N.* (Polish.) Effect of Austenitizing Temperature on Martensitic Transformation in Fe-C-Ni and Fe-C-Mn Alloys Below Room Temperature. W. Cias. *Prace Instytutow Hutniczych*, v. 11, no. 2, 1959, p. 55-69.

Cooling curves. Effect of increases in C, Ni and Mn content on martensitic transformation. 7 ref. (N8p, 2-60, 2-61; Fe-b, *C, Ni, Mn*)

546-N. (Russian.) Growth of Single Crystals From Germanium-Silicon Alloys. I. N. Belokurova, M. G. Kekua, D. A. Petrov and A. D. Suchkova. *Izvestiya Akademii Nauk SSSR-Otdelenie Tekhnicheskikh Nauk*, Jan-Feb. 1959, p. 9-12.

Single crystals grown from a melt by slow cooling show inhomogeneities in the distribution of Si and in the electrial resistivity. By an alternative method—growth from a melt steadily fed from an ingot, single crystals with uniform Si distribution and resistivity are produced. 6 ref. (N3r; Ge, Si)

556-N. (French.) Apparatus for Studying the Diffusion of Rare Gases in Stainless Steel. J. A. Stohr and L. Alfille. Paper from "Symposium on Solid State Diffusion". North Holland Publishing Co., Amsterdam, 1959, p. 73-78.

(N1a, 1-53; SS)

557-N. (Book-French.) Symposium on Solid State Diffusion. 175 p. 1959. North Holland Publishing Co., Amsterdam.

Current research on solid state diffusion occurring between metals, and that of a gas into a metal. Papers separately abstracted. (N1)

558-N.* On the Aging Behavior of the Alloy Ti-6A1-4V. J. M. Dupouy, M. B. Bever and B. L. Averbach. *American Society for Metals, Transactions,* Preprint no. 141, v. 52, 1959, 12 p.

Effects of aging in the range 800-1100° F. on mechanical properties. As aging progressed, the tensile strength, yield strength and hardness went through two and, in some instances, three maxima and the ductility developed minima. The lower the aging temperature, the longer were the times required to reach these maxima and minima and the lower were the values of the strength properties. 15 ref. (N7a, 2-61, Q-general; Ti-b, *Al, V*)

559-N.* Compatibility of a Number of Metals and Alloys With Graphite. Arnold F. Gerds and Manley W. Mallett. *American Society for Metals, Transactions,* Preprint no. 145, v. 52, 1959, 16 p.

The graphite was heated in intimate contact with the test metal in welded metallic capsules. Cu was the least reactive material tested in contact with graphite. Ni was only slightly more reactive. Outside of a very hard carbide band at the graphite-metal interface, no evidence of interaction of carbon with Mo was found. Inconel "X" was the most compatible alloy tested in contact with graphite, although some pickup was observed. Alnicro was the next best alloy. Nichrome V, Inconel, and Types 316 and 318 stainless steels were all much more reactive. 5 ref. (N1; Cu, Ni, Mo, SS, NM-k36, 14-60)

560-N.* Kinetics of Decomposition of Alpha Prime in a Titanium-Copper Alloy. Mario P. Gomez and D. H. Polonis. *American Society for Metals, Transactions,* Preprint no. 147, v. 52, 1959, 18 p.

Since the amount transformed is assumed proportional to the variation in electrical resistivity, a mechanism is proposed which explains variation in the state of strain of the matrix; variation in the number and relative amounts of the phases involved in the transformation; depletion of solute in the alpha prime. 17 ref. (N7d; Ti-b, *Cu*)

561-N.* Gas-Metal Reactions During Box Annealing of Low Carbon Steel. R. M. Hudson and G. L. Stragand. *American Society for Metals, Transactions,* Preprint no. 150, v. 52, 1959, 16 p.

Considerable amounts of gas are evolved from steel by heating in vacuum at elevated temperatures. Gas-metal reactions during heat treatment produce changes in furnace atmosphere composition. Experiments were conducted in which gas samples were taken from the atmosphere surrounding steel coils and from within steel coils during annealing. The presence of carbonaceous gases within the coil may result from reactions such as oxidation of carbides by water or by oxides and from thermal cracking and oxidation of organic material, such as cold reduction lubricants that are present on the steel surface. 10 ref. (N15, J23, 1-73; CN-g)

562-N.* The Strength of Martensite Formed From Cold-Worked Austenite. J. C. Shyne, V. F. Zackay and D. J. Schmatz. *American Society for Metals, Transactions,* Preprint no. 163, 1959, 16 p.

Effects of certain thermal-mechanical treatments on the structure and properties of ultra-high-strength steels. Plastic deformation of metastable austenite increased the strength of the subsequently formed martensite. The increases in

yield and tensile strength were proportional to the degree of austenite deformation. Associated with the increase in strength was a refinement of the martensite plate size. By such processing ultimate tensile strengths as great as 465,000 psi. and yield strengths over 400,000 psi. can be achieved. 12 ref. (N8, 3-68, Q27a; ST, SGB-a)

Theory and mathematics of martensite formation. (N8p)

567-N.* Transformation Kinetics and Mechanical Properties of Uranium-0.5 W/O Columbium-0.5 W/O Molybdenum Alloy. Eugene G. Zukas, *American Society for Metals, Transactions*, Preprint no. 177, v. 52, 1959, 12 p.

Two solution treatment temperatures were used, one in the high-temperature gamma-phase field (950° C., 1740° F.) and the other in the (beta + gamma) phase field (675° C., 1245° F.). The lower solution treatment temperature was used to increase the amount of retained beta-phase. Hardness, density, metallography and X-ray diffraction were used to determine the transformation boundaries. Isothermal transformation diagrams are presented. 7 ref. (N7c, J27a, Q-general; U-b, *Cb, Mo*)

568-N. (Russian.) Effect of Magnesium on the Contact Angle Between Graphite and Liquid Cast Iron. I. E. Brainin and S. I. Shapovalov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 2, 1959, p. 74-77.

Measurement of the contact angle between a horizontal graphite plate and a specimen of molten cast iron containing various amount of Mg to elucidate the effect of Mg on the shape of graphite particles in cast iron. 7 ref. (N8s, 2-60; CI, *Mg*)

569-N.* Diffusion of Uranium-Zirconium. Y. Adda and J. Philibert. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 137-147.

The existence of a Kirkendall effect in the bcc. gamma-phase U-Zr is in agreement with recent results. Small concentrations of carbon can totally inhibit diffusion—which, at the time of sheathing the uranium, leads to a weak bond between the metal and its sheath (sheathing by drawing under pressure at 600° C.) Additions of Zr can fix the carbon present in the uranium, and "normal" diffusion does not occur. 23 ref. (N1e; U-b, *Zr*)

570-N.* The Kinetics and Crystallography of the Transformations Between the Primary Phases of Uranium and Its Dilute Alloys. B. R. Butcher and A. N. Holden. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 419-428.

The beta→alpha phase change may take place either by a normal diffusion controlled nucleation and growth reaction, or by a low-temperature mode which bears many resemblances to a martensitic phase change. The outstanding characteristic of the latter is that the growth of the

alpha-phase takes place slowly and isothermally. The gamma→alpha phase change may also take place by a diffusion-controlled nucleation and growth mechanism, and there seem to be at least three other modes of transformation. 32 ref. (N7c, M26; U-b)

571-N. (Russian.) Formation of Epsilon Martensite in the Plastic Deformation of Steel. A. P. Gulyaev and Ya. E. Sanchuk. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya,* no. 2, 1959, p. 181-185.

Effects of various heat treatments, removal of nitrogen by vacuum annealing and deformation temperature. 5 ref. (N8p, Q24, 2-61, 2-64, 2-60; SS)

Effect of thoria or Al-Si-K additives on recrystallization properties and hardness. Theoretical mechanism. (N5, N3m, Q29n; W, AD-p, 4-61, *Al, Si*)

589-N.* Austenite Formation in the Hypo and Hypereutectoid and Eutectoid Plain

Carbon Steels. C. Dasarathy. *Indian Institute of Metals, Transactions*, v. 12, June 1959, p. 135-153.

Mode of austenitization of pearlite in a eutectoid steel and pearlite accompanied by ferrite or cementite in hypo and hypereutectoid steels. Austenite nucleation sites and growth patterns. Factors controlling solutions of ferrite, pearlite and cementite. Significance of distance between adjacent carbide particles. 29 ref. (N8f; CN)

590-N. The Strengthening of Austenitic Solid Solutions. F. Eberle, J. Hoke, E. J. Rozic and W. E. Leyda. Babcock & Wilcox Co. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131992, Apr. 1958, 70 p. $1.75.

Experiments to develop peak-strength alloys for use at 1800° F. Alloys with a Fe-Cr-Ni or a Cr-Ni base appeared to be better than those with Fe-Cr-Co, Cr-Co or Fe-Cr-Ni-Co bases. These two alloys had superior cold ductility, superior oxidation resistance at lower Cr contents in the presence of certain unfavorable strengthening elements and the ability to develop a higher strength level. The compositions 10 Fe, 20 Cr, 70 Ni and 20 Cr, 80 Co showed the highest 100-hr. rupture strength at 1800° F. (N7, Q-general; Fe-b, *Cr, Ni, Co*, 14-67)

591-N.* Phase Transformations in Carbon Steels During Heating at Increased Rates. G. T. Fomin. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 54-55.

Effect of the heating rate on the ferrite-austenite transformation investigated by dilatometric measurements and the determination of magnetic properties. 7 ref. (N8f, M23b, P16e, 3-67; CN-r)

592-N.* Some Physico-Chemical Processes Occurring in Fissionable Materials Under Irradiation. S. T. Konobeevsky, K. P. Dubrovin, B. M. Levitsky, L. D. Panteleev and N. F. Pravdyuk. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 574-586.

Low-temperature thermal cycling, effect of irradiation on the width and position of X-ray diffraction lines, stress relaxation in uranium during irradiation and thermal cycling, structural changes in a uranium-9% Mo alloy given. 14 ref. (N1c, M28n, Q7j, 2-67; U-b, *Mo*)

593-N.* Crystallographic Studies of Irradiated Uranium. J. Bloch, J. P. Mustelier, P. Bussy and J. Blin. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 593-601.

Measurements of hardness and density. Recrystallization observed by heating from the alpha phase into the beta range. Hardness of uranium as a function of exposure to neutrons for very slight irradiations. 7 ref. (N5, Q29n, P10a, 2-67; U)

594-N. (Book.) Preparation of Single Crystals. Semi-Conductor Monographs. W. D. Lawson and S. Nielsen. 255 p. 1958. Academic Press Inc., 111 Fifth Ave., New York 3, N. Y.

Techniques and apparatus for growing single crystals of semiconductive compounds. Methods for purification including zone melting, distillation, sublimation, filtration, electrodeposition, extraction and chromatography. Detection of trace impurities. Mechanism of crystal growth; origin, type and properties of lattice defects. 195 ref. (N3r, C-general; EG-j)

595-N. (Translation—AIP.) Unit Cell Determination of a Precipitation Phase From One Rotation Photograph of a Single Crystal of the Original Phase Along With Particles of the New Phase. I. A. Bagariatski. *Soviet Physics Crystallography*, v. 3, Jan. 1958, p. 8-14.

Method of determining, with only one rotating X-ray photograph, the coordinates of the reciprocal lattice points of the precipitation phase in a Ti-Cr alloy. Many orientations with respect to the original single crystal in the reciprocal lattice of a cubic crystal in the original phase are indicated. (N7b; M26; Ti-b, *Cr*)

596-N. (Translation—Brutcher no. 4715.) Ultrasonic Treatment of Metals and Alloys in the Solid State Applied to Intensify Diffusion Processes and Diffusionless Transformations. E. A. Al'ftan. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 19-24.

Intensification of the effects of various heat treatments, aging and strain hardening by ultrasonic treatment. Principles followed in the design of ultrasonic equipment. 15 ref. (N1, J-general, N7e, N6, 1-74)

597-N. (Translation—Brutcher no. 4716.) Characteristic Transformations in the High-Speed Recrystallization of Steel. G. K. L'vov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 203-205.

After cold deformation of 60% the steel was heated by high frequency at a velocity of 1500° C. per sec. and held at 650 and 850° C. through various times up to 6 sec. Effect of holding time on tensile strength, elongation and ferritic structure. (N5, Q27a, 2-64, 3-67, N8j; ST)

Effect of deformation at various temperatures on martensite formation, tensile strength, yield point and elongation. (N8p, Q27a, Q23b, Q23p, 3-68, 2-61; SS)

615-N.* (Russian.) Formation of a Eutectoid With Laminar Graphite. R. P. Todorov and G. I. Koshovnik. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 47-48.

Conditions for the formation are high Si content (3.5-4.5%) of the Fe and a moderate cooling velocity, such as is obtained in dry sand molds. (N8s, 2-60, 3-67; CI, *Si*)

616-N.* Growth of Whiskers by Reduction of Halogenides. H. Wiedersich. *Electrochemical Society, Journal*, v. 106, Sept. 1959, p. 810-815.

Reduction of $FeCl_2$ and $SiCl_4$ produced whiskers. Growth of the crystals is due in part to the partial pressure of $FeCl_2$ or $SiCl_4$. (N3r; Si, Fe, 14-61)

617-N.* The Effect of Alloying Elements on the Recrystallization of a Nickel-10% Cobalt Alloy. Stephen Floreen. *Institute of Metals, Journal*, v. 87, July 1959, p. 384.

Effect of Al, Cu and Co on the recrystallization temperature. (N5, 2-60; Ni-b, *Co*)

618-N.* Solute Segregation During Ingot Solidification. W. A. Tiller. *Iron and Steel Institute, Journal*, v. 192, Aug. 1959, p. 338-350.

Solidification theory with reference to the effects of growth conditions on mode of solidification in ingots and castings. 11 ref. (N12; 5-60, 5-59)

619-N.* Application of the Mayer Method to the Melting Problem. H. N. V. Temperley. *Physical Society, Proceedings*, v. 74, Aug. 1, 1959, p. 183-195.

Theoretical analysis of the melting of metals by means of the antiferromagnetic Ising model applied to a lattice gas having only repulsive interactions. Transition is first order. (N12n)

620-N.* (Czech.) Phase Analysis of Welded Joints. I. Hrivnak. *Zvaranie*, v. 8, Sept. 1959, p. 258-261.

Metallography and electron microscope analysis of welds of several austenitic and ferritic steels. Phase transformations were observed after long-time annealing at 800° C., and this considerably decreased the mechanical properties. The diffusion of both metals causes a critical transition layer which is unsatisfactory in the high-temperature ranges. (N-general, N1, M21e; SS-e, SS-d, 7-51)

621-N.* (Japanese.) Behavior of Carbides Due to Heat Treatment in High-Tungsten and Molybdenum High Speed Steels. Pt. 2. Study of Carbides in High Speed Steels by Electrolytic Isolation. Sadao Koshiba, Shin Kimura and Hideki Harada. *Tetsu to Hagane*, v. 45, June 1959, p. 608-614.

Determination of the total amounts of carbides in heat treated high-tungsten high speed steels and Mo high speed steels in the as-annealed states. Higher tempering temperatures resulted in a greater precipitation of carbides from the austenite. (N8r, S11; TS-m)

622-N.* (Japanese.) Metallographic Study of Nitrogen Absorption in 20% Cr-Fe Alloys. Effect of Carbon Content. Pt. 4. Function of Nitrogen as an Alloying Element in Heat Resisting Materials. Masazo Okamoto and Ohmi Miyakawa. *Tetsu to Hagane*, v. 45, June 1959, p. 614-621.

Influence of carbon content on austenite formation due to nitrogen absorption of alloys containing 0.04, 0.14 or 0.22% carbon. Behavior of the austenite as affected by heat treatment. (N8f, 2-64; Fe-b, *Cr*)

623-N. Self-Diffusion in Gamma Uranium. S. J. Rothman, L. T. Lloyd, R. Weil and A. L. Harkness. Argonne National Laboratory. *U. S. Atomic Energy Commission*, ANL-5971, July 1959, 38 p. (Available from U. S. Office of Technical Services, Washington 25, D.C.) $1.25.

Data are fitted by an Arrhenius-type equation and agree well with previously reported results. The value obtained is lower than that predicted by Zener's theory and the activation energy is much less than the value expected from various empirical correlations. 34 ref. (N1d; U)

624-N. Precipitation Processes in Copper-Rich Copper-Iron Alloys. A. Boltax. Nuclear Metals, Inc. *U. S. Atomic Energy Commission*, NMI-1210, Aug. 28, 1959, 44 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

On slowly cooling alloys of 3.25% Fe from 1050° C. to room temperature, two distinct stages in the precipitation process were detected. Above 850° C., a coarse fcc. precipitate is formed which transforms to bcc. form below 850° C., whereas below 850° C. the precipitation reaction involves the formation of fine fcc. coherent particles which are stable at room temperature. 35 ref. (N7b; Cu-b, *Fe*)

625-N.* (English.) Magnetic Domains in Cementite. M. Hillert and N. Lange. *Jernkontorets Annaler*, v. 143, no. 7, 1959, p. 414-425.

Cementite displays a zebra-striped pattern when examined in polarized light with crossed polars. This pattern has been observed in cementite of different origin and is independent of the mechanism of formation of the cementite. Proof of the magnetic nature of the pattern was obtained by mounting a thin specimen in the gap of an electromagnet and studying it in the microscope. One of the sets of stripes disappeared as the specimen was magnetized and returned in a new pattern when the magnetic field was again decreased. 5 ref. (N8k, P16; ST)

626-N.* (French.) Cast Iron With Finely Distributed Graphite. Jacques Pomey. *Fonderie*, no. 163, Aug. 1959, p. 357.

Phase transformations studied during the heat treatment by thermomagnetic and dilatometric measurements on Fe-C alloys, steels of various composition and white cast iron. (N8, M23b, M23a, 2-64; Fe-b, *C*, ST, CI-p)

627-N.* (Japanese.) Carbides in Tungsten High Speed Steels. Pt. 7. Tomoo Sata, Taiji Nishizawa and Kousuke Murai. *Tetsu to Hagane*, v. 45, Apr. 1959, p. 409-415.

The carbides were isolated electrolytically from two kinds of high speed steels—18-4-1 and 11-4-2—and were

studied by chemical analysis and X-ray examination. The carbides in the annealed structure are composed of M_6C, $M_{23}C_6$ and MC. By austenitizing treatment, $M_{23}C_6$ dissolves into the matrix, but part of the M_6C remains. 18 ref. (N8r; TS-m)

628-N.* (Japanese.) Aging of 16-15-6 Type Alloys. Pt. 2. Masazo Okamoto, Ryohei Tanaka, Akira Stato and Takeo Ishizuka. *Tetsu to Hagane*, v. 45, Apr. 1959, p. 423-432.

Effect of nitrogen, Ni and carbon content on aging characteristics of the low-Ni Timken 16 Cr, 15 Ni, 6 Mo (7.5 Mn) type alloys was studied by measurements of differential dilatation, hardness and microstructure. Maximum amount of nitrogen addition was limited to about 0.3%. (N7a, 2-60, Q29n; SS, *Mo*, Mn, *N*)

629-N. (Russian.) Effect of Deformation on Structure and Properties of the Heat Resisting Ni-Cr Alloy EI437. M. L. Bernshtein and Z. V. Svistunova. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 517-535.

Changes in hardness and resistivity caused by cold deformation in rolling or drawing, various cooling speeds after holding at 1080° C., and time and temperature of subsequent aging. 11 ref. (N7e, Q29n, P15g, 2-64; Ni-b, *Cr*)

630-N. (Russian.) Mechanism of Recrystallization Caused by Deformations Reaching the Critical Degree. S. S. Gorelik and M. B. Guterman. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 536-547.

Samples of Armco iron are subjected to a tensile deformation of 7.5-8% and vacuum heated up to 820° C. Recrystallization phenomena such as coalescence of adjacent grains or boundary migration are studied micrographically. 9 ref. (N5f, 2-64, 3-68; Fe)

631-N.* Neutron Irradiation Effects in a Copper-Aluminum Alloy. C. R. Houska and B. L. Averbach. *Journal of Applied Physics*, v. 30, Oct. 1959, p. 1525-1531.

Irradiated polycrystalline copper alloy with 14.5 at.% Al has a change of short-range order configuration in five neighboring shells. X-ray data are related to defect model of local radiation damage. (N10a, 2-67; Cu-b, *Al*)

632-N.* Diffuse X-Ray Scattering in Powder Patterns Arising From Displacements in Cubic Solid Solutions. C. R. Houska and B. L. Averbach. *Journal of Applied Physics*, v. 30, Oct. 1959, p. 1532-1534.

Calculation of diffuse scattering from static atomic displacement for cubic powder patterns. Excess scatter due to elastic interaction in solid solution. (N10a, M22g, 2-67; 14-67)

633-N.* Stabilization of the Martensitic Transformation in Iron-Nickel Alloys. John Woodilla, P. G. Winchell and Morris Cohen. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 849-851.

Kinetics of stabilization with respect to the isothermal component of the martensitic reaction. Although the carbon (or nitrogen) content may be very low in these alloys, it plays an important role in the stabilization phenomenon. In fact, if these interstitial elements are removed by moist-hydrogen treatment, no evidence of stabilization is found. 8 ref. (N8p; Fe-b, *Ni*)

634-N.* The Effect of Vibrations on Ordering in CuAu. H. C. Burghard, Jr., and Franz R. Brotzen. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 863-868.

Effects of 5, 10 and 15-kc. vibrations were investigated over a range of ordering temperatures of 280 to 360° C. A decrease in the rate of ordering was observed at all frequencies and ordering temperatures. 20 ref. (N10; Cu-b, *Au*)

635-N.* Strain-Hardening Exponent of Cross-Rolled Beryllium Sheet. S. R. Maloof. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 872-873.

Load-strain data after yielding and prior to necking are converted to true stress and true plastic strain, and plotted on log-log paper. The value of the strain hardening exponent of Be is not a sufficient criterion for predicting the formability of the metal. 5 ref. (N7e; Be, 4-53)

636-N.* The Effect of Radiation on the Rate of Diffusion of Arsenic Into Germanium. Norman L. Peterson and Robert E. Ogilvie. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 873-874.

Concept of the Frenkel defect and other lattice defects suggests that radiation may alter the rate of many metallurgical phenomena, especially those which are diffusion controlled. 6 ref. (N1, 2-67; *As*, Ge)

637-N.* Alpha ⇌ Beta Transformations in Titanium. S. J. Wiskel, W. V. Youdelis and J. Gordon Parr. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 875-876.

Transformation, in a sample of levitation melted iodide Ti, studied with a Leitz hot stage microscope. Structures indicate a sheer transformation beta → alpha, athermally nucleated, but capable of isothermal progression. (N6; Ti)

638-N.* The Transformation Temperature of Hafnium. D. K. Deardorff and Haruo Kato. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 876-877.

Transformation temperature to Hf from hcp. to bcc. is 1750 ± 20° C., in contrast to previously published values which are believed inaccurate. Temperatures were measured at which a sudden decrease was observed in the electrical resistance of Hf alloys continuing up to 18 at.% Zr, followed by extrapolating the temperatures to 0% Zr. 5 ref. (N6; Hf)

639-N.* (Japanese.) A Unified and Systematic Interpretation of the Formation Mechanism of Three Principal Segregations. Pt. 4. Solidification and Segregation of Larger Steel Ingots. Shinsaku Onodera and Yutaka Arakida. *Tetsu to Hagane*, v. 45, Jan. 1959, p. 16-21.

V, inverse V and negative segregations are formed as the liquid-solid interface in solidifying steel advances inwards. 13 ref. (N12; ST, 9-69)

640-N.* (Japanese.) Factors Controlling the Graphitization at Subcritical Temperature of High-Carbon Steel. Pt. 2. Study on the Graphitization of High-Carbon Steel. Naomichi Yamanaka and Kunio Kusaka. *Tetsu to Hagane*, v. 45, Jan. 1959, p. 45-51.

Effects of cold working, annealing atmosphere and other process variables. 8 ref. (N8s, 2-64, 3-68; CN-r)

641-N.* (Japanese.) Influence of Various Elements on the Graphitization of High-Carbon Steel. Pt. 2. Study of the Graphitization of High-Carbon Steel. Naomichi Yamanaka and Kunio Kusaka. *Tetsu to Hagane*, v. 45, May 1959, p. 499-506.

Si promotes graphitization after water quenching and cold drawing, while Mn has an inhibiting effect. Ti, Zr and boron promote graphitization after water quenching and accelerate graphitization after cold drawing. Vanadium restrained graphitization after cold drawing, but accelerated it after water quenching. Effects of Sn, Ni, P, Te and Sb. 8 ref. (N8s, 2-60; CN-r, Si, Mn, Sn, Sb, Te, Ni, Ti, Zr, *B*)

642-N.* (Japanese.) Carbides in High-C High-V High Speed Steels. Pt. 8. Study on Carbides in Commercial Special Steels by Electrolytic Isolation. Tomo-o Sato, Taiji Nishizawa and Kousuke Murai. *Tetsu to Hagane*, v. 45, May 1959, p. 511-516.

X-ray and chemical analyses of carbides isolated electrolytically from several high-vanadium high-speed steels and the effect of carbon, tungsten and vanadium content on the constitution of carbides in these steels. 16 ref. (N8r; TS-m)

643-N.* (Japanese.) Relation Between Magnetic and Mechanical Properties of the Transformation-Type Magnet Alloys. Pt. 1. Workability of Permanent Magnet Materials. Yasuo Kumura. *Tetsu to Hagane*, v. 45, Aug. 1959, p. 804-808.

In quench-hardening magnet steels, coercive force is proportional to square root of the volume of retained austenite and the best value of magnet is obtained when fine particles of martensite needles are distributed in the retained austenite and the ratio of martensite to austenite is 2 to 1. The magnet steels are mechanically hard in the quenched state, but are machinable in the annealed state without martensite structure. 17 ref. (N8p; ST, SGA-n)

644-N.* Iron-Alumina Materials. Arno Gatti. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 753-755.

Investigation of the system iron plus alumina. Various methods of dispersing and amounts of alumina were used. Alloys containing up to 16% alumina by weight are ductile at all temperatures tested. The iron-alumina materials have a higher yield stress and improved creep resistance over that of pure Fe. (N7; Fe, *Al*)

645-N.* A Study of the Recrystallization Kinetics and Tensile Properties of an Internally Oxidized Solid-Solution Aluminum-Silver Alloy. A. Gatti and R. L. Fullman.

Metallurgical Society of AIME, Transactions, v. 215, Oct. 1959, p. 762-769.

A very fine dispersion of Al oxide is produced by internal oxidation of solid-solution alloy of 0.14% Al in Ag. The particle size of the Al oxide is approximately 50 to 100 Å in radius. The yield strength of the alloy is increased markedly by internal oxidation. A further increase in strength is produced by cold working the internally oxidized alloy. 15 ref. (N5, R2s; Ag-b, *Al*, 14-67)

646-N.* Stabilization Phenomena in Beta-Phase Au-Cd Alloys. Howard K. Birnbaum. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 786-792.

"Normal" transformation of the beta phase (CsCl structure) to the orthorhombic beta prime (47.5 at.% Cd) and to the tetragonal beta (50.0 at.% Cd) phases occurred, after cooling from elevated temperatures at moderate rates, at about 60 and 30° C., respectively. Annealing the 47.5 at.% Cd alloy above the "normal" transformation temperature stabilized the beta phase relative to the beta prime and eventually caused transformation to the beta phase on cooling. 14 ref. (N6, 2-64; Au-b, *Cd*)

647-N.* Alloying Behavior of Ni_3Al (Gamma Prime Phase). R. W. Guard and J. H. Westbrook. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 807-814.

Influence of a number of alloying additions on structure and hardness. Three general effects are observed; solid-solution hardening, strain aging, and defect hardening arising from deviations from stoichiometry. The solid-solution hardening phenomena are complicated relative to binary terminal solid solutions due to the possibility of virtually independent substitution for the component elements and to the concomitant effects of strain aging. 27 ref. (N7, N7e, 2-60; Ni-b, *Al*, 14-67)

648-N.* Effect of Neutron Irradiation on the Martensite Transformation in Iron-Nickel Alloys. L. F. Porter and G. J. Dienes. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 854-863.

Irradiation lowers the M_s temperature of the alloy, causes changes in the electrical and magnetic properties of the high-temperature phase which indicate either an acceleration of phase separation or a clustering Ni, and enhances strain recovery on specimens partially transformed to martensite prior to irradiation. Possible mechanisms are offered to account for these effects. 21 ref. (N8p, 2-67; Fe-b, *Ni*)

649-N. (English.) Precipitation Process of Carbon in Alpha Iron. Tetsuro Suzuki and Yuzo Tomono. *Physical Society of Japan, Journal,* v. 14, May 1959, p. 597-601.

Studied by measuring the internal friction and observing the precipitates by electron microscope. 9 ref. (N7; Fe, *C*)

650-N. (French.) Relation Between the Alpha-Phase of Cold Work and the Parent Austenite in Low-Carbon 18-8 Steels. P. Bastien and R. Margerand. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, Oct. 1959, p. 463-470.

4 ref. (N8, M26c; SS)

651-N. (French.) Method for Preparation of Bicrystals of Aluminum Having Pre-Determined Orientations. C. Goux and J. Montuelle. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, Oct. 1959, p. 497-504.

4 ref. (N7a; Cu-s)

654-N.* The Evaporation of Various Alloys at High Temperature in Vacuo. W. A. Blonn. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 30-34.

Rates of evaporation are temperature dependent only when the pressure is less than 100 micron. Coupons of materials intended for use in vacuum furnace construction were subjected to temperatures up to 2280° F. in vacuums of 0.1-10 micron. Rates of evaporation range from 4.7×10^{-3} for 80 Ni-20 Cr to 1.2×10^{-2} grams per sq. cm. per hr. for type 430 stainless steel. (N16n, 2-61, 1-73)

655-N.* Mechanism of Evolution of Gases From Liquid Metal Under Vacuum.

A. M. Semarin and R. A. Karasev. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 35-37.

If the liquid metal is kept under sufficiently high vacuum to exclude oxidation of the metal by the oxygen in the furnace atmosphere, two sources of oxygen are left in the system: the oxygen dissolved in the metal and that contained in the refractory material of the crucible. Oxygen isotopes were used to differentiate these two sources of oxygen and to study the features of the mechanism of evolution of the oxygen dissolved in the liquid metal depending on the carbon content. (N16m, 1-73, 1-59)

656-N.* Diffusion of Aluminum, Magnesium, Silicon and Zirconium in Nickel. Herbert W. Allison and Harold Samelson. *Journal of Applied Physics*, v. 30, Sept. 1959, p. 1419-1424.

Diffusion rates of Al, Mg, Si and Zr alloyed as single additives in Ni, measured at temperatures between 800 and 970° C. as shown by weight gain caused by surface oxidation of additive. (N1; Ni, *Al, Mg, Si, Zr*)

657-N.* (German.) Carbon Separation in the Aging of Chromium and Chromium-Tungsten Steel. H. Krainer, K. Ebner and M. Storek. *Harterei-Technische Mitteilungen*, v. 14, no. 1, 1959, p. 24-50.

The carbon separation from the martensite is delayed by additives such as W and Cr. At low aging temperatures, up to 400° C.; the separation of carbides takes place while formation of the carbides is reached at temperatures above 400° C. 34 ref. (N8f, N7a, 2-60; TS, *Cr, W*)

658-N.* (Japanese.) Effect of Aluminum and Nitrogen on the Graphitization of High-Carbon Steel. Pt. 1. Graphitization of High Carbon Steel. Pt. 2. Naomichi Yamanaka and Kunio Kusaka. *Tetsu to Hagane*, v. 45, Feb. 1959, p. 110-117.

Effect of water quenching, cold drawing, air-cooling, furnace cooling, nitrogen content, Al content on graphitization. (N8s, 2-60, 2-64; CN-r, *N, Al*)

659-N.* (Japanese.) Effect of Heating Rate on Properties of Heat Treated 13% Cr Stainless Steel. Seita Sakui, Tsutomu Mori and Chiaki Yamamoto. *Tetsu to Hagane*, v. 45, Feb. 1959, p. 117-122.

Two different heating rates were applied. The effect of the varying heat treatments on recrystallization temperature, grain size and directionality. (N5, N8p, 2-64, M27c; SS)

660-N.* (Russian.) The Influence of Thermal Magnetic Aging on the Chemical Composition of Iron-Cobalt-Nickel-Aluminum Alloys. A. M. Morozova and F. E. Degina. *Fizika Metallov i Metallovedenie*, v. 7, no. 1, 1959, p. 40-47.

Influence of Al, Ni, Cu and Co in Fe Co-Ni-Al alloys, with special reference to stability. The most obvious results were produced by the cooling process. (N7a, 2-60; Fe-b, Cu, *Ni, Al, Co*)

661-N.* The Kinetics of Solution of Tungsten Carbide in Molten Cobalt. L. Skolnick. Paper from "Kinetics of High-Temperature Processes". John Wiley & Sons, Inc., New York 16, 1959, p. 92-97.

The dissolution of WC in molten Co is limited by a phase-boundary reaction. The high activation energy for this process, of 175 ± 45 k.-cal. per mole, and other indirect evidence suggest a mechanism in which an intermediate compound is formed at the boundary between solute and liquid. 16 ref. (N1; Co, W, 6-69)

662-N.* Metal-Gas Reactions. C. E. Birchenall. Paper from "Kinetics of High-Temperature Processes". John Wiley & Sons, Inc., New York 16, 1959, p. 277-281.

Reactions of solid metals with gases by means of dissolution and diffusion, formation of volatile or liquid products or of solid phases. 25 ref. (N15d)

663-N.* (Japanese.) Effects of Stress Caused by Preventing Thermal Contraction on the Amount of Retained Austenite. Pt. 1. Effects of Stress in Cooling on Austenite Stability. Iwao Hagiwara, Shogo Kanazawa and Uko Kumada. *Japan Institute of Metals, Journal*, v. 23, May 1959, p. 299-302.

Effects of thermal stress on retained austenite; tensile stress induced by preventing the thermal contraction increased linearly with decreasing temperature and indicated the maximum value at Ms temperature. (N8n, Q25p; ST)

664-N.* (Japanese.) X-Ray Study on Aging and Precipitation of Deformed Al-Ag Alloys. Mutsuo Ohta. *Japan Institute of Metals, Journal*, v. 23, May 1959, p. 303-307.

Specimens were cold rolled 50%, and then annealed at 150° C. for varying

times. The state of zones and gamma prime-precipitates were investigated by X-ray small-angle scattering photographs. Precipitation of gamma prime-phase during annealing at 150° C. begins earlier in these specimens than in the specimens cold rolled immediately after quenching. (N7, 3-68, M21f; Al-b, *Ag*)

665-N.* (Japanese.) Release of the Stored Energy of Cold Compressed Commercial Aluminum by Annealing. Genjiro Mima and Mitsugu Tokizawa. *Japan Institute of Metals, Journal*, v. 23, May 1959, p. 307-311.

Recovery and recrystallization processes of statically and dynamically cold worked metals. The total released energy under static compression is somewhat larger than that under impact compression but both increase in proportion to the degree of compression. (N5, 3-68, 2-64; Al)

666-N.* (Japanese.) Reactivity of Zinc Powder. Pt. 5. Replica Study on the Surface Structure of Caustic Electrolytic Zinc Powder (E-Zn). Yoshio Kubota. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 445-448.

Electrolyte temperature, stirring and additives affect particle shape and number of branches, thickness and layer interstices. Effect of grinding and HCl etching after electrolysis. (N12b, N12d, M20q, M20r; Zn, 6-68)

667-N.* (Japanese.) Structural Changes Produced by Aging of a Cu-Cr-Ti Alloy. Pt. 1. Precipitation of a Cu-Cr-Ti Alloy. Toshio Doi. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 477-481.

Solution treatment and aging for various times and temperatures of Ti alloys with 0.54% Cu and 3.06% Cr. Precipitate composition and crystal structure are related to aging time and temperature. 6 ref. (N7a, M26; Ti-b, *Cu, Cr*)

668-N.* (Japanese.) Precipitates of a Cu-Cr-Ti Alloy Studied by Extraction-Replica Technique. Pt. 2. Toshio Doi. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 482-485.

Ti alloy with 0.54 Cu and 3.06% Cr solution treated and aged for various times and temperatures. Identification of precipitates obtained. 7 ref. (N7; Ti-b, *Cu, Cr*)

669-N. (Czech.) Isolation of Carbides From Steel and Similar Alloys. Hanus Tuma. *Chemicke Listy*, v. 53, no. 9, 1959, p. 909-921.

55 ref. (N8r; ST)

Temperature dependence of recovery after quenching determined for resistivity of Al in terms of vacancy motion in the lattice. Activation energy for self-diffusion in Al calculated for mono-vacancy mechanism. Effects of impurities. (N1b, N1d, P15g, 3-69, 2-61; Al-a)

687-N. (Transiation-Brutcher no. 4634.) Conditions for the Transition of Carbon Into Solid Solution During the Induction Heating of Chromium Steel. I. N. Kidin. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 405-419.

Effects of heating temperature and rate and Cr content on the quantity of carbon found in solid solution after quenching. 5 ref. (N8p, J2g, 2-61, 3-67; AY, *C*, 14-67)

SECTION P

PHYSICAL PROPERTIES and TEST METHODS

1-P.* The Magnetization of Cobalt-Aluminum, Cobalt-Silicon, Iron-Aluminum and Iron-Silicon Alloys. D. Parsons, W. Sucksmith and J. E. Thompson. *Philosophical Magazine*, v. 3, Oct. 1958, p. 1174-1184.

Rate of change of magnetic moment with composition in several ferromagnetic Co-rich and Fe-rich alloys of these systems is derived from measurements of the variation of spontaneous magnetization with temperature. In the Fe-Al and Fe-Si alloys, the initial rate of change of moment with composition corresponds to a simple dilution of the Fe by the solute element, and increases in the range of compositions where ordering is known to exist. In the Co-Al and Co-Si alloys, the rate of change of moment with composition does not correspond to the number of valence electrons normally associated with the solute elements. 15 ref. (P16, 2-60; Co, Al, Si, Fe)

2-P.* (Japanese.) Effect of Low-Temperature Deformation on Recovery Phenomena of Aluminum-Magnesium Alloys. Jiro Wada and Masanobu Sasagawa. *Light Metals*, no. 31, July 1958, p. 13-15.

Recovery phenomena of electrical resistance and tensile stress of alloys with 2 to 6% Mg annealed at various temperatures after deformation at -196° C. Annealing of the alloys containing 4 and 6% Mg between -75 and +20° C. increased electrical resistance and tensile strength. Electrical resistance of alloys with 2% Mg decreased over the same temperature range. Annealing at -75 to +60° C. increased tensile stress of 2% alloys. 5 ref. (P15g, Q27a, 2-64, 3-68; Al, *Mg*)

3-P.* (Japanese.) Kinetics of Reaction of Commercial Pure Titanium and Titanium Alloys With O_2, N_2, and H_2. Pt. 3. Hidetake Kusamichi, Yoshiro Yagi, Toru Yukawa and Hidenori Toda. *Light Metals*, no. 31, July 1958, p. 55-59.

Wires of pure Ti alloy with 0.2% C, with 5% Al, and with 2% Al and 2% Fe were subjected to hydrogen at 1 atm. and the solubility of hydrogen was measured at elevated temperatures. Heat of dissolution of hydrogen in metal was calculated. Results compared to published data. 9 ref. (P12e, N15e, 2-62; Ti, *H, O*, N, 4-61)

4-P.* (Russian.) Magnetizing Processes in Silicon-Iron Crystals. Ia. S. Schur and V. R. Abels. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 556-563.

Under magnetic field action, complex changes occur in magnetic structure of Si-Fe crystals, which depend upon field size, appearance of initial magnetic structure and field orientation in relation to crystallographic axes. Structure changes may consist of boundary displacement, orientation changes of magnetizing region and of the type of magnetic structure. The regularity of magnetic structure changes, under field action, in Si-Fe crystals are in general for soft magnetic strip materials, especially for those having a crystalline lattice type of Fe and a sufficient large anisotropic coefficient. 4 ref. (P16; Fe, Si)

5-P. Single Crystal Anisotropy and Magnetostriction Constants of Several Ferromagnetic Alloys. R. C. Hall. Westinghouse Electric Corp. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151036, Apr. 1958, 41 p. $1.25.

Effects of radiation on magnetic materials. Anisotropy and magnetostriction

of single crystals of several soft ferromagnetic materials measured prior to irradiation. Single crystals were prepared of Fe and Ni, of binary alloys of Ni-Fe, Si-Fe, Co-Ni, Co-Fe and Al-Fe, of several ternary alloys, and of magnetite. The effect of the order-disorder reaction on these properties was measured where possible. New data presented for the Co-Ni and Co-Fe systems. Generally, ordering was found to lower anisotropy in the A_3B type of order-disorder system. On the other hand, ordering has a complicated and inconsistent effect on magnetostriction. (P16b, M24b, N10, 2-67, 3-72; Al, Co, Fe, Ni, Si, SGA-n, 14-61)

6-P. On the Interpretation of Radiation Effects in the Noble Metals. D. K. Holmes, J. W. Corbett, R. M. Walker, J. S. Koehler and Frederick Seitz. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2385, 1958, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Irradiations have been carried out at temperatures near 10° K. with fast reactor neutrons, electrons and gamma rays and deuterons. Change in electrical resistivity with bombarding flux, release of stored energy during annealing; change of lattice parameter and linear dimensions during bombardment and annealing. 7 ref. (P15g, P10d, 2-67; EG-c)

7-P. Effects of Transients and Longer-Time Anneals on Irradiated Uranium-Zirconium Alloys. William V. Johnston. Knolls Atomic Power Laboratory, U. S. Atomic Energy Commission, KAPL-1965, Oct. 3, 1958, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Small pieces of Zircaloy-clad U-Zr alloys (7 and 8%) irradiated from 0.4 to 1.5 at. % burnup of the total core atoms were heat treated at temperatures between 510 and 980° C. for 1 sec. to 500 hr. Resulting changes in density, electrical resistivity and microstructure appear to be due to the growth of inert gas bubbles formed in the epsilon phase and to a transformation occurring in the delta phase. 5 ref. (P10a, P15g, M27, 2-64, 2-67; U, Zr)

8-P. (Dutch.) Basic Physical Concepts of Magnetic Materials. G. W. Rathenau. *Metalen*, v. 13, July 31, 1958, p. 252-257.

10 ref. (P16; SGA-n)

9-P. (Polish.) Thermodynamic Properties of Liquid Metallic Solutions. Pt. 2. The Bi-In System. Janusz Terpilowski. *Archiwum Hutnictwa*, v. 3, no. 3, 1958, p. 227-237.

Tests performed with 11 alloys of 5 to 95 at. % In at 380 to 520° C. by the method of measuring electromotive forces. 23 ref. (P12, M24b; Bi, In, 14-60)

10-P. (Russian.) Stability of Unevenly Heated Electrically Conducting Liquid in a Magnetic Field. E. M. Zhukhovitskii. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 385-394.

Investigation of a convection movement arising in an electrically conducting liquid in presence of an outer magnetic field in a limitless vertical cylinder. 12 ref. (P16, P11j; 14-60)

11-P. (Russian.) Computation of the Basic State of a Nonmagnetic Iron With a Single Nonmagnetic Axis. A. Ts. Amatuni. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 395-399.

In a definite boundary of an outer magnetic field directed parallel to anisotropic axis in a definite correlation, the anisotropic constant fluctuates from zero magnetism to some definite end point; which means that a phase transition of the first order takes place. 7 ref. (P16, 3-72; Fe)

12-P. (Russian.) Thermodynamics of Ideal Crystals. S. K. Savvinkh. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 400-411.

General formulas for thermodynamic functions applied to equation of state and thermal capacity of crystalline A. 9 ref. (P12r; A-r)

13-P. (Russian.) Magnetic Surface Effect of a Pulsating Two-Component Field Acting on Its Field Surface. Yu. D. Sytchev. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 412-419.

Surface effect can be utilized in analyzing work of induction heaters. Pulsation is understood to mean a nonmoving sinosoidal distribution in field space. 6 ref. (P16, J2g)

14-P. (Russian.) Magnetic Properties of Magneto-Anisotropic Samples of Ferromagnetic Powders. Pt. 4. Ya. S. Schur, E. V. Schtolts and G. S. Kandawrova. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 420-425.

Structures existing in a fine powder (1-10 microns) at room temperature disappear at -190° C. and a different structure forms. This new structure is related to the decreasing anisotropic constant at a lower temperature. 9 ref. (P16; Bi, Mn, 6-68)

15-P.* Mechanical and Physical Properties of Three Low-Shrinkage, Copper-Base Casting Alloys. J. G. Kura and R. M. Lang. *American Society for Testing Materials, Proceedings*, Reprint, v. 58, 1958, 16 p.

Ultimate strength, yield strength, elongation, reduction of area, Young's modulus, compressive strength, V-notch Charpy impact strength, Brinell hardness, fatigue, machinability, shrinkage, density and specific gravity, electrical resistivity, thermal conductivity and thermal expansion of 80-10-10, 85-5-5-5 and Navy "M" alloys at various temperatures from -40 to 550° F. 5 ref. (P-general, Q-general, 2-62; Cu-b, Cu-s)

16-P.* The Electrical Conductivity and Hall Effect of Silicon. E. H. Putley and W. H. Mitchell. *Physical Society, Proceedings*, v. 72, Aug. 1, 1958, p. 193-200.

Electrical conductivity and Hall effect measured over the range 20 to 500° K. on single crystals of Si with extrinsic carrier concentrations between 2 and 5 x 10^{12} cc. 8 ref. (P15p, P15g; Si, 14-61)

17-P.* Heat Content of Zirconium and of Five Compositions of Zirconium Hydride From 0° to 900°C. Thomas B. Douglas and Andrew C. Victor. *National Bureau of Standards, Journal of Research*, v. 61, July 1958, p. 13-23.

Measurements by a precise Bunsen ice calorimeter, a "silver core" furnace and a "drop" method. At each temperature up to 550° C. the heat contents of the hydrides relative to 0° C. varied linearly with composition in accord with the phase diagram of the system. The effective heat capacity of each hydride sample reached its maximum value between 550 and 600° C., due to the endothermic formation of the high-temperature beta phase. 13 ref. (P12r; Zr)

18-P.* Magnetic Susceptibilities of Alloys of Cerium With Thorium. L. F. Bates and M. M. Newmann. *Physical Society, Proceedings*, v. 72, Sept. 1, 1958, p. 345-352.

Temperature dependence of the resistivity of 90, 60, 40, 20 and 5 at.% Ce-Th alloys is investigated over the range 90 to 293° K. Thermal expansion of the 60% alloy is also measured over this range. All the alloys exhibit a sharp decrease in susceptibility at low temperatures. 15 ref. (P16, 2-63; Ce, Th)

19-P.* Galvanomagnetic Effects in p-Type Bismuth Telluride. J. R. Drabble. *Physical Society, Proceedings*, v. 72, Sept. 1, 1958, p. 380-390.

Resistivity components, Hall coefficients and low field magneto-resistance coefficients are measured on a number of single crystal specimens of p-type bismuth telluride at 77° K. Results are used to discuss the variation of the resistivities and the Hall coefficients with temperature over the range 77 to 290° K. and, in particular, to obtain the conductivity mobility for holes for current flow parallel to the cleavage planes. 5 ref. (P15; 14-61, Bi, Te)

20-P.* Magnetothermal Resistance and Magnetothermoelectric Effects in Bismuth Telluride. A. E. Bowley, R. Delves and H. J. Goldsmid. *Physical Society, Proceedings*, v. 72, Sept. 1, 1958, p. 401-410.

Scattering laws for the charge carriers are derived from the magnetothermoelectric effect and also from the magnetothermal-resistance effect for p-type material. It has, however, not been possible to fit a simple scattering law to the results from the magnetothermal-resistance effect in n-type material. (P11, P15, P16; Bi, Te)

21-P.* Optical Properties of Evaporated Chromium Films. Robert M. Hill and Charles Weaver. *Faraday Society, Transactions*, v. 54, Oct. 1958, p. 1464-1476.

Structures of very thin, vacuum-evaporated films of Cr investigated by optical methods. The optical constants for a series of films of varying thicknesses are

calculated from reflectivity and transmission measurements and the films are found to be inhomogeneous. The changes in the optical constants with thickness are inconsistent with either the Maxwell-Garnett theory of spherical particles or with Schopper's theory of ellipsoidal aggregates. 15 ref. (P17; Cr, 14-62)

22-P.* Thermodynamics of Nonstoichiometric Nickel Tellurides. Pt. 2. Dissociation Pressures and Phase Relations of Tellurium-Rich Compositions. Edgar F. Westrum, Jr., and R. E. Machol. *Journal of Chemical Physics*, v. 29, Oct. 1958, p. 824-828.

Modifications of the manometric technique permit fine accuracies at high temperatures with corrosive substances where the pressure is sensitive to impurities or to composition changes. Results, together with data on the vapor pressure of pure Te, define the partial molal free energies and entropies of Te and, together with direct eutectic temperature measurement, delineate features of the phase diagram for compositions with more than 60 at. % Te. 8 ref. (P12; Ni, Te, 14-68)

23-P.* (Russian.) Emission Spectrum of the Electrons in Iron-Chromium Alloys. N. D. Borisov, V. V. Nemoshkalenko and A. M. Fefer. *Doklady Akademii Nauk SSSR*, v. 121, no. 2, 1958, p. 264-267.

Spectra of highly purified electrolytic iron, with 4 to 75% purified Cr and spectra of Cr alone tested from 300 to 1200° C. Conclusions on the relative position of energy band made from the measurements. (P15k; Fe, Cr)

24-P.* (Russian.) Hall Effect of Pure Nickel in the Range of Helium Temperatures. N. V. Volkenshtein, G. V. Fedorov and S. V. Vonsovski. *Zhurnal Eksperimental'noi i Teoreticheskoi Fiziki*, v. 35, July 1958, p. 85-88.

Hall effect studied on 99.99% Ni over a wide temperature range and down to the temperature of liquid helium. Ferromagnetic constant R_1 decreases with the falling temperature and reaches a minimum at 20-30° K. 17 ref. (P16, 2-62; Ni-a)

25-P. Gamma Phase in Uranium Alloys. R. G. Loasby. *Physical Society, Proceedings*, v. 72, Sept. 1, 1958, p. 425-428.

Resistance and magnetic susceptibility properties of two alloys based on gamma-uranium interpreted in terms of a theoretical structure derived from X-ray analysis. 6 ref. (P16, M21f; U)

26-P. Magnetic Properties of the Praseodymium and Neodymium Metals. Tsuyoshi Murao. *Progress of Theoretical Physics*, v. 20, Sept. 1958, p. 277-286.

17 ref. (P16; Pr, Nd)

27-P. Freezing Point of Zinc as a Primary Point of the International Temperature Scale. C. R. Barber and Anne Horsford. *Royal Society Proceedings*, v. 247, Sept. 16, 1958, p. 214-224.

Substitution of the Zn point for the S point as a primary fixed point of the International Temperature Scale would lead to greater precision in definition of the scale. 9 ref. (P12n; Zn)

28-P.* Thermal Conductivity and Thermoelectric Power of Germanium-Silicon Alloys. M. C. Steele and F. D. Rosi. *Journal of Applied Physics*, v. 29, Nov. 1958, p. 1517-1520.

At 300° K. for an alloy containing 56 at. % Si, the thermal conductivity was found to be six times smaller than the value for pure Ge. Solid solution alloying can significantly increase the figure of merit of thermo-electric materials. (P11h, P15g; Ge, Si)

29-P.* Electrical Properties and Thermal Expansion of the Laves Phases, $CaMg_2$ and $MgCu_2$. J. F. Smith and J. R. Ogren. *Journal of Applied Physics*, v. 29, Nov. 1958, p. 1523-1525.

Electrical resistivities, temperature coefficients of resistivity, and Hall coefficients were measured on single crystals of hexagonal $CaMg_2$ and on polycrystals of cubic $MgCu_2$. Appreciable scatter in measured resistivities on different specimens was observed, presumably due to variations in the degree of crystalline perfection. (P15, P11g; Ca, Mg, Cu, 14-61, 14-68)

30-P.* Approximate Elastic Spectrum of Beta-AuZn From Temperature Diffuse Scattering of X-Rays. Milton Schwartz and Leonard Muldawer. *Journal of Applied Physics*, v.29, Nov. 1958, p. 1561-1568.

Temperature vibration diffuse scattering of X-ray from beta Au-Zn was measured at room temperature over various regions of reciprocal space and the equal intensity contours agree qualitatively with those of other cubic materials. Analysis of the Debye temperatures of the Au and Zn atoms in the alloy shows that the root mean square atomic displacement of the lighter atoms is larger than that of the heavier atoms. (P17, P12r, Au, Zn)

31-P.* Effect of Elongation on the Electrical Resistivity of Metals. Pt. 1.. Aluminum. Pt. 2. Molybdenum. H. R. Peiffer. *Journal of Applied Physics*, v. 29, Nov. 1958, p. 1581-1584.

Changes introduced in the face-centered cubic metal Al upon elongation at 78° K., changes in body-centered cubic metal Mo at 298° K. For both metals the resistivity caused by point defects and the residual resistivity are directly proportional to the elongation. (P15g, 3-68; Al, Mo)

32-P.* Electrical Properties of Bismuth Telluride. R. Mansfield and W. Williams. *Physical Society, Proceedings*, v. 72, Nov. 1, 1958, p. 733-741.

Measurements of electrical conductivity, Hall coefficient, thermo-electric power and Nernst coefficient on specimens cut from zone melted Bi_2Te_3 and on a single crystal. The current flow was parallel to the cleavage planes and the galvanomagnetic effects of the single crystal were measured with the magnetic field perpendicular and parallel to the cleavage planes. 6 ref. (P15; Bi, Te, 14-61, 14-68)

33-P.* Magnetic Susceptibility and Electrical Resistance Properties of Some Uranium Alloys. L. F. Bates and R. G. Loasby. *Physical Society, Proceedings*, v. 72, Nov. 1, 1958, p. 757-764.

Quenched alloys of U with Zr, Cb and Mo, metals which have 4, 5 and 6 outer electrons respectively, were measured over the temperature range 90 to 300° K. General features of the three systems are the same, with anomalies at about 0.5 and 2.0 at.% of the solute. 6 ref. (P15, P16; U-b)

34-P.* Copper Nuclear Magnetic Resonance in Cu-Ni and Cu-Mn Alloys. A. C. Chapman and E. F. W. Seymour. *Physical Society, Proceedings*, v. 72, Nov. 1, 1958, p. 797-809.

Cu^{63} resonance observed in Cu-Ni alloys containing up to 9.2% Ni, at 3 and 7 megacycles per sec. in the temperature range 20 to 290° K. The resonance shows a reduction in intensity and a shift to lower frequency and substantially independent of temperature. The line width is not much greater than in pure Cu. 18 ref. (P18m; Cu, Ni, Mn)

35-P.* Some Observations on Field Emission From Mercury Whiskers. Robert Gomer. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 126-132.

Field emission from Hg whiskers was obtained by growing them in a modified field emission tube on a W substrate that was electrically connected to an external voltage source. Whiskers gave field emission patterns which could be identified from symmetry as 110 oriented (f.c.c. pseudo-system) single crystals. 8 ref. (P15K, M26; 14-61, Hg)

36-P.* (German.) Susceptibility Measurements on Heat Resistant Nickel-Chromium and Cobalt-Nickel-Chromium Alloys. Wilheim Wink and Werner Jellinghaus. *Archiv fur das Eisenhuttenwesen*, v. 29, Sept. 1958, p. 567-573.

Variations in composition of the solid solution and appearance of new phases in Ni-Cr and Co-Ni-Cr alloys proven through susceptibility measurements. Influence of field strength, temperature, cold deformation and annealing upon the susceptibility. 7 ref. (P16n, P16p, 2-61, 2-64, 3-68, 3-71; Co, Cr, Ni, *Pd*)

37-P. Heating and Cooling of Flat Strip. Pt. 2. A. H. Vaughan. *Industrial Heating*, v. 25, Nov. 1958, p. 2216-2218, 2220, 2222, 2224, 2226.

Radiation, convection, heat content and emissivity are discussed to enable practical application of ideal heating and cooling curves. (P11, F21b; ST, 4-53)

38-P. On the Hall Effect in Bismuth. Rosemary A. Coldwell-Horsfall and D. Ter Haar. *Physica*, v. 24, Oct. 1958, p. 848-854.

18 ref. (P15p; Bi)

39-P. Exponential Experiments With Organic Moderated Uranium Lattices. W. W. Brown. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/595, 1958, 12 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Measurement of the nuclear properties of both moderator and lattices. Fuel used consists of 1-in. diameter U rods of enrichments 0.721 (natural) and 0.912 at.% U^{235}. For each enrichment, lattices of moderator to fuel volume ratios 1.5, 2.0, 3.0 and 4.0 were studied. (P18, T11g, T11h; U, 14-63)

40-P. Plutonium Recycle R in Power Reactors. P. Greebler, W. H. Harker, J. M. Harriman and E. L. Zebroski. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF. 15/P/2000, 1958, 17 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Physics model used included such effects as shifting thermal and epithermal neutron spectra and interaction of resonances of the various isotopes. Effects of partial batch cycling and special power variations. (P18, T11g; Pu, 14-63)

41-P. (German.) Behavior of Heat Conducting Alloys in Nitrogen and Gases Containing Nitrogen. Harald Pfeiffer. *Archiv fur das Eisenhuttenwesen*, v. 29, Sept. 1958, p. 575-584.

New apparatus to determine the behavior of wire heating elements. (P11h, X10, 2-66; N)

42-P.* (German.) Hysteresis Loop of an Iron-Chromium Alloy With 24% Cr Influenced by the Temperature. Albrecht v. Kienlin. *Archiv fur das Eisenhuttenwesen*, v. 29, Oct. 1958, p. 661-662.

At 475° C. a hysteresis loop resulted that showed irregularities typical for the Perminvar effect. (P16a; Fe, *Cr*, SGA-n)

43-P.* (German.) Thermodynamic Analysis. Calorimetry and Thermodynamics of Lead-Bismuth Alloys. Willy Oelsen and Ruth Bennewitz. *Archiv fur das Eisenhuttenwesen*, v. 29, Oct. 1958, p. 663-672.

Peritectic reaction was found to take place at 184° C. 28 ref. (P12, N12r, Pb-b, *Bi*)

44-P.* Piezoresistance Constants of n-Type InAs. A. J. Tuzzolino. *Physical Review*, v. 112, Oct. 1, 1958, p. 30.

Piezoresistance constants as a function of temperature from 77 to 300° K. From the small magnitude found for the three constants throughout the temperature range investigated, it is concluded that results of this experiment are consistent with a spherical conduction-band model for InAs. (P15p, 2-61; In, As)

45-P.* Effects of Pressure on the Superconducting Transition Temperatures of Sn, In, Ta, Tl and Hg. L. D. Jennings and C. A. Swenson. *Physical Review*, v. 112, Oct. 1, 1958, p. 31-43.

Transition temperature data for Sn and In show considerable curvature when plotted versus pressure, but give a roughly linear relationship when plotted against volume. No curvature was found for Ta. (P15g, 3-74; Sn, In, Ta, Tl, Mg)

46-P.* Magnetic Properties of Terbium Metal. W. C. Thoburn, S. Legvold and F. H. Spedding. *Physical Review*, v. 112, Oct. 1, 1958, p. 56-58.

Magnetic measurements over the range from 4 to 375° K. Tb is found to have a paramagnetic Curie point of 237° K. Tests with fields of from 50 to 800 oe. indicate an order-to-disorder transition at approximately 230° K., which is a Néel point. (P16, 2-63; Tb)

47-P.* Magnetization Curves of Superconductive Tin Alloys. E. A. Lynton and B. Serin. *Physical Review*, v. 112, Oct. 1, 1958, p. 70-72.

An appreciable amount of magnetic flux remains inside the specimen when it first becomes completely superconducting in decreasing fields. This flux subsequently leaks or migrates out of the specimen as the field is reduced to zero. (P15g, P16; Sn-b)

48-P.* Thermal Conductivity of Selenium at Low Temperatures. G. K. White, S. B. Woods and M. T. Elford. *Physical Review*, v. 112, Oct. 1, 1958, p. 111-113.

Measurements of glassy Se and polycrystalline metallic (hexagonal) Se at temperatures from 2 to about 100° K. (P11h, 2-63; Se)

49-P.* Thermal Expansion of Some Crystals With the Diamond Structure. D. F. Gibbons. *Physical Review*, v. 112, Oct. 1, 1958, p. 136-140.

Linear coefficient of thermal expansion of Si, Ge and In antimonide measured in the range 4.2-300° K. using an interferometric method. Si and InSb have negative values at low temperatures, probably due to fourfold coordination in the lattice, covalent bonding and openness of structure. (P11g, M26q; Si, Ge, In, Sb)

50-P.* Experimental Determination of the Fermi Surface in Lead. A. V. Gold. *Royal Society of London, Philosophical Transactions*, v. 251, Nov. 6, 1958, p. 85-112.

The oscillatory variation of magnetic moment with magnetic field (de Hass-van Alphen effect) studied in Pb single crystals in the range 1.2 to 4.2° K. and at fields up to 80 KG. using an impulsive-field tech. nique. 10 ref. (P16n; Pb, 14-61)

51-P.* Spontaneous Magnetization of Nickel + Copper Alloys. S. A. Ahern, M. J. C. Martin and W. Sucksmith. *Royal Society, Proceedings*, v. 248, Nov. 11, 1958, p. 145-152.

Spontaneous magnetization of a ferromagnetic alloy may be deduced exclusively from the determination of magnetic isothermals, or in conjunction with magnetocaloric measurements. Values of a Ni-Cu alloy containing 30.73 at.% Cu were obtained near its Curie temperature using both of these techniques. 19 ref. (P16; Ni-b, Cu-b)

52-P.* Investigation of the Structural Changes Taking Place in a Uranium-Molybdenum Alloy Under the Action of Neutron Irradiation. S. T. Konobeevskii, N. F. Pravdiuk, K. P. Dubrovin, B. M. Levitskii, L. D. Panteleev and V. M. Golianov. *Soviet Journal of Atomic Energy*, v. 4, Jan. 1958, p. 33-45.

Rate of diffusion leading to homogenization under the action of irradiation in annealed specimens is inversely proportional to the square of the grain size. In a homogeneous specimen (gamma-phase) irradiation causes a change in properties and structure which rapidly (in 2-4 hr.) attains a limiting value, which is explained as being due to radiation annealing. 4 ref. (P10d, 2-67; U-b, *Mo*)

53-P.* Nucleation of Ferromagnetic Domains in Iron Whiskers. R. W. DeBlois and C. P. Bean. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 253-261.

The maximum experimentally obtained coercive force for an iron whisker of 483 oe., with a probable error judged to be about ± 10 oe., is within 15% of the value $2K_1/M_S$ = 560 oe. theoretically predicted for an ideal specimen of iron at 25° C. 13 ref. (P16c; Fe, 14-61)

54-P.* (English.) Construction and Behavior of Constituents in the Molten Slag of the Fundamental System. Rokuro Sakagami and Yukio Matsushita. *University of Tokyo, Institute of Industrial Science*, Report, v. 7, Mar. 1958, p. 180-223.

Measurements of emf. made on K_2O-SiO_2, Na_2O-SiO_2, BaO-SiO_2, CaO-SiO_2, CaO-Al_2O_3-SiO_2, CaO-MgO-Al_2O_3-SiO_2 systems. Composition voltage measured for CaO-SiO_2 and BaO-SiO_2 systems and values of activities derived. Expressions developed giving relationship between decomposition voltage emf. and the activities of CaO and SiO_2. Amphoteric behavior of Al_2O_3, MgO and TiO_2 in multiple slag systems. 43 ref. (P12b, P15, D11n, D11r; RM-q)

55-P. Effect of Increasing the Area of Iron to Zinc on the Rate of Reversal of Potential in a Zinc-Iron System. Henry L. Shuldener and Leo Lehrman. *Corrosion*, v. 14, Dec. 1958, p. 545t-552t.

For the same composition solution, reversal of potential was always faster when the ratio of Fe to Zn area was increased. 7 ref. (P15; Zn, Fe)

56-P. Ferromagnetic Resonance in Iron Whiskers. D. S. Rodbell. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 247-252.

12 ref. (P16; Fe, 14-61)

57-P. (French.) Growth Mechanism of Alpha-Uranium Exposed to Temperature Cycles. S. F. Pugh. Paper from "Symposium on Special Problems in Metallurgy," Presses Universitaires de France, Paris, France, 1958, p. 3-9.

Longitudinal growth of U bars with fine grain thought to be caused by axial dilation

and slip of crystals. 15 ref. (P10d, 2-61; U)

58-P. (Russian.) Electrochemistry of Rare Elements. S. I. Cklyarenko. *Khimicheskaya Nauk i Promyshlenost*, v. 3, no. 4, 1958, p. 455-463.

7 ref. (P16p, 2-61; Ni-b)

77-P. (Translation—Con Bur.) Potentials of Copper, Antimony, Bismuth and Lead in Nitric Acid Solutions. V. V. Tenkovtsev. *Journal of Applied Chemistry of the USSR,* v. 30, 1957, p. 1161-1163.

4 ref. (P15; Cu, Sb, Bi, Pb)

78-P. Irradiation of Prototype CP-4 (EBR-I) Reactor Fuel Slugs in the CP-3' Goat Hole. S. H. Paine, P. J. Persiani and W. F. Murphy. Argonne National Laboratory. *U. S. Atomic Energy Commission,* ANL-5855, Aug. 1958, 24 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Effect of irradiation upon small U^{235} cylinders simulating in size those designed for the initial CP-4 experimental breeder reactor (EBR) fuel loading. Exposures were performed in the graphite reflector in a biological experimental facility known as the "goat hole". Experiments were performed under different conditions of encapsulation and at different fission rates. 5 ref. (P10d, T11g, 2-67; U)

79-P. Burnup and Specific Power Calculations for the Thermal Neutron Irradiation of Thorium-Uranium Alloys. A. L. Bement. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW-56631, Jul. 14, 1958, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Variation in burnup with flux density is essentially linear for the irradiation times investigated. A marked contribution to the burnup by the U^{235} atoms exists. Terms of the burnup equation are developed with reference to the total atom percent burnup as a function of average thermal neutron flux. (P18, 2-67; Th, U)

80-P.* (Italian.) Application of Radioisotopes in Electrochemistry. *Galvanotechnica,* v. 9, Sept. 1958, p. 221-232.

"Tracers" used to clarify phenomena of electrodeposition and other little known aspects of electrochemistry such as polishing, electrolytic protection and corrosion. 36 ref. (P15, 1-59)

81-P.* (Russian.) Solubility of Carbon in Alpha Iron. E. F. Petrova, M. I. Lapshina and L. A. Schwartzman. *Doklady Akademii Nauk SSR,* v. 121, no. 6, 1958, p. 1021-1024.

Carbon concentration and solubility in ferrite in equilibrium with cementite at low temperatures and in equilibrium with gamma iron at higher temperatures. 8 ref. (P12e; C, Fe)

82-P. Preliminary Analysis of Fission-Induced Dimensional Changes in Single Crystals of Uranium. S. H. Paine and J. H. Kittel. Argonne National Laboratory. *U. S. Atomic Energy Commission,* ANL-5676, Oct. 1958, 18 p. (Available from U. S. Office of

Technical Services, Washington 25, D. C.) $ .75.

Irradiation of true single crystals and lineage crystals of U. Following irradiation, crystals became elliptical cylinders with oblique ends, lengthening axially and shortening in the diameter corresponding with the <100> direction. Lineage crystals elongated in the <010> direction at appreciably higher rates than the single crystals. (P10d; 14-61, 2-67, U)

83-P.* (Russian.) Temperature Dependence of Coercive Force of Nickel and Iron-Nickel Alloys. E. Konoorskii and Rosenberg. *Doklady Akademii Nauk SSSR*, v. 120, no. 4, 1958, p. 753-756.

The coercive force of Ni and Fe-Ni alloys depends upon the alloy thickness. The force is increased with reduction in thickness, as shown with heat treated samples. (P16a, 2-61, 2-64; Ni-b, *Fe*)

84-P. (Japanese.) Cooling and Heating by Semiconductors. N. Makino and H. Shidara. *Metals*, v. 28, Nov. 1958, p. 866-870.

Application of Peltier effect using n-p junction as a thermo-electric element. (P15g; EG-j)

85-P.* Effect of Cooling Rate From Ms Temperature to Room Temperature on Magnetic Properties of 3.5% Chromium Magnet Steel. W. L. Hodnapp and E. A. Loria. *American Society for Metals, Transactions*, v. 52, Preprint no. 122, 14 p.

Effect of the alteration of cooling rate from 500° F. to room temperature is associated with retained austenite. The most rapid rate of cooling (water) produces the least amount of austenite, while the slowest rate (furnace) results in the greatest amount of retained austenite according to X-ray determinations. 12 ref. (P16, 2-64, N8n; ST, *Cr*, SGA-n)

86-P.* (German.) Specific Heat of Iron and Nickel. Siegfried Valentiner. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 685-688.

Values found for the range 0° C. to the curie point. 14 ref. (P12r; Fe, Ni)

87-P.* (German.) Calorimetry and Thermodynamics of Bismuth-Tin Alloys. Willy Oelsen and Karl Friedrich Golucke. *Archiv fur das Eisenhuttenwesen*, v. 29, Nov. 1958, p. 689-698.

From calorimetric measurements performed with samples of different composition, the constitutional curve was derived. Formation of solid solutions. 17 ref. (P12, M24b; Bi, *Sn*)

88-P.* Structure and Magnetic Properties of Some Alloys of the Fe-C-Al System. N. Dzheru, P. Iliescu, A. Moroanu and E. Crucianu. *Revue de Metallurgie (Bucharest)*, v. 3, no. 2, 1958, p. 5-18.

About 50 samples were microscopically investigated. The most favorable combination of magnetic properties was obtained by tempering for 1 hr. at 350° C. The results point to the economic value of these alloys as magnetically stable material. By hardening in different media (water, oil), a martensite or austenite structure can be obtained. 5 ref. (P16, M27, 2-64; Fe, Al)

89-P.* An Adiabatic Dropping Calorimeter for Enthalpy Measurements at High Temperatures. Heat Content of Silicon From 1200 to 1550° C. M. Olette. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 18-26.

Copper-block dropping calorimeter. Data on pure Si, with curve of enthalpy versus temperature. 33 ref. (P12r, X24e; Si)

90-P.* Surface Tension of Pure Liquid Iron, Cobalt, and Nickel at 1550° C. P. P. Kozakevitch and G. Urbain. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 27-34.

Measured by the sessile-drop method. By control of the atmosphere (partial pressure of oxygen less than 10^{-15} atm.), and use of pure oxide refractories, it was possible to obtain less than 0.001% dissolved oxygen in the drop. "Capillary constant" was found. 18 ref. (P13h; Fe, Co, Ni, 14-60)

91-P.* Equilibrium of Carbon and Oxygen in Molten Iron Saturated With Carbon. Pt. 2. Effect of Silicon in the Range of 0 to 5.20%. Paper from "Physical Chemistry of Steelmaking". Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 42-45.

Effect of Si content on solubility and on activity coefficient of C in Fe. Oxygen content and activity coefficient of O_2. 7 ref. (P12d, P12b, D11h; Fe, *C, O, Si*)

92-P.* Thermic Coefficient of Resistivity of Tin in Thin Layers. Mircea Oncescu.

Revue de Physique, v. 3, no. 1, 1958, p. 71-76.

Temperature coefficient of resistivity measured at 77 and 293° K. Experimental procedures, results. 9 ref. (P15g, Sn, 14-62)

93-P.* Alpha-Particle Irradiation of Ge at 4.2° K. G. W. Gobeli. *Physical Review*, v. 112, Nov. 1, 1958, p. 732-739.

Degenerate n-type and p-type Ge samples were irradiated with polonium alpha-particles. Thermal recovery was studied up to 78° K. Experiments with various annealing procedures, using electrical resistivity as a measure, indicated that there were two distinct regions of thermal recovery, with maximum rates of change occurring near 33 and 67° K. (P15p; Ge, 2-63, 2-67)

94-P.* Fundamental Absorption Edge in Cadmium Sulfide. David Dutton. *Physical Review*, v. 112, Nov. 1, 1958, p. 785-792.

Absorption and reflection spectra of CdS in temperature range 90-340° K. as determined by photo-electric measurements on single crystals using polarized light. Equations for temperature and frequency dependence of the absorption coefficient in the edge over a substantial range of absorption magnitudes. (P17; Cd, *S*, 14-68, 14-61)

95-P.* High-Vacuum Studies on Surface Recombination Velocity for Germanium. H. H. Madden and H. E. Farnsworth. *Physical Review*, v. 112, Nov. 1, 1958, p. 793-800.

Values of mean lifetime obtained by decay-of-photoconductivity method and corresponding values of surface recombination velocity determined from geometrical considerations. The recombination velocity of clean and annealed (100) Ge surfaces was insensitive to room-temperature absorption of 0 at pressures as high as 5×10^{-8} mm. Hg. (P15g, 1-73; Ge)

96-P.* Magnetoresistance in PbS, PbSe and PbTe at 295, 77.4 and 4.2° K. Robert S. Allgaier. *Physical Review*, v. 112, Nov. 1, 1958, p. 828-836.

The longitudinal magnetoresistance was generally larger (4 to 5 times in some cases) then the transverse at both 77.4 and 4.2° K. Results did not appear to be significantly different for n-type and p-type material. Data favor a model with considerable mass anisotropy (prolate allipsoids). (P16; Pb-b, *S*, *Se*, *Te*, 14-68)

97-P.* Preparation and Electrical Properties of Mercury Telluride. T. C. Harman, M. J. Logan and H. L. Goering. *Physics and Chemistry of Solids*, v. 7, Nov. 1958, p. 228-235.

HgTe was prepared by direct reaction of Hg vapor with liquid Te. The compound was zone melted and annealed in Hg vapor under various pressures. The composition near stoichiometry was altered by the anneal Hall coefficient and resistivity as a function of temperature. 8 ref. (P15p; Hg, Te, 14-68)

98-P.* Thermodynamics of the Au-Pt System. R. J. Weiss and K. J. Tauer. *Physics and Chemistry of Solids*, v. 7, Nov. 1958, p. 249-251.

The electronic, lattice and mixing free energies are separated for the Au-Pt system and it is shown that the asymmetric segregation in this system can be ascribed to the filling of the d band at about 30% Au. 7 ref. (P12a, M24b; Au, Pt)

99-P.* Electrical Resistivity and Superconductivity of Some Uranium Alloys and Compounds. B. S. Chandrasekhar and J. K. Hulm. *Physics and Chemistry of Solids*, v. 7, Nov. 1958, p. 259-267.

A series of alpha (orthorhombic) and quenched gamma (body-centered cubic) binary alloys of U with Cb and Mo were investigated at temperatures down to 1° K. The gamma alloys are particularly unusual in possessing a negative temperature coefficient from room temperature down to the superconducting transition point. Both systems exhibit superconducting transitions, the gamma alloys in the vicinity of 2° K. and the alpha alloys closer to 1° K. 34 ref (P15g; U-b)

100-P.* Heat Capacity of Dilute Magnesium-Aluminum Alloys Below 4.2° K. John Rayne. *Physics and Chemistry of Solids*, v. 7, Nov. 1958, p. 268-274.

Resulting variation of the electronic term with solute concentration suggests that a new overlap across the Brillouin zone is initiated at an electron concentration of about 2.02. No abrupt change of the Debye temperature with solute concentration is observed. 18 ref. (P12r, 2-63; Mg-b, *Al*)

101-P.* Thermodynamics and Properties of Liquid Solutions. O. J. Kleppa. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 56-86.

Application of thermodynamic theory to study of liquid metal systems. Experimental method of deriving thermodynamic information including phase equilibrium, chemical equilibrium and calorimetric methods. Data on heat of mixing and excess entropy of various binary solutions. 35 ref. (P12, 14-60)

102-P.* Thermal Considerations in Freezing. C. M. Adams, Jr. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 187-217.

Derivation of equations for heat flow during solidification of a pure metal from a plane, from a cylindrical and from a spherical chill surface. Expressions of freezing rates and times for spheres and cylinders. Total heat removal during solidification of chill castings; effect of superheat. Equations expressing heat conduction in mold-metal systems for plain mold wall with perfect thermal contact between metal and mold. Effect of thermal contact resistance between metal and mold. Heat flow during solidification of cast alloys which freeze over wide temperature range. 21 ref. (P11, P12, N12; ST, Al-a)

103-P.* (English.) Calorimetric Measurements on the Structural Energy of an Annealed Metal of High Purity. H. U. Astrom. *Arkiv for Fysik*, v. 14, no. 3, 1958, p. 263-275.

Isothermal micro-calorimetric method applied to Ag. Increasing temperature leads to an isothermal absorption of energy, which becomes larger with increasing grain size and purity of the metal. (P12; Ag)

104-P.* (French.) Effect of Impurities of the First Long Period on the Resistivity of Copper and Aluminum. C. R. Vassel. *Physics and Chemistry of Solids*, v. 7, Oct. 1958, p. 90-93.

Residual resistivity of K, Ca, Ti, V, Cr, Mn, Fe, Co, Ni, Zn, Ga, As and Se in Cu; and of Ca, Ti, Cr, Mn, Fe, Cu and Zn in Al. 14 ref. (P15g, 3-69; Cu, Al, *K, Ca, Ti, V, Cr, Mn, Fe, Co, Ni, Zn, Ga, As, Se*)

105-P.* (Rumanian.) Semiconductor Properties of Resistance Alloys. T. Dulamita, D. Drimer and E. Fokt. *Studii si Cercetari de Metalurgie*, v. 3, no. 2, 1958, p. 151-160.

The resistance of Ni alloy wires was tested under a vacuum at different temperatures. A decrease in conductivity followed by an increase while the temperature is gradually raised is thought to reveal semiconductor characteristics. 6 ref. (P15g, 2-60, 2-61; Ni-b, *Cr, Cu*)

106-P. Photoconductive Response of Single Crystal Germanium Layers Prepared by the Pyrolytic Decomposition of GeI_2. Donald C. Cronemeyer. *Journal of Applied Physics*, v. 29, Dec. 1958, p. 1730-1735.

(P15g; 14-61, Ge)

107-P. Theoretical Calculation of Distribution Coefficients of Impurities in Germanium and Silicon, Heats of Solid Solution. Kurt Weiser. *Physics and Chemistry of Solids*, v. 7, Nov. 1958, p. 118-126.

The crystalline impurity was chosen as the reference state, and the change in enthalpy and entropy was estimated for the transfer of impurity atoms to the solid and the molten host substance, respectively. 16 ref. (P12; Ge, Si, 3-69)

108-P. (French.) Temperature Spectra and Their Use. Maria Bolgiu. *Revue de Metallurgie (Bucharest)*, v. 3, no. 2, 1958, p. 113-121.

Differential thermal analyses under vacuum are proposed to interpret a whole series of obscure phenomena. Certain mechanical properties of iron and steels may result not only from transformations of the crystalline lattices, but also from those caused by transformations in the energy state of the atoms. 6 ref. (P17; Fe)

109-P.* Characteristic Temperature of Silver From X-Ray Reflections. J. Boskovits, M. Roilos, A. Theodossiou and K. Alexopoulous, *Acta Crystallographica*, v. 11, Dec. 10, 1958, p. 845-847.

The integrated intensity of diffraction lines (111 and (422) from a Ag wire was measured at six different temperatures between 81 and 774° K, which were determined from the angular shift of diffraction line (422). By applying the formula of the usual Debye theory to each neighboring pair of temperatures a value was obtained for the middle of the temperature interval. (P12r, M22g; Ag)

110-P.* Influence of Method of Demagnetization on the Reversible Permeability of a High-Permeability Nickel-Iron Alloy. R. C. Jackson, E. W. Lee and A. G. H. Troughton. *British Journal of Applied Physics*, v. 9, Dec. 1958, p. 495-497.

Measurement of the reverse permeability shows that its dependence upon biasing field depends on method of demagnetization used. Results explained in terms of

residual magnetization, some specimens possessing residual magnetization even after a high-temperature anneal. 4 ref. (P16q; Ni-b, *Fe*)

111-P.* Temperature Dependence of the Characteristic Energy Loss of Electrons in Aluminum. Lewis B. Leder and L. Marton. *Physical Review*, v. 112, Oct. 15, 1958, p. 341-343.

Above room temperature the energy loss change agrees with the change expected due to decreased electron density resulting from expansion of the lattice. Below room temperature the energy loss change is much greater than expected on the above basis. 9 ref. (P12, 2-61; Al)

112-P.* Hall Effect, Magnetoresistance, and Size Effects in Copper. Ted G. Berlincourt. *Physical Review*, v. 113, Oct. 15, 1 1958, p. 381-387.

Measurements of the Hall Coefficient of several annealed polycrystalline Cu strips of resistivity ratio and thicknesses ranging from 0.05 to 1.6 mm have revealed the existence of a marked size effect at low temperature. 30 ref. (P15p, P16, 2-63, 3-73; Cu)

113-P.* (Russian.) Solubility of Magnesium, Zinc, Tin and Iron in Hydrochloric Acid. A. G. Loshkarev. *Zhurnal Prikladnoi Khimii*, v. 31, Oct. 1958, p. 1493-1497.

Solubility rate is limited to the solvent's rate of diffusion into the metal surface. Rate solubility of Zn and Fe in HCl is limited to the rate of electrolysis. (P12e, Nl; Fe, Mg, Sn)

114-P.* (Russian.) Anodic Polarization of Zinc in Sulphuric Acid. G. P. Maitak. *Zhurnal Prikladnoi Khimii*, v. 31, Oct. 1958, p. 1504-1511.

Anodic passivation and electrochemical polishing takes place. Passivation is unstable and increases with increase of acid concentration. (P15, R10c, Zn)

115-P.* Measurement of Surface Recombination Velocity of Silicon. A. H. Benny and F. D. Morten. *Physical Society, Proceedings*, v. 72, Dec. 1, 1958, p. 1007-1012.

Measurement of filaments spectral distribution of photoconductivity. Velocity is function of carrier concentration at the surface. 10 ref. (P15g; Si)

116-P.* The Change of Spontaneous Magnetization With Hydrostatic Pressure. D. Gugan. *Physical Society, Proceedings*, v. 72, Dec. 1, 1958, p. 1013-1026.

Measurements of Ni and its alloys and Co by disk permeameter producing high magnetic fields. Verifies thermodynamic relation obtained on Ni-Fe system. 24 ref. (P16, 2-74; Ni, *Fe*, Co)

117-P.* Saturation Magnetostriction of Ni Crystals at Low Temperature. W. D. Corner and F. Hutchinson. *Physical Society, Proceedings*, v. 72, Dec. 1, 1958, p. 1049-1052.

Measured at 20-500° K. by capacitance bridge method. Curves allow extrapolation to absolute zero. (P16; Ni, 2-62)

118-P. Free-Carrier Absorption in n-Type Ge. Robert Rosenberg and Melvin Lax. *Physical Review*, v. 112, Nov. 1, 1958, p. 843-852.

(P15; Ge)

119-P.* Grid Emitting Properties of Titanium. J. A. Champion. *British Journal of Applied Physics*, v. 9, Dec. 1958, p. 491-495.

Emission from thin films of Ba and Ba oxide deposited on Ti compared with similar films on W. Emission from Ti much lower than from W in the range 700-1000° C. Concludes that Ti would have good grid emission supression properties in this range. 5 ref. (P15k, Ti, Ba, 14-62)

120-P.* Influence of the Method of Demagnetization on the Reversible Permeability of a High-Permeability Nickel-Iron Alloy. R. C. Jackson, E. W. Lee and A. G. H. Troughton. *British Journal of Applied Physics*, v. 9, Dec. 1958, p. 495-497.

Measurement of the reversible permeability shows that its dependence upon biasing field depends upon the method of demagnetization used. 4 ref. (P16q; Ni-b, *Fe, Cu, Mo*)

121-P.* Magnetoresistance and Fermi Surface of Alkali Metals. F. Garcia-Moliner. *Physical Society, Proceedings*, v. 72, Dec. 1958, p. 996-1000.

Anisotropy of Fermi surface estimated by magnetoresistance effects in low fields of Na, Rb, K, Cs, Li. 14 ref. (P16; Na, Rb, K, Cs, Li, 3-72)

122-P. (Translation-AIP.) Effect of Iodine on the Electric and Photoelectric Properties of Se. D. M. Nasledov and B. V. Sokolov. *Soviet Physics, Technical Physics*, v. 3, no. 4, 1958, p. 660-668.

Small additions of I inhibit crystallization of amorphous Se and lower its activation energy. Concentrations of I greater

than 0.2% have opposite effect. 9 ref. (P15k, N12; Se, *I*, 3-69)

123-P. (Translation—AIP.) Electric and Thermoelectric Properties of AlSb. D. N. Nasledov and S. V. Slobodchikov. *Soviet Physics, Yechnical Physics*, v. 3, no. 4, 1958, p. 669-676.

Electrical conductivity, Hall effect, thermal emf. at 78-1250° K. 6 ref. (P15; Al, Sb, 14-68)

124-P. (Translation—AIP.) Retardation of Electrons in Some Metals and Semiconductors. A. Ia. Viatskin and A. F. Makhov. *Soviet Physics, Technical Physics*, v. 3, no. 4, 1958, p. 690-696.

Range of electrons, equal to film thickness; dependence of current passing through film upon incident electrons, energy for Ge, Cu, Si, Bi. 9 ref. (P15k; Ge, Cu, Si, Bi, 14-62)

125-P. (Translation—AIP.) Electric and Magnetic Properties of the System ZnSb-CdSb. I. M. Pilat, L. D. Chizh and S. Iu. Voityshen. *Soviet Physics, Technical Physics*, v. 3, no. 4, 1958, p. 734-735.

Dependence of electrical conductivity and activation energy, mobility isotherms and dependence of magnetic susceptibility and thermal emf. on composition. (P15, P16, M24c; Zn, Sb, Cd, 14-68)

126-P. (Translation—Columbia.) Changes in the Structure and Properties of Nickel Solid Solutions During Heat Treatment. B. G. Livshits. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 9, 1957, p. 1216-1222.

Measurement of resistance, expansion, hardness and saturation magnetization in Nichrome, Mo Permalloy and Invar alloyed with Mo. 6 ref. (P15, P16; 2-64, Ni-b, *Mo*)

127-P. (Translation—Columbia.) Decay of Magnetic Permeability in Silicon Iron. Iu. S. Vail'. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 9, 1957, p. 1268-1274. (P16q; Fe, *Si*)

128-P. (Translation—Columbia.) Magnetic Moments and Curie Constants of Ferromagnetic Alloys. F. M. Gal'perin. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 9, 1957, p. 1308-1311.

Properties of Fe-Cr and Fe-Ni alloys. (P16; Fe-b, *Ni, Cr*)

129-P. (Translation—Columbia.) Investigation of the Magnetic Susceptibility of Iron and Nickel-Base Solid Solutions. V. V. Parfenov. *Academy of Sciences of the USSR, Bulletin*, v. 21, (1957), p. 1312-1318. (P16n; Fe, Ni, 14-67)

130-P.* Electrical Resistivities of Some Semiconductors at High Pressures. S. D. Hamann. *Australian Journal of Chemistry*, v. 11, Nov. 1958, p. 391-398.

Resistivities of B, I, TiS_2, $TiSe_2$, ZrS_2, ZrS_3, $ZrSe_2$ and $ZrTe_3$ measured at room temperature under static pressures between 1 and 40,000 atm. In every instance the resistivity decreased with increasing pressure but the change was never great enough to render the materials metallic. 20 ref. (P15; B, I, Ti, Zr, *S, Se, Te*, 14-68)

131-P.* The Sulphides, Selenides and Tellurides of Titanium, Zirconium, Hafnium and Thorium. Pt. 2. Chemical Properties. Joy Bear and F. K. McTaggart. *Australian Journal of Chemistry*, v. 11, Nov. 1958, p. 458-470.

Reactions of the main phase of these systems include those with O, Cl, alkali metals, S and Se, acids, alkalis, oxidizing agents, alcohols, H and thermal degradation in a vacuum. A number of heats of formation are given. 20 ref. (P12, M24b; Ti, Zr, Hf, Th, *S, Se, Te*, 14-68)

132-P.* The Sulphides, Selenides and Tellurides of Titanium, Zirconium, Hafnium and Thorium. Pt. 3. Electrical Properties. F. K. McTaggart. *Australian Journal of Chemistry*, v. 11, Nov. 1958, p. 471-480.

Resistivities, types of conduction (metallic N or P semiconduction), thermoelectric power and rectifying properties of each of the phases now known to exist in the 12 systems. 4 ref. (P15, M24b; Ti, Zr, Hf, Th, *S, Se, Te*, 14-68)

133-P.* Secondary Positive Ion Emission From Metal Surfaces. Richard C. Bradley. *Journal of Applied Physics*, v. 30, Jan. 1959, p. 1-8.

Emission from surfaces of Mo, Ta and Pt under bombardment by inert gas ions of low energy in high vacuum. Ion species characteristic of the base metal, of surface compounds and of a few bulk impurities were found. Method can be applied to investigation of sputtering, surface and bulk compositions and surface kinetics. (P17d; Mo, Ta, Pt)

134-P.* (French.) Physical Properties of Gallium Monocrystals Near the Melting Point. Ch. 4. Effect of Temperature on

Electrical Resistance. Marc Erny. *Metaux-Corrosion-Industries*, v. 33, July-Aug. 1958, p. 305-323.

Resistance was measured in range of 15 to 29.75° C. Above 27° C. resistance ceases to be linear function of temperature. (To be continued.) (P15g, 2-61; Ga, 14-61)

135-P.* (Russian.) Temperature Stabilization of Magnetic Properties of Permalloy. I. M. Puzei. *Doklady Akademii Nauk SSSR*, v. 120, no. 4, 1958, p. 768-770.

First constant of anisotropy at room temperature and nitrogen temperature of -195.86 show that from 480 to 530° and higher, constants have a normal temperature dependence intrinsic to pure metals. That is, with lowering temperature the absolute value of anisotropy increases. (P16, 2-61; Ni-b)

136-P.* (Russian.) Effect of Pressure on Solubility of Hydrogen in Columbium and Tantalum. P. S. Permivov. *Doklady Akademii Nauk SSSR*, v. 121, no. 6, 1958, p. 1041-1042.

Study of Ta-H and Cb-H, in which H concentration reaches value close to atomic relation 1:1., at 620-680°. Chemically pure powder of Ta and Cb, 0.1 mm. in size, used. In both systems the increase of pressure above atmospheric leads at first to sharp rise in solubility and then a continuing slower logarithmic rise. 5 ref. (P12e; Cb, Ta, *H*)

137-P.* (Russian.) Study of Cation Adsorption on Platinum Platinate by Measuring Adsorption Potentials. A. D. Obrucheva. *Doklady Akademii Nauk SSSR*, v. 120, no. 5, 1958, p. 1072-1075.

Specific adsorption of anions of chlorine, bromine and iodine and cations of thallium on platinated Pt electrodes. (P15; Pt, Tl)

138-P.* (Russian.) Dissolution of Sheet Steel in Different Fluxes Used in Tinning. A. I. Vitkin. *Zhurnal Prikladnoi Khimii*, v. 31, Oct. 1958, p. 1607-1608.

Contamination of Sn baths by Fe caused by the penetration of Fe into the flux. (P12e, L16; ST, Sn, RM-q)

139-P.* (Russian.) Adsorption of Bromine and Iodine Ions on Platinum. N. A. Balashova. *Zhurnal Fizicheskoi Khimii*, v. 32, Oct. 1958, p. 2266-2273.

Adsorption of both ions depends upon the potential in correspondence with the charge on Pt surface, but the amount of ions adsorbed is, in all cases, above that necessary for the building up of an electrical double layer. (P15, 2-61; Pt, Br, I)

140-P.* (Russian.) Effect of Addition Agents on Electrical Properties of Gallium Arsenide. S. K. Averkieva and O. V. Emar'yarhehko. *Zhurnal Teknicheskoi Fiziki*, v. 28, no. 9, 1958, p. 1945-1947.

In group II, Zn and Cd act in GaAs as acceptors; in Group VI, S, Se, Te as donors as in other $A^{III}B^{V}$ compounds. Copper acts as acceptor; in group III-V In, Si, Ge, Sn and Sb do not form electrically active centers in GaAs. 4 ref. (P15g; Ga-b, As, EG-j, AD-q41)

141-P.* (Ukrainian.) Intensity of Magnetization of Two-Components Cermets. A. I. Raichenko and I. M. Fedorchenko. *Dopovidi Akademii Nauk Ukrain'skoi RSR*, no. 8, 1958, p. 835-837.

Estimating the intrinsic saturation induction of cermets composed of metals of complete mutual solubility. Calculation may be carried out for alloy of arbitrary average concentration and for any degree of sintering. The distribution of magnetization by concentration at the given degree of sintering. (P16, 6-70)

142-P. Crystallographic and Magnetic Properties of Several Spinels Containing Trivalent JA-1044 Manganese. D. G. Wickham and W. J. Croft. *Physics and Chemistry of Solids*, v. 7, Dec. 1958, p. 351-360.

18 ref. (P16, M26, M24c; Mn, Zn, Ge, Co)

143-P. (Russian.) Adsorption of Hydrogen Upon Nickel, Platinum, Iron, Chromium and Other Metals. N. N. Kaftaradze. *Izvestiya Akademii Nauk, SSSR*, Sept. 1958, p. 1045-1053.

146-P. (Russian.) Determination of Solubility of Hydrogen in Magnesium and Magnesium Alloys. M. V. Sharov and V. V. Serebryakov. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1226-1228.

Apparatus for saturating of Mg with H. Results of two methods of determining the percentage of H in different Mg alloys. (P12e; *H*, Mg)

147-P. (Russian.) Effect of Plastic Deformation Upon Anomalous Behavior. Electric Resistance of Gold at Low Temperature. N. E. Alekseevskii and Yu. P. Gaidukov. *Zhurnal Experimental'noi i Teoreticheskoi Fiziki*, v. 35, Sept. 1958, p. 804-808. (P15g, 2-63, 3-68)

148-P. (Russian.) Germanium With Aluminum Additions. S. G. Kalashnikov and K. P. Tissen. *Zhurnal Tekhnicheskoi Fiziki*, v. 28, no. 9, 1958, p. 1890-1895.

Al is good alloying element for obtaining Fe with high electric conductivity and long electrode life. 15 ref. (P15g; Ge-b, Al, EG-j)

149-P. (Russian.) Electron Reflections and Secondary Electron Emissions From Metallic Surfaces in the Region of Primary Electrons With Low Energy. I. M. Bronshtein and V. V. Roshin. *Zhurnal Tekhnicheskoi Fiziki*, v. 28, Oct. 1958, p. 2200-2208. (P15k, P15n)

150-P. (Russian.) Theory of Ion-Electron Emissions From Metals. Pt. 1. S. V. Izmailov. *Zhurnal Tekhnicheskoi Fiziki*, v. 28, no. 10, 1958, p. 2209-2216. (P15k)

151-P.* The Electrical Resistance of Oxide Films on Zirconium in Relation to Corrosion. R. D. Misch and F. H. Gunzel, Jr. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 15-20.

Conductivity of anodic and corrosion films of Zr increased during heating in vacuum. Changes in conductivity were attributed to the diffusion of anion vacancies into the oxide. Corrosion films produced in water at 350° C. appeared to have higher coefficients. Zircaloy-1 and Zircaloy-2 had the highest corrosion rates and diffusivities, as judged by the conductivity changes. 14 ref. (P15g, R-general; Zr-b)

152-P.* Magnetic and Electrical Anisotropies of Iron Sulfide Single Crystals. Eiji Hirahara and Miuki Murakami. *Physics and Chemistry of Solids*, v. 7, Dec. 1958, p. 281-289.

Direction of the antiferromagnetic spins is parallel c-axis of the crystal below T_{alpha} (temperature of alpha-transformation) and perpendicular to the c-axis above T_{alpha}. Behavior of the spin orientation in the temperature range between T_{alpha} and Tn (the Neel temperature) clarified. 23 ref. (P15, P16, 3-72; Fe, S, 14-61)

153-P.* (German.) Vapor-Pressure of the Compounds InAs, GaAs, InP and GaP. O. G. Folberth. *Physics and Chemistry of Solids*, v. 7, Dec. 1958, p. 295-300.

Method consists of freezing melt in equilibrium with vapor phase. Vapor-pressure calculated from the amount of high-volatility component in the vapor phase during freezing process. 18 ref. (P12c; In, Ga, As, P, 14-68)

154-P.* Neutron-Irradiation Effects on Copper-Aluminum Alloys. M. S. Wechsler and R. H. Kernohan. *Physics and Chemistry of Solids*, v. 7, Dec. 1958, p. 307-326.

Solid-state reaction that causes a decrease in electrical resistivity is accelerated by irradiation at 32-45° C. Effect is absent in pure Cu and increases with Al content. When conducted at -120° C. no decrease in resistivity is observed. 44 ref. (P15q, 2-67; Cu-b, *Al*)

155-P.* (Russian.) Magnetic Structure and Processes of Magnetization of Magnetites. Ya. Shur. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya*, v. 22, no. 10, 1958, p. 1177-1180.

Magnetic properties of iron magnetites regularly change with their magnetic structures. As the size of the magnetite (Fe_3O_4) is decreased, the form of its magnetic structure is simplified and magnetization process becomes more difficult. (P16; Fe, O)

156-P.* (Russian.) Magnetostriction of Nickel-Iron-Molybdenum Alloy. I. M. Pyzei and B. V. Molotilov. *Izvestiya Akademii Nauk, SSSR, Seriya Fizicheskaya*, v. 22, no. 10, 1958, p. 1244-1250.

Temperature relation of magnetostriction saturation of polycrystalline alloys at various hardening and annealing temperatures. (P16b, 2-60, 2-64; Ni-b, Fe, Mo)

157-P.* (Russian.) Magnetostriction Properties of Binary Alloys. G. P. D'yakov.

Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, v. 22, no. 10, 1958, p. 1254-1258.

Study of magnetostriction constants and characteristics of magnetostriction in monocrystal system Fe-Ni. (P16b; Fe-b, *Ni*)

158-P.* (Russian.) Anisotropy of Coercive Force in Magneto-Anisotropical Samples Made From Fine Powders. E. B. Shtol'ts, Ya. S. Shur and G. S. Kandayrova. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya,* v. 22, no. 10, 1958, p. 1269-1272.

Coercive force of magneto-monoaxial powders of the following: Co, Mn-Bi, magnetite and gamma oxide of iron. With change of particle size there is no change in the properties of the coercive force. Anisotropy of coercive force in magneto-anisotropical iron-magnetites is indicative as to type of magnetic structure. (P16; Co, Mn-b, *Bi,* Fe, *O,* 6-68)

159-P.* (Russian.) Rate of Dissolution and Zinc Amalgam in Hydrochloric Acid. S. A. Nikolaeva. *Zhurnal Fizicheskoi Khimii,* v. 32, Oct. 1958, p. 2257-2261.

Stirring affects both dissolution and steady state potential of the amalgam. Addition of $ZnCl_2$ shifted the potential to the positive, lowering the dissolution rate; addition of KCl lead to the negative shift, increasing the rate. (P12e; Zn-b, *Hg*)

160-P.* (Russian.) Effect of the Components of an Oxide Melt on Its Interfacial Tension With Iron. S. I. Popel. *Zhurnal Fizicheskoi Khimii,* v. 32, Oct. 1958, p. 2398-2402.

In case of $CaO-SiO_2-Al_2O_3$ melts, tension is high and slightly increases on substituting SiO_2 for calcium and aluminum oxides. Enrichment of the oxide phase in ferrous oxide is accompanied by a large decrease in the interfacial tension. (P13h, D11n)

161-P.* (Russian.) Cathodic Polarization in Slag Containing Titanium. V. I. Musikhin and O. A. Esin. *Zhurnal Fizicheskoi Khimii,* v. 32, Oct. 1958, p. 2410-2414.

Polarization accompanying the complete and partial reduction of Ti ions in melts of $CaO-MgO-Al_2O_3-B_2O_3-TiO_2$. (P17g, N1, 2-60, 2-61; Fe, Ti, RM-q)

162-P.* (Russian.) Activation Energy of Various Processes in Solid Metals. K. A. Osipov. *Doklady Akademii Nauk SSSR,* v. 121, no. 4, 1958, p. 637-639.

Activation energy in self-diffusion, crystal growth and recrystallization, plastic deformation, failure and dislocation shifts. (P13a)

163-P.* (Russian.) Determination of Surface Tension in Iron Group. V. N. Eremenko, Yu. N, Ivashchenko, V. I. Nizhenko and V. V. Fesenko. *Izvestiya Akademii Nauk SSSR,* July 1958, p. 144-146.

Ni tested at 1520-1470°; Co at 1500-1520° and Fe at 1650°. (P13h; Co, Fe, Ni)

164-P.* (Russian.) Magnetic Structure Changes in Silicon Iron Crystals Under Elastic Stress. V. A. Azikova and Ya. S. Shur. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya,* v. 22, no. 10, 1958, p. 1185-1189.

Changes consist of replaced boundaries, change in type of magnetic structure, change in form of magnetic structure. Changes are irreversible. (P16, 3-66; Fe-b, Si)

165-P.* (Russian.) Magnetic Structures of Residual Magnetized Magnetite and Changes During Demagnetization With Alternating Pole. I. E. Startseva and Ya. S. Shur. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya,* v. 22, no. 10, 1958, p. 1189-1193.

Form of magnetic structure in state of residual magnetization depends upon crystallographic surface orientation and pole orientation of preliminary magnetized sample in relation to crystallographic axis. (P16; Fe, O, RM-q)

166-P.* (Russian.) Stabilizing Temperature of Magnetic Properties in Alloys. I. M. Puzei. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya,* v. 22, no. 10, 1958, p. 1194-1199.

In some temperature ranges there is detected a reversed process in the constant of the anisotropic system Fe-Co-Ni. (P16, 2-61; Fe-b, *Co, Ni*)

167-P.* (Russian.) Effect of Thermomagnetic Treatment of Magnetically Weak Magnetite. A. I. Glaser and Ya. S. Shur. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya,* v. 22, no. 10, 1958, p. 1205-1211.

Electromagnetic effect of temperature relation in saturated magnetization. Kinetics of thermodynamic treatment of alloys. (P16; Fe, O, RM-q)

168-P.* (Russian.) Investigation of Kinetics in Determining Magnetic Structure of 65% Permalloy. SH. I. Zusman. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya,* v. 22, no. 10, 1958, p. 1212-1216.

Kinetic changes of magnetic properties during low-temperature treatment; relationship between processes bringing about formation of rectangular and deformed hysteresis loops. (P16a; Ni-b, *Fe*)

169-P.* (Russian.) Determining Concentration Distributions of Powdered Alloys. A. I. Raichenko. *Ukrainskii Phizichenii Zhurnal Akademii Nauk, Ukrainskii RSR*, v. 3, no. 3, 1958, p. 407-417.

Concentration distribution functions in powdered alloy, prepared from two metals with unrestricted mutual solubility at various degree of mutual diffusion in a solid state. Study of Co-Ni powders at various rates of sintering showed a non-ideal blending and porosity leading to retardation of the homogenation process, contrary to theoretical expectations. (P12e, H15; Co, Ni)

170-P.* (Ukrainian.) Magnetic Susceptibility of Solid Solutions of Some Metal-Like Compounds. G. V. Samsonov, V. S. Neshor and N. S. Strel'nikova. *Dopovidi Akademii Nauk Ukrain'skoi RSR*, no. 8, 1958, p. 838-840.

Magnetic susceptibility of solid solutions CbC-ZrC, AgC-CbC, TaB_2-ZnB_2 and Ti, C-T and N. (P16; C, B, N, Cb, Ag, Ta, Ti, Zn, Zr, 14-67)

171-P.* (Ukrainian.) Viscosity of a Tin-Bismuth System. A. Z. Golik, N. A. Runoich and S. A. Babenko. *Ukrainskii Phizichnii Zhurnal Akademii Nauk, Ukrainskoi RSR*, v. 3, no. 3, 1958, p. 365-369.

Coefficient of dynamic viscosity investigated for solutions containing 25, 42 and 69% by weight of Sn in Bi, at a temperature ranging from melting point to 350° C. (P10f; Bi-a, *Sn*)

172-P.* Exchange Between Metals and Their Ions in Solution. Cecil V. King and Nancy E. McKinney. *Canadian Journal of Chemistry*, v. 37, 1959, p. 205-212.

Mechanisms by which a metal specimen can acquire radioactivity when immersed in a tracer solution of its own ions. Influence of exchange current, adsorption, local cell electrolysis, corrosion and self-diffusion within the metal. 14 ref. (P15, N1, 1-59; Ag)

173-P.* Cathodic Polarization of Silver in Sulphuric Acid. A. A. Antoniou and F. E. W. Wetmore. *Canadian Journal of Chemistry*, v. 37, 1959, p. 222-227.

H overpotential on fine Ag cathodes determined from 2 to 35°. Two distinct Tafel slopes were observed. A rise exists in the low current slope as the electrode is worked and this change may be related to the surface condition. 5 ref. (P15; Ag)

174-P.* Effects of Certain Chemical Treatments and Ambient Atmospheres on Surface Properties of Silicon. T. M. Buck and F. S. McKim. *Electrochemical Society, Journal*, v. 105, Dec. 1958, p. 709-722.

Measurements of surface conductance, recombination velocity and field effect on n and p-type Si specimens. Low recombination velocity occurred when the surface was strongly p-type, after treatments in boiling de-ionized water and sodium dichromate solution, or when the surface was strongly n-type, after treatment in concentrated hydrofluoric acid. Chemical treatments have stronger effects than atmosphere in determining surface potential. 21 ref. (P15g; Si)

175-P.* Some Semiconducting Properties of HgTe. J. Black, A. M. Ku and M. T. Minden. *Electrochemical Society, Journal*, v. 105, Dec. 1958, p. 723-728.

HgTe synthesized and single crystals prepared both in horizontal capsule and by the Bridgman technique. Hall coefficient and resistivity measured as a function of temperature and magnetic field. HgTe has high carrier mobilities characteristic of low energy gap compared semiconductors. All HgTe synthesized was p-type. 12 ref. (P15g; Hg, Te, 14-68, 14-61)

176-P.* Electron Mobility in InP. M. Glisksman and K. Weiser. *Electrochemical Society, Journal*, v. 105, Dec. 1958, p. 728-731.

Hall mobility of electrons in InP observed as a function of temperature and carrier concentration. Electrons in InP have a small effective mass, while the lowest conduction band is spherically symmetric. 12 ref. (P15; In, P, NM-a37, 14-61)

177-P.* Vapor Pressure of Niobium. Rudolph Speiser, P. Blackburn and H. L. Johnston. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 52-53.

Langmuir method used with an accomodation coefficient of unity assumed. Measurements of rate at which a Cb surface sublimed into a high vacuum. Equation for the heat of sublimation at absolute zero. (P12c; Cb)

178-P.* (Russian.) Temperature Dependence of Magnetic Properties in Highly Coercive Alloys. I. A. Baranova and Ya. S. Shur. *Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya,* v. 22, no. 10, 1958, p. 1273-1275.

Temperature effect on basic magnetic characteristics of magneto-anisotropic highly coercive alloys-Alnico and Vicalloy. (P16, 2-61; Fe, Co, SGA-n)

179-P.* (French.) Geometric Study of Adsorption on Some Crystallographic Faces. Interpretation of the Two Adsorptions of Hydrogen on Bare Metal Surfaces. J. C. P. Mignolet. *Sociétés Chimiques Belges, Bulletin,* July-Aug. 1958, p. 358-372.

It is suggested that on base metal surfaces H atoms are adsorbed over deepest regions of periodic surface (sites b or d). Negative adsorption is adsorption of one H atom per metal atom. For some faces there are two sites per metal atom. A second H atom may then be adsorbed, but it inevitably interacts with pre-absorbed neighbors. This interaction involves partial lateral bonding between H atoms, together with a loosening of ions holding pre-adsorbed atoms to the surface. Application of these ideas in field of adsorption and catalysis briefly analyzed. 17 ref. (P13d, P13c, *H*)

180-P.* (Russian.) Clarification of Transverse Electric Thermomagnetic Phenomenon in Ferromagnetics by Means of Metal Exchange Force Data. N. P. Patrakhin. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 15-22.

A mathematical attempt to explain Nernst's thermomagnetic phenomenon on the basis of (s - d) exchange force lattice in ferromagnetic metals. 6 ref. (P16; SGA-n)

181-P.* (Russian.) Some Problems in the Theory of Semiconductors With Narrow Zones of Admixture. V. M. Nitzovich. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 23-39.

The properties of electron gases in narrow zones of admixture and those of semiconductors with narrow zones of admixture are examined. By calculating chemical potentials the limit of application for the method of effective determination is established. The density of distribution in cubic and body-centered lattices is calculated and a method is derived for calculating the dependence of conductivity on temperature in zones of various degrees of admixture. 14 ref. (P15g; EG-j)

182-P.* (Russian.) Influence of Scale on Magnetic Properties of Hot Rolled Transformer Steels. V. V. Druzhinin and L. K. Kurennikh. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 40-45.

Scale deteriorates magnetic properties of transformer steels by lowering their permeability and by increasing specific losses. Decrease in total loss of 10,000 gauss due to pickling by means of induction does not appear to be significant, but decrease of 15,000 gauss does. Lowering of specific loss is at the expense of those caused by hysterisis and eddy currents. Decrease of losses by hysterisis resulting from pickling is not due to decrease in coercive forces, but to decrease of maximum magnetizing pole. 6 ref. (P16, 9-62; ST, SGA-n)

183-P.* (Russian.) Magnetic Properties of Manganese-Bismuth Permanent Magnets. A. B. Al'tman. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 46-51.

Simplified method of preparing Mn-Bi permanent magnets by powder metallurgy. The maximum magnetic energy developed is 150,000 ergs per sq. cm. However, irreversible dip in magnetic properties below room temperature limits their broad industrial application. Further research may lower their temperature coefficient to make them as effective at lower temperature as at 20° C. 13 ref. (P16, H-general, 2-61; Mn-b, *Bi,* SGA-n)

184-P.* (Russian.) Electromagnetic Effect in Platinum at Low Temperatures. E. S. Borovik and V. G. Volotskaya. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 60-66.

Dependence of resistance on temperature was investigated from 4.2 to 20° and divergence from Matissen's rule indicated. Hall effect studied in fields up to 27,000 oersteds. Results used to calculate electron movement and concentration in Pt which showed less tendency to order than those of nontransition metals. 13 ref. (P16, 2-63; Pt)

185-P.* (Russian.) Investigation of Physical Properties of Chromium-Germanium Alloys. Pt. 1. I. G. Fakidov and N. P. Grazhdankina. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 67-73.

Series of ferromagnetic Cr-Ge alloys with Curie temperature at 98°. Specific electric resistance, temperature coefficient and change of resistance in magnetic field investigated from 50 to 98 atm. Ferromagnetism of these alloys is conditioned by

a magnetic phase of $CrGe_3$ 8 ref. (P16, P15; Ge-b, *Cr*)

186-P.* (Russian.) Cold Rolled Transformer Steel. A. I. Belyakov, A. A. Nefedov and M. S. Simakova. *Stal'*, Dec. 1958, p. 1128-1129.

Cold rolled steel, 1 mm. thick, with 3% Si, after annealing at 850° is isotropic with sufficiently good electric and magnetic properties. After annealing at 1150° the steel is characterized by considerable anisotropy, because of a recrystallization texture. After final annealing the steel possesses durability and good ductility. (P15, P16, Q-general; ST, *Si*, SGA-n)

187-P. (Russian.) Potential of Titanium in Chlorine Solutions. M. V. Smirnov, L. E. Ivanovski and N. A. Loginov. *Doklady Akademii Nauk SSSR*, v. 121, no. 4, 1958, p. 685-688.

Calculates cross section for inelastic scattering of neutrons with absorption of one magnon and emission of another. 6 ref. (P18j; SGA-n)

228-P. (Translation—AIP.) Investigation of Photoelectric Properties of Semiconductors of the PbS Group by the Capacitor Method. B. T. Kolomiets and V. N. Larichev. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 859-861.

6 ref. (P15k; Pb, *S*)

229-P. (Translation—AIP.) Effect of the Surface Treatment of Semiconductors on the Magnitude and the Spectral Distribution of Photoconductivity. S. M. Ryvkin and R. Iu Khansevarov. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 862-867.

Using high-intensity electron bombardment heating in vacuum and in air, and short duration exposure of CdS single crystals to gaseous discharge. 7 ref. (P15k; Cd, S, NM-a)

230-P. (Translation—AIP.) Current Voltage Characteristic of Metal-AlSb Point Contact. Iu. V. Ilisavskii. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 898-904.

Preparation, measuring, forming, temperature dependence, effect of strong field. 20 ref. (P15; Al-b, *Sb*, 14-68)

231-P. (Translation—AIP.) Effect of Heat Treatment on Electric Properties of Silicon. E. I. Givargizov and Ia. E. Pokdovskii. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 905-907.

Single crystals heated in vacuum in a resistance furnace and quenched in vaseline oil. No change in resistivity during treatment. 10 ref. (P15, 2-64; Si, 14-61)

232-P. (Translation—AIP.) Thermoelectric Properties of Bismuth Telluride With Alloying Elements. G. N. Gordiakova and S. S. Sinani. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 908-911.

Effect of I, Pb, Cu and CuBr on electrical conductivity and thermal emf. (P15g, P15j, 3-69; Bi-b, *Te, I, Pb, Cu*, 14-67, 14-68)

233-P. (Translation—AIP.) Investigation of the Nernst-Ettingshausen Effect in Bismuth Telluride. R. I. Bashirov. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 917-920.

Measurements on cast and pressed specimens of electrical conductivity, Hall effect and N-E effect at 120-600° K. 6 ref. (P16, P15g; Bi, *Te*, 5-60, 14-68)

234-P. (Translation—AIP.) Electrical Properties of Thin Films of Fe, Ni and Co. N. I. Ginzburg and A. M. Poliakov. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 957-959.

Resistance of films of various thickness at 1.65-300° K. 5 ref. (P15g; Fe, Ni, Co, 14-62)

235-P. (Translation—AIP.) Investigation of a Coated W-Co Cathode. A. E. Dol'nikov. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 960-963.

Coating Ca on W cathode increases emission current. (P15k, T1j; W, *Ca*)

236-P. (Translation—Brutcher, no. 4447.) Distortion of Surface Hardened Steel. Yu. M. Bogatyrev and V. P. Eremina. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 35-41.

Distortion resulting from hardening temperature, cooling rate, the initial structure state and method of tempering. Elevated hardening temperature brings about increase of deformation but has no effect on its nature. (P10d, 2-64; ST, 9-74)

237-P. (Russian.) Thermodynamic Properties of Alloys Containing Alkali Metals.

A. F. Alabyshev and M. F. Lantratov. *Uspekhi Khimii*, v. 27, no. 8, 1958, p. 921-942. 79 ref. (P12; EG-e)

238-P.* (German.) Manufacture of Ni-Free Nonmagnetic Cast Iron. Ludwig Kolb. *Freiberger Forschungshefte*, no. B31, 1958, p. 217-240.

Production of nonmagnetic gray iron with pure Mn. Materials high in carbon and of high graphite given preference because of their good machinability and good magnetic properties. Machinability improved by Ti. 10 ref. (P16, G17k, 2-60; CI-q, *Mn, Ti*)

239-P.* (German.) Limits and Variations of Activation Energy Related to Creep and Other Phenomena Occurring in Solid Metals. K. A. Ossipow. *Neue Hutte*, v. 3, Oct. 1958, p. 619-622.

Analyzing the thermodynamic properties of crystals, actual values compiled relating to activation energies of Al, Cu and Ag with respect to creep and recovery of electric conductivity after heating. (P13a, P15g, Q3; Al, Ag, Cu)

240-P.* (Russian.) Thermodynamic Properties of Alkaline Earth Metals and of Their Oxides and Monohydrides in Gaseous States. I. V. Veits, L. V. Gurvich and N. I. Rtishcheva. *Zhurnal Fizicheskoi Khimii*, v. 32, no. 11, 1958, p. 2532-2542.

Thermodynamic functions of Mg, Ca, Sr, Ba, their oxides and monohydrides computed for the ideal gaseous state. 29 ref. (P12; Mg, Ca, Sr, Ba)

241-P.* (Russian.) Correlations in the Discharge of Zinc and Hydrogen Ions in Sulphuric Acid Solutions in Presence of Metal Impurities More Electropositive Than Zinc. *Zhurnal Fizicheskoi Khimii*, v. 32, no. 11, 1958, p. 2561-2564.

On models of galvanic pair of Zn and associated metals (Co, Sb, Pb, Cu) the current distribution over the components of the pair was studied and potentials measured. At high current densities, the locations of the cathode occupied by the impurity metals serve as active centers of the H_2 ions discharge, as a result of which the current efficiency with respect to Zn is lowered. These locations also serve as centers of dendrite growth, after they have been covered with Zn. 4 ref. (P15m, 3-69; Co, Cu, H, Pb, Sb, Zn)

242-P.* (Japanese.) Curvature Distortion of Plate Castings. Toshiro Owadano. *Japan Foundrymen's Society, Journal*, v. 30, Dec. 1958, p. 953-958.

Casting strain in Pb, Zn, Sn and Pb-Sn alloys in horizontal green sand open molds; distortion measured by an optical lever during cooling; effects of casting temperature, chill plate and the types of molds on distortion. (P10d, 2-61, 3-73; Zn, Pb-b, Sn, 5-60)

243-P. Mass Spectrometric Study of Heats of Sublimation of Dysprosium, Samarium, Thulium, and Ytterbium. William R. Savage, Donald E. Hudson and Frank H. Spedding. *Journal of Chemical Physics*, v. 30, Jan. 1959, p. 221-227.

(P12q; Dy, Sm, Tm, Yb, EG-g)

244-P. Experimental Determination of the Electrical Resistivity of the Liquid Alloys HgIn, HgT1, GaIn, GaSn and of Liquid Gallium. L.G. Schulz and P. Spiegler. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 87-90.

19 ref. (P15g; Hg-b, Ga-b, *In, Tl, Sn*, 14-68, 14-60)

245-P. Inelastic Scattering of Neutrons by Thorium. R. Batchelor and J.H. Towle. *Physical Society, Proceedings*, v. 73, Pt. 2, Feb. 1, 1959, p. 193-200.

12 ref. (P18; Th, U)

246-P. Electrical Conduction in n-Type InSb Between 2 and 300° K. E.H. Putley. *Physical Society, Proceedings*, v. 73, Pt. 2, Feb. 1, 1959, p. 280-290.

13 ref. (P15g, P15p, 2-63; In, Sb, 14-68)

247-P. Decay Scheme of Mo^{99}. V. Estulin, G.M. Chernov and Z.V. Pastukhova. *Soviet Physics—JETP*, v. 8, Jan. 1959, p. 51-56.

Angular correlation of gamma rays emitted. 17 ref. (P18h; Mo, 14-63)

248-P. (English.) Differential Capacity of the Electrical Double Layer Between Mercury and Methanol-Water Mixtures. A.A. Moussa, H.M. Sammour and H.A. Ghaly. *Egyptian Journal of Chemistry*, v. 1, no. 2, 1958, p. 165-174.

12 ref. (P15m; Hg, NM-a31)

249-P. (German.) Ferromagnetism in Welded Austenitic Steel. F. Erdmann-Jesnitzer and M. Gerlach. *Werkstatt und Betrieb*, v. 91, Dec. 1958, p. 709-713.

Appearance of ferromagnetism is explained by limited formation of martensite due to shrinkage stresses. Amount of

ferromagnetism is related to several types of welds. (P16; SS-e, 7-51)

250-P.* Physical Damage Brought About by Thermally Cycling Uranium Through Its Phase Changes. S.N. Buckley, A.G. Harding and M.G. Waldron. *Institute of Metals, Journal*, v. 87, Jan. 1959, p. 150-154.

Thermally cycling U through alpha-beta and beta-gamma transformations. Influence of prior history, thermal conditions during testing and alloying on changes in volume and density. 11 ref. (P10d, N6p, 2-60, 2-61, 3-70; U-a)

251-P.* Surface Tension and Contact Angles in Some Liquid Metal Solid Ceramic Systems at Elevated Temperatures. B.C. Allen and W.D. Kingery. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 30-37.

Sessile drop method applied to pure Fe, Cu, Co, Ni and Sn and Fe-C, Co-C and Ni-C alloys; wetting behavior of Sn, Ni-Ti alloys, and Sn-Ti alloys on Al_2O_3, Si_3N_4, Mo-Si_2 and Si-C. Ti additions lower contact angles. 38 ref. (P13h; Fe-b, Cu-b, Co-b, Ni-b, Sn-b, *C, Ti*, 14-60)

252-P.* Enhanced Surface Reactions. Pt. 3. Adsorption of Gases on Prepared Ruthenium Surfaces. Manfred J. D. Low and H. Austin Taylor. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 138-142.

Rates of adsorption of H_2, CO and O_2 on $Ru{\cdot}Al_2O_3$ catalyst surfaces prepared by pre-adsorption of gases. Results are discussed in terms of a site-creation mechanism. Pre-adsorption of gas may influence both the initial and the ambient rates of adsorption to various and, at times, opposite extents, resulting in several types of "poisoning". 14 ref. (P13d, P13c; Ru, *Al, O*, NM-a34)

253-P.* Effect of Trace Elements on the Tensile, Electrical Resistance and Recrystallization Properties of High-Purity Nickel. K.M. Olsen. *American Society for Metals, Transactions*, v. 52, Preprint no. 130, 1958, 27 p.

Effects of small quantities of Mg, Al, Mn, Si, C, Zr, Co, W and Ti. 13 ref. (P15g, Q27a, N5h, 3-69; Ni-a, *Mg, Al. Mn, Si, C, Zr, Co, W, Ti*)

254-P.* Strain Electrometry and Corrosion. Pt. 4. Film Properties and Strain Potential. J. Calvin Giddings, Albert G. Funk, Carl J. Christensen and Henry Eyring. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 91-95.

Measurements of strain transients for several metal electrodes; Cu, Al, Zn, Ag, and Fe. Shows magnitude of transients as function of percentage strain, with transients depending on position of electrode in emf.series and on protective nature of film. Effects of corrosion inhibitors and organic coatings on strain transients shown. 11 ref. (P15, 3-68, R10b; Cu, Ag, Al, Zn, Ni, Fe)

255-P.* Heat Capacity of Dilute Solutions of Chromium in Nickel. R. Hultgren and C. Land. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 165-166.

Heat content determined by diphenyl ether calorimeter. Kopp's law of additivity of heat capacities followed. 6 ref. (P12r; Ni-b, *Cr*, 14-60)

256-P.* (German.) Characteristics of Sintered Al-Ni-Cu-Fe Materials for Permanent Magnets as Influenced by the Constituent Elements. Gunter Ritzow and Werner Ebert. *Neue Hutte*, v. 4, Jan. 1959, p. 35-40.

Influence of Al, Ni, Cu in Alnico alloys; effect of cooling velocity on the magnetic properties. (P16; 6-72, Fe-b, *Al, Ni, Cu*, SGA-n)

257-P.* (Russian.) Phosphide Porosity in Cast Iron. A.A. Timofeev. *Liteinoe Proizvodstvo*, Dec. 1958, p. 17-18.

Varies with different carbon equivalents in metal. The greater the P content, the greater the number of phosphide eutectoids and development of porosity. (P10m, 2-60; CI, *C, P*)

258-P.* Mechanism of Growth of Uranium on Thermal Cycling in the Alpha Range. S. F. Pugh. *British Nuclear Energy Conference, Journal*, v. 4, Jan. 1959, p. 27-33.

Kinetics of the creep process. Determination of internal stress cycle and modes of deformation during a typical cycle; quantitative account of internal strains and resulting external growth. Processes leading to a change in growth per cycle when the heating and cooling rates are changed. 7 ref. (P10d, Q3, Q25; U)

259-P.* Chemisorption of Nitrogen on Tungsten. P. Kisluk. *Journal of Chemical Physics*, v. 30, Jan. 1959, p. 174-181.

The amount of N chemisorbed on a polycrystalline W ribbon measured as a function of the temperature of the ribbon and the pressure in the region of less than one monolayer. 33 ref. (P13d, 2-61, 3-74; W, *N*)

260-P.* Effects of Heat and Pressure on the Swelling of Irradiated Uranium. A. T. Churchman, R. S. Barnes and A H. Cottrell. *Journal of Nuclear Energy*, v. 7, Aug. 1958, p. 88-95.

Small pieces of a natural U fuel bar, after irradiation at below 300° C., heated to higher temperatures under various pressures. Heat treatment produced changes in both density and microstructure. 13 ref. (P10d, 2-64, 2-67, 3-74; U)

261-P.* Determination of the Solubility of Oxygen Bearing Impurities in Sodium, Potassium and Their Alloys. D. D. Williams, J. A. Grand and R. R. Miller. *Journal of Physical Chemistry*, v. 63, Jan. 1959, p. 68-71.

Finds relatively low solubilities of the various impurities in the alkali metals. (P12e, M24c; Na, K, O, EG-e, 14-60)

262-P.* Magnetic Flux and Resistance of Circular Indium Rods at the Superconducting Transition. Yoshio Shibuya. *Tohoku University, Research Reports, (Series A)*, v. 10, no. 5, Oct. 1958, p. 326-342.

Paramagnetic effect in In. Current minimum required for the occurrence of the magnetic flux increase is represented by functions of the temperature and the external magnetic field maximum beyond which quasi-paramagnetism cannot be observed at that temperature. (P16; In, 4-55)

263-P.* (French.) Physical Properties of Ga Monocrystals Near the Fusion Point. Pt. 2. Marc Erny. *Metaux Corrosion-Industries*, v. 33, Dec. 1958, p. 493-513.

Comparative study of variations in electric resistivity and specific heat as influenced by temperature. 33 ref. (P12, P15, 2-61; Ga, 14-61)

264-P.* (Polish.) Defects in the Calculation of Equilibrium Constants. W. M. Szczedrin. *Hutnik*, v. 25, Oct. 1958, p. 377-385.

Defects shown with reference to the reaction $2\ Fe + O_2 = 2\ FeO$. Faulty calculation of heat reaction must be avoided as well as of entropy changes. 15 ref. (P12; Fe, O)

265-P. Ceramic Coatings for the Control of Radiant Heat. Edward A. Douglas. *American Ceramic Society Bulletin*, v. 38, Jan. 15, 1959, p. 20-23.

Emissivities of ceramic coatings for low-alloy steels. It was found that most dark refractories give highly emissive coatings. (P17d, T24b, 2-60; AY-n, 8-71, 17-57)

266-P. Thermodynamic Properties of Binary Alloys Exhibiting Miscibility in Solid and Liquid Phases. R. P. Rastogi and K. T. Rama Varma. *Indian Academy of Sciences, Proceedings*, v. 48A, Dec. 1958, p. 336-343.

Thermodynamic properties of Ni-Mn alloys determined from phase diagram. 16 ref. (P12, M24b; Ni-b, Mn)

267-P. Magnetic Flux Increase in Noncircular Tin Rods at the Superconducting Transition. Yoshio Shibuya. *Tohoku University, Research Reports, (Series A)*, v. 10, no. 5, Oct. 1958, p. 343-355.

Current minimum required for the occurrence of the paramagnetic effect. (P16; Sn, 4-55)

268-P. Magnetic Field Dependence of the Surface Impedance of Superconducting Tin. M. Spiewak. *University of Chicago, Institute for the Study of Metals, Quarterly Report*, no. 51, Dec. 1958, p. 381-411.

Surface impedance at 1000 mc. per sec. of super-conducting Sn investigated as a function of temperature, and of static magnetic field, both longitudinal and transverse to the r.f. current. 18 ref. (P15g, 2-61; Sn)

269-P. Effect of Uniaxial Tensile Stress on Impurity Conduction in Germanium. H. Fritzsche. *University of Chicago, Institute for the Study of Metals, Quarterly Report*, no. 51, Dec. 1958, p. 414-417.

6 ref. (P15g, 3-66, 3-69; Ge)

270-P. Transport Processes in Liquid Alloys. Pt. 1. A Transport Cell for Liquid Alloys. Paul C. Mangelsdorf, Jr. *University of Chicago, Institute for the Study of Metals, Quarterly Report*, no. 51, Dec. 1958, p. 426-444.

Study of electrolysis and diffusion. 13 ref. (P15g, N1c; 14-60)

271-P.* (French.) Magnetoscopic Control of Ferrous Parts. *Machine Moderne*, v. 53, Feb. 1959, p. 47-52.

Carbon content reduces magnetic permeability, hysteresis cycles of different alloy steels; interrelation of temperature and magnetization; influence of cold working on magnetization and hysteresis losses. (P16, S13h, S14h; AY)

272-P.* Interaction of Silver Impurity Atoms With a Copper Solvent. T. Pyle and R. Shuttleworth. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 598-608.

Radioactive isotopes used to measure the thermodynamic properties of solutions of Ag impurity in a Cu solvent in which the Ag was present at a concentration of less than 0.1 at.%. At these low concentrations it is possible to neglect the interaction between the Ag atoms and to consider only the interaction of the Ag atoms with the Cu solvent. 15 ref. (P12e, 1-59; Cu-b, *Ag*, 14-67)

273-P.* Frictional Sparking of Aluminum. J. C. Bailey. *Institution of Mining Engineers, Transactions*, v. 118, Jan. 1959, p. 11-244.

Al alloys are not especially prone to impact sparking on rusted steel, though more so than mild steel, and less so than Mg-base alloys. The susceptibility is greater with increasing hardness and Mg content of the alloys, and with increasing energy of impact. 8 ref. (P13, Q9p, 2-60, 3-74; Al-b, *Mg*)

274-P.* (German.) Thermodynamics of the Liquid Binary Systems Bi-Sn and Bi-Pb at 475° C. Franz Eberhard Wittig and Franz Huber. *Zeitschrift fur Physikalische Chemie Neue Folge*, v. 18, Dec. 1958, p. 330-347.

Free mixture enthalpies as a function of increasing Sn or Pb content. 34 ref. (P12r, M24b, 2-60; Bi, *Sn, Pb*)

275-P. (German.) Pyrophoric Alloys. H. Nowotny, Helga Auer-Welsbach and A. Wittmann. *Osterreichische Chemiker Zeitung*, v. 60, Jan. 1959, p. 12-16.

Structure of various types of mischmetal. Pyrophoric phases of Ce-free alloys on Ti and Zr-base. (P13, M26; Fe-b, Ti-b, Zr-b, *Ce, La*)

276-P. (Translation—AIP.) Secondary Nuclear Reactions Induced in Bismuth and Lead by High Energy Proton Bombardment. B. V. Kurchatov, V. N. Mekhedov, L. V. Christiakov, M. Ia. Kuznetsova, N. I. Borisova and J. G. Solv'ev. *Soviet Physics-JETP*, v. 8, Jan. 1959, p. 40-46.

Production of astatine isotope. Cross sections studied. 12 ref. (P18; Pb, Bi)

277-P. (Translation—AIP.) Hall Effect in Pure Nickel at Helium Temperature. N. V. Volkenshtein, G. V. Fedorov and S. V. Vonsovskii. *Soviet Physics-JETP*, v. 8, Jan. 1959, p. 61-63.

Ferromagnetic constant drops with temperature; minimum at 20-30° K. 17 ref. (P15p, 2-63; Ni-a)

278-P. (Translation—AIP.) Hall Constant in Semiconductors for Strong Magnetic Fields. Iu. A. Fursov. *Soviet Physics, Technical Physics*, v. 3, June 1958, p. 1051-1061.

7 ref. (P15p; EG-j)

279-P. (Translation—AIP.) Penetration of Electrons in Germanium and Silicon. B. Ia. Iurkov. *Soviet Physics, Technical Physics*, v. 3, June 1958, p. 1078-1082.

Curves of energy loss of electrons calculated on basis of Spencer's theory. 9 ref. (P15m; Ge, Si)

280-P. (Translation—AIP.) Electrical Properties of GaAs at Low Temperatures. O. V. Emel'ianenko and D. N. Nasledov. *Soviet Physics, Technical Physics*, v. 3, June 1958, p. 1094-1103.

Electrical conductivity, Hall coefficient and resistivity change in magnetic field measured at 1.5—300° K. 14 ref. (P15g, P15p, 2-63, 1-60, 1-54; Ga, *As*)

281-P. (Translation—AIP.) Electrical Properties of Tin-Antimony System. V. I. Ustianov. *Soviet Physics, Technical Physics*, v. 3, June 1958, p. 1106-1110.

Compositions included the gamma solution and beta phase. Properties with Sb composition and high temperature. 12 ref. (P15, M24b, 2-62, 2-60; Sn-b, Sb)

282-P. (Translation—Columbia.) Influence of Thermal Vibrations of Atoms on the Electron Energy Distribution in Metals and Alloys. I. B. Borovskii and G. N. Ronami. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 10, 1957, p. 1385-1388.

Determination of energy distribution of electric status in solids by investigation of frequency variation of the intensity in X-ray emission and absorption spectra. 7 ref. (P12, P15)

283-P.* (French.) Manganese Alloyed Austenitic Cast Iron Containing Nodular Graphite. N. Popescu. *Revue de Metallurgie (Bucharest)*, v. 3, no. 3, 1958, p. 73-77.

Mechanical, electrical and magnetic properties as influenced by Mn and other alloying additions. 5 ref. (P15g, P16q, Q27, 2-60; CI-r, *Mn*)

284-P.* (German.) Activation Energies, Disintegration and Evaporation Equilibrium in Pb-Cd Melts. Eberhard Schurmann. *Archiv fur das Eisenhuttenwesen*, v. 30, Jan. 1959, p. 41-49.

Both components of the melt show a definite tendency toward decomposition. In evaporation equilibrium Cd displays

much higher vapor pressure than Pb, resulting in practically pure Cd vapors, leaving a melt with 17 at.% Cd at 900° C. and 1 atm. ambient pressure. 17 ref. (P12; Pb-b, *Cd*)

285-P.* (German.) Properties of Mixed Nickel Ferrites Influenced by the Degree of Sintering. Elena Labusca, Gh. Stancu and N. Andreescu. *Revue de Metallurgie (Bucharest)*, v. 3, no. 3, 1958, p. 79-86.

Nickel ferrites and Cu-Ni ferrites were sintered at different temperatures with other conditions being kept constant. The specific gravity and magnetic permeability increase as the sintering temperature is raised, while specific electrical resistance decreases. 6 ref. (P16q, P15g; 6-72, *Ni, Cu*, NM-a34)

286-P.* (Russian.) Improved Properties of Aluminum by Small Alloying Additions. M. Protopopesku. *Revue de Metallurgie (Bucharest)*, v. 3, no. 3, 1958, p. 33-51.

Effect of Mn, Zn, Cu and Mg and influence of artificial aging on mechanical properties and electrical conductivity. 11 ref. (P15g, Q-general, 2-60, 2-65; Al-b, *Mn, Zn, Cu, Mg, Si*)

287-P.* (French.) Electrical Conductivity of Resistance Wires of Solid Solution Type Alloys. T. Dulamita, D. Drimer and E. Fokt. *Revue de Metallurgie (Bucharest)*, v. 3, no. 3, 1958. p. 53-60.

Electrical resistance of wires of various Ni-Cr, Ni-Cu and Ni-Cr-Cu alloys measured at temperatures from 273 to 1073° C. 7 ref. (P15g, 2-61, 4-61; Ni-b, *Cr, Cu*, 14-67)

288-P.* Effect of a Magnetic Field on Thermionic Emission From Molybdenum. Joel Greenburg. *Physical Review*, v. 112, Dec. 15, 1958, p. 1898-1900.

Applied field of 6000 gauss or less has no effect on the saturation current density. 6 ref. (P15k, P16; Mo, 4-61)

289-P.* (German.) Effect of Tensile Stress on the Remanence of Alpha Iron at High Temperatures. B. J. Shepstane and L. Alberts. *Zeitschrift fur Naturforschung*, v. 13a, Dec. 1958, p. 1096-1097.

Effects emphasize that magnetization by domain growth is taken over by rotation at higher temperatures. Experimental and theoretical results agree except near the Curie temperatures. (P16c, 3-66, 2-62; Fe-a)

290-P. Unit Cell and Thermal Expansion of Beta-Plutonium Metal. W. H. Zachariosen. Acta Crystallographica, v. 12, pt. 3, Mar. 10, 1959, p. 175-176.

Data show anisotropy in expansion of this monoclinic element with 34 atoms per unit cell. (P11g; Pu)

291-P.* (French.) Results of Research on Nonmagnetic Ni-Cu-Mn Cast Irons. A De Sy and J. Van Eeghem. *Fonderie Belge*, v. 29, Jan. 1959, p. 7-11.

Study of domain stability of austenite in Ni-Cu-Mn cast irons has led to development of a group of cast irons with magnetic permeability under 1.05 for a field of 200 oersteds. Physical and mechanical properties of these new irons are comparable to those of "Nomag" iron. (To be continued.) (P16; SGA-n, CI, *Ni, Cu, Mn*)

292-P.* (Dutch.) Copper and Copper Alloys. Pt. 18. Effect of Hydrogen. W. G. R. de Jager. *Metalen*, v. 14, Feb. 14, 1959, p. 34-40.

Copper samples of various compositions heated to 800° C. in a hydrogen or nitrogen atmosphere. An increase of electrical resistance caused by hydrogen contamination takes place in samples containing chemically combined oxygen or As and in phosphorus deoxidized Cu. Formation of coarse grain is influenced by composition and temperature. (P15g, 2-60, N3; Cu-b, *H*)

293-P. Spin-Disorder Effects in the Electrical Resistivities of Metals and Alloys. B. R. Coles. *Philosophical Magazine Supplement—Advances in Physics*, v. 7, Jan. 1958, p. 40-71.

60 ref. (P15g, N10, 3-71)

294-P. The Solubility of Nickel in Lithium. K. Q. Bagley and K. R. Montgomery. *United Kingdom Atomic Energy Authority*, IGR-TN/C-250, Sept. 1958, 4 p.

Results indicate that the solubility of Ni rises slowly from 60 ppm. at 200° C. to 220 ppm. at 500° C., then more rapidly to 0.2% at 675° C. (P12e; *Ni*, Li)

295-P. (German.) Magnetic Investigations of Solid Solutions of Transition Elements in Pd. D. Gerstenberg. *Annalen der Physik*, v. 2, Nov. 1958, p. 236-262.

Magnetic susceptibility of solid solutions of Ti, V, Cr, Mn, Fe, Co, Ni, Zr, Cb, Mo, Ta, W and Re in Pd measured from 90-1100° K. Results discussed in terms of Pauli's and Staner's equations

for spin paramagnetism. 41 ref. (P16q; Pd-b, *Ti, V, Cr, Mn, Fe, Co, W, Re, Ni, Zr, Cb, Mo, Ta,* 14-67)

296-P. (German.) Magnetic Properties of Electrolytically Produced Nickel Layers. W. Ruske. *Annalen der Physik,* v. 2, Nov. 1958, p. 274-286.

Hysteresis loops of single and multiple layers of 20 to 2.10^4 Å thickness. Elimination on separation of the various magnetic effects permitted the influence of the layer thickness on the magnetic properties to be determined. 35 ref. (P16a; 14-62, Ni-a)

297-P.* (Polish.) Thermodynamic Properties of Liquid Metallic Solutions. Pt. 3. Semiregular Two-Consistent Solutions. Janusz Terpilowski and Emilia Przezdziecka. *Archiwum Hutnictwa,* v. 3, no. 4, 1958, p. 315-327.

Enthalpy and entropy of liquid solutions of Au-Tl, Bi-Cd, Bi-Sn, Cd-Pb, Cd-Sn, In-Zn, Pb-Sb, Sn-Tl and Sn-In. 38 ref. (P12r, P12s; 14-60, Au, Tl, Bi, Cd, Sn, Pb, In, Zn, Sb)

298-P.* Hysteresis Torque Limits Lifted With New Magnetic Alloy. Joseph C. Betts. *Electrical Manufacturing,* v. 63, Mar. 1959, p. 101-104.

Magnetic and electric properties of iron-cobalt alloy P-6. (P16, P15; Co-b, *Fe*)

299-P.* (Czech.) Effect of Composition on the Magnetic Properties of Low-Coercivity Steels. Jiri Wozniak, Ludek Kodrle, Vaclav Foldyna and Tasilo Prnka. *Hutnicke Listy,* v. 14, Feb. 1959, p. 93-98.

The absolute coercivity is increased by carbon, Mn and oxygen. Increase of coercivity in aging is promoted by oxygen, nitrogen and sulphur and retarded by Mn and Cr. 16 ref. (P16a, 2-60; CN-g, *C, Mn, O, Cr, S*)

300-P.* (Czech.) Changes Observed on Metallic Surfaces in Air. Antonin Hrbek. *Hutnicke Listy,* v. 14, Feb. 1959, p. 111-117.

Influence of atmospheric corrosion on the emission of electrons when exposed to light. 24 ref. (P17d, R3; Zn, Al)

301-P. Influence of the Demagnetizing Field on Domain Structure. J. Kocinski. *Acta Physica Polonica,* v. 17, no. 5, 1958, p. 283-294.

6 ref. (P16c)

302-P. (Engligh.) Influence of Hydrogen Permeation on the Potential of Iron Cathodes Polarized in Sulphuric Acid Solutions. H. Angerstein-Kozlowska. *L'Academie Polonaise des Sciences, Bulletin, Serie des Sciences,* v. 6, no. 12, 1958, p. 739-746.

18 ref. (P15, P13d; Fe, H)

303-P.* (French.) New Experimental Results on the Conductivity of Very Thin Films of Nickel. A. Colombani and G. Goureaux. *Comptes Rendus,* v. 248, Jan. 19, 1959, p. 380-383.

Under 130 Å, resistivity of films increases rapidly with decreasing thickness. (P15g, P15p; Ni, 14-62)

304-P.* (French.) Magnetic Resonance of Polycrystalline Cobalt at 35,500 Megacycles Per Second as a Function of Temperature. Georges Asch. *Comptes Rendus,* v. 248, Feb. 9, 1959, p. 781-784.

Measurement in -80 to +400° C. range, in which energy of magnetocrystalline anisotropy varies greatly. Decrease of this energy brings about increase of field of resonance and decrease of line width; field of resonance is maximum and line width minimum around 260° C., at which temperature energy of anisotropy is itself minimum. 6 ref. (P16f, 2-61; Co)

305-P.* (French.) Solubility of Hydrogen in Stainless Steels. Rene Blanchard. *Comptes Rendus,* v. 248, Feb. 16, 1959, p. 966-968.

Solubility of hydrogen varies from 5.3 to 7.25 cc. per 100 g. between 700 and 1000° C.; addition elements (Mo, Cb) cause slight decrease in solubility. 4 ref. (P12e, 2-60; SS, *H, Mo, Cb*)

306-P.* (German.) Electroconductivity of Aluminum Casting Alloys Conforming to DIN 1725. A. Buckeley. *Aluminium,* v. 35, Mar. 1959, p. 135-139.

Effect of composition, thickness and cooling conditions, heat treatment, quenching and type of mold on electrical conductivity. 17 ref. (P15g, 2-60, 2-64, E-general; Al-b, 15-56, 5)

307-P.* (French.) Magnetic Properties of Very Thin Films of Nickel. G. Goureaux and A. Colombani. *Comptes Rendus,* v. 248, Jan. 26, 1959, p. 543-546.

Hall effect in films up to 1000° Å thick. 4 ref. (P15p; 14-62, Ni)

308-P.* (German.) Conductivity of Pure Copper Influenced by Admixtures. Ernst

Gunter Hess and Franz Pawlek. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 57-70.
Presence of oxygen, sulphur, Se and Te slightly increases electrical resistance. 67 ref. (P16g, 2-60; Cu, *O, Se, S, Te*)

309-P.* (Russian.) Measurement of the Radioactivity of Metal and Slag. B. I. Bruk. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 184-185.
To melts of low-carbon steel and austenitic stainless steel and various slags, ferrous sulphide containing the isotopes S^{35} and S^{16} was added and the radioactivity measured. With the same S isotope content, metal showed a higher irradiation than slag, which is explained by differing absorption properties. (P18, 1-59; CN-g, SS-e, RM-q, *Si, O, Ca*)

310-P.* Changes of Electric Resistance of Nickel Films With Absorption of Hydrogen. Zenjiro Oda and Hikaru Arata. *Journal of Physical Chemistry*, v. 62, Dec. 1958, p. 1471-1474.
Resistance increases on very clean films, decreases on contaminated films. Experiments show that this decrease is due not to the oxygen absorbed on the surface but to that which has diffused into Ni lattice. 15 ref. (P15g; Ni, 14-62)

311-P.* (French.) Influence of Purity and Structure of Iron in Hydrogen Pickup Under Cathodic Conditions. Simone Besnard and Jean Talbot. *Revue de Metallurgie*, v. 56, Feb. 1959, p. 163-170.
Polycrystalline Fe heated at 930° C. for three days absorbs 50 cc. of hydrogen per 100 g. while the same Fe absorbs less than 10 cc. per 100 g. after polygonization. Addition of 0.1 g. of Na_2S to the electrolyte increases absorption. 6 ref. (P13d; Fe, *H*)

312-P.* (German.) Solubility of Nitrogen in Solid Iron in Presence of Vanadium and Chromium. Martin G. Frohberg and Hans Graf. *Stahl und Eisen*, v. 79, Mar. 5, 1959, p. 304-306.
Solubility in alpha iron in the presence of 0.016 and 0.051% V at 500 and 600° C. (P13d; Fe, *N, V, Cr*)

313-P. Adsorption of Oxygen on Tungsten. Joseph Eisinger. *Journal of Chemical Physics*, v. 30, Feb. 1959, p. 412-416.
13 ref. (P13d; W, *O*)

314-P. Specific Heats of Some Copper-Rich Copper-Nickel Alloys at Liquid Helium Temperatures. G. L. Guthrie, S. A. Friedberg and J. E. Goldman. *Physical Review*, v. 113, Jan. 1, 1959, p. 45-48.
25 ref. (P12r, 2-63; Cu-b, *Ni*)

315-P. Low-Temperature Electrical and Magnetic Behavior of Dilute Alloys: Mn in Cu and Co in Cu. I. S. Jacobs and R. W. Schmitt. *Physical Review*, v. 113, Jan. 15, 1959, p. 459-463.
26 ref. (P15, P16, 2-63; Cu-b, *Co, Mn*)

316-P. (German.) Electrical Conductivity of Treated and Untreated Aluminum-Silicon Alloys. W. Patterson and D. Ammann. *Aluminium*, v. 35, Mar. 1959, p. 139-140.
Electrical conductivity of the Al-Si eutectic can be increased 30% by sodium treatment. (P15g, 2-60; Al-b, *Si, Na*)

317-P.* Thermal Conductivity of Some Non-Superconducting Alloys at Low Temperatures. M. S. R. Chari and J. De Nobel. *Physica*, v. 25, Jan. 1959, p. 84-96.
Thermal conductivity of dilute alloys of Ag-Mn and Ag-In and of some steels at low temperatures. 32 ref. (P11h, 2-63; Ag-b, *In, Mn*)

318-P.* (English.) Magnetic Properties of Spheroidal Graphite Cast Iron. Yuki Shirakawa and Takeshi Miyazaki. *Tohoku University, Science Reports of the Research Institutes*, v. 10A, no. 6, 1958, p. 399-404.
Under the same degree of graphitization, the maximum induction, the coercive force and the hysteresis loss of spheroidal graphite cast iron were lower than those of flake graphite cast iron, and so the maximum permeability and the residual induction were higher. With increasing degree of graphitization, the maximum permeability increased, whereas the other four quantities decreased. (P16, N8s; CI, CI-r)

319-P.* Malleable Iron: A Magnetic Alloy. W. K. Bock. *Modern Castings*, v. 36, Apr. 1959, p. 61-68.
Magnetic variation, saturation value, permeability, hysteresis, coercive force and retentivity of malleable iron. Comparison with other magnetic alloys. Mechanical properties, foundry characteristics and machinability. (P16; CI-s, SGA-n)

320-P.* Electrical Conductivity of Sand-Cast Copper-Base Alloys. D. G. Schmidt and F. L. Riddell. *Modern Castings*, v. 35, Apr. 1959, p. 69-76.
Electrical conductivities of over 100 sand-cast Cu-base alloys including tin

bronzes, leaded tin bronzes, leaded red and semi-red brasses, leaded yellow brasses, high-strength yellow brasses, aluminum bronzes, leaded nickel bronzes, silicon bronzes, silicon brasses and nickel silvers. Effect of alloy elements on conductivity. 5 ref. (P15g, 2-60; Cu-b, Cu-n, Cu-s, *Al, Sn, Ni, Si,* Pb, 5-60)

321-P.* Electrochemical Properties of the Platinum Metals. M. J. N. Pourbaix, J. Van Muylder and N. de Zoubov. *Platinum Metals Review,* v. 3, Apr. 1959, p. 47-51.

Thermodynamic approach to corrosion and cathodic protection. 9 ref. (P15, R10d, R4; Pt, 17-57)

322-P.* Thermal Conductivity of Some Steels at Low Temperatures. M. S. R. Chari and J. De Nobel. *Physica,* v. 25, Jan. 1959, p. 73-83.

With increasing Ni and Cr content from 2-27%, the lattice conductivity decreases. The electronic thermal conductivity decreases by about 80% for the mentioned temperatures. 21 ref. (P11h, 2-60, 2-63; AY, SS)

323-P.* Electrical and Thermal Resistivity of the Transition Elements at Low Temperatures. G. K. White and S. B. Woods. *Royal Society of London, Philosophical Transactions,* v. 251A, Mar. 12, 1959, p. 273-302.

Intrinsic or ideal electrical resistivity, from 295° K. to about 10° K. and for the ideal thermal resistivity, from above 100° K. to about 20° K. 100 ref. (P11h, P15g, 2-63)

324-P. Heat Transfer Tests on Aluminum Bonded Stainless Steel Heat Exchangers. T. I. M Crofts and D. Gambles. *United Kingdom Atomic Energy Authority,* IGR-TN/W-259, 1958, 5 p.

Breakdown in the bond commenced when the control temperature was raised to 150° C., while the breakdown was aggravated by continued operation at a control temperature of 160° C. (P11k, W13b; SS, 7-58, Al)

325-P.* (English.) Ferromagnetic Phase in Manganese-Aluminum System. Hiroshi Kono. *Physical Society of Japan, Journal,* v. 13, Dec. 1958, p. 1444-1451.

Conditions necessary for formation, structure, stability and thermal and magnetic properties of the promagnetic phase. 8 ref (P16; Mn-b, *Al*)

326-P.* A Redetermination of the Volume Changes on Solidification and Fusion of Lead-Bismuth Alloys Near to the Eutectic Composition. C. T. Preston and C. H. Broomfield. *Institute of Metals, Journal,* v. 87, p. 240.

Displacement method reveals that the eutectic alloy of 55.5% Bi, remainder Pb, contracts on freezing by 1.52 + 0.1% of its solid volume. (P10c, Pb-b, *Bi*)

327-P.* How Fabrication Affects Stainless Magnetic Properties. W. S. Eberly. *Iron Age,* v. 183, Apr. 23, 1959, p. 106-108.

For best magnetically soft properties (maximum permeability, lowest residual magnetism), ferritic stainless steels, 400 series, must be heat treated to remove all cold work stresses and to minimize the amount of carbon retained in the matrix of the alloy. (P16, 2-64; SS)

328-P. High Temperature Brazing Alloy-Base Metal Wetting Reactions. W. Feduska. *Welding Journal,* v. 38, Mar. 1959, p. 122s p. 122s-131s.

Wettability of high-temperature alloys by brazing alloys decreases as the brazing temperature increases above the nominal level in atmospheres of dry hydrogen, dry helium and a vacuum. 4 ref. (P13h, K8, 2-62, 1-73, 1-54; SS-c, SS-e, Co-b, Ag-b, Ni-b, *Cr, Si, B*)

329-P.* (Russian.) X-Ray Structure Study of Ferromagnetic Alloys Fe-Mo and Fe-Mo-Co. B. Ya. Pines and I. N. Barutkin. *Fizika Metallov i Metallovedenie,* v. 6, no. 5, 1958, p. 832-837.

Coercivity changes caused by various heat treatments are investigated by radiographic methods and explained by microstress and the presence of finely dispersed phases. (P16a, 2-64; Fe-b, *Mo, Co*)

337-P. Principles of Electrochemistry. Fred G. Brune. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 68-72.

Basic factors involved in the passage of electric current through a solution and obtaining plate or deposit of metal. (P15, L17, C23)

338-P. Temperature Coefficients of Resistance of Metallic Films in the Temperature Range 25 to 600° C. Richard B. Belser and Walter H. Hicklin. *Journal of Applied Physics*, v. 30, Mar. 1959, p. 313-322.

Values of thin metal films depart from those of bulk metal because of the imperfections of films intrinsic in their method of deposition and growth. 18 ref. (P11h, 3-71; 14-62)

339-P.* The Heat Capacity of Solid Solutions of Cadmium in Silver. Ralph Hultgren and K. N. Rao. *Indian Institute of Metals, Transactions*, v. 11, Dec. 1958, p. 55-58.

Heat capacities of Ag-Cd alloys containing 20 or 42 at .% Cd determined at 350 to 600° K. (P12r; Ag-b, Cd, 14-67)

340-P.* Atomic Heats of Gold, Platinum and Antimony at Liquid Helium Temperatures. K. G. Ramanathan and T. M. Srinivasan. *Indian Academy of Sciences, Proceedings*, v. 49A, Feb. 1959, p. 55-60.

New investigation with vacuum calorimeter. 9 ref. (P12r, 2-63; Au, Pt, Sb)

341-P.* Lattice and Electronic Specific Heats of Zinc and Cadmium. T. M. Srinivasan. *Indian Academy of Sciences, Proceedings*, v. 49A, Feb. 1959, p. 61-65.

Results of investigation with vacuum calorimeter. 12 ref. (P12r, 2-63; Cd, Zn)

342-P.* Internal Ferromagnetic Resonance in Nickel. J. C. Anderson and B. Donovan. *Physical Society, Proceedings*, v. 73, Apr. 1, 1959, p. 593-599.

Investigated over 5 to 100° C. range. Resonant frequency is a decreasing function of temperature. Resonance is due to the internal magnetic field associated with the anisotropy energy. 14 ref. (P16f, P16q, 2-61; Ni)

343-P.* (French.) Nonmagnetic Ni-Cu-Mn Cast Iron. Albert de Sy and J. van Eeghem. *Fonderie Belge*, v. 29, Feb. 1959, p. 41-49.

Tests on magnetic, thermal and mechanical properties as influenced by composition. 4 ref. (P16q, P11g, Q-general, 2-60; CI-q, *Ni, Cu, Mn*)

344-P.* (Italian.) Chemical Properties of Zirconium. *Aluminio*, v. 28, Mar. 1959, p. 125-132.

Effect of impurities and alloying additions on corrosion behavior and physical and mechanical properties of Zr. 6 ref. (P-general, Q-general, R-general, 2-60; Zr, *Hf, C, H, Fe, Ni, Cr, Sn, N*)

345-P. Fermi-Thomas Angular-Dependent Potential for Iron. D. M. Hum. *Physical Society, Proceedings*, v. 73, Apr. 1, 1959, p. 650-660.

Method for calculating angular-dependent potential field, which is suitable for body-centered and face-centered cubic structures; calculations performed for Fe. Total energy per atom of any metal, in the angular-dependent case, is reduced to a sum of integrals over the surface of the atomic polyhedron. 11 ref. (P18n, M25n; Fe)

346-P. (French.) Nomograms for Calculation of Thermal Processes Occurring in Arc Welding. Traian Salagean. *Metalurgia si Constructia de Masini*, 1958, p. 43-50.

10 ref. (P11k, K1)

347-P.* Determining the Specific Resistance of Solid and Molten Aluminum and Its Alloys. W. Marty. *Brown Boveri Review*, v. 45, Nov-Dec. 1959, p. 549-552.

During melting, the resistance increases to double or triple the normal value. The temperature coefficient of electric resistance is positive in both solid and molten states. (P15g, 2-61; Al, 14-60)

348-P.* (German.) Correlations Between Magnetic Induction of Unalloyed Cast Steel, Composition and Brinell Hardness. Alfred Kolorz and Karl Lohberg. *Giesserei*, v. 46, Apr. 9, 1959, p. 187-190.

A decrease in carbon causes an increase of the induction value. With normalized steel castings, the Brinell hardness, since it is influenced by carbon, allows conclusions to be made as to magnetic induction. (P16, Q29b; ST, 5-60)

349-P. The Thermodynamics of the Liquidus-Solidus Gap in Binary Alloys: the Silver-Gold System. J. L. White. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 178-181.

The liquidus-solidus gap of the Ag-Au system was investigated by thermal analysis to resolve the discrepancy between the phase diagram and the measured thermodynamic properties of the solid and liquid alloys. The results confirm the gap calculated from the thermodynamic properties. 9 ref. (P12, M24b, N12; Ag, Au)

350-P. Effects of Heat and Pressure on the Swelling of Irradiated Uranium. A. T. Churchman, R. S. Barnes and A. H. Cottrell. *United Kingdom Atomic Energy Authority*, AERE M/R 2510, Mar. 1958, 14 p.

Heating in vacuum produced an increase in volume (swelling) of about 2% at 575° C., and over 20% above 1000° C. Repeated thermal cycling, and reheating at low pressure after first heating at high pressure, produced swelling of 10 to 20% at 810-835° C. Swelling appears to be caused by the separation of the fission gases, krypton and xenon, to form gas pockets in the metal. 13 ref. (P10d, 3-74, 2-62; U)

351-P. Conductivity Testing of Zinc Dust Pigmented Coatings. D. S. Nantz. Wright Air Development Center. *U. S. Office of Technical Services*, PB 131435, Sept. 1957, 27 p. $.75.

Zinc-rich coatings can provide excellent galvanic protection if the coating is properly pigmented with Zn and is sprayed at the proper thickness. (P15g, 1-54; Zn, NM-g30)

352-P.* (French.) Testing of Thermomagnetic Ni-Cu Alloys. David. *Revue du Nickel*, v. 25, Jan-Feb. 1959, p. 3-7.

Magnetic induction of Ni-Cu alloys in the -20 to +60° C. range. Magnetic induction is affected by alloying additions of Fe, Co, Mn and Si and reheating at 800 to 1200° C., followed by cooling affects. (P16, 2-60; Ni-b, *Cu, Fe, Co, Mn, Si*)

353-P.* (German.) Changes of Thin Lead Layers Due to Annealing. R. Grigorovici, N. Croitonu, A. Devengi and Ath. Trutia. *Zeitschrift fur Physik*, v. 154, no. 2, 1959, p. 160-171.

Electrical resistance as a function of temperature and thickness. Changes in grain structure by annealing. 11 ref. (P15g, J23; Pb, 14-62)

354-P.* Effects of High Temperature on Magnetic Properties of Core Materials. Michael Pasnak and R. H. Lundsten. *Journal of Applied Physics*, v. 30S, Apr. 1959, p. 107S-108S.

Increase in temperature decreases the coercive force and maximum and residual inductions. Maximum and initial permeabilities increase with increasing temperature until the Curie temperature is approached, then they decrease. (P16, 2-62; Fe-b, Ni-b, SGA-n)

355-P.* Ferromagnetic Resonance of Iron Whisker Crystals. D. S. Rodbell. *Journal of Applied Physics*, v. 30S, Apr. 1959, p. 187S-188S.

Two resonance modes may be excited and identified. The mode driven by the curl component of the microwave magnetic field exhibits a line width for some whisker crystals of Fe that at 9 kmc. per sec. is about an order of magnitude smaller than previously observed with other crystals of Fe. 29 ref. (P16; Fe, 14-61)

356-P.* Development of Metallurgical Structures and Magnetic Properties in Iron Silicon Alloys. R. H. Pry. *Journal of Applied Physics*, v. 30S, Apr. 1959, Apr. 1959, p. 189S-193S.

Processes which lead to the development of strong textures of both the cube and cube-on-edge type and a comparison of some of the magnetic properties of textured silicon iron. 29 ref. (P16, M26c, 3-71; Fe-b, *Si*, SGA-n)

357-P.* Solubility of Carbon in Iron as Determined by the Magnetic Aftereffect. Joseph Singer and Eugene S. Anolick. *Journal of Applied Physics*, v. 30S, Apr. 1959, p. 193S-194S.

Time decay of permeability is proportional to dissolved carbon. 6 ref. (P12e, P16, 2-60; Fe, C)

358-P. The Activities of Iron and Nickel in Liquid Fe-Ni Alloys. G. R. Zellars, S. L. Payne, J. P. Morris and R. L. Kipp. *Metallurgical Society of AIME, Transactions,* v. 215, Apr. 1959, p. 181-185.

Activities determined by measuring vapor pressures of Fe and Ni above the alloys and comparing with vapor pressures of pure metals. Ni deviates negatively from Raoult's law over the entire composition range. Fe behaves ideally down to 0.7 mole fraction but shows negative deviations at lower concentrations. 8 ref. (P12; Fe-b, Ni)

359-P. Activities of Iron and Nickel in Liquid Iron-Nickel Solutions. R. Speiser, A. J. Jacobs and J. W. Spretnak. *Metallurgical Society of AIME, Transactions,* v. 215, Apr. 1959, p. 185-192.

Activities of Ni in liquid Fe-Ni solutions containing from 10 to 90% Ni measured over the 1510 to 1600° C. range. A sepcial function was devised whereby activities can be computed by a graphican computation integration using the results of chemical analyses on the vapor phase alone. The liquid solutions studied exhibit negative deviation from Raoult's law but approach ideality as the temperature is raised from 1510 to 1600° C. 11 ref. (P12; Ni, Fe)

360-P.* (German.) Boiling Point in Silver-Phosphorus and Gold-Phosphorus Systems. Rudolf Vogel, Raymund Dobbener and Ortrud Strathmann. *Zeitschrift fur Metallkunde,* v. 50, Mar. 1959, p. 130-135.

In the system Au-P the boiling point is at 935° C., at a maximum solubility of 2.4% P. The boiling point for the system Ag-P is at 995° C., at a maximum solubility of 1.6% P. (P12p; Ag, Au, *P*)

361-P.* Temperature Dependence of the Magnetic Properties of Nickel-Iron Alloys. J. J. Clark and J. F. Fritz. *Journal of Applied Physics,* v. 30S, Apr. 1959, p. 105S-107S.

Trade names of the alloys tested are: Hipernik Deltamax, Hipernik V, Supermalloy, 4-79 Mo-Permalloy and Hymu 80. (P16, 2-61; Fe-b, Ni-b, SGA-n)

362-P.* Effect of Composition and Processing on the Activity of Some Magnetostrictive Materials. C. M. Davis, Jr., and S. F. Ferebee. *Journal of Applied Physics,* v. 30S, Apr. 1959, p. 113S-115S.

Strain sensitivity due to magnetostriction was found to be a maximum in the neighborhood of 8 oersteds for alloys, 16 oersteds for ferrites. The strain sensitivity of both the ferrites and the Alfenols decreased when the samples were quenched. 6 ref. (P16b, Q21a, 2-60, 3-66; Ni-b, Co-b, Fe-b, *Al,* SGA-n)

363-P.* Influence of Plastic Deformation on the Time Decrease of Permeability in Transformer Steel. A. K. Smolinski, Z. Kaczkowski and M. Zbikowski. *Journal of Applied Physics,* v. 30S, Apr. 1959, p. 195S-199S.

Measurements show a drop of time decrease of permeability at large elongations and a maximum at small elongations. 11 ref. (P16q, 3-68; AY, SGA-n)

364-P.* Variation in Orientation Texture of Ultrathin Molybdenum Permalloy Tape. P. K. Koh, H. A. Lewis and H. F. Graff. *Journal of Applied Physics,* v. 30S, Apr. 1959, p. 208S-210S.

Evaluation of magnetic properties of tapes for computor applications. 5 ref. (P16, M26c; Ni-b, *Fe, Mo*)

365-P.* Progress in Ultrathin Mo-Permalloy Tapes With Square Hysteresis Loops. Martin F. Littmann and Chester E. Ward. *Journal of Applied Physics,* v. 30S, Apr. 1959, p. 213S-214S.

Effects of thickness, temperature of the final anneal, crystal structure. (P16, 2-64; Ni-b, *Fe, Mo,* SGA-n)

366-P.* Controlled Potential Reactions of Cadmium and Silver in Alkaline Solution. George T. Croft. *Electrochemical Society, Journal,* v. 106, Apr. 1959, p. 278-284.

Data from electrochemical oxidation and reduction of electrodes in potassium hydroxide electrolyte, with overpotential independent and current dependent variables. 6 ref. (P15; Cd, Ag)

367-P.* (French.) Reflection of Solid Silicon and Germanium Between 1000 and 3000 Å. Sonja Robin-Kandare and Boris Vodar. *Comptes Rendus,* v. 248, Apr. 1, 1959, p. 1965-1967.

Reflection of solid moncrystalline Si and Ge in the spectral range from 1000-3000 Å; effect of surface structure on reflectivity. 5 ref. (P17a; Si, Ge)

368-P.* (French.) Dilatometric Testing of Chromium-Hydrogen System Between 20 and 550° C. Lucien Espagno, Pierre Azou

and Paul Bastien. *Comptes Rendus*, v. 248, Apr. 1, 1959, p. 2003-2005.

Application of a differential dilatometer of high sensitivity allows direct determination of the solubility limit of hydrogen in alpha Zr and the solubility of delta hydride. 10 ref. (P12e, M24b; Zr, H)

369-P.* (French.) Properties of Austenitic Cast Iron With a 5-10% Nickel Content. Andre Meallier. *Fonderie*, no. 158, Mar. 1959, p. 107-124.

Testing of magnetic properties, elongation, tensile strength, hardness, Young's modulus, density, coefficient of expansion, electrical resistivity. 11 ref. (P16, P15, P11, Q-general; CI, *Ni*)

370-P. Effect of Magnetic Annealing on the Properties of (110) [001] Oriented 3¼% Silicon-Iron Strip. H. C. Fiedler and R. H. Pry. *Journal of Applied Physics*, v. 30S, Apr. 1959, p. 109S-110S.

6 ref. (P16, 2-64; Fe-b, *Si*, SGA-n)

371-P. Heat Capacity of Pseudo-Copper Below 4.2° K. G. L. Guthrie. *Physical Review*, v. 113, Feb. 1, 1959, p. 793-795.

Results of measurements on fcc. Cu-Zn-Ni alloys. 15 ref. (P12, 2-63; Cu-b, Ni, Zn)

372-P. (German.) Results of Low-Temperature Research. Pt. 23. Atomic and Electronic Heat of Molybdenum and Tungsten Between 10 and 273° K. K. Clusius and P. Franzosini. *Zeitschrift fuer Naturforschung*, v. 14A, Feb. 1959, p. 99-105.

19 ref. (P12, 2-63; Mo, W)

373-P. (Italian.) Potential of a Platinum Electrode in a Gas-Solid Solution System. G. Bombara. *Metallurgia Italiana*, v. 51, Mar. 1959, p. 101-108.

Considerations on the determination of pH values and air in solution by the electrode potential. 14 ref. (P15m, T1f; Pt)

374-P.* (Russian.) Electrical Resistance of Metallic Ferromagnetics Under Influence of High-Frequency Magnetic Field. P. A. Dautov. *Fizika Metallov i Metallovedenie*, v. 6, no. 6, 1958, p. 999-1005.

Effect of relatively strong radiofrequency magnetic field on Goldhammer effect in 4% Si transformer steel and Mo Permalloy. 14 ref. (P15g; AY, SGA-n, Fe-b, *Ni*, *Mo*)

375-P.* (Russian.) Abnormality of Electric Resistance of Nickel-Chromium Alloys. N. V. Semenova. *Fizika Metallov i Metallovedenie*, v. 6, no. 6, 1958, p. 1017-1026.

Abnormal electrical resistance changes in Nichrome alloys related to physical properties, microstructure, crystal lattice, hardness of Ni_3Cr at various heat treating stages and thermo-electromotive force. (P15g, M27; Ni-b, *Cr*)

376-P.* Heating and Cooling of Flat Strip. Pt. 5. A. H. Vaughan. *Industrial Heating*. v. 26, Apr. 1959, p. 672-680.

Curves for heating and cooling by radiation or convection for a constant specific heat. Correction for thickness, thermal properties of Fe, stainless steel, Ni, Al, Cu and brass. (Concluded.) 9 ref. (P11, P12r; SS, ST, Fe, Cu-a, Cu-n, Ni, Al, 4-53)

377-P.* (German.) Effects of Impurities and of Previous Cold Deformation in the Residual Resistance of Sintered Tungsten. Erich Krautz and Hermann Schultz. *Zeitschrift fur Metallkunde*, v. 49, Aug. 1958, p. 399-403.

Measurements performed at liquid hydrogen temperatures. Additions of elements far removed from tungsten in the periodic table remarkable increase the residual resistance. Additions of alumina have the same effect. 8 ref. (P15g, 3-69, W, *Ti*, *Ta*, *Cb*, *Mo*, *Re*)

378-P.* Capacities of Solid Metal-Solution Interfaces. J. J. McMullen and Norman Hackerman. *Electrochemical Society, Journal*, v. 106, Apr. 1959, p. 341-346.

Simulated conditions with electrical circuit; application of square-wave voltage. Verifies capacity measurement analysis by applying the following systems: Hg in 0.1 Na_2SO_4, Pt, Ag, Cu, Al and Ti in 1.oN Na_2SO_4. 19 ref. (P15; Pt, Ag, Cu, Al, Ta)

379-P. (German.) Measurement of the Specific Heat of Metals at High Temperatures. Friedrich Krauss. *Zeitschrift fur Metallkunde*, v. 49, July 1958, p. 386-392.

Measurements with a Cr sample; equipment. (P12, 2-62; Cr)

380-P. (German.) Magnetic Properties and Ordered Structure of Nickel-Manganese Alloys. Pt. 1. Rolf Hahn and Eckart Kneller. *Zeitschrift fur Metallkunde*, v. 49, Aug. 1958, p. 426-441.

Magnetical and electrical properties as functions of the composition, temperature and holding time. (P16, P15, N10; Ni-b, *Mn*)

381-P. (Russian.) Magnetostriction and Magnetization Abnormality of Ternary Iron-Nickel-Cobalt Alloys. S. I. Voskoboinikov. *Fizika Metallov i Metallovedenie*, v. 6, no. 6, 1958, p. 1011-1016.

5 ref. (P16b; Fe-b, *Ni, Co*)

382-P.* (German.) Properties of Metallic Melts. Pt. 15. Viscosity. Erich Gebhardt and Konrad Kostlin. *Zeitschrift fur Metallkunde*, v. 49, Dec. 1958, p. 605-613.

Factors influencing the viscosity of pure metal melts and molten-binary alloys include atomic volume, atomic number, temperature, concentration and constitution. 46 ref. (P10f; 14-60, Ag-b, Al-b, Pb-b, Cu-b, Mg-b)

383-P.* (German.) Differences in the Thermal Expansion in Rolling Direction and in Transverse Direction in Iron-Nickel Alloys. Gerhard Pupke and Hans-Joachim Bunge. *Zeitschrift fur Metallkunde*, v. 49, Dec. 1958, p. 626-629.

Expansion coefficients vary with the angle of measurement to the rolling direction. The cause is to be found in the perturbation of short range ordering in rolling. 8 ref. (P11g, F23, 3-68; Fe-b, *Ni*)

384-P. The Thermal Conductivity of a Molten Pu-Fe Eutectic (9.5 a/o Fe). John E. Deverall. Los Alamos Scientific Laboratory. *U. S. Atomic Energy Commission, LA-2269*, Mar. 12, 1959, 62 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

Thermal conductivity values varied from 0.034 at 220° C. to 0.042 at 400° C. in the solid state, and from 0.043 at 420° C. to 0.046 at 520° C. in the molten state, with the units of cal/cm sec C. The curves appear to be linear with positive temperature coefficients for both phases. 6 ref. (P11h; Pu-b, *Fe*, 14-60)

385-P.* (German.) Effect of Admixtures, Structure and Temperature of the Magnetic Properties of Cast Iron. Anton Koniger. *Giesserei*, v. 46, Apr. 23, 1959, p. 216-228.

Coercivity, magnetization, permeability, remanence and hysteresis, influenced by carbon, graphite, Si, Mn and P, austenite transformation; testing temperature. 22 ref. (P16, 2-60, 2-61, N8; CI, *Si, Mn, P*)

386-P.* (German.) Susceptibility Measurements on the Silver-Manganese System. Erich Scheitl, Ernst Wachtel and Arno Kalkuhl. *Zeitschrift fur Metallkunde*, v. 49, Sept. 1958, p. 464-466.

At moderate temperatures, a range of ordering with a maximum at 25 at.% Mn is assumed. The susceptibility maximum appearing after quenching from 900° C. is promoted by artificial aging and lowered by deformation. (P16, N10-b, 2-61, 3-68; Ag-b, *Mn*)

387-P.* (German.) Magnetic Properties and Ordering in Nickel-Manganese Alloys. Rolf Hahn and Eckhart Kneller. *Zeitschrift fur Metallkunde*, v. 49, Sept. 1958, p. 480-488.

Changes of magnetic properties after deformation were observed in Ni-Mn monocrystals. Recovery after deformation is thought to be connected with long-range ordering processes. 29 ref. (P16, N10b, 3-68; Ni-b, *Mn*, 14-61)

388-P. The Irradiation Stability of Low Wt. Pct. Uranium-Zirconium Alloys. A. H. Willis. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 245-251.

Specimens were irradiated in both static and power cycling tests below the phase transformation temperature; cycled to temperatures above the transformation temperature; and irradiated above 600° C. without cycling. (P10d, 2-67; U-b, *Zr*)

389-P. Solubility of Oxygen in Alpha Iron: Revision. A. U. Seybolt. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 298-301.

True oxygen solubility is very low, probably about 0.002% or less. Upon repeating oxygen saturation experiments with zone-refined Fe, it was found that the oxygen solid solubility was at least an order of magnitude less than previously observed. 6 ref. (P12e; Fe-a, *O*)

390-P. Porosity in Formed Titanium. R. A. Wood, D. N. Williams, H. R. Ogden and R. I. Jaffee. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 308-315.

Strain-induced porosity occurs in Ti and other materials at tensile strains greater than the uniform elongation of the material. Porosity in Ti increases with increasing strain and temperature, being most severe at 300 to 800° F. Strain-induced porosity is believed to be a normal part of the mechanism of deformation in ductile materials. 11 ref. (P10m, 3-68, 2-61; Ti)

391-P. The Immiscibility Limits of Uranium With the Rare-Earth Metals. J. F. Haefling and A. H. Daane. *Metallurgical Society of AIME, Transactions*, Apr. 1959, p. 336-338.

Solubilities of La and Ce in uranium are greater than those of the remaining

rare earths by a factor of more than two. The solubility of uranium is greater in Ce, Pr and Ne than in the other rare earth metals studied. 8 ref. (P13d; *La, Ce, Pr, Ne, EG-g,* U)

392-P. (English.) Contributions From Thermal Lattice Defects to the Energy Content of Au, Ag, Cu and Al. G. Borelius. *Arkiv for Fysik,* v. 15, no. 1, 1959, p. 65-80.
20 ref. (P12; M26s, Al, Au, Ag, Cu)

393-P. (German.) Magnetic Tests With Manganese-Tin Alloys. Robert Ochsenfeld. *Zeitschrift fur Metallkunde,* v. 49, Sept. 1958, p. 474-476.
Samples of modified composition tested for magnetic susceptibility and Curie-point at various temperatures. 13 ref. (P16n, P16d; Mn-b, *Sn*)

394-P. (German.) Instrument for Specific Heat Measurement. Heinrich Wollenberger. *Zeitschrift fur Metallkunde,* v. 49, Dec. 1958, p. 629-633.
13 ref. (P12r, 1-53)

395-P. (Book.) Permanent Magnet Handbook. Earl M. Underhill, Editor. 200 p. 1959. Crucible Steel Co. of America, Oliver Bldg., Mellon Square, Pittsburgh 22, Pa. $10.
Permanent magnet steels, Ferrimag, cast Alnico and other permanent magnet alloys; magnetization, demagnetization and ferromagnetism. (P16; SGA-n)

396-P. (Translation—AIP) Structure of the Energy Spectrum of Electrons in Iron-Chromium Alloys. N. D. Borisov, V. V. Nemoshkalenko and A. M Fefer. *Soviet Physics Doklady,* v. 3, July-Aug. 1958. p. 826-829.
See item 23-P, 1959. (P15k; Fe-b, *Cr*)

397-P. (Translation—AIP) Bulk Recombination in Aluminum-Doped Germanium. S. G. Kalashnikov and K. P. Tissen. *Soviet Physics—Technical Physics,* v. 3, Sept. 1958, p. 1739-1743.
See item 148-P, 1959. (P15g; Ge-b, *Al,* EG-j)

398-P.* Reactor Fuel Life—the Metallurgical Limits. M. D. Jepson. *Atomic World,* v. 10, Apr. 1959, p. 136-139.
Changes in natural uranium metal, brought about by irradiation, cause the elements to fail before the limit set by reactivity considerations. (P10d, T11g, 2-67; U)

399-P.* (French.) Electrical Properties of Thin Films of Cobalt. F. Savorin. *Journal de Physique et le Radium,* v. 19, Dec. 1959, p. 90S-92S.
Effect of time, temperature and thickness of film on resistivity and thermoelectric power. (P15, 3-67, 2-61; 14-62, Co)

400-P.* (German.) Reasons for Ferromagnetic Anisotropy. F. W. Ackermann and H. Stablein. *Metall,* v. 13, May 1959, p. 411-419.
Anisotropy caused by preferred orientation or the geometric shape of a part. Characteristics of various anisotropic materials, such as Fe-Si sheets, transformer steel, 50% Ni-Fe, 50% Co-Fe, Al-Ni-Co-Fe for permanent magnets and Fe-Co-V-Cr alloys. 17 ref. (P16, 3-72; Fe-b, *Si, Ni, Co, Al, V,* AY, SGA-n)

401-P. The Swelling of Beryllium From Neutron-Induced Gasses. C. E. Ellis. Chalk River, Ont. *Atomic Energy of Canada Ltd.,* CR-MET-809, Nov. 1958, 21 p.
Quantity of neutron induced gases in Be following irradiation in the Materials Testing Reactor was determined. The gas consists mainly of He_4. Neutron induced gases do not constitute a serious deterrent to the use of Be in reactor applications up to 600° C. 8 ref. (P10d, 2-67; Be)

402-P.* Radiation Damage Effects on Reactor Control Materials. W. E. Ray, W. K. Anderson and D. N. Dunning. Paper from "Symposium on Radiation Effects on Materials", v. 3. American Society for Testing Materials, STP no. 233, 1958, p. 103-126.
Damage to boron alloys, cermets and Cd-In-Ag alloys. 12 ref. (P10d, 2-67; B-b, Cd-b, *Ag, In,* 6-70)

403-P.* Irradiation of Uranium-Fissium Alloys and Related Compositions. Karl F. Smith. Paper from "Symposium on Radiation Effects on Materials", v. 3. American Society for Testing Materials, STP no. 233, 1958, p. 136-144.
Fissium is superior to Mo in resistance to radiation. (P10d, 2-67; Mo, U-b)

404-P.* (Russian.) Equilibrium of Carbon With Liquid Iron, Manganese and Silicon. M. S. Petrushevskii. *Zhurnal Prikladnoi Khimii,* v. 32, Jan. 1959, p. 86-94.
At 1460° C. with increased Si concentration the coefficient of carbon activity is increased. In Mn-Fe alloy increased Mn concentration results in a reduced gamma carbon. With increased Si content

the activation coefficient of carbon in Fe-Mn-Si alloys is increased. (P12e; Fe-b, *Mn, Si, C*)

405-P. (Russian.) Thermodynamic Properties of Copper-Palladium Alloys. A. A. Vecher and Ya. I. Gerasimov. *Doklady Akademii Nauk*, v. 123, no. 5, 1958, p. 868-869.

Free energy, heat and displacement entropy. 6 ref. (P12; Cu-b, *Pd*)

406-P. A Literature Survey on the Relationship Between Dimensional Changes Produced by Radiation and Crystal Structure. Irving B. Cadoff. New York University. *Wright Air Development Center*, Technical Report no. 58-325, June 1958, 14 p.

Dimensional instability in uranium seems to be related to a mass movement of atoms which may be a result of anisotropic diffusion or some form of anisotropic plastic deformation within the uranium. The dimensional instability of uranium is not accomplished by a change in lattice parameter or crystalline form of uranium. 26 ref. (P10d, M26, 3-68; U)

407-P.* (German.) Investigation on the "K-State." Horst-Guido Muller and Peter Muth. *Zeitschrift fur Metallkunde*, v. 50, Apr. 1959, p. 217-224.

Resistivity, differential thermo-electric voltage and Hall constant of Ni-Cr and Ni-Cr-Fe alloys measured after varying heat treatments and following varying degrees of cold deformation. A theory explaining the behavior in the "K-state" is developed. 19 ref. (P15g, P15j, P15p, 2-64, 3-68; Ni-b, *Cr, Fe*)

408-P.* (German.) Vapor Pressure of Liquid Zinc-Tin and Magnesium-Lead Alloys. Erich Scheil and Friedrich Wolf. *Zeitschrift fur Metallkunde*, v. 50, Apr. 1959, p. 229-233.

Zr and Mg vapor pressures and Zn and Mg activities determined for Zn-Sn and Mg-Pb alloys. In Zn-Sn alloys, a tendency towards decomposition was observed, while Mg-Pb alloys tend towards the formation of Mg_2Pb. 14 ref. (P12c, P12b; Zn-b, Sn, Mg-b, *Pb*, 14-60)

409-P.* Growth of Aluminum During Porcelain Enameling. A. L. Sopp, Jr. *Porcelain Enamel Institute, Proceedings*, v. 20, 1958, p. 88-91.

Small dimensional changes in Al panels usually occur as a result of the enameling operation. Many factors such as alloy composition, temper, metal thickness and enamel processing variables affect the magnitude of these changes. (P10d, L27; ST, 8-71)

410-P.* Electrical Properties of Porcelain Enamels. C. G. Bergeron. *Porcelain Enamel Institute, Proceedings*, v. 20, 1958, p. 105-113.

Room-temperature and elevated-temperature electrical properties of a conventional ground coat, a titania-opacified cover coat and a composite of cover coat over ground coat and comparison of the electrical properties of these enamels with those of currently used insulation materials. 12 ref. (P15, 2-62; 8-71)

411-P. (Russian.) Thermodynamics of Solid Solutions of Gold With Silver and Copper. Pt. 2. An. N. Nesmeyanov, L. A. Smakhlin and Lebedev. *Zhurnal Fizicheskoi Khimii*, v. 33, no. 3, 1959, p. 559-606.

Partial vapor pressure of Au and Ag in solid solution Au-Ag and Au and Cu in Au-Cu solid solutions were studied by employing radioactive isotopes Au^{198}, Ag^{110} and Cu^{64}. 16 ref. (P12c, 1-59; Au, Ag, Cu, 14-63)

412-P. The Swelling of 0.17% Burn-Up Uranium on Post-Irradiation Annealing. D. Rhodes and V. W. Eldred. *United Kingdom Atomic Energy Authority*, IGR-TN/W-933, Aug. 14, 1958, 17 p.

Post-irradiation annealing gave a density decrease of 0.01% on heating at 610° C. for periods up to 140 hr. On heating at 710° C. a 1% decrease was observed for periods up to 100 hr. After an initial change, no progressive change with time was detected at either temperature over these annealing periods. (P10d, J23; U)

413-P.* (French.) The Fine Structure of the X-Ray Absorption Discontinuities of Nickel and Iron in Ni-Fe Alloys. D. Bally and L. Benes. *Comptes Rendus*, v. 248, Apr. 20, 1959, p. 2327-2329.

Absorption spectra in Ni, Fe and three Ni-Fe alloys. 12 ref. (P17c; Fe-b, *Ni*)

414-P.* (German.) Wettability. Luigi Piatti, Alexander Kung and August Kaiser. *Werkstoffe und Korrosion*, v. 10, Apr. 1959, p. 239-243.

Experiments on the wettability of stainless steel, Al and glass after various surface treatments. Wettability is influenced by surface roughness, various degreasers and cleaners, by pickling and (as shown in the case of Al) by the degree of corrosion. 9 ref. (P13h; SS, Al, NM-f42)

415-P.* (Russian.) Measurement of the Magnetic Properties of Electrical Steels in Weak and Medium Fields. O. N. Al'tgausen and H. A. Semenova. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 426-428.

Effect of demagnetizing conditions following heat treatment on magnetic structure and temporary falling off of magnetic permeability. 4 ref. (P16; SGA-n, AY)

416-P.* (Russian.) Methods for the Determination of Magnetic Properties of Electrical Sheets. N. G. Chernysheva. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 437-439.

Supplementary data on the basic magnetization curve under dynamic conditions; relationship between specific losses and maximum magnetic induction at corresponding frequencies of magnetizing current; ultimate hysteresis cycles at varying frequencies; properties of the electrical sheets under complex magnetization. (P16, 1-54; SGA-n, AY)

417-P.* (Russian.) Specific Heat of Iron-Nickel-Aluminum and Iron-Cobalt-Aluminum Alloy Steels. Yu. O. Tret'yakov and Khomyakov. *Zhurnal Neorganicheskoi Khimii*, v. 4, no. 3, 1959, p. 645-649.

Two exothermic transitions were established in the temperature ranges 300-600° C. and 640-680° C. A relationship exists between high temperature and transition and the process of magnetic annealing of Fe-Ni-Al steel. In the Fe-Co-Al system magnetic annealing proceeds at a slow rate. 27 ref. (P12r, P16e, J23; *AY, Ni, Al, Co*)

418-P.* Vapor Pressure Measurements Over Calcium, Magnesium, and Their Alloys and the Thermodynamics of Formation of CaMg. J. F. Smith and R. L. Smythe. *Acta Metallurgica*, v. 7, Apr. 1959, p. 261-267.

The low values of the enthalpy and entropy of formation of the compound, $CaMg_2$, are consistent with the view that the compound forms because of atomic size considerations. Heats of combustion were measured for two samples of $CaMg_2$ and for corresponding weights of unreacted Ca and Mg. The difference between these heats of combustion was used to obtain the heat of formation. 28 ref. (P12; Mg-b, *Ca*)

419-P.* (Russian.) Structure Changes and Anti-Ferromagnetic Properties of Iron-Nickel Alloys. M. V. Dekhtyar. *Izvestiya Akademii Nauk Seriya Fizicheskaya Nauk*, v. 33, no. 3, 1959, p. 272-279.

Study of magnetic properties of Ni_3Fe and other Fe-Ni alloys showed that an antiferromagnetic orientation of magnetic exists below their transition temperature into paramagnetic state. 23 ref. (P16p; Ni-b, SGA-n)

420-P.* (Russian.) Structure of Iron-Aluminum Alloy With Abnormal Electrical Conductivity. E. I. Vlasov and L. N. Fedotov. *Izvestiya Akademii Nauk Seriya Fizicheskaya*, v. 23, no, 3, 1959, p. 403-405.

Tempering of Fe-Al alloy (3 to 10% Al) results in a "K" state. The alloy has an abnormal electrical resistance, monophased solid solution with a bcc. lattice. The electrical resistance increase is caused by scattering (dispersion) of electrons on the domain boundary. (P15g, J29, M27g; Fe-b, *Al*)

421-P.* (Russian.) New Iron-Platinum, Iron-Palladium and Nickel-Palladium-Iron Alloys With High Magnetostriction. Z. I. Alizade. *Izvestiya Akademii Nauk Seriya Fizicheskaya*, v. 23, no. 3, 1959, p. 416-417.

In these systems there is a range of alloys (Fe-Pt and Fe-Pd) with a maximum positive magnetostrictive saturation while the alloys (Ni-Pd) have a maximum negative magnetostriction saturation. (P16b; Fe-b, Ni-b)

422-P.* The Effects of Anisotropic Relaxation Times on the Hall Coefficients of Some Dilute Alloys of Silver. J. R. A. Cooper and S. Raimes. *Philosophical Magazine*, v. 4, Feb. 1959, p. 145-157.

Theoretical consideration of Hall effect taking into account effect of nonspherical energy surfaces and anisotropic relaxation times. Application to dilute alloys of Pd, Pt, Cd, Sn and Sb in Ag. 12 ref. (P15p, P15e; Ag-b, *Pd, Pt, Cd, Sn, Sb*)

423-P.* On the Knight Shift of Alloys. A. Blandin, E. Daniel and J. Friedel. *Philosophical Magazine*, v. 4, Feb. 1959, p. 180-182.

Changes of nuclear magnetic resonance shifts of Ag produced by various solute elements explained by fluctuations of electron density produced at long range by each solute atom. Values of the change in Knight shift for Cd, In, Sn, Sb, Pd and Pt solutes. 9 ref. (P16f; Ag-b, *Cd, In, Sn, Sb, Pd, Pt*)

424-P.* Measurements of the Optical Constants of Mercury and Mercury-Indium Amalgams in the Spectral Region 4000 to 17000

Cm^{-1}. J. N. Hodgson. *Philosophical Magazine*, v. 4, Feb. 1959, p. 183-193.

Reflection method used in measuring optical constants of free surface of Hg. 9 ref. (P17a, P17e; Hg-b, *In*)

425-P.* The Heat Capacity of Pure Silicon and Germanium and Properties of Their Vibrational Frequency Spectra. Pl Flubacher, A. J. Leadbetter and J. A. Morrison. *Philosophical Magazine*, v. 4, Mar. 1959, p. 273-294.

Heat capacities of Si and Ge between 2.5 and 300° K. Properties of lattice frequency spectra. Interpretation of anharmonic effect. 30 ref. (P12r, 2-63; EG-j, Ge, Si)

426-P.* Thermoelectric Power of the Alkali Metals at Low Temperatures. J. M. Ziman. *Philosophical Magazine*, v. 4, Mar. 1959, p. 371-379.

Effect of phonon drag calculated, taking into account electron-phonon Umklapp process and anisotropy of the Fermi surface. 8 ref. (P15j, 2-63; EG-e, Cs, Li, K, Rb, Na)

427-P.* Measurements of Thermoelectricity Below 1° K. Pt. 3. D. K. C. MacDonald, W. B. Pearson and I. M. Templeton. *Philosophical Magazine*, v. 4, Mar. 1959, p. 380-383.

Thermo-electric power of Ni, Pd, Fe, Pt, Co, Rb and Cs. (P15, 2-63; Ni, Pd, Fe, Pt, Co, Rb, Cs)

428-P.* Nuclear Magnetic Resonance in Silver-Cadmium. L. E. Drain. *Philosophical Magazine*, v. 4, Apr. 1959, p. 484-501.

Nuclear magnetic resonance shifts and line widths measured in alloys of Ag and Cd at 300° K. in a field of 4200 gauss. Theoretical interpretations. 31 ref. (P16f, P18m; Ag-b, Cd-b)

429-P. (Russian.) Shape of Steel Samples Used in Determining Their Magnetic Properties. V. V. Druzhinin. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 429-433.

(P16, 1-54, 3-73; AY)

430-P. (Russian.) Magnetic Properties of Cold Rolled Electrical Sheets. A. A. Roitman. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 433-434.

(P16e; SGA-n, AY)

431-P.* (Rumanian.) Cathodic Polarization of Nickel-Phosphorus Alloys in an Electrolyte. I. Atanasiu, A. Calusaru and Mira Popescu. *Studii si Cercetari de Chimie*, v. 6, no. 4, 1958, p. 585-596.

Reduction of polarization is caused in a Ni bath by addition of H_3PO_3 and is also influenced by temperature. Depolarization maximum at 90° C. As the concentration of H_3PO_3 increases the phosphorus content of the alloy decreases. 4 ref. (P15m; Ni-b, *P*)

432-P.* (German.) Thermodynamics of Liquid Alloys of B-Metals. Franz Eberhard Wittig. *Zeitschrift fur Elektrochemie Berichte der Bunsengesellschaft fur Physikalische Chemie*, v. 63, no. 2, 1959, p. 327-341.

Relationship between the thermodynamic behavior of binary systems of B-metals and their position in the periodic system. 41 ref. (P12r, M24b; Zn-b, Sn-b, Pb-b, Cd, In, Tl, Bi, 14-60)

433-P. Graphite-How It Compares With Metals, Ceramics. G. B. Engle and L. M. Liggett. *Materials in Design Engineering*, v. 49, June 1959, p. 88-90.

Electrical, tensile and thermal properties of graphite compared with other engineering materials. (P15g, P11, Q27a; NM-k36)

434-P. A Glossary of Physical Properties and Tests. Manual no.159. John B. Campbell. *Materials in Design Engineering*, v. 49, June 1959, p. 91-110.

Electrical, magnetic, thermal, density, optical and acoustic are major groups of properties covered. (P-general; 1-54)

435-P.* Development of High-Temperature Strain Gage Wire. W. H. Graft. Paper from "Symposium on Elevated Temperature Strain Gages". American Society for Testing Materials, STP no. 230, Philadelphia 3, 1958, p. 76-86.

Fe-base alloys containing Cr and Al investigated for use as electric strain gage materials. Alloys containing up to 25% Cr and 12.5% Al exhibit high values of resistivity and a range of thermal coefficients of resistivity ranging from positive to negative. (P11, X28j, 2-62; Fe-b, *Cr, Al*)

436-P. (Russian.) Aluminum Solubility in Acids and Alkalis Affected by Ultrasonic Waves. A. M. Ginberg. *Zhurnal Prikladnoi Khimii*, v. 32, Mar. 1959, p. 563-566.

Solubility rate of Al in acids and alkalis in contact with Cr can be considerably increased by the application of ultrasonic waves. The solubility of Al in contact with Cr in HCl solution may be retarded or accelerated by the frequency and wave intensity. (P12e, 1-74; *Al, Cr*)

437-P. (Ukrainian.) Viscosity and Conductivity of Zinc and Cadmium Amalgams. A. Z. Golik and I. F. Klassen. *Ukrainskii Fizicheskii Zhurnal*, v. 3, no. 5, 1958, p. 683-687.

Temperature dependence of the viscosity is subjected to an exponential law, the activation energy of the viscous curves being a linear function of the concentration. (P10f, P15g; Zn, Cd, *Hg*)

438-P. Polarisation of Nickel and Aluminum in Neutral Solutions. J. H. Greenblatt and E. M. Levy. *Journal of Applied Chemistry*, v. 9, May 1959, p. 269-273.

(P15; Ni, Al)

439-P. (Russian.) Theory of Radioactive Changes in Metals. I. M. Lifshits, M. N. Kaganov and L. M. Tamarova. *Atomnaya Energiya*, v. 6, Apr. 1959, p. 391-401.

12 ref. (P18)

440-P.* (French.) Influence of Trace Amounts of Iron on Electric Resistance of High-Purity Aluminum at Liquid Hydrogen Temperature. F. Montariol. *Comptes Rendus*, v. 248, Mar. 9, 1959, p. 1519-1520.

By measuring the electrical resistance at low temperature it is possible to observe the transformation into solution or the precipitation of traces of Fe in high-purity Al. (P15g, 2-60, 2-63; Al-a, *Fe*)

441-P.* (Japanese.) Solubility of Zirconium in Liquid Magnesium and Magnesium Alloys. Riei Ichitaka. *Nagoya Institute of Technology, Report*, no. 10, 1958, p. 197-203.

Unfavorable effect of Al, Mn, Si and Fe on grain-refining properties of Zr. Maximum solubility curves at 700 or 800° C. in the Mg corner of the ternary phase diagram are derived. (P12e, M24c, 2-60; Mg-b, *Zr, Al, Mn, Si, Fe*, AD-p35)

442-P.* (Russian.) Investigation Into the Thermodynamics of Solid Solutions of Gold, Silver and Copper. D. Ya Chopovov and V. A. Lebedev. *Zhurnal Fizicheskoi Khimii*, v. 33, no. 2, 1959, p. 342-348.

Saturated vapor pressure of solid Au, Ag and Cu were measured by Knudsen diffusion method, employing radioactive isotopes Au^{198}, Ag^{110} and Cu^{68}. 12 ref. (P12c, 1-59; Au, Ag, Cu)

443-P. (Translation—AIP.) Calculation of the Limit Values of the Activation Energy of Various Processes in Solid Metals. K. A. Osipov. *Soviet Physics Doklady*, v. 3, July-Aug. 1958, p. 848-850.

See item 162-P, 1959. (P13a)

444-P. (Translation—Brutcher no. 4505.) Some Magnetic Properties of Present-Day Permanent-Magnet Materials and Their Commercial Uses. K. Tendeloo. *Metalen*, v. 13, Aug. 15, 1958, p. 268-272.

See item 637-P, 1958. (P16, X11g; SGA-n)

445-P.* (Polish.) Effect of Plastic Deformation on the Properties of Transformer Sheet. Georg Juretzek. *Hutnik*, v. 26, Mar. 1959, p. 98-105.

Ingot specimens of four melts of steel with 2.73, 3.21, 3.87 and 4.40% Si were hot rolled, heated, cold rolled and reheated in hydrogen and in vacuum, 2-5 hr. at 800-1100° C. Magnetic properties of electrical steel sheet; effect of vacuum heat treatment and rolling. 7 ref. (P16, F23, 3-68, 2-64; SGA-n, 4-53, AY)

446-P. Effect of Molybdenum on the Overpotential of Copper Deposition. H. R. Skewes. *Australian Journal of Applied Science*, v. 10, Mar. 1959, p. 85-94.

Addition of 20 mg. per liter Mo^{VI} to an acid Cu sulphate electrolyte containing 40 g. per l. Cu and 50 g. per.l H_2SO_4 resulted in a decrease in the cathode overpotential of 40 millivolts during electrolysis at 24 milliamps. per sq. cm. and 30° C. 19 ref. (P15; Cu, *Mo*)

447-P.* Studies on Industrialization of "MT" Permanent Magnets. Tokushichi Mishima and Noboru Makino. *Tetsu-to-Hagane Abstracts*, no. 7, 1957, p. 2-12.

New magnet steel is an Fe-Al-C ternary alloy and does not contain rare metals. It has magnetic properties nearly equal to a middle-cobalt magnet steel with intermediate quality between Alnico and Cr magnet steel. Chemical composition; heat treatment; microstructure and phase diagram; magnetic properties; magnetic stability; industrial applications. (P16, X11g; Fe-b, *C, Al*, SGA-n)

448-P.* Single Crystal Anisotropy and Magnetostriction Constants of Several Ferromagnetic Materials Including Alloys of NiFe, SiFe, AlFe, CoNi and CoFe. R. C. Hall. *Journal of Applied Physics*, v. 30, June 1959, p. 816-819.

Effects of order-disorder reaction on these properties in Fe, Ni and a wide range of binary and tertiary alloys. 31 ref. (P16b, N10, 3-72, 2-60; Fe-b, Ni-b, *Si, Co, Mo, Al*, 14-61, SGA-n)

449-P. The Examination and Evaluation of Irradiated Thorium-11 w/o Uranium

Specimens. John E. Gates, Gerald E. Lamale and Ronald F. Dickerson. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-1334, Apr. 16, 1959, 40 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Swelling of all specimens appeared to be a linear function of burn-up to the highest level studied (1.5 total a/o) and at temperatures below about 1100° F. Swelling increased significantly above 1100° F., even at burn-ups as low as 0.2 a/o. Fission gas losses were due to diffusion and recoil. 5 ref. (P10d, 2-67; Th-b, *U*)

450-P.* Electron Cloud Outside a Metal Surface. Ragnar Holm. *Journal of Applied Physics,* v. 30, May 1959, p. 792-793.

Estimations of attraction between parallel metal surfaces produced by electron clouds. 4 ref. (P15j)

451-P.* (Spanish.) Spoiling of F-233 Permanent Magnet Steel Alloyed With Tungsten. J. Terraza and J. M. Bermudez de Castro y Mosquera. *Instituto del Hierro y del Acero,* d. 12, Jan-Mar. 1959, p. 46-64.

Magnetic properties of steel alloyed with 5.50-6.50% W in spoiled and recovered conditions and relation of structural changes caused by heat treatment. Influence of composition of magnetic properties. 52 ref. (P16, 2-60, 2-64; AY, *W*, SGA-n)

452-P.* (Rumanian.) Semiconductor Properties of Antimony-Zinc Alloys. M. Protopopescu, D. Crimer, E. Fokt and T. Dulamita. *Studii si Cercetari de Metallurgie,* v. 4, no. 1, 1959, p. 33-57.

Thermo-electric properties are determined for various compositions and structures. Microhardness is influenced by the distribution of phases. Relationship between electromotive force and conductivity. 24 ref. (P15g, Q29q, 2-60, 3-71, M24b; Sb-b, *Zn*)

453-P.* (Ukrainian.) Electrical Resistance of Cast Iron at High Temperatures. V. K. Titov and V. S. Vanin. *Dopovidi Akademii Nauk Ukrainskoi R.S.R.,* v. 4, no. 4, 1959, p. 396-398.

Electrical resistance of white cast iron during graphitization, when heated above critical temperature, remains unchanged. At temperatures below the critical point the lower electrical resistance, as influenced by graphitization, becomes more obvious the lower the temperature at which the Rho phase of cast iron exists. (P15g, N8s, 2-61; CI)

454-P.* Nuclear Relaxation in Aluminum. John J. Spokas and Charles P. Slichter. *Physical Review,* v. 113, Mar. 15, 1959, p. 1462-1472.

Nuclear spin-lattice relaxation time and phase memory times measured in 99.99% pure Al foil from 77° K. to the melting point by the spin-echo method. Data on high-temperature resonance. The line narrowing which occurs at 330° C. is examined. 28 ref. (P16f, 2-62; Al, 4-56)

455-P.* Magnetic Field Dependence of the Surface Impedance of Superconducting Tin. M. Spiewak. *Physical Review,* v. 113, Mar. 15, 1959, p. 1479-1494.

Surface impedance at 1 kmc. per sec. of Sn investigated as a function of temperature and static magnetic field. 18 ref. (P16, 2-61; Sn, 4-61)

456-P.* Nuclear Spin Relaxation in Normal and Superconducting Aluminum. L. C. Hebel and C. P. Slichter. *Physical Review,* v. 113, Mar. 15, 1959, p. 1504-1519.

Measured in Al from 0.94° K. to 4.2° K., and as a function of static field in the normal state. 27 ref. (P16f, 2-63; Al)

457-P.* (French.) Deformation of Irradiated Fuel Elements. Ch. Allain and P. Thome. *Revue de Metallurgie,* v. 56, May 1959, p. 443-450.

Radiation induced surface deformation, growth, variations in density, expansion and swelling, bowing and cracking tendencies in uranium and uranium alloy fuel elements. 36 ref. (P10d, T11g, 2-67; U)

458-P.* (German.) Effect of Alpha-Irradiation on the Electron Structure of Aluminum. E. Schmid. *Osterreichische Akademie der Wissenschaften-Mathematisch-Naturwissenschaftliche Klasse-Anzeiger,* v. 95, no. 1-15, 1958, p. 186-189.

The decrease of conductivity following irradiation is explained by a reduced mobility of electrons and a decrease in the number of holes. 4 ref. (P15, 2-67; Al)

459-P.* (German.) The Law of Magnetic Convergence Studied in Single Crystals of Nickel and Nickel-Cobalt Following Plastic Deformation. Helmut Kronmuller. *Zeitschrift fur Physik,* v. 154, no. 5, 1959, p. 574-600.

Ferromagnetic saturation measurements after tensile deformations at room temperature and at -183° C. The increase in differential susceptibility with the degree of deformation is explained

by the magnetostrictive effect of dislocations that are produced as a result of the deformation. 25 ref. (P16, M26b, 3-68; Ni, Ni-b, *Co*, 14-61)

460-P.* (Rumanian.) Properties of Cast Iron. V. P. Ciornobrovkin. *Studii si Cercetari de Metalurgie*, v. 4, no. 1, 1959, p. 7-19.

Relationships between cooling from the liquid state, contraction and electrical resistance; data on structural changes. (P10c, P15g, N12; CI)

461-P.* (Rumanian.) Influence of Manganese on the Contraction of Solidifying Cast Iron. L. Sofroni and C. Cosneanu. *Studii si Cercetari de Metallurgie*, v. 4, no. 1, 1959, p. 21-32.

Gray cast iron with varying Mn and P content tested for contraction, structural changes, hardness, initial dilation and contraction before pearlite formation. (P10c, N12, Q29n, 2-60; CI-n, *Mn, P*)

462-P.* (German.) Mathematical Calculation of Heat Flow for the Heating and Cooling of Finite Solid Cylinders Applicable to the Heat Treatment of Large Forgings. Heinz Uhlitzsch. *Neue Hutte*, v. 4, May 1959, p. 277-287.

Theoretical calculations allowing conclusions on stresses present in ingots, castings, and forgings during heat treatment. 13 ref. (P11, Q25p, J-general; ST, 5-60, 4-51, 5-59)

463-P.* (German.) Effect of Alpha-Irradiation on the Electron Structure of Aluminum. W. Kapp and F. Stangler. *Zeitschrift fur Physik*, v. 154, no. 4, 1959, p. 486-494.

Computation of the number and mobility of electrons and holes and of their partial conductivities, based on the Hall constant and on electrical conductance. Irradiation and measurements were carried out in a liquid air bath. (P15, 2-67; Al)

464-P.* Activities of Silica and Alumina in Molten $CaO\text{-}SiO_2Al_2O_3$ Slags. K. Sanbongi and Y. Omori. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 10 p.

Activities of silica and alumina in molten slags at 1630° C. calculated from electromotive force of reversible cells. 6 ref. (P12b, D11n; RM-q)

465-P.* Measurements of the Viscosity of Undercooled Molten Metals. Gilbert Cavalier. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 12 p.

Viscosity of molten Sn, Cu, Fe, Co and Ni in pure argon. 24 ref. (P10f; Sn, Cu, Fe, Co, Ni, 14-60)

466-P.* Thermodynamic Study of Iron Sulphide-Iron Oxide Melts. Sigmund Bog and Terkel Rosenqvist. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 7 p.

Composition of iron sulfide-iron oxide melts equilibrated at 1120-1400° C. with ternary gas mixture, hydrogen, + hydrogen sulfide, + water vapor. Calculation of activities. 3 ref. (P12, M24c; Fe, *O, S*, 14-60)

467-P.* Densities of Molten Silver, Copper and Iron. G. Urbain and L. D. Lucas. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v. 2. Her Majesty's Stationery Office, London, 1959, 10 p.

Determination of densities and coefficients of volumetric expansion from difference in least pressure needed to release bubble of argon from end of a tube in each of two depths of immersion. 25 ref. (P10a, P11g; Ag, Cu, Fe, 14-60)

468-P.* High-Temperature Enthalpy of Gamma and Delta Pure Iron. Michel Olette and Albert Ferrier. Paper from "Physical Chemistry of Metallic Solutions and Intermetallic Compounds", v, 2. Her Majesty's Stationery Office, London, 1959, 11 p.

Results of measurements obtained with an adiabatic drop calorimeter on a specimen of 99.97% Fe. 21 ref. (P12r, N6p; Fe-a)

469-P.* (German.) Iron and Lead Interface Reactions. E. Pelzel. *Metall*, v. 13, June 1959, p. 552-554.

Conditions at the interface of a binary system consisting of molten Pb and solid Fe. Addition of alloying elements to the melt affects solubility of Fe in Pb. Wetting, surface tension, angle of contact and interface bond-strength discussed as a function of Sn and Sb content. 6 ref. (P13h, P12e; 14-60, Pb, Fe, Sn, Sb)

470-P.* (Russian.) Magnetic Properties of Some Copper-Nickel-Iron Alloys. D.

Balli and A. Glodyani. *Revue de Physique Academie de la Republic Populaire*, v. 3, Feb. 1959, p. 132-139.

Residual magnetism of isothermally treated Cu-Ni-Fe alloys increases proportionately to increases in tempering time, reaching 400 Gauss units, depending on the alloy composition. The magnitude of residual magnetism for any given Ni content is determined by the relative Fe-Cu concentration. 13 ref. (P16, 2-60, 2-64; Cu-b, Fe, Ni)

471-P. (Czech.) Porosity Tests on Lacquer-Coated or Tinned Surface of Sheet Metal Used in Food Preservation. Alena Hrabakova-Zvonickova. *Obaly*, no. 4, July-Aug. 1958, p. 108-109.

Colorimetric and electrolytic testing methods. 9 ref. (P10m, S13a; 4-53, 8-62, 8-65, NM-g)

472-P.* (Germaa.) Magnetic After-Effects in Fe-Si Alloys at Elevated Temperatures. H. D. Dietze. *Technische Mitteilungen Krupp*, v. 17, May 1959, p. 67-81.

Initial permeability of Fe-Si alloys decreases following demagnetization at temperatures above 300° C. This phenomenon is interpreted as the diffusion of vacancies into the Bloch wall. The higher potential in the wall leads to a drop in permeability. (P16q, 2-62; Fe-b, *Si*)

473-P.* (German.) Change of Initial Permeability With Temperature in the MnO-ZnO-FeO-$FeZnO_3$ System. W. Heister. *Technische Mitteilungen Krupp*, v. 17, May 1959, p. 82-89.

A second peak is formed in the graph of permeability versus temperature for Mn-Zn ferrites. This is due to the magnetic after-effect and largely depends on the FeO excess in the system. Sintering temperature and atmosphere are influencing factors. 8 ref. (P16q; NM-a34, Fe, *Mn, Zn, O*, 6-72)

474-P.* (German.) Magnetic Materials. H. Fahlenbrach. *Technische Mitteilungen Krupp*, v. 17, May 1959, p. 95-99.

Magnetization and demagnetization curves for an assortment of materials. Magnetization is influenced by direction in the monocrystal and is determined either by rotation of magnetization vectors or by displacement of Bloch walls. 8 ref. (P16; SGA-n)

475-P.* (German.) Effects of the Surface Structure of Electrodes on Current Density and Potential. Heinz Sudermann. *Archiv fur das Eisenhuttenwesen*, v. 30, June 1959, p. 371-380.

Mathematical considerations on the effects of surface roughness, geometrical shape and of surfaces composed of two or more phases. 20 ref. (P15m, 3-73, 3-71)

476-P. (Book-German.) Magnetic Materials (Gmelin's Handbook for Inorganic Chemistry. Iron System no. 59, Pt. D Supplementary Volume.) Gmelin Institut, Frankfurt am Main. Verlag Chemie, GmbH., Weinheim/Bergstrasse, 1959, 580 p.

Properties of ferromagnetic elements and alloys including Fe, Fe alloys, Co and Co alloys, Ni and Ni alloys, Cr alloys and permanent magnet alloys. Data on ferrospinels, iron oxides, M-Fe-oxides and M-M-Fe oxides. (P16; Fe, Co, Ni, Cr, *O*, SGA-n, 14-68)

477-P.* (Russian.) Passivation of Platinum Electrode. E. T. Aikazyan. *Zhurnal Fizicheskoi Khimii*, v. 33, May 1959, p. 1016-1022.

Passivation in HCl, HBr, H_2SO_4, $HClO_4$ and NaOH solutions showed that the process is associated with a fall in the number of pits of the electrode surface, caused by the specific adsorption of anions which lowers the Pt-H bond energy. 16 ref. (P15, R10c; Pt)

478-P.* (French.) Electrochemical Behavior of 18-8 Austenitic Stainless Steel With Molybdenum in Dilute Sulphuric Acid. Philippe Berge. *Comptes Rendus*, v. 248, June 22, 1959, p. 3557-3559.

Polarization of samples in 20% H_2SO_4. Depassivation process and dissolution potential are retarded in steels containing approximately 3% Mo. (P15m, R6g, 2-60; SS-e, *Mo*)

479-P.* (German.) Undercooling Behavior of Tin, Affected by Vibrations. Friedrich Erdmann-Jesnitzer and Jochen Schubert. *Neue Hutte*, v. 4, June 1959, p. 359-365.

Sn melt containing impurities shows no anomaly in its undercooling behavior when exposed to vertical vibrations of 40 to 70 Hz. at temperatures above the solidification point of Sn, while vibration at temperatures close to the solidification point causes slight undercooling. 26 ref. (P12n, 3-69; Sn, 14-60)

480-P. (Russian.) Thermodynamic Properties of Binary Metallic Systems by Electromotive Force Technique. A. V. Nikol'skaya,

A. L. Lomov and Ya. I. Gerasimov. *Zhurnal Fizicheskoi Khimii*, v. 33, May 1959, p. 1134-1139.

12 ref. (P12, M24b)

481-P.* (French.) Crystallization of Al-Al_2Cu Alloys. Claude Mascre and Aleth Touguet. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, June 1959, p. 1-13.

Structural changes and thermodynamic properties of Al-Cu alloys with and without Ti additions (up to 1%). Solidification and undercooling are affected by the composition ratio. The undercooling effect decreases with the addition of Ti. 19 ref. (P12n, N12, M27d, 2-60; Al-b, *Cu, Ti*)

482-P.* (Russian.) Stability of Zinc-Base Alloys. V. I. Veprintsev and A. G. Spasskii. *Liteinoe Proizvodstvo*, June 1959, p. 18-20.

Dimensional changes in Zn-base die castings are caused by the decomposition of unstable phases and the occurrence, during rapid casting, of intercrystalline corrosion. It was found that admixtures of 0.3-0.8% Pb, Cd and Sn present in Zn have no remarkable influence on the change of dimensions. Stabilized heat treatment reduces these changes. 11 ref. (P10d, R2h, 2-64, 2-60; 5-61, Zn-b, *Pb, Cd, Sn*)

483-P.* Ultrasonic Attenuation by Electrons in Metals. Eugene I. Blount. *Physical Review*, v. 114, Apr. 15, 1959, p. 418-436.

Calculation of ultrasonic attenuation for arbitrary frequency and band structure. The results are applied to the cases of a metal with a spherical energy surface and a semimetal with electrons in two "valleys". Possible experimental uses and the occurrence of saturation. (P15)

484-P.* (English.) The Delta E Effect in Iron-Nickel Alloys. Mikio Yamamoto. *Tohuku University, Science Reports of the Research Institutes*, Series A, v. 11, Apr. 1959, p. 102-119.

Variation in Young's modulus of elasticity with magnetization for annealed Fe-Ni alloys covering whole range of compositions. Density and magnetic characteristics. 32 ref. (P16, P10a, Q21a, Q27a; Fe-b, *Ni*)

485-P.* (Chinese.) The Rectangular Hysteresis Loop of Grain-Oriented Nickel-Iron Alloy. Tai Li-chi and Liu Ren-Pao. *Acta Metallurgia Sinica*, v. 4, Mar. 1959, p. 60-68.

D-c and a-c. methods for measuring magnetic properties of 50% Ni-Fe alloy. The ratio between remanence and magnetic saturation induction, and the coercive force is taken as a criterion for assessing the magnetic characteristics of the alloy. (P16a; Ni-b, *Fe*)

486-P.* (German.) Behavior of Electrical Measuring Strips Used to Control Elongation When Exposed to Radiation. H. Buhler and W. Schreiber. *Atomkern-Energie*, v. 4, no. 4, 1959, p. 138-140.

Commercial measuring strip was exposed to neutron irradiation. Insulation resistance decreases while the resistance of Ni-Cr wire increases with irradiation time. Constantan wire showing slighter resistance changes is preferred. 15 ref. (P15g, X28j, 2-67; Ni-b, Cu, U)

487-P.* (German.) Behavior of Hydrogen Present in Iron and Iron Alloys Investigated by Magnetic Measurements. Friedrich Erdmann-Jenitzer and Irmtraud Bohm. *Materials Testing*, v. 1, Feb. 20, 1959, p. 43-53.

Relay sheet, deep drawing sheet and dynamo sheet were made the cathode in a H_2SO_4 electrolyte exposing them to the action of hydrogen. Effects of hydrogen, previous deformation and Si content on coercivity. 11 ref. (P16a, 2-60, 3-68; ST, 4-53, *H, Si*)

488-P. An Experimental Determination of the Increase With Temperature of the Resonance Absorption in Uranium and Thorium. V. G. Small. *United Kingdom Atomic Energy Authority*, AERE R/R 2774, Apr. 1959, 25 p.

Measurements made with the DIMPLE pile oscillator of the change in the effective resonance absorption integral of U and Th bars of various diameters produced by heating the bars to temperatures up to 270° C. Experimental data interpreted in terms of Doppler temperature coefficients of the resonance integral. 27 ref. (P18m, 2-61; U, Th)

489-P. The Preparation and Properties of 14 to 17% Aluminum-Iron Alloys. A. Foster and D. Pavlovic. Westinghouse Electric Corp. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151472, May 1958, 41 p. $1.25.

Mechanical, physical and magnetic properties of Al-Fe alloys. Effects of heat treatment on magnetic properties. Potential applications. (P16, Q-general, 2-64; Fe-b, *Al*, SGA-n, 17-57)

490-P. Effect of Temperature on the A-C Magnetic Properties of Nickel-Iron Alloys.

J. J. Clark and J. F. Fritz. Westinghouse Electric Corp. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151601, Aug. 1958, 44 p. $1.25.

Magnetic properties studied on Hipernik, Hipernik V, Deltamax, Hymu 80, Supermalloy and 4-79 Mo-Permalloy for temperatures from -60 to 250° C. (P16, 2-61; Fe-b, *Ni*, SGA-n)

491-P.* The Properties of Metals at Low Temperatures. H. M. Rosenberg. Paper from "Progress in Metal Physics" v. 7. Pergamon Press Inc., New York, 1958, p. 339-389.

Effect of low temperature on thermal conductivity, creep, fatigue and specific heat of some dozen metallic elements. 192 ref. (P11h, P12r, Q3, Q7a, 2-63)

492-P.* (German.) Physical Properties of Pure Copper. F. Pawlek. *Metall*, v. 13, July 1959, p. 630-637.

Resistivity is affected by imperfections resulting from cold deformation, irradiation or quenching and varies both with the kind and amount of impurities. (Research at Institut fur Metallhutten kunde der Technischen Universitat, Berlin.) 44 ref. (P15g, 3-68, 3-69, 2-67; Cu-a)

493-P.* (Italian.) Surface Quality of Nonferrous Castings. *Fonderia*, v. 8, June 1959, p. 239-242.

Factors influencing surface roughness. (P13h, S15; EG-a38, 5, 9-71)

494-P. The Heats of Combustion of Some Rare-Earth Metals. F. H. Spedding, R. E. Eberts and A. W. Naumann. Ames Laboratory. *U. S. Atomic Energy Commission*, ISC-934, May 15, 1959, 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

A bomb calorimeter is used for measuring the heats of combustion of Nd, Sm, Gd and Er. (P12q; Nd, Sm, Gd, Er, EG-g)

495-P. Synthesis of a (110) 001 Type Torque Curve in Silicon Iron. C. G. Dunn and J. L. Walter. *Journal of Applied Physics*, v. 30, July 1959, p. 1067-1072.

Orientations and sizes of all the grains in a polycrystalline disk specimen of high-purity 3.25% silicon iron are measured to determine a calculated magnetic torque curve and the texture of the specimen. 11 ref. (P16, 3-72, 3-73; Fe-b, *Si*)

496-P.* Magnetic Annealing in Permivar. Pt. 2. Magnetic Properties. E. A. Nesbitt and R. D. Heidenreich. *Journal of Applied Physics*, v. 30, July 1959, p. 1000-1003.

Magnetic anisotropy introduced by heat treatment in a magnetic field arises either from short-range order within the faults or from the arrangements of the faults each of which is parallel to a (111) into regions whose shape anisotropy is along the direction of the magnetic field. 11 ref. (P16, J23, 2-60; Ni-b, *Fe, Co*, SGA-m)

497-P.* Effect of Neutron Irradiation on Thermally and Mechanically Induced Non-equilibrium States in AuCu. R. L. McCollum and G. Allen. *Journal of Applied Physics*, v. 30, July 1959, p. 1105-1108.

In thermally disordered specimens, the effect of the irradiation decreased the resistivity in completely disordered states and increased the resistivity in completely ordered states. The effect on mechanically disordered specimens was to increase the resistivity. 14 ref. (P16, 2-67; Au-b, Cu, 14-68)

498-P.* On the Electrical Conductivity of Metals. G. V. Chester and A. Thellung. *Physical Society, Proceedings*, v. 73, May 1, 1959, p. 745-766.

Application of Van Hove's techniques for quantum mechanical transport problems to the derivation of conductivity formulas without use of repeated random phase assumption. 14 ref. (P15g)

499-P.* Effect of Copper on the Work Function of Liquid Tin. T. C. Toye. *Physical Society, Proceedings*, v. 73, May 1, 1959, p. 807-810.

Photo-electric work function of liquid Sn containing up to 1% Cu determined by measurement of stopping potential when surface is irradiated by light from Sn spark. 6 ref. (P15k, 2-60; Sn-b, *Cu*, 14-60)

500-P.* Permanent Magnet Materials. F. Anselin. *Cobalt*, v. 3, June 1959, p. 17-27.

Basic magnetism, domain theory and explanation of magnetic properties in Co alloys. (To be continued.) (P16; Co-b, SGA-n)

501-P. Effects of Neutron-Induced Gas Formation on Beryllium. C. E. Ells and E. C. W. Perryman. *Journal of Nuclear Materials*, v. 1, Apr. 1959, p. 73-84.

Density decrease observed after the annealing of Be, previously exposed to irradiation, is attributed to the growth of voids containing He^4. 15 ref. (P10a, 2-67, 2-64; Be, *He*)

502-P. Heat Capacity of Copper Below 300° K. A Test of Two Calorimeter Designs. Thomas A. Sandenaw. Los Alamos Scientific Laboratory. *U. S. Atomic Energy Commission*, LA-2307, Mar. 1959, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Values for the heat capacity of OFHC Cu are given to show the reliability to be expected from determinations of heat capacity of elements in which the self-heating by radioactive disintegration is appreciable and can be used as the sole source of heating. (P12r, X24e; Cu)

503-P.* Electrochemical Properties of the Platinum Metals. M. J. N. Pourbaix, J. Van Muylder and N. de Zoubov. *Platinum Metals Review*, v. 3, July 1959, p. 100-106.

Ir, Pd, Rh and Ru potential-pH diagrams for study of electrochemical and corrosion properties. 14 ref. (P15, R-general; Ir, Pd, Rh, Ru, EG-c)

504-P.* (French.) Sulphur Adsorption by Copper Surfaces at Elevated Temperatures. Jacques Oudar. *Comptes Rendus*, v. 249, July 6, 1959, p. 91-93.

Adsorption of sulphur from a $H+H_2S$ atmosphere at 830° C. and 10 cm. M.C. pressure. The surface activity varies with the ratio $H:H_2S$. 5 ref. (P13d, 3-74, 2-66; Cu, *S*)

505-P.* (Czech.) Surface Tension of Liquid Metals and Slags. Ivan Kasik and Jiri Skala. *Hutnicke Listy*, v. 14, July 1959, p. 602-608.

Various methods applied in surface tension measurements. Values for the surface tension of various slags and alloy steels at a certain temperature. 8 ref. (P13h, 2-60; AY, 14-60, RM-q)

506-P. (Russian.) Radiation Capacity of Metal in a Liquid Phase. A. M. Samarin and D. Ya. Svet. *Doklady Akademii Nauk SSSR*, v. 126, Jan. 1959, p. 78-80.

15 ref. (P18n, 14-60)

507-P. (Russian.) Thermodynamic Properties of Liquid Metallic Solutions in the Magnesium-Lead System. M. F. Lantratof. *Zhurnal Neorganicheskoi Khimii*, v. 4, June 1959, p. 1415-1419.

6 ref. (P12s; Mg-b, *Pb*, 14-61)

508-P.* (English.) Reflection of Light From a Metal With a Thin Interfering Nonmetallic Film. Antonin Vasicek. *Czechoslovak Journal of Physics*, v. 9, no. 3, 1959, p. 296-300.

Influence of the thickness of an Al_2O_3 film on the azimuth and the phase difference. (P17a; Al, 14-62, 14-68)

509-P.* (English.) The Susceptibility of Lead Telluride PbTe. Milos Matyas. *Czechoslovak Journal of Physics*, v. 9, no. 3, 1959, p. 301-308.

Susceptibility measurements carried out with PbTe samples of n-type or p-type semiconductor properties, containing either an excess of Pb or Te, or Cl or Ag^+ ions as impurities. 11 ref. (P16; EG-j, Pb-b, *Te, Cl, Ag*)

510-P.* (German.) Electron Emission of Thin Aluminum Platings. Vaclav Strelka. *Czechoslovak Journal of Physics*, v. 9, no. 3, 1959, p. 377-378.

Emission of thin Al layers on mica occurring at various temperatures in CH_2 + Ar and C_2H_5OH + Ar atmospheres of low pressure. (P15k; Al, 14-62)

511-P.* (Russian.) Influence of an Alternating Magnetic Field on the Remanence of Magnetically Soft Materials. Vladimir Hajko, Juraj Daniel-Szabo. *Czechoslovak Journal of Physics*, v. 9, no. 1, 1959, p. 37-46.

Ring-shaped sheets of Ni, Permally, transformer steel and two ferrites are exposed to an alternating field to study the remanence as a function of the field amplitude. 5 ref. (P16a; Ni, CN, SGA-n, 4-53)

512-P.* (Russian.) Determination of the Reflection Coefficient. Frantisek Lukes. *Czechoslovak Journal of Physics*, v. 9, no. 1, 1959, p. 118-123.

Measurement of the reflection coefficient for Ge in ultra-violet and visible light. 7 ref. (P17a; Ge)

513-P. (English.) Energy Balance in the Optics of Metals. Zdenek Knittl. *Czechoslovak Journal of Physics*, v. 9, no. 2, 1959, p. 133-145.

10 ref. (P15k)

514-P. (English.) Measurement of Hall Coefficient and Electrical Conductivity in Semi-Conductors by Method of an Alternating Current. Jan Dusek. *Czechoslovak Journal of Physics*, v. 9, no. 2, 1959, p. 250-255.

6 ref. (P15p, P15g; EG-j)

515-P.* Activity of Cd in Mg-Cd Alloys. Richard J. Borg and C. Ernest Birchenall. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 393-395.

Vapor pressures of eight compositions determined by the Knudsen effusion technique. Measurements are made at several temperatures for each alloy and the results interpolated to a common temperature for the calculation of the activities. 8 ref. (P12c, P12b; Mg-b, *Cd*)

516-P.* Heat Content and Specific Heat of WC-Co Alloys. H. J. Booss. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 395-397.

Mean specific heat in the temperature range from 20 to −190° C. Deviations of the individual values exclude construction of a correlation between specific heat and Co content with satisfying exactness. There seems to be a minimum of the specific heat up to 5% Co. 6 ref. (P12r; W, Co, 6-69)

517-P.* (French.) Effect of Oxygen on the Electrochemical Behavior of Stainless Steel in Dilute Sulphuric Acid. Phillippe Berge. *Comptes Rendus*, v. 249, July 15, 1959, p. 262-264.

Electrodes of 18-8 stainless steel with 3% Mo are exposed to a voltage in the electrolyte with dissolved oxygen present or absent. Effects of oxygen on the current intensity and on the passivation process. 6 ref. (P15, R10c, R1a, R6g; SS, *Mo, O*)

518-P.* Solubility of Thorium Dihydride in Thorium Metal. D. T. Peterson and D. G. Westlake. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 444-447.

Solubility increases from about 1 at.% at 300° C. to above 20 at.% at 800° C. Over this temperature range the log of the solubility is a linear function of the reciprocal absolute temperature for Th of good purity. The heat of solution of thorium dihydride is 7.9 k-cal. per atom of hydrogen in crystal bar Th and 6.6 k-cal. per atom of hydrogen in Ames Th. (P12e, 2-61; Th)

519-P.* The Isothermal Transfer From Solid to Liquid in Metal Systems. J. M. Lommel and B. Chalmers. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 499-508.

Isothermal transfer of material from solid Pb into liquid Pb-Sn alloys. When there is no stirring of the liquid the process is controlled by liquid diffusion, while at high stirring rates it is controlled by a surface reaction. The activation energy for the surface reaction was 2 ±1 k-cal. per mole, as predicted by a kinetic theory of melting and freezing. 21 ref. (P12; Pb-b, *Sn*)

520-P. (Book.) The Properties of the Rare Earth Metals and Compounds. John A. Gibson, James F. Miller, Paul S. Kennedy and George W. P. Rengstorff. 197 p. May 1959. Battelle Memorial Institute, 505 King Ave., Columbus 1, Ohio.

Collected properties of rare earth elements and compounds; phase diagrams of rare earth elements; properties of some 16 rare earth elements and their components. (P-general, Q-general, M24; EG-g)

521-P.* Temperature Dependence of Residual Magnetization in Alnico V. Yoshikichi Konishi and Kazuo Yamakawa. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 74.

Change in residual magnetization of Alnico V with temperature between +60 and -60° C. (P16, 2-61; Al-b, *Ni, Co, Fe*)

522-P. Magnetostriction in Iron and Silicon Steel. Eiji Tatsumoto, Tetsuhiko Okamoto, Akinori Mishimura and Akira Fukai. *Hiroshima University, Journal of Science*, v. 22, Sept. 1958, p. 120-135.

(P16b; Fe-b, AY, *Si*)

523-P. Redetermination of the Lead-Lead Sulphide Equilibrium Between 585 and 920° C. J. R. Stubbles and C. E. Birchenall. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 535-538.

Equilibrium between lead-lead sulphide and circulating atmospheres of hydrogen and hydrogen sulphide measured between 585 and 920° C. The equilibrium atmospheres were analyzed by an iodometric method. Angles between the crystallographic planes were calculated for In. (P12d; Pb)

524-P.* (French.) Hall Effect of Thin Nickel Films. Antoine Colombani and Guy Goureaux. *Comptes Rendus*, v. 249, July 20, 1959, p. 381-383.

Measurements in a vacuum on Ni films obtained by evaporation. Hall effect varies with thickness of film and testing temperature. (P15p, 2-61, 3-73; Ni, 14-62)

525-P.* (French.) Variations of the Coefficient of Secondary Emission by the Enery of Bombarding Ions. Pierre Cousine, Nicole Colombie, Charles Fert and Rene Simon. *Comptes Rendus*, v. 249, July 20, 1959, p. 387-389.

Bombardment of Al, Pb, Mo and Cu with A^+ and H^+ ions. Secondary emission coefficient varies with the metal and the kinetic energy of ions. 6 ref. (P15k, 2-60; Al, Pb, Mo, Cu)

526-P. (French.) Method for the Determination of Adiabatic Shock and Its Application to Metals. Jean Jacquesson. *Comptes Rendus*, v. 249, July 20, 1959, p. 369-371.

5 ref. (P12r)

527-P.* (English.) Thermostatic Bimetal. *Aciers Fins et Speciaux*, no. 32, July 1959, p. 42-47.

Increase in the specific deflection of the bimetal results in increased sensitivity for same length and thickness, reduced bulk, increased work output or forces developed. Good results are obtained by Fe-Ni-Co alloys in which the deflection gain is 30-50%. Double helicoidal bimetal design assured a linear expansion. (P11g, X9q; Fe-b, *Ni, Co*, SGA-s, 8-66)

528-P. Nuclear Irradiation Effects on Ferromagnetic Core Materials. R. S. Sery and D. I. Gordon. U. S. Naval Ordnance Laboratory. *U. S. Office of Technical Services*, PB 151174, June 1958, 72 p. $2.

The highest permeability, lowest coercive force materials, such as Supermalloy and 4-79 Mo Permalloy, were degraded drastically by irradiation. Materials such as Mumetal, grain-oriented 50-50 Ni-Fe and 48 Ni-Fe also deteriorated appreciably, but to a lesser degree. Least damage was shown by Si-Fe, Al-Fe and 2 V Permendur. (P16, 2-67; Ni-b, *Fe*, Fe-b, *Si, Al*, SGA-n)

529-P. Thermal Properties of Certain Metals. Pt. 2. Iron, Beryllium, Iridium, Palladium, Platinum and Tungsten. T. C. Goodwin, Jr., and M. W. Ayton. Library of Congress. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151679, Sept. 1958, 321 p. $5.

Bibliography of references, with abstracts, to pertinent open literature published from 1920 to 1957, and to unclassified military research reports issued from about 1944 to 1957. Among the thermal properties included are heat capacity, thermal conductivity, emissivity, thermal diffusivity and thermal expansion. (P11; Fe, Be, Ir, Pd, Pt, W)

530-P. The Effect of Radiation on the Physical and Mechanical Properties of Metals and Alloys. Stanley Wallack. *Wright Air Development Center*, Technical Report no. 68-605, Feb. 1959, 30 p.

Results of fast neutron irradiation of Al 1100, Al SAP, Al 2024-O, Al 2024-T3, Ti 75A and Ti 6A1 4V alloys. 7 ref. (P-general, Q-general, 2-67; Al-b, Ti-b, *Al, V*)

531-P.* Properties of Various Semiconductors. A. Joffe. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 6-14.

Thermal conductivity as a function of electrical conductivity. Thermal resistivity, Hall constant and electrical conductivity as a function of testing temperature. Carrier mobility of semiconducting mixtures varying with the concentration of a component. (P15g, P15p, P11h, 2-61, 2-60; EG-j)

532-P.* Binding and Semiconductor Properties of $A^{III}B^{V}$ Compounds. O. G. Folberth and H. Welker. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 14-20.

Polarization of valence electrons is thought to increase with increasing B^{V}-ions, with the chemical bond and with the mean atomic weight. Lattice potential as a function of polarization. 18 ref. (P15, 2-60; EG-j)

533-P.* Studies on the Recombination of Electrons and Holes in Germanium. S. G. Kalashnikov. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 52-59.

Lifetime of nonequilibrium charge carriers in Al, B, P and Cu-doped Ge as a function of equilibrium carrier concentration. 26 ref. (P15g, 2-60, 3-69; Ge, *Al, B, P, Cu*)

534-P.* Deep Level Impurities in Germanium. W. W. Tyler. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 59-65.

Positions, with reference to the band edges, of deep acceptor levels introduced into Ge by the elements Zn, Cd, Mn, Fe, Co, Ni, Cu, Ag and Au, and of deep donor levels introduced by S, Se and Te. 54 ref.

(P15g, 2-60, 3-69; Ge, *Zn, Cd, Mn, Fe, Co, Ni, Cu, Ag, Au, S, Se, Te*)

535-P.* Giant Traps. Melvin Lax. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 66-73.

Theories explaining the existence of centers of giant (10^{-15} to 10^{-12} sq.cm.), large (10^{-17} to 10^{-15} sq.cm.) and minuscle (10^{-22} sq.cm.) neutron capture cross-sections in Si and Ge containing impurities. 5 ref. (P15g, P18j, 3-69; Si, Ge)

536-P.* Radiative Recombination and Lifetime in Germanium. Patricia H. Brill and Ruth F. Schwarz. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 75-77.

Experiments showing the relationship between the net rate of radiation per unit volume, the equilibrium concentration and excess concentration of carriers. After exposing a Ge semiconductor to light, the recombination radiation and change in resistance were measured. (P15g, P18h, 2-67; Ge, 9-51)

537-P.* Carrier Recombination in Germanium as a Function of Temperature Between 100 and 550° K. S. Goldstein, H. Mette and W. W. Gartner. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 78-80.

Conductivity and photoconductance and the open-circuit photo-magneto-electric (PME) field of Ge crystals are measured as functions of temperature to evaluate the lifetimes. 6 ref. (P15g, 2-61; Ge, 14-61)

538-P.* Effect of Annealing on the State of Certain Impurities in Germanium. V. E. Lashkarev, E. G. Miselyuk and K. D. Glinchuk. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 84-86.

Samples of Ge, doped with Fe, Ni or Co, were annealed and the effect on carrier concentration and lifetime studied. (P15g, 2-64, 3-69; Ge, *Fe, Ni, Co*)

539-P.* The Electrical Structure of Semiconductor Surfaces. A. Many. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 87-96.

Energy distribution and hole and electron capture cross-sections of the fast states in Ge and Si are deduced from field effect and surface recombination measurements. 26 ref. (P15g, P18j, Ge, Si)

540-P.* The Effect of Some Surface Treatments on the Characteristics of Fast States on Germanium Surfaces. E. Harnik and Y. Margoninski. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 96-99.

Influence of etching in various media on the surface combination velocity and trapped charge density. 4 ref. (P15g; Ge)

541-P.* Optical and Magnetic Surface Studies on Germanium. Ralph Bray and R. W. Cunningham. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 99-102.

Remarkable conductance increase after illumination by white light is explained by an increase of electron charge in the slow states inside or on the oxide layer. 6 ref. (P15g, P17, R2r; Ge, *Au, O*)

542-P.* Magneto-Surface Properties of Near Intrinsic Germanium. J. N. Zemel and R. L. Petritz. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 102-105.

Surface conditions are modulated by a cycle consisting of wet, dry and sparked oxygen. The sample is then exposed to a magnetic field to measure Hall coefficient and magnetoresistance as functions of the conductance change. Discrepancies between measured and theoretical results allow the assumption of a diffuse surface scattering mechanism. (P15g, R1h; Ge, 9-51)

543-P.* Effect of the Metal-to-Semiconductor Potential on the Semiconductor Surface Barrier Height. N. J. Harrick. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 106-108.

The infrared intensity transmitted by a Ge sample exposed to infrared light was measured when the etched Ge surface was brought in contact with Hg or Ga. Changes in transmitted intensity are interpreted as changes in surface conductivity and changes in the semiconductor surface barrier height. 4 ref. (P15g, 2-66; Ge, 9-51, EG-j, *Hg, Ga*)

544-P.* Hall Mobility of a Cleaned Germanium Surface. Rolland Missman and Paul Handler. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, 109-111.

The surface of Ge slab is cleaned by argon ion bombardment and annealed in a vacuum at 650° C. The effect of a thin oxygen atmosphere on conductivity and Hall coefficient were measured. (P15g, 2-60; Ge, *O*)

545-P.* Electrical Properties of Clean Germanium Surfaces. G. A. Barnes and P. C. Banbury. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 111-113.

Ge surfaces are exposed to the air after cleaning by bombardment with positive ions from an inert gas discharge and after vacuum annealing. Effects of composition and oxygen contamination on field effect and photoconductance. (P15g, R3, 2-60; Ge, 9-51, *O*)

546-P.* (English.) Magnetostriction Constants of Face-Centered Cubic Nickel-Copper and Nickel-Cobalt Alloys. Mikio Yamamoto and Takuro Nakamichi. *Tohoku University, Science Reports of the Research Institutes,* Series A, v. 11, June 1959, p. 168-182.

Determination of saturation magnetostriction in (110) and (111) directions at room temperature using single crystal disk specimens and strain gage technique. Magnetostriction of Ni alloys containing 7 to 25 at.% Cu or 10 to 55 at.% Co. 20 ref. (P16b, 2-60, 3-73; Ni-b, *Cu, Co*)

547-P.* (English.) Thermocouples With Curved Characteristics Composed of Fe-Al-Cr and Cu-Ni Alloys. Yuki Shirakawa, Toru Ohara and Daiji Amemiya. *Tohoku University, Science Reports of the Research Institutes,* Series A, v. 11, June 1959, p. 190-200.

Thermo-electromotive forces of Fe-Al (up to 8% Al), Fe-Cr (up to 15% Cr), Fe-Al-Cr (up to 6% Al), and 11% Cr and Cu-Ni alloys (up to 5% Ni) between 100-800° C. Characteristics of thermocouples composed of Fe-Al-Cr and Cu-Ni alloys. 10 ref. (P15j, X9q; Fe-b, *Al, Cr,* Cu-b, *Ni*)

548-P.* (German.) Variation in Electrical Resistance of Tungsten Wire at Low and High Temperatures as Dependent on Metal Structure. W. Kleber and G. Kohlstrung. *Technik,* v. 14, Apr. 1959, p. 281-285.

Measurements between 20 and 800° C. indicate that heated and recrystallized wires show a greater variation in electrical resistance than hot drawn wires. Relative deviation in recrystallized specimens increases proportionally with increasing grain size. 9 ref. (P15g, 2-61, 2-59, N5; W, 4-61)

549-P.* (Spanish.) Antiferromagnetism. Victor S. Giron. *Revista de Ciencia Aplicada,* v. 13, May-June 1959, p. 213-221.

General exposition of Neel theory of decomposition of the magnetic lattice into two equal sublattices magnetized in opposite directions. (P16p)

550-P. (Russian.) Calculation of New Nucleus to Measure Pressure of Vapor Saturated Metals. Yu. N. Lubitov and V. M. Polyanskii. *Doklady Akademii Nauk SSSR,* v. 125, Jan. 1959, p. 135-138.

(P12c)

551-P. (Russian.) Heat of Formation of Alloy Calcium-Aluminum. I. V. Kocherov, Yu. M. Gertman and I. V. Gel'd. *Zhurnal Neorganicheskoi Khimii,* v. 4, May 1959, p. 1106-1112.

13 ref. (P12q; Ca-b, *Al*)

552-P.* (German.) Properties of Metallic Melts. Pt. 26. The Internal Friction of Eutectic Aluminum Alloys. Erich Gebhardt and Karl Detering. *Zeitschrift fur Metallkunde,* v. 50, July 1959, p. 379-385.

For alloys with 80-100% Zn and 0-32% Si both the viscosity-concentration isotherms and the graphs representing the activation energy for the viscous flow as a function of concentration show continuity. The viscosity and viscous flow activation energy of alloys with 20-43% Mg are influenced by the presence of the intermetallic compound Al_3Mg_2. 29 ref. (P10f, Q22, 2-61, 2-60; Al-b, *Zn, Si, Mg,* 14-60)

553-P.* (German.) The Specific Volume of Liquid Antimony-Bismuth Alloys. Erich Pelzel. *Zeitschrift fur Metallkunde,* v. 50, July 1959, p. 392-395.

Determination of specific volume in the solid state at room temperature and in the liquid state near 700° C., for alloys with 0-100% Bi. On the Bi side, formation of Bi_3Sb causes dilation; contraction occurs by Sb_3Bi formation on the Sb side. 14 ref. (P10a, 2-60, 2-61; Sb-b, *Bi,* 14-60)

554-P.* (German.) Thermodynamic Activities of Liquid In-Cd Alloys and Formation Enthalpy of the Intermetallic Phase $InCd_3$. Theo Heumann and Bruno Predel. *Zeitschrift fur Metallkunde,* v. 50, July 1959, p. 396-402.

Thermodynamic activities are determined from vapor pressure measurements at 426-580° C. with alloys containing 0-100% Cd. Computation of the formation enthalpy for $InCd_3$, based on the enthalpy change occurring in the dissociation of $InCd_3$, and on the formation enthalpy of the solid solution of high In content. 10 ref. (P12, 2-60, M24b; In-b, *Cd*, 14-60)

555-P.* (Russian.) The Anisotropy of Heat Conductivity in Monoclinic Tellurium. Kh. I. Amirkhanov, G. B. Bagdyev and M. A. Kazhlaev. *Doklady Akademii Nauk, SSSR*, v. 123, Mar. 1959, p. 554-556.

Measurement of the heat conductivity of a monoclinic Te produced in the furnace by slow cooling from 750° K. to room temperature. The anisotropy of heat conductivity is explained by the fact that the direction of the heat flow is perpendicular to the shearing off plane. (P11h, Te)

556-P.* The Effect of Uniaxial Tensile Stress on Impurity Conduction in Germanium. H. Fritzsche. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 257-259.

The conductance of samples was measured for various stresses and temperatures. (P15g, 3-66, 3-69, 2-61; Ge)

557-P.* Absorption Spectra of Group V Donors in Germanium. H. Y. Fan and P. Fisher. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 270-272.

Effect of quantity of Sb impurities on the absorption spectrum for light of 60-170 microns wavelength. 5 ref. (P17c, 3-69; Ge, *Sb*)

558-P.* Far Infrared Magneto-Optic Effects From Impurities in Germanium. W. S. Boyle. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 321-323.

Effect of a magnetic field on the far infrared transmission by Ge single crystals at liquid He temperature. 7 ref. (P16e, 3-69; Ge, 14-61)

559-P.* Microwave Hall Effect in Germanium and Silicon at 20 Kmc/s. G. E. Hambleton and W. W. Gartner. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 329-332.

Determination of the Hall mobility in a d.c. and in a 20 kmc/s field for temperatures from 80 to 500° K. 10 ref. (P15p, 3-69; Ge, Si)

560-P.* (French.) Electromagnetophotomic Effect in Germanium. Maurice Bernard. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 332-337.

An intrinsic Ge-semiconductor sample cut from a crystal is exposed to a magnetic field and simultaneously to an electric field. Infrared emission through recombination transitions is the result. 8 ref. (P15k; Ge)

561-P.* Thermal Conductivity of Germanium in the Temperature Range 300-1080° K. B. Abeles. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 340-343.

Single crystals of n-type Ge were placed between a heater and a sink to measure thermal conductivity. Thermal and electrical conductivities vary with testing temperature. 12 ref. (P11h, P15g, 2-61; Ge, 14-61)

562-P.* Electronic Properties of Gray Tin Single Crystals. A. W. Ewald and O. N. Tufte. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 523-525.

Measurements of conductivity, Hall coefficient, magnetoresistance coefficient and transverse magnetoresistance at temperatures from 4.2 to 273° K. 4 ref. (P15, P16; Sn, 14-61)

563-P.* Measurement of the Galvanomagnetic Effects in Pure Tellurium. H. Roth. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 525-530.

Resistivity and Hall coefficient as functions of temperature. Magnetoresistance as a function of the angle between the current and the magnetic field. 11 ref. (P15p, P16, 2-61; Te-a)

564-P.* (French.) Usefulness of Tests in a High Magnetic Field: Application to Study of Steels. P. Bastien and A. Sulmont. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 131-143.

Apparatus measures intensity of magnetization between 20 and 700° C. in cylindrical specimens about 100 mm. long by 6 mm. diameter, in a variable field of 100 to 3500 oersteds. Fields of application include determination of magnetic phases in a duplex material, such as austenitic-ferritic steel. 19 ref. (P16, X26; ST)

565-P. Electrode Potential Behavior on Titanium in Fluoride Media. E. M. Khairy and M. M. El-Khatib. *Egyptian Journal of Chemistry*, v. 1, no. 1, 1958, p. 65-74.

Fluoride ion exerts a specific activating effect on the metal surface depending on both its concentration and concentration of the hydrogen ion in the solution. (P15; Ti)

566-P. (Russian.) Cathodic Behavior of Stainless Steel in Nitric Acid Solution. E. N. Mirolyubov and M. M. Kurtetsov. *Doklady Akademii Nauk, SSSR*, v. 125, June 1959, p. 1288-1291.

11 ref. (P15; SS)

567-P.* Radiation Effects on Recombination in Germanium. Orlie L. Curtis, Jr. *Journal of Applied Physics*, v. 30, Aug. 1959, p. 1174-1180.

Minority carrier lifetime is studied as a function of temperature and gamma or fission-neutron irradiation and conclusions reached on the recombination process. 30 ref. (P15g, 2-61, 2-67; Ge)

568-P.* High-Energy Electron Irradiation of Germanium and Tellurium. Victor A. J. van Lint and Harold Roth. *Journal of Applied Physics*, v. 30, Aug. 1959, p. 1235-1238.

Effect of irradiation at 78° K. on conductivity and the reciprocal of the Hall coefficient of Te. By annealing, the original conductivity is restored. Irradiation of n-type Ge at room temperature caused first intrinsic properties and then p-type behavior. 8 ref. (P15g, 2-61, 2-64, 2-67; Ge, Te)

569-P.* Heat Capacity of Aluminum Between 0.1° K. and 4.0° K. Norman E. Phillips. *Physical Review*, v. 114, May 1, 1959, p. 676-685.

Heat capacity of Al between 0.11 and 4.0° K. in normal state and between 0.17 and 1.2° K. in superconducting state. 31 ref. (P12r, 2-63; Al-a)

570-P.* Impurity Effects on the Superconductive Critical Temperature of Indium and Aluminum. G. Chanin, E. A. Lynton and B. Serin. *Physical Review*, v. 114, May 1, 1959, p. 719-724.

Superconductive critical temperatures of In containing small amounts of Bi, Pb, Tl, Sn, Cd or Ga and of Al containing small amounts of Zn, Mg, Ag, Ge or Si. Effect of electronic mean free path and of valence difference between solvent and solute. 6 ref. (P15g, 2-63, 3-69; In, Al, *Bi, Pb, Tl, Sn, Cd, Ga, Zn, Mg, Ag, Ge, Si*)

571-P.* Aluminum Clad Copper 40%. *Sylvania Wire Technical Information Bulletin*, n. d., 4 p.

Electrical conductivity of Al-clad Cu wire at temperatures to 900° F. Density, composition and mechanical properties. Applications of anodized wire. (P15g, P10a, Q27a; Cu, *Al*, 4-61, 8-66)

572-P.* Capture Diameter of Dislocations in Low-Angle Grain Boundaries in Germanium. Rolf K. Mueller. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 157-161.

The conductance of a sample of n-type semiconductor properties measured at testing temperatures from 350-200° K. and at various angles to the direction of grain boundaries. 5 ref. (P15g, 2-61, M26b, M27f; Ge, 9-51)

573-P.* The Effect of Pressure on the Properties of Germanium and Silicon. William Paul. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 196-204.

Effects of pressure on intrinsic resistivity, carrier mobility, magnetoresistance and dielectric constant. 20 ref. (P15g, P15n, 3-74; Ge, Si, 9-51)

574-P.* Dielectric Constant of Germanium and Silicon as a Function of Volume. Manuel Cardona, William Paul and Harvey Brooks. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 204-206.

The refractive index for infrared wavelengths from 1-5 microms measured at various temperatures. 5 ref. (P15n, P17b, 2-61; Ge, Si)

575-P.* On Photo-Ionization by Fast Electrons in Germanium and Silicon. Victor S. Vavilov. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 223-226.

Reflectivity and photo-electric efficiency as a function of photon energy. 18 ref. (P15k; Ge, *In*)

576-P.* Effect of Electron and Impurity Density on the Field-Dependence of Mobility. J. B. Gunn. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 239-241.

Measurements of the resistance of a thin Ge filament (containing Sb) as a function of applied voltage. 6 ref. (P15g, 3-69; Ge, *Sb*)

577-P.* The Mobility of Electrons Heated by Microwave Fields in n-Type Germanium.

T. N. Morgan. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 245-249.

Simultaneous exposure of an n-type Ge semiconductor to a steady d.c. field and to a modulated microwave field. Electron mobility varies with the microwave field. (P15g; Ge)

578-P.* The High-Temperature Stability of Oxides and Sulphides. D. T. Livey. *Journal of the Less-Common Metals*, v. 1, Apr. 1959, p. 145-151.

Free energy of formation, melting point and vapor pressure of refractory oxides. 20 ref. (P12; NM-a34, NM-a37)

579-P.* Hall Effect, Resistivity and Magnetoresistivity of Th, U, Zr, Ti and Nb. Ted G. Berlincourt. *Physical Review*, v. 114, May 15, 1959, p. 969-977.

Effect of temperature and of exposure to a magnetic field on Hall effect, resistivity and magnetoresistivity. 30 ref. (P15, P16e, 2-61; Th, U, Zr, Ti, Cb)

580-P. Anodic Behavior of Titanium at Low and High Current Densities With Particular Reference to the Specific Effect of the Fluoride Ion. E. M. Khairy and M. M. El-Khatib. *Egyptian Journal of Chemistry*, v. 1, no. 1, 1958, p. 75-85.

Ti exposed to air is covered with a protective dioxide film, making it passive; fluoride ion exerts an appreciable corrosive action on its surface. (P15, R-general; Ti)

581-P.* Activity of Carbon in Liquid-Iron Alloys. Tasuku Fuwa and John Chipman. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 708-716.

The effects of various elements on the activity coefficient of carbon in liquid Fe have been studied by two experimental methods: equilibration with controlled mixtures of CO and CO_2 and the solubility of graphite in the melt. Activity coefficient of C is increased by Al, Co, Cu, Ni, P, Si, S and Sn. It is decreased by Cr, Cb, Mn, Mo, W and V. 22 ref. (P12b, 2-60; Fe, 14-60, *Al, C, Co, Cu, Ni, P, Si, S, Sn, Cr, Cb, Mn, Mo, W, V*)

582-P.* On the Heats of Formation of Copper-Nickel Alloys. J. S. Ll. Leach and Michael B. Bever. *Metallurgical Society of AIME, Transactions*, v. 215, Aug. 1959, p. 728-729.

Calorimetric measurements of the heat effects on dissolution of some Cu-Ni alloys in Sn. 10 ref. (P12q; Cu-b, *Ni, Sn*)

583-P.* (German.) The Ratio V_{15}/V_{10} of Hot Rolled Transformer Sheet and the Hysteresis Loss as a Function of Specific Gravity. Theodor Bruggemann. *Neue Hutte*, v. 4, Apr. 1959, p. 207-209.

Lowering of hysteresis loss by vacuum annealing and vacuum treatment in the ladle. Variation of the ratio V_{15}/V_{10} (V_{15}, V_{10} = hysteresis losses for field strengths of 15000 and 10000 G.) Specific gravity as a function of Si content. 6 ref. (P16s, P10a, D9m, 2-60, 2-64, 1-73; CN, 5-59, SGA-n, *Si*)

584-P.* (Spanish.) Deterioration of Magnetic Properties of Tungsten Magnet Steel. Pt. 2. Jose Terraza Martorell, Jose M.ª Bermudez de Castro y Mosquera. *Instituto del Hierro y del Acero*, v. 12, Apr-June 1959, p. 122-135.

Measurement of magnetic properties after various heat treatments. Metallographic and radiographic structure tests. (P16, 2-64, 3-71; SGA-n, AY, *W*)

585-P. Electrode Potential Behavior of Titanium in Solutions Initially Free From the Metal Ions. E. M. Khairy and M. M. El Khatib. *Egyptian Journal of Chemistry*, v. 1, no. 1, 1958, p. 47-55.

9 ref. (P15; Ti)

586-P. Methods for Determining the Thermodynamic Activities of Alloy Constituents at High Temperatures. P. Gross, D. L. Levi and G. L. Wilson. *Journal of the Less-Common Metals*, v. 1, Apr. 1959, p. 113-115.

Effusion and capillary vessel methods. (P12, 1-54)

587-P. Gamma Rays Following Thermal Neutron Capture in Titanium. J. W. Knowles, G. Manning, G. A. Bartholomew and P. J. Campion. *Physical Review*, v. 114, May 15, 1959, p. 1065-1074.

36 ref. (P18j; Ti)

588-P. The Magnetic Susceptibility of Semi-Conductors. R. Bowers. Paper from "Advances in Semi-Conductor Science". Pergamon Press, Inc., New York 22, 1959, p. 206-211.

Literature review covering Ge, In and Sb. 20 ref. (P16; Ge, In, Sb)

589-P.* Deviations From Matthiessen's Rule and Lattice Thermal Conductivity of Alloys. P. G. Klemens. *Australian Journal of Physics*, v. 12, June 1959, p. 199-202.

The difference in the ideal electronic thermal conductivity between an alloy and a pure metal can be estimated from the

difference in the ideal electrical resistivity using the Wiedeman-Franz law. The ideal resistivity arises by the scattering of electrons by lattice waves. (P11h, M26)

590-P.* Thermodynamics of the Lead-Tin System. W. B. Kendall and R. Hultgren. *Journal of Physical Chemistry*, v. 63, July 1959, p. 1158-1160.

The heats of formation of solid solutions of Sn in Pb are measured at 450° K. by liquid Sn solution calorimetry. Results are correlated with thermodynamic data and phase diagrams. A wide range of thermodynamic properties for both liquid and solid alloys are determined. (P12, M24b; Pb, Sn, 14-60, 14-67)

591-P.* The Melting of Finite Slabs. Theodore R. Goodman and John J. Shea. *American Society of Mechanical Engineers*, Paper no. 59-APMW-11, 1959, 9 p.

Use of heat balance integral method to determine melting rate of finite slab, which is initially at uniform temperature below melting point and is acted upon by a constant heat input at one face and has its other face either insulated or kept at initial temperature. Time histories of melting and temperature distribution in slab. (P11k, P12; 4-52)

592-P.* Solubility of Carbon in Silicon and Germanium. R. I. Scace and G. A. Slack. *Journal of Chemical Physics*, v. 30, June 1959, p. 1551-1555.

Solubility of carbon in Si is measured from 1500-2900° C. The enthalpy of the solution is established. Phase diagrams for the system include solubility data and peritectic point. Solubility of carbon in Ge was measured at temperatures from 2780 to 3170° C. (P12e, M24b; Si, Ge, *C*)

593-P.* The Dissociation Pressure of Aluminum Carbide. D. J. Meschi and A. W. Searcy. *Journal of Physical Chemistry*, v. 63, July 1959, p. 1175-1178.

The vapor pressure of Al_4C_3 has been measured in the temperature region 1500 to 1800° K. by Knudsen effusion and torsion methods. Results indicate there to be no more than 2% C content in the vapor when Al carbide is dissociated at 1600° K. (P12c; Al, NM-a35)

594-P.* Heat Continues as Major Problem. F. C. Krug. *Missiles and Rockets*, v. 5, July 20, 1959, p. 90-100.

Capabilities of high-temperature materials, melting points, recrystallization temperature and estimated capacity of basic materials for missile applications. (P11k, T24e, 2-62; SGA-h, 17-57)

595-P.* Effects of Dissolved Gas on Superconducting Characteristics of Tantalum. W. B. Ittner and J. F. Marchand. *Physical Review*, v. 114, June 1, 1959, p. 1268-1269.

Thin wires of varying nitrogen content are exposed to longitudinal magnetic fields of 0-600 oersteds and resistance is measured as a function of the field strength. A higher nitrogen content caused a resistance increase. (P15g, P16, 2-60; Ta, *N*, 4-61)

596-P.* (English.) Anodic Behavior of Titanium in Alkaline Solution. Hiroshi Chiba. *Electrochemical Society of Japan, Journal*, v. 27, no. 1-3, 1959, p. E6-E8.

Effect of dissolved oxygen upon the anodic potential time curves and potential changes in aerated sodium borate solutions. Oxygen has no effect on the initial linear portion of the potential increase but it effects the flat and upper parts of the potential increase. (P15; Ti)

597-P.* (English.) Electrochemical Behavior of Zinc in H_2SO_4-Zn. Yoshihiro Hisamatsu. *Electrochemical Society of Japan, Journal*, v. 27, no. 1-3, 1959, p. E44-E45.

Polarization behavior of Zn in Zn electrolyte such as sulphuric acid-zinc sulphate solution. (P15)

598-P.* Effect of Irradiation on Fuel Materials. Pt. 2. J. H. Kittel and S. H. Paine. *Nuclear Energy*, v. 13, July 1959, p. 357-360.

Deleterious changes occurring at moderate irradiation temperatures in unalloyed uranium with suitable metallurgical treatment are principally caused by surface roughening and anisotropic growth. Alloying additions alter the transformation kinetics of uranium so that preferred orientations, resulting from fabrication procedures, may be removed by heat treatment. (P10d, 2-67, 2-60, 2-64, N-general, T11g, M26c; U-a)

599-P.* (English.) Anodic Polarization and Anodic Protection of Titanium Against Hydrochloric and Sulphuric Acids. Rikuro Otsuka. *Electrochemical Society of Japan, Journal*, v. 27, no. 1-3, 1959, p. E41-E43.

Specimens used were prepared from cold rolled and vacuum-annealed Ti sheet 0.5 mm. thick and 99.5% pure. Anode potential-current density curves of Ti were obtained together with the open-circuit activation and passivation potentials and minimum current density. (P15, L17; Ti)

600-P.. (Russian.) Magnetic Susceptibility of Al-Sb and Ga-Sb Alloys in the Liquid State. A. A. Vertman and V. M. Glazov. *Izvestiya Akademii Nauk SSSR-Otdelenie Tekhnicheskikh Nauk*,. Jan-Feb. 1959, p. 60-63.

Susceptibility tests performed at temperatures from 1050-1350° C. (for Al-Sb alloys) and from 700-1180° C. (for Ga-Sb alloys). At an composition ratio of 50 at. %, a chemical reaction of the two components and dissociation at higher temperatures are assumed. 7 ref. (P16, 2-60, 2-62; Al-b, *Sb*, Ga-b, *Sb*, 14-60)

601-P. (Russian.) Correction of Formulas Applying to Normal Solutions. I. T. Sryvalin and O. A. Esin. *Nauchnye Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 5-9.

Formulas concerning thermodynamical properties are applied to the alloys Sn-Tl, Sn-Zn and Na-Cd. 13 ref. (P12; Sn-b, *Tl, Zn*, Cd-b, *Na*)

602-P. (Book.) Advances in Semi-Conductor Science. J. Badeen and H. Brooks. 553 p. 1959, Pergamon Press Inc., 122 E. 55th St., New York 22, N. Y. $15.

Collection of papers presented at the Third International Conference on Semi-Conductors held at the University of Rochester, U.S.A. Subjects covered include band theory, impurity centers, dislocations, excitons and photons, ionic crystals, magneto-optical effects, semi-conducting compounds, etc. Papers abstracted separately. (P15g; EG-j)

603-P.* The Thermal and Electrical Conductivities of Ductile Cast Iron and Several Gray Cast Irons. J. H. Brophy and M. J. Sinnott. *American Society for Metals, Transactions*, Preprint no. 139, v. 52, 1959, 16 p.

Thermal conductivity increased and electrical conductivity decreased as the effective length of the graphite particles increased. The lowest thermal conductivity and highest electrical conductivity were found when the graphite was spheroidal. In ferritic ductile cast irons, the thermal conductivity was found to be higher and the electrical conductivity lower than those of the graphite-free iron matrix. The magnitude of this difference was independent of the maximum graphite sphere size, but was dependent upon the volume percent of the graphite present and the orientation of the atomic structure in the graphite phase. 17 ref. (P11h, P15g, N8s; CI-r, CI-n)

604-P.* The Lattice Thermal Conductivity of Dilute Alloys of Silver and Gold. G. K. White, S. B. Woods and M. T. Elford. *Philosophical Magazine*, v. 4, June 1959, p. 688-692.

Electrical and thermal conductivities of fully annealed dilute alloys of Fe in Au and Sn in Ag between 2 and 150° K. Calculation of lattice thermal conductivity and comparison with theoretical values. 12 ref. (P11h; Ag-b, *Sn*, Au-b, *Fe*)

605-P. (Russian.) Coercivity Change of Patented Steel by Deformation. K. F. Starodubov and V. K. Babich. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 151-153.

Effects of deformation and heat treatment on the coercivity of patented carbon steel. (P16a, 3-68, 2-64; CN-p, CN-r)

606-P. (Russian.) Structural Changes Occurring in the Heat Treatment of K40NKHM Type Alloys After Cold Deformation. B. G. Livshits and and N. G. Makhukov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 175-178.

Effects of testing temperature and heat treatment temperature on the expansion coefficient and electrical resistance. Changes of the same properties caused by the presence of Mo. (P11g, P15g, N11h, 2-64, 3-68, 2-60, 2-61; Co-b, *Cr, Ni, Fe*)

607-P.* Electrochemical Process in the Decomposition of Sodium Amalgam. I. Hine, M. Okada, S. Yo. Shizawa and S. Okada. *Electrochemical Society of Japan, Journal*, v. 27, no. 1-3, 1959, p. E46-E50.

Polarization data in the decomposition of the amalgam—electrolytic current, hydrogen over-voltage on the graphite and steel cathode, anode polarization curves and temperature characteristics. (P15; Hg-b, Na, NM-k36)

608-P.* The Solubility of Tantalum and Cobalt in Sodium by Activation Analysis. J. A. Grand, R. A. Baus, A. D. Bogard, D. D. Williams, L. L. Lockhart and R. R. Miller. *Journal of Physical Chemistry*, v. 63, July 1959, p. 1192-1194.

Solubilities of Ta and Co were determined by equilibrating Na in Ta and Co vessels at three temperatures. Na was irradiated in the material testing reactor and the solubility values determined from a separation and counting of the active

isotopes in the Na. (P12e, S11q, 1-59; Ta, Co, Na)

609-P.* (English.) Electrical Conductivity of Metals at Low Temperatures. I. Supek. *Nuovo Cimento*, v. 12, May 1959, p. 1202-1204.

Bloch's integral equation for metal electrons in an electrical field, at very low temperatures, can be reduced to a differential equation on the energy surface. The same can be done for Peierl's system where the change of lattice quanta distribution is taken into consideration. (P15g, 2-63)

610-P. (Russian.) Determination of Melting and Solidification Points of Co-Cr-Ti Alloys by the Optical Method. E. K. Zakharov. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 239-243.

Measurements with a photo-electric pyrometer. Constitution diagrams. 5 ref. (P12n, N12, S16; Co-b, *Cr, Ti*)

611-P.* Hydrogen in Uranium. R. Darras and R. Caillat. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 19-27.

Hydrogen can be associated with uranium in two distinct ways; either dissolved in the metal, or in the form of a hydride. The solubility of hydrogen in uranium depends on the allotropic form of the metal; it is greater in molten than in solid uranium. Two types of hydride, both given by the formula UH_3, have been identified. The first, the alpha-type, is stable at low temperature. It is generally accompanied by small amounts of the beta-type, into which it is wholly transformed above 140°C. 36 ref. (P12e, N6p; U, *H*)

612-P.* Wetting by Liquid Metals. J. W. Taylor. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". Pergamon Press, Inc., New York 22, 1959, p. 398-416.

Wetting is controlled by the three interfacial tensions, liquid-vapor, liquid-solid and solid-vapor. Dependence of these on temperature and composition. 24 ref. (P13h, 2-60, 2-61; 14-60)

613-P.* (English.) Effects of Heat Treatment on the Electrical Properties of Silicon. Y. Matukura. *Physical Society of Japan, Journal*, v. 14, July 1959, p. 918-923.

Changes in carrier concentration and minority carrier lifetimes are observed in pulled single crystals of Si after heat treatment in the range 400-1200°C. At low temperatures, the formed donors are fewer near defects. At high temperatures, carrier concentration decreases in both p and n-type crystals, and formed donors are annihilated. (P15g, 2-64; Si, 14-61)

614-P.* Chemistry and Physics of Zinc Technology. R. Schuhmann, Jr. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 65-102.

Structures and physical properties of Zn and its compounds. Thermodynamics of Zn roasting and smelting reactions. 31 ref. (P-general, M25, P12, M26, C21, B15; Zn)

615-P. (German.) Use of a Slightly Inhomogeneous Magnetic Field for the Quantitative Determination of Small Ferromagnetic Admixtures in Susceptibility Measurements. Dieter Gerstenberg. *Zeitschrift fur Metallkunde*, v. 50, Aug. 1959, p. 472-477.

14 ref. (P16, S11g, 1-53; SGA-n)

616-P.* Magnetothermal Effects in Iron and Silicon-Iron. L. F. Bates and D. J. Sansom. *Physical Society, Proceedings*, v. 74, July 1, 1959, p. 53-64.

Measurement of thermal changes accompanying the magnetization of Fe, 0.05% Si-Fe, and a single crystal of 2.7% Si-Fe. (P16, P11; Fe-b, Si, 14-61)

617-P.* (German.) Addition Elements Influencing the Activity of Carbon Dissolved in Liquid Iron in Quantities Near the Saturation Point. Franz Neumann and Hermann Schenck. *Archiv fur das Eisenhuttenwesen*, v. 30, Aug. 1959, p. 477-483.

Effect of V, Mo, Cr, Mn, Ni, Cu, Al, Sb, Si, P, Sn and S additions. The influence on the activity exerted by an element depends on its position in the periodic system. 13 ref. (P12b, 2-60; Fe, 14-60, *C, V, Mo, Cr, Mn, Ni, Cu, Al, Sb, Si, P, Sn, S*)

618-P.* (German.) New Research on Supraconductivity. W. Buckel. *Metall*, v. 13, Sept. 1959, p. 814-818.

Transition temperatures for Sn and its isotopes and of Zr-Rh, Zr-Os and Zr-Co alloys. Specific heat of electrons for Zr, Co, Rh, W, Cr and Mo. Effect of a magnetic field on supraconductivity. (P15g, 2-63, P16, M25g; Zr-b, *Rh, Os, Co*, Sn, 14-63)

619-P. Rhenium as an Incandescent Source. W. G. Mathesson. *Illuminating Engineering Society, National Technical Conference,* Preprint no. 36, Sept. 1959, 5 p.

Properties of Re wire in terms of mechanical strength, formability, evaporation, emissivity, resistivity and incandescent brightness in relation to temperature. (P17f, P15; Re, 4-61)

620-P.* Thermodynamics of Liquid Mg-Bi Alloys. J. J. Egan. *Acta Metallurgica,* v. 7, Aug. 1959, p. 560-564.

Thermodynamic studies using the e.m.f. method. A cell suitable for measuring Mg activities in this system is described. Values of the excess partial molar free energy, the relative partial molar free energy, entropy and enthalpy are listed along with the corresponding integral quantities. 16 ref. (P12; Mg-b, *Bi,* 14-60)

621-P.* The Lattice Stability of Metals. Pt. 1. Titanium and Zirconium. Larry Kaufman. *Acta Metallurgica,* v. 7, Aug. 1959, p. 575-587.

The difference in free energy between the b.c.c. and h.c.p. modifications of Ti and Zr was calculated between 0 and 2000° K. using existing thermodynamic data. The chemical driving force for martensitic b.c.c.→h.c.p. reactions in these systems is about 50 cal. per mol. This value, compared to 300 cal. per mol. for Fe-base alloys, can be explained by the difference in physical characteristics of martensitic transformations in Fe-base and in Ti-base alloys. 37 ref. (P12a, N6q; Ti-b, Fe-b)

622-P.* Permanent Magnet Materials. F. Anselin. *Cobalt,* no. 4, 1959, p. 29-39.

Classification of magnet materials—quench-hardened steels, precipitation-hardened alloys, including Fe-Co-Mo and Fe-Co-W alloys, Fe-Co-V alloys, Ni-Co-Cu alloys, Alni alloys, Alnico Alloys and work-hardened alloys such as Vicalloy II and Silmanal. (P16; Fe-b, *Co, Mo, W, V, Cu,* Co-b, *Ni,* SGA-n)

623-P.* The Nature, Cause and Effect of the Porosity in Electrodeposits. Pt. 5. An Evaluation of the Sensitivity of the Ferroxyl Test. Fielding Ogburn, D. W. Ernst and W. H. Roberts. *Plating,* v. 46, Sept. 1959, p. 1052-1053.

Comparison of porosity in Au coatings on steel as determined by ferroxyl tests and photographic and microscopic examinations. Importance of pore size. (P10m; ST, *Au,* 8-62)

624-P.* (French.) Effect of Cold Work on the Electrical Resistivity of Copper Solid Solution Alloys. W. R. Hibbard, Jr. *Acta Metallurgica,* v. 7, Aug. 1959, p. 565-574.

Measurements of stress and strain during tensile deformation at 78° K. and after subsequent recovery treatments suggest that in solid solution alloys the higher strength is primarily associated with the higher yield stress and the presence of additional or more effective dislocation barriers in the initial structure rather than the more rapid or effective generation of dislocation barriers for a given strain during strain hardening. 16 ref. (P15g, 3-66, N7e; Cu-b, 14-67)

625-P. The Effect of Flux Distribution on Iron Losses. M. J. Schindler. *American Institute of Electrical Engineers, Transactions,* Paper no. 59-1204, Oct. 30, 1959, 11 p. $1.

Determination of approximate solutions for Maxwell's field equation under the condition of variable permeability that will lead to a modified formula for the eddy-current losses. (P16s; Fe)

626-P. An Analysis of a Reactivity Transient in Irradiated Thorium. R. G. Nisle. Phillips Petroleum Co. *U. S. Atomic Energy Commission,* IDO-16513, July 9, 1959, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Change in reactivity of Th slugs immediately after irradiation is due to the change in uranium 233 content. This content can be determined at any time, after correlation with standards, by a simple reactivity measurement. 5 ref. (P18h, 2-67; Th)

627-P.* (Russian.) Effect of Some Elements on the Surface Tension of an Al-Mg Alloy. L. Kubichek and M. V. Mal'tsev. *Izvestiya VUZ—Tsvetnaya Mettallurgiya,* no. 4, 1959, p. 112-117.

Surface tension of an alloy with 10.6% Mg; effects of temperature and elements present, such as Li, Sn, Sb, Ca, Pb and Bi. Influence of holding time after additioning on the surface tension. Structural changes caused by addition. 13 ref. (P13h, M27d, 2-60, 2-61, 3-67; Al-b, *Mg, Li, Sn, Sb, Ca, Pb, Bi*)

628-P.* (Russian.) Surface Tension of Copper Alloys. V. M. Chursin and V. M.

Ryumshin. *Izvestiya VUZ—Tsvetnaya Mettallurgiya*, no. 4, 1959, p. 118-124.

Changes in the surface tension of molten binary and ternary alloys of Cu with Sn, Pb and Zn. Effects of small P additions on surface tension and macrostructure. 13 ref. (P13h, M28h, 2-60, 2-61; Cu-b, *Sn, Pb, Zn, P*)

629-P.* Swelling and Inert Gas Diffusion in Irradiated Uranium. R. S. Barnes, A. T. Churchman, G. C. Curtis, V. W. Eldred, J. A. Enderby, A. J. E. Foreman, O. S. Plail, S. F. Pugh, G. N. Walton and L. M. Wyatt. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 543-565.

Description of the experimental procedure; experiments show the way in which inert gases escape from uranium metal under irradiation or on heating after irradiation; method of calculation based on the assumption that the fission product gases are present in bubbles under very high pressure and that the resultant stresses in the uranium matrix cause it to creep or to yield plastically and thus allow the bubbles to grow. 38 ref. (P10d, N1, 2-67; U, EG-m)

630-P.* Influence of the Structure and Properties of Uranium on Its Behavior Under Irradiation. A. S. Zaimovsky, G. Y. Sergeev, V. V. Titova, B. M. Levitsky and Y. N. Sokursky. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 566-573.

Creep of uranium under irradiation; surface distortion of nontextured uranium; influence of composition and heat treatment on uranium structure and mechanical properties. 12 ref. (P10d, Q3n, 2-59, 2-60, 2-64, 2-67; U)

631-P.* Development of High-Temperature Thermocouple-Materials. R. C. Lever. *Society of Automotive Engineers*, Preprint no. 105V, 1959, 12 p.

The ultimate temperature measurement capacity of alloys operating unprotected in an oxidizing atmosphere should be about 1800° C. and consists of platinum metals containing minor alloying additions. Above this temperature it is necessary to rely on the development of devices based on other principles, such as microwave attenuation. 17 ref. (P12n, 2-60; Pt, SGA-a)

632-P. A Simple Method of Determining the Magnetization Curve of High-Permeability Cast Steel. J. F. Hinsley. *Edgar Allen News*, v. 38, Sept. 1959, p. 195.

(P16, 1-54; 5-60, ST)

633-P. (Polish.) Principle of Additivity in Relation to Thermodynamic Functions. Aleksander Krupkowski and Kazimierz Szpunar. *Archiwum Hutnictwa*, v. 4, no. 2, 1959, p. 123-131.

Investigation on formulas applied in the computation of thermodynamic properties, such as internal energy, entropy and enthalpy. (4 ref.) (P12)

634-P. (Book.) Engineering Thermodynamics. D. B. Spalding and E. H. Cole. 375 p. July 9, 1959. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $8.50.

Fundamentals and theory. (P12)

635-P. (Book.) Property Measurements at High Temperatures. W. D. Kingery. 416 p. 1959. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16, N. Y. $16.50.

Factors affecting the physical properties of materials and their measurement at temperatures above 1400° C. (P-general, 2-62, 1-54; SGA-h)

636-P. (Translation—ConBur.) Secondary Emission Characteristics of Magnesium and Beryllium Alloy Cathodes After Short-Term Activation. V. L. Boisov and V. N. Lepeshinskaia. *Bulletin of the Academy of Sciences of the USSR, Physical Series*, v. 22, July 1959, p. 537-546.

Due to the high secondary emission coefficient of Mg and Be alloys increased application is found in photomultipliers and electron tubes. An activation procedure with a high secondary emission yield coefficient at small primary energies is described. (P15k; Mg, Be)

637-P.* Lattice Thermal Conductivity of Copper Alloys: Effect of Plastic Deformation and Annealing. W. R. G. Kemp, P. G. Klemens and R. J. Tainsh. *Philosophical Magazine*, v. 4, July 1959, p. 845-857.

Thermal and electrical conductivities measured and the lattice thermal conductivities deduced of Cu-0.4% As and Cu-32% Zn after severe torsional deformation and after subsequent annealing. 16 ref. (P11h, P15g, 3-68, 2-64; Cu-b, *Zn*, As)

638-P. A Simple Method of Determining the Magnetization Curve of High-Permeability Cast Steel. F. J. Hinsley. *Edgar Allen News*, v. 38, Aug. 1959, p. 173-175.

Application of British Standard 2454: 1954 to ring-shaped test pieces; Fluxmeter calibration. (P16r, P16a; ST, 5-60)

639-P.* (German.) Shrinkage of Weldments. I. Bizinger. *Periodica Polytechnica (Budapest)*, v. 3, no. 2, 1959, p. 123-145.

Available theoretical shrinkage equations were correlated with actual shrinkage measurements. None of the theoretical equations covers the actual shrinkage results. The closest correlation was observed with the use of the Werner Gilde equation. (P10c; 7-51)

640-P.* (German.) Influence of Aging on the Contraction of Steels. G. Ziaja. *Periodica Polytechnica (Budapest)*, v. 3, no. 2, 1959, p. 147-156.

The contraction activities of 35 F and C15 steel showed no changes after aging. Cold working decreases contraction activity. (P10d, 3-68, 2-65; ST)

641-P.* (German.) Shrinkage of Aluminum as Influenced by Magnesium. L. Juhasz. *Periodica Polytechnica (Budapest)*, v. 3, no. 2, 1959, p. 157-161.

A clear relationship exists between alloy structure and shrinkage. A shrinkage increase is noted up to the limit of the metal's solubility. The peak contraction is reacted at the equilibrium point of the saturated solution. (P10c, 2-60; Al, *Mg*)

642-P.* Effects of Ultra High Temperature on Magnetic Properties of Core Materials. Michael Pasnak and Richard Lundsten. *American Institute of Electrical Engineers*, Paper no. 59-1117, Oct. 30, 1959, 12 p.

Effects on Orthonol, 4-79 Mo Permalloy, AEM 4750, L and Z Silectron, Transformer A, Audio Transformer A, 11.7 Alfenol, 15.5 Alfenol, 3 Mo Thermenol, 7-70 Perminvar and Supermendur. Coercive force decreased with increase in temperature. The maximum permeability increased with increasing temperature until the Curie temperature was approached, then it started to decrease. 7 ref. (P16, 2-61; Fe-b, *Si, Al*, Ni-b, *Co*, SGA-n)

643-P.* High Temperature Alloys for the Glass Industry. Pt. 2. Bruce F. Richardson. *Glass Industry*, v. 40, Sept. 1959, p. 473-475, 498.

Application and properties of Ni base, precipitation-hardened alloys. (P11, T29a; Ni-b, SGA-h, 17-57)

644-P.* (English.) Electrical Resistivity Properties of Noble Metal Alloys. J. O. Linde. *Physics*, v. 24, Sept. 1958, p. 109-117.

Temperature dependence of the resistivity of alloys at low and medium high temperatures. Influence of elastic and plastic deformation at normal temperatures. Theory of the resistivity with transition metals as solutes. (P15g, 2-61, 3-68; EG-c)

645-P.* (French.) Temperature Coefficient of the Photo-Electric Effect of Metals. A. Meessen. *Journal de Physique et la Radium*, v. 20, May 1959, p. 513-576.

Temperature coefficient of the photoelectric current is positive near the threshold but becomes negative toward the blue and ultra-violet. This is due to a surface photo-electric effect whose function is linearly temperature dependent. (P15k, 2-61)

646-P.* Thermodynamic Behavior of Solids. M. A. Jaswon. *Research Applied in Industry*, v. 12, July 1959, p. 274-284.

Thermodynamics of solids with reference to liquid-solid phase transformations, order-disorder and stable and metastable equilibriums. (P12, N10)

647-P. Determination of Electrical Resistance of Metal Parts. G. A. Escoffery. *Electrical Manufacturing*, Sept. 1959, p. 108-113.

Tables of resistivity and related quantities for all common metals. Resistance nomogram for circular wire. (P15g)

648-P. Materials for Service Above 1000° F. Metals and Ceramics. Julius J. Harwood. *Mechanical Engineering*, v. 81, Oct. 1959, p. 46-51.

Physical and mechanical properties of some high-temperature alloys and ceramics. (P-general, Q-general, 2-62; 6-60, SGA-h)

649-P.* Examination of Some Refractory-Slag Reactions by Contraction Tests. J. F. Hyslop. *British Ceramic Transactions*, v. 58, June 1959, p. 329-340.

Potential volume and melting change characteristics of openhearth brick + slags at 1300 to 1750° C. (P10d; D2, RM-j, RM-q)

650-P.* Transitions From Ferromagnetism to Antiferromagnetism in Iron-Aluminum Alloys. Experimental Results. A. Arrott

and H. Sato. *Physical Review*, v. 114, June 15, 1959, p. 1420-1426.

Fe-Al alloys from 0 to 40 at.% Al investigated between He point and room temperature. Transition was determined by both temperature and composition. (P16e, 2-60, 2-63; Fe-b, *Al*)

651-P.* Transitions From Ferromagnetism to Antiferromagnetism in Iron-Aluminum Alloys. Theoretical Interpretation. Hiroshi Sato and Anthony Arrott. *Physical Review*, v. 114, June 15, 1959, p. 1427-1440.

Theoretical model for magnetic anomaly of alpha phase Fe-Al alloys in terms of magnetic interaction of Fe atoms. Correlation of conclusions with neutron diffraction data. (P16e; Fe-b, *Al*)

652-P.* Temperature Dependence of the Work Function of Silver, Sodium and Potassium. C. R. Crowell and R. A. Armstrong. *Physical Review*, v. 114, June 15, 1959, p. 1500-1506.

Freshly evaporated films of Ag by capacitive contact potential of Na and K by diode retarding-field method for mean work function of surface. Temperature effects and anisotropy. (P15j, 2-61; Ag, Na, K, 14-61)

653-P.* Anodic Behavior of Aluminum at Low Potentials. J. V. Petrocelli. *Electrochemical Society, Journal*, v. 106, July 1959, p. 566-570.

Electrode potentials, differential capacities and anodic polarization curves in H_2SO_4 solutions. Very thin film formed and modified by electrochemical action of Al with electrolyte. 30 ref. (P15p, L19m; Al, 14-62)

654-P.* Kinetic Studies on Corrosion Systems. Pt. 2. The Reduction of Cupric Ion on Passive Stainless Steel Electrodes. Franz A. Posey, G. H. Cartledge and R. P. Yaffe. *Electrochemical Society, Journal*, v. 106, July 1959, p. 582-589.

Effect of addition of cupric ion on the electrode potential and rates of partial processes of the passive 347 stainless steel in aerated, dilute H_2SO_4 system. 14 ref. (P15m; SS)

655-P.* Temperature Dependence of the Electrical Properties of Bismuth-Antimony Alloys. A. L. Jain. *Physical Review*, v. 114, June 15, 1959, p. 1518-1528.

Resistivity and Hall coefficient as a function of temperature for zone-levelled single crystals. Carrier activation energies, lattice parameters, interpretation of data in terms of band structure. (P15g, P15p, 2-61; Bi-b, *Sb*, 14-61)

656-P.* Sources of Fuel Element Instability. A. H. Willis. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 532-536.

The nature of fissionable materials appears to be decidedly influenced by irradiation. Post-irradiation tests may not provide a suitable measure of in-pile behavior. The ductility appears to be increased and the strength reduced in U-Zr during irradiation while in Zr-B, this effect is not observed. The exact source of this property change has not been established. High fission rates and low diffusion rates reduce bubble size and swelling and decrease the importance of material imperfections as sources of volume instability. 21 ref. (P10d, T11g, 2-67; U-b, *Zr*, Zr-b, *B*)

657-P.* Radiation Stability of Fuel Elements for the Enrico Fermi Power Reactor. D. O. Leeser, F. A. Rough and A. A. Bauer. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 587-592.

Test program included binary alloys of U-Cr, U-Zr and U-Mo. Post-irradiation metallographic examinations and physical property measurements of density, dimensions, electrical resistivity and thermal expansion on specimens irradiated to 2.5 % burn-up, and in-pile temperature. Post-irradiation mechanical properties investigated include hardness, ductility, elastic modulus and ultimate strength. 6 ref. (K10d, T11g, 2-67; U-b, *Cr*, *Zr*, *Mo*)

Calculations for all product elements for seven different irradiation times, two cooling periods and three thermal neutron fluxes. 21 ref. (P10h, P10k, 2-67, U, 14-63)

659-P. (French.) Calculation of the "Fission Spike" of Uranium. Y. Quere and F.

Nakache. *Journal of Nuclear Materials*, v. 1, July 1959, p. 203-209.

Annihilation of pre-existing lattice defects in region of intense thermal agitation, "fission spike", associated with each fission. Evaluation of the volume of the "fission spike". (P18n, P26s, 2-67; U)

660-P. (Russian.) Effect of Grain Elements on the Surface Tension of Aluminum Alloys. L. Kubichek. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 96-103.

Effect of various additions on the surface tension of an Al-Cu and an Al-Mg alloy. Structural modifications are explained by changes in surface tension. 17 ref. (P13h, 2-60, Al-b, *Cu, Mg*, 14-60)

661-P. (Russian.) Effect of the Composition of Al-Cu Alloys on the Dimensional Changes in Cycling Heat Treatments. A. A. Zyikova. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 115-116.

Influence of repeated heating and cooling on the dimensions of samples. (P10d, 2-60, J-general, 1-63; Al-b, *Cu*)

662-P. (Russian.) Measurement of the Surface Tension and Density of Liquid Chromiun. V. N. Eremenko and Yu. V. Naidich. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 111-112.

Equipment and method. (P13h, P10h, 1-53; Cr, 14-60)

663-P. A Variable Shear-Rate Capillary Viscometer for Use With Fluid Metals. F. A. Johnson. *United Kingdom Atomic Energy Authority*, AERE R/M 232, 1959, 11 p.

A viscometer designed to investigate the rheological properties of fluid metals with various flow rates at temperatures up to 600° C. (P10f, 1-53, 2-62; Bi, Th-b, 14-60)

664-P.* (English.) Measurement of Dielectric Constant of Germanium at Microwave Frequencies. Tadao Fukuroi and Kazuo Yamagata. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 285-295.

Dielectric constants and electrical conductivity at microwave frequencies from 1.6 to 300° K. measured by resonant cavity method. Errors due to size and relaxation time were corrected. (P15n, 2-61; Ge)

665-P.* (French.) Electrical Properties of Very Thin Films of Germanium. Clement Uny. *Comptes Rendus*, v. 249, Aug. 3, 1959, p. 645-647.

Evolution of films and observed deviations from Ohm's law during vacuum deposition. (P15g, L25g; Ge, 14-62)

666-P.* (French.) Influence of pH and Current Density on Hydrogen Overvoltage of Tungsten and Molybdenum. Jean Amosse and Marie-Jeanne Barbier. *Comptes Rendus*, v. 249, Aug. 3, 1959, p. 686-688.

Changing overvoltages in solutions of potassium phthalate. (P15m; W, Mo)

667-P.* (German.) Determination of the Most Favorable Current Density in a Zinc Electrolyte Solution. Zoltan Horvath. *Freiberger Forschungshefte*, v. B34, May 1959, p. 38-79.

Equations are derived as a function of the specific energy consumption. Minimum specific energy consumption in the Zn electrolysis process. Current density is increased with a high H_2SO_4 concentration, a low Zn concentration and small electrode distance. (P15; Zn)

668-P.* (Japanese.) Effects of Nickel, Cobalt, Tungsten and Molybdenum on Activity of Carbon in Liquid Steel. Pt. 1. Activity of Carbon in Liquid Iron Alloys. Tasuku Fuwa and John Chipman. *Tetsu to Hagane*, v. 45, June 1959, p. 600-607.

Equilibrium studies at 1560° C. on carbon monoxide-carbon dioxide mixtures with carbon dissolved in liquid Fe alloys (0.1-0.3% C). An equation shows the relationship between the activity of carbon and concentration of carbon and Ni, Co, W and Mo. (P12d, 2-60; CN, Fe-b, ST, *Ni, Co, W, Mo*)

669-P. (Russian.) Viscosity and Electrical Properties of the Melts of Some Binary Systems. D. K. Belashchenko and A. P. Lyubimov. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 135-172.

Measurements with Sb-Sn, Cd-Sb, Bi-Tl, Cd-Cu, Pt-Tl and Fe-Ni melts. Relationship between ordering and the values for viscosity and electrical resistance. 19 ref. (P10f, P15g, N10b; Fe-b, *Ni*, Cd-b, *Cu*, Sb-b, *Sn, Cd*, Tl-b, *Bi, Pb*, 14-60)

670-P. (Russian.) Solution of Metalloids in Metals. V. K. Zhuravlev and A. A. Zhukhovitskii. Paper from "Production and Further

Processing of Steel and Alloys. Collection of Papers no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 226-244.

Thermodynamic activity of sulphur in the systems Fe-S, Fe-C-S, Fe-Si-S and Fe-P-S. 20 ref. (P12b, D11n, Fe, S, C, Si, P, 14-60)

671-P. (Russian.) Uses and Properties of Columbium. G. V. Zakharova, I. A. Popov, L. P. Zhorova and G. V. Kurganov. *Tsvetnye Metally*, no. 1, 1959, p. 73-79.

Physical and mechanical properties. 12 ref. (P18j, P10a, P12r, Q27a, Q23p, Q28g; Cb)

672-P.* Kovar—the "Friendliest Alloy". *Advanced Materials Technology*, v. 2, Sept. 1959, p. 8-9.

Thermal properties and applications where a variable rate of thermal expansion is needed—metal to glass bands, other places where thermal expansion of dissimilar materials is encountered. (P11g, P11g, P12; Fe-b, *Ni, Co*, SGA-s)

673-P.* Experimental Determination of Atomic Scattering Factors. R. B. Roof, Jr. *Journal of Applied Physics*, v. 30, Oct. 1959, p. 1599-1603.

Corrections to the atomic scattering factor of Al taking into account effects of temperature, surface roughness, primary and secondary extinction and anomalous dispersion. Powder slab specimen under monochromatic X-ray irradiation. (P17d, 2-61, 2-67; Al-a, 6-68)

674-P.* Density Measurements of Some Thin Copper Films. N. Wainfan, Nancy J. Scott and L. G. Parratt. *Journal of Applied Physics*, v. 30, Oct. 1959, p. 1604-1609.

Density distribution across thickness of vaccum deposited Cu film determined by reflection coefficient and glancing angle for X-rays. Comparison to optical measurements. (P10a, 2-67; Cu-a, 14-62)

675-P.* The Influence of the Valency States of Cations on Electrical Conductivity of Mg-Mn Ferrite. S. Krupicka and K. Zaveta. *Journal of Electronics and Control*, v. 6, Apr. 1959, p. 333-336.

Correlation between valency states of Mn and Fe. Electrical resistivity of Fe-deficient Mg-Mn ferrite and effect of firing temperature on bulk density and resistivity. 4 ref. (P15g; Mn, Fe, NM-a34)

676-P.* The Effects of Nuclear Radiation on Materials. T. P. Flanagan. *Journal of Electronics and Control*, v. 6, Apr. 1959, p. 337-346.

Effects of charged particles, gamma radiation and neutrons to produce ionization, lattice defects and other mechanical, chemical and physical changes in metals and other materials. 10 ref. (P-general, Q-general, 2-67)

677-P.* High-Temperature Thermodynamics of the Silicon, Nitrogen, Silicon-Nitride System. R. D. Pehlke and J. F. Elliott. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 781-785.

Equilibrium pressure of nitrogen gas over pure Si metal and Si nitride measured from 1400 to 1700° C. Standard free energies and enthalpies of formation of Si_3N_4 (alpha) are calculated as functions of temperature over the above temperature range. Specific heat, molar enthalpy, molar entropy, standard enthalpy of formation and standard free energy of formation are estimated for the temperature range 298 to 1400° C. 8 ref. (P12, 2-62, 2-61; Si, NM-k36)

678-P.* The Effect of Plastic Deformation on the Resistivity of Copper-Palladium Alloys. Erik Klokholm and Barry Hyatt. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 792-794.

Resistivity of Cu-Pd alloys of 9.6 to 29% Pd alloys was measured after plastic deformation in tension. A continuing decrease in resistivity with increasing plastic strain is observed. Anomalous decreases in resistivity are due to the decrease in short-range order caused by cold work. 5 ref. (P15g, 3-68; Cu-b, *Pd*)

679-P.* Resistivity Measurements on Eutectoid Beryllium Copper. Robert J. Block and G. H. Kehl. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 878-879.

Values of the resistivity and temperature coefficient over a ± 5° C. range for selected temperatures. There is seen to be a significant discontinuity at -62° C. The sudden increase in resistivity suggests the spontaneous transformation of one of the phases present. The inherent instability of the bcc. structure at low temperatures leads to the conclusion that the gamma phase of Be-Cu undergoes a spontaneous martensitic reaction in the region of -62° C. (P15g, 2-61; Cu-b, *Be*)

680-P. The Determination of Solid Solubilities by Quantitative Metallography of a

Single Alloy. D. L. Douglass and R. E. Morgan. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 869-870.

Method consists of equilibrating samples of the alloy in a two-phase region adjacent to the desired solid solution at three or more temperatures, quenching measuring the volume fraction of second phase present and applying an analytical treatment to calculate the unknown solid solution. 4 ref. (P12e; 14-67)

681-P. Determination of Maximum Terminal Solid Solubility. A. S. Yue. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 870-871.

Experiments to determine maximum solid solubility in Mg-base alloys. 5 ref. (P12e; Mg-b)

682-P. (French.) Occurrence of Two Different Kinetics During Low-Temperature Anneals for the Variation of Electrical Resistivity of Zone Refined Aluminum, Cold-Worked at Liquid Nitrogen Temperature. Omourtague Dimitrov and Phillippe Albert. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, Oct. 1959, p. 491-496.

6 ref. (P15g, N5f, J23c, 2-63, 3-68; Al)

683-P. (French.) Activity of Dissolved Phosphorus in Molten Iron. G. Urbain. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, Oct. 1959, p. 529-547.

Established thermodynamic behavior of dissolved phosphorus in molten Fe as a function of temperature and for phosphorus contents corresponding to dilute solution of the Fe_2 P compound. 23 ref. (P12b; Fe, *P*)

684-P. (Japanese.) Effects of Chromium, Copper, Niobium, Sulphur, Tin and Vanadium on the Activity of Carbon in Liquid Iron. Pt. 2. Activity of Carbon in Liquid Iron Alloys. Tasuku Fuwa and John Chipman. *Tetsu to Hagane,* v. 45, July 1959, p. 681-689.

Equilibration with controlled mixtures of CO and CO_2 ; solubility of graphite in the melt. 16 ref. (P13; Fe, 14-60, *Cb, Cr, Cu, S, Sn, V, C*)

685-P. Measurements on the Magnetic Susceptibilities of Ag-Mn and Cu-Mn Alloys. A. Van Itterbeek, R. Pollentier and W. Peelairs. *Applied Scientific Research,* Series B, v. 7, no. 5, 1959, p. 329-337.

(P12; Ag-b, Cu-b, *Mn*)

686-P. (German.) Behavior of Nickel Anodes in Sulphuric Acid. R. Landsberg and G. Jost. *Zeitschrift fur Physikalische Chemie,* v. 211, no. 5-6, 1959, p. 294-306.

The galvanostatic passivation of Ni anodes in sulphuric acid determined in relation to time and diffusion intensity. In highly concentrated acids an increased viscosity is apparent. 11 ref. (P15; Ni)

687-P.* Fusion Curves of Four Group VIII Metals to 100,000 Atmospheres. H. M. Strong and F. P. Bundy. *Physical Review,* v. 115, July 15, 1959, p. 278-284.

Melting temperatures and change in volume during melting are determined experimentally for Ni, Pt, Rh and Fe. (P12n, P10d; Ni, Pt, Rh, Fe)

688-P.* Magnetic Susceptibility of Close-Packed Hexagonal Gold-Indium Alloys. T. B. Massalski, L. Meyer and D. Weiner. *Physical Review,* v. 115, July 15, 1959, p. 301-302.

Magnetic susceptibility is measured at 300, 77, 4.2 and 1.2° K. by Gouy method. The susceptibility shows a maximum at 19 at.% In. 11 ref. (P16e, 2-63; Au-b, *In*)

689-P.* Ultrasonic Attenuation in Bismuth at Low Temperatures. Darrell H. Reneker. *Physical Review,* v. 115, July 15, 1959, p. 303-313.

Attenuation of ultrasonic waves measured at frequencies between 12 and 84 Mc per sec. Attenuation exhibits a saturation region at fields between 5 and 1600 oersteds. Method for measuring maximum Fermi velocity for given orientation. (P16e, 2-63; Bi)

690-P.* Low-Temperature Transport Properties of Copper and Its Dilute Alloys. Pure Copper, Annealed and Cold-Drawn. Robert L. Powell, Hans M. Roder and William J. Hall. *Physical Review,* v. 115, July 15, 1959, p. 314-323.

Experimental results for thermal conductivity, electrical resistivity and thermo-electric force and power between 4 and 300° K. (P15g, P11h; Cu)

691-P.* Surface States in Metals. G. Bonfiglioli and R. Malvano. *Physical Review,* v. 115, July 15, 1959, p. 330-335.

Conductivity modulation in metals by an electric field is measured in Au, Sb and Bi between -20 and +80° C., confirming the existence of localized and conducting surface states at metal/dielectric interface. (P15p; Au, Sb, Bi)

692-P.* Piezoresistance of n-Type Germanium. H. Fritzsche. *Physical Review*, v. 115, July 15, 1959, p. 336-345.

Changes in electrical resistance in uniaxial tension of Ge single crystals doped with As or Sb is measured from 6 to 300° K. (P15g, 2-63, 3-69; Ge 14-61, *Sb, As*)

693-P.* Electron Damage Thresholds in InSb. F. H. Eisen and P. W. Bickel. *Physical Review*, v. 115, July 15, 1959, p. 345-346.

Conductivity recovery in InSb by electron bombardment as a function of electron energy is determined by measuring the rate at which carriers are removed from the conduction band. (P18n; In-b, *Sb*, 14-68)

694-P.* Elastic Scattering of Protons by Vanadium, Chromium, Iron and Cobalt. C. A. Preskitt and W. P. Alford. *Physical Review*, v. 115, July 15, 1959, p. 389-397.

Angular distributions of elastically scattered protons are measured between 3.49 and 6.42 mev. for V, Cr, Fe and Co as targets. (P18n; V, Cr, Fe, Co)

695-P.* Total Photoelectric Cross Sections of Copper, Molybdenum, Silver, Tantalum and Gold at 662 Kev. W. F. Titus. *Physical Review*, v. 115, July 15, 1959, p. 351-356.

Total photo-electric cross sections are measured at 662 kev. from a beam of gamma rays from a Cs-137 source. (P18h; Cu, Mo, Ag, Ta, Au)

696-P. Thermal Property Data Requirements for New Weapons Systems. J. I. Wittebort. Paper from "Proceedings of the Florida Conference on High-Speed Aerodynamics and Structures". v. 1. U. S. Office of Technical Services, PB 151538, Washington 25, D. C., 1959, p. 95-108.

Thermal conductivity, heat capacity, thermal expansion, thermal emissivity of Cu, Ni, Cr, Ta, Mo, Pt, Pb and Al are graphite form as a function of temperature up to melting point. (P11, T2, 2-61; Cu, Ni, Cr, Ta, Pt, Pb, Al)

697-P.* (French.) Low-Temperature Electrical Conductivity of Zone-Melted Zirconium. L. Renucci, J. P. Langeron and P. Lehr. *Comptes Rendus*, v. 249, Sept. 28, 1959, p. 1113-1115.

Alpha-phase behavior of Zr prepared by Van Arkel method and Zr purified by zone melting measured as to electrical resistivity of liquid hydrogen and liquid oxygen temperatures. (P15g, 2-63, N5f; Zr-a)

698-P.* (German.) Thermal Potential in Physical Processes. W. Scheuble and P. Wiest. *Harterei-Technische Mitteilungen*, v. 14, no. 1, 1959, p. 14-23.

Thermal potential measurements of metallographic polished microsections. The potential is dependent on heat conductivity of the measured material. Measurements on steel showed considerable dependence on carbon content, heat treatment and alloy composition. 6 ref. (P11h, M23r, 2-60, 2-64; ST)

699-P.* (Japanese.) Activity of Nitrogen in High Purity Liquid Iron. Yutaka Kasamatsu and Sachio Matoba. *Tetsu to Hagane*, v. 45, Feb. 1959, p. 100-105.

Equilibrium of pure Fe under pressures up to 2.3 atmospheres and temperatures from 1566 to 1740° C. Nitrogen solubility deviates from Sieverts' law under these conditions. Formulae of equilibrium constant, free energy change and activity coefficient. (P12a, P12b, P12d; Fe, *N*)

700-P. Optical Properties of Some Ferromagnetic Films. John R. Holmes, Anda Rosen and Fred McClung. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 76-78.

Properties of vacuum-evaporated films of Co and Gd. 11 ref. (P17, 1-73; 8-72, Co, Gd, 14-62, SGA-n)

701-P. (Swedish.) Steel With Low Cobalt and Manganese Content. *Teknisk Tidskrift*, v. 89, Oct. 16, 1959, p. 1030.

Use of Cr-Ni steel with less than 0.10% Mn and 0.005-0.007% Co in nuclear reactors. (P18, T11g, 2-60; AY, *Co*, 17-57)

702-P. The Contribution of Microfissures to the Dielectric Losses of Anodic Oxide Films on Tantalum and Zirconium and Their Role in Electrolytic Rectification. L. Young. *Faraday Society, Transactions*, v. 55, May 1959, p. 842-849.

25 ref. (P15n; Ta, Zr)

703-P.* (Japanese.) Ar "Transformation of High-Carbon and High-Chromium Steel Studied by the Direct-Vision Determination of the Magnetization Curve. Tsuneo Matsukura, Akira Nagai and Etsuo Matsumoto. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 473-477.

Changes in magnetization curves during heat treatment. Effects of temperature and time. 10 ref. (P16, 2-64, 2-61, 3-67; CN-r, *Cr*)

704-P. Copper and Copper Alloy Castings for High Conductivity Applications. *Copper*, Summer 1959, p. 12-18.
14 ref. (P15g; Cu, 5-60)

705-P. The Combustion of Titanium and Zirconium. P. L. Harrison. *Seventh Symposium (International) on Combustion, Aug. 28-Sept. 3, 1958*. 1959. p. 913-920.
6 ref. (P12q; Ti, Zr)

706-P. Electron Emission From Plastically Strained Aluminum. W. D. Von Voss and F. R. Brotzen. *Journal of Applied Physics*, v. 30, Nov. 1959, p. 1639-1645.
Al under tension emits electrons, probably from oxide or nitride surface layer. Emission rates are related to mechanical variables. (P15k, 3-68, 3-69; Al-a)

707-P. Measurement of the Linear Magnetostriction of Hard-Worked Nickel. H. E. Stauss. *Journal of Applied Physics*, v. 30, Nov. 1959, p. 1648-1650.
Anisotropic effect of plastic deformation of Ni does not cause measurable volume magnetostriction. (P16b, 3-68; Ni-a)

708-P. Magnetic Viscosity in Iron Due to Carbon Atoms Anchored in Dislocations. G. Biroci, A. Ferro and G. Montalenti. *Journal of Applied Physics*, v. 30, Nov. 1959, p. 1732-1735.
Iron containing carbon in solid solution shows a marked decrease of magnetic permeability at 180° C. after cold working. Relaxation data interpreted as due to diffusion of carbon in surroundings of dislocations. (P16g, N1c, 3-68; Fe, *C*, 14-67)

709-P. The Solubility of Krypton in Liquid Lead, Tin and Silver. G. W. Johnson and R. Shuttleworth. *Philosophical Magazine*, v. 4, Aug. 1959, p. 957-963.
Solubility of Kr in liquid Pb and liquid Sn measured by radioactive Kr^{85}. 15 ref. (P12e, 1-59; Pb, Sn, Ag, 14-60, *Kr*)

710-P. Investigation of the Reaction of Manganese and Bismuth by Differential Thermal Analysis. A. Goldman and G. I. Post. Westinghouse Electric Corp. *Wright Air Development Center Technical Note* no. 58-254, Aug. 1958, 21 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.
8 ref. (P13b, M23r; Mn, Bi)

711-P. (English.) Semiconducting Properties of Bismuth-Antimony Alloys. Seiichi Tanuma. *Physical Society of Japan, Journal*, v. 14, Sept. 1959, p. 1246.
(P15g; Bi-b, *Sb*)

718-P. (Russian.) Sign Changes (From Minus to Plus) of the Hall Constant During the Ordering of Atoms in Alloys. A. P. Komar, N. V. Volkenstein and G. P. Federov. *Doklady Academii Nauk, SSSR*, v. 125, Mar. 1950, p. 530-531.
10 ref. (P15p, N10a)

719-P. (Russian.) Abnormally Large Hall Effect in Chromium-Tellurium Ferromagnetic Alloys. I. K. Kikoin, E. M. Buryak and Yu. M. Muromkin. *Doklady Akademii Nauk*,

SSSR, v. 125, May 1959, p. 1011-1014. 7 ref. (P15p; Cr-b, Te)

720-P.* Heat Transfer to Liquid Metals With Variable Properties. R. Viskanta and Y. S. Touloukian. *American Society of Mechanical Engineers*, Paper no. 59—A-148, 1959, 7 p.

Heat transfer to liquid metals with variable physical properties in the case of fully developed turbulent flow in cylindrical tubes of constant diameter. (P11k, S16a; 14-60, 4-60)

721-P.* Electrokinetic Measurements on Stainless Steel Capillaries. B. Levy and A. R. Fritsch. *Electrochemical Society, Journal*, v. 106, Aug. 1959, p. 730-735.

Zeta potentials of types 304 and 347 stainless steel measured by steaming current technique in H_2SO_4 and HCl solutions in the concentration range of 10^{-6} to 10^{-1} *N*. (P15; SS)

722-P.* Selection of Alloy Tubing for Glass Sealing. Malcolm W. Keenan. *Electronic Design*, v. 7, Oct. 14, 1959, p. 38-41.

Solid pins, tubular pins, ribbon and wire are used for glass-to-metal sealed feed-through terminals. (P11g, T1j; Ag-b, Ti-b, Fe-b, Ni-b, Co-b, CN, 4-61)

723-P.* Recombination Properties of Nickel in Germanium. G. K. Wertheim. *Physical Review*, v. 115, July 1, 1959, p. 37-47.

Carrier lifetimes in Ni-doped Ge interpreted by means of multilevel model as a function of electroncapture cross-section of Ni. (P15g, 3-69; Ge, *Ni*)

724-P.* Studies of the Semiconducting Properties of the Compound CsAu. W. E. Spicer, A. H. Sommer and J. G. White. *Physical Review*, v. 115, July 1, 1959, p. 57-62.

CsAu is shown to be a semiconductor by existence of an optical excitation threshold in the absorption characteristic, and by the resistivity values at low temperature. Structure and lattice parameter determined by X-ray diffraction. (P15g, P17c, M22g, M26, 2-63; Cs-b, *Au*, EG-j)

725-P.* Nernst and Ettingshausen Effects in Germanium Between 300 and 750° K. Herbert Mette, Wolfgang W. Gartner and Claire Loscow. *Physical Review*, v. 115, Aug. 1, 1959, p. 537-542.

Determination of Nernst and Ettingshausen coefficients for single-crystal Ge in high magnetic flux. Comparison of thermal conductivity is calculated from these measurements with accepted values. Derivation of the Nernst constant from photomagneto-electric theory. (P15g, P11h; Fe-a, 14-61)

726-P.* Effect of Oxygen on the Work Function of Barium. P. A. Anderson and A. L. Hunt. *Physical Review*, v. 115, Aug. 1, 1959, p. 550-552.

In metals which absorb gases strongly, work function is sensitive to gas; in nonsorbing metals, work function is insensitive. Ba is unique in absorbing gas without any effect on work function. Mechanism at Ba surface determined by engulfment of oxygen ions. (P15j, N15e, 2-60, 2-66; Ba-a, *O*)

727-P.* Work Function of Gold. P. A. Anderson. *Physical Review*, v. 115, Aug. 1, 1959, p. 553-559.

Work function of Au determined by Kelvin method contact potential with reference to Ba surfaces of known work function. (P15j; Au-a)

728-P.* Application of the Diffusion-Modified Bloch Equation to Electron Spin Resonance in Ordinary and Ferromagnetic Metals. Jerome I. Kaplan. *Physical Review*, v. 115, Aug. 1, 1959, p. 575-577.

Derivation of diffusion constant for electrons in ferromagnetic and nonmagnetic metals. Approximate calculation of saturation in a nonmagnetic metal. (P16p, P16r, N1; SGA-n)

729-P.* Typical Design and Materials Problems. W. A. Maxwell. Paper from "Metals for Nuclear Reactors". American Society for Metals, Metals Park, Novelty, Ohio, 1959, p. 18-31.

Fission process and heat utilization in heat and power production. Shielding of radiation, gamma heating, material requirements for nuclear reactors. Thermal neutron cross-sections of metals. Physical and mechanical properties, phase transformations and thermal expansion characteristics of uranium. Problems of dimensional stability, corrosion and diffusion. (P10b, P18j, P-general, Q-general, N6p, T11, 17-51; U)

SECTION Q

MECHANICAL PROPERTIES and TEST METHODS; DEFORMATION

1-Q.* A Theory for the Effect of Mean Stress on Fatigue of Metals Under Combined Torsion and Axial Load or Bending. W. N. Findley. *American Society of Mechanical Engineers,* Paper no. 58-A-61, 1958, 5 p.

The concept that alternating shear stress is the primary cause of fatigue with the normal stress on the critical shear plane as an influencing factor is developed for the case of mean (or static) stresses superimposed on combinations of torsion and axial load or bending. Influence of the maximum stress of the cycle of stress on the allowable alternating stress for a given number of cycles and on the orientation of the critical shear plane. Predictions of the theory are consistent with the known trends of fatigue data both for ductile metals and cast irons. 13 ref. (Q7e)

2-Q.* An Investigation of Dry Adhesive Wear. R. P. Steijn. *American Society of Mechanical Engineers,* Paper no. 58-LUB-8, 1958, 10 p.

Sliding-motion experiments under unlubricated conditions were carried out on various metals. Oxide film formation was studied by electrical contact-resistance measurements made in conjunction with wear tests. Effects on the wear rate and basic wear formula. 9 ref. (Q9)

3-Q.* Sliding Wear and Metal Transfer Under Unlubricated Conditions. R. P. Steijn. *American Society of Mechanical Engineers,* Paper no. 58-LUB-9, 1958, 11 p.

Wear experiments on radioactive brass rings against hardened steel in a ring tester. Effect on metal transfer of sliding speed, surface finish, material of the harder surface and presence of slots in the steel ring. Tests also conducted in argon atmospheres to exclude oxidation. 6 ref. (Q9, R2a)

4-Q.* Consider Cr-Mo-V Low Alloy Steels for 1000° F. Service. C. M. Cosman. *Materials in Design Engineering,* v. 48, Oct. 1958, p. 93-96.

Addition of V improves high-temperature properties. Long-time high-temperature properties of creep and stress-rupture in Cr-Mo-V and other low-alloy steels compared and evaluated. 6 ref. (Q-general, 2-62; Ay, *Cr, Mo, V*)

5-Q.* Some Properties of Zinc-Aluminium Alloys. K. P. Scott. *Metallurgia,* v. 58, Oct. 1958, p. 188-192.

Results of mechanical tests on Zn-Al alloys containing 2-50% Al. In the cast state, optimum mechanical properties are obtained with a 4% Al alloy. Alloys containing more than 10% Al have poor impact strength, and shrinkage porosity is present in alloys containing more than 20% Al. (Q-general, 2-60; 5-60, *Zn,* Al)

6-Q.* Low Ductility in Cast Carbon Steel. T. A. Cosh and W J. Jackson. *Metallurgia,* V. 58, Oct. 1958, p. 190-192.

Low ductility in plain carbon steel castings suggests presence of indigenous or exogenous inclusions. Former type are those involving metallic compounds of oxygen, sulphur or nitrogen which separate out of molten steel. The latter type arises from slag entrapment, from occlusion of refractory material or from the interaction of constituents of the molten steel with refractory materials. (Q23p; CN, 5-60, 9-69)

7-Q.* Tensile Properties of Microshrinkage-Graded AZ-63 Magnesium Alloy. I. J. Feinberg and J. D. Grimsley. *Modern Castings*, v. 34, Aug. 1958, p. 71-76.

Microshrinkage is damaging to tensile properties of Mg casting alloy AZ-63. Determination of tensile properties is related to the degree of the defect obtained in radiographic classification. Quantitative determinations of ultimate strength, yield strength and elongation values through statistical analysis. Transverse alignment reduces elongation and ultimate strength; longitudinal alignment of microshrinkage reduces yield strength. 3 ref. (Q27a; Mg-b, 9-67)

8-Q.* Effect of Vanadium on the High and Low Temperature Mechanical Properties of a 1Cr-1Mo Cast Steel. L. D. Tote and R. S. Zeno. *Modern Castings*, v. 34, Aug. 1958, p. 87-94.

Steels were tested in normalized and tempered condition. About 0.25% V was added to 10,000 lb. heats of steels. Effects on rupture strength, ductility, creep strength, transition temperature, grain-size and structure. (Q-general, 2-60, 2-62, 2-63; AY-b, *Cr, Mo, V*)

9-Q.* Ductile-Brittle Transition in the Fracture of Alpha-Iron. Pt. 1. N. J. Petch. *Philosophical Magazine*, v. 3, Oct. 1958, p. 1089-1097.

A criterion for the transition in fracture mode from ductile to cleavage is calculated for fracture at a notch. Transition temperature is found to be a function of grain size, the friction on a free dislocation, the strength of the dislocation locking, the degree of tri-axiality of the applied stress and the elastic constants. 11 ref. (Q26; Fe)

10-Q.* Orientation Dependence of Cyclic Work-Hardening in Aluminum Crystals. P. Charsley and N. Thompson. *Philosophical Magazine*, v. 3, Oct. 1958, p. 1098-1104.

Crystals of Al were subjected to several hundred slow cycles of stress; the rate of decrease of the width of the hysteresis loop is taken as a measure of cyclic work hardening. The manner of hardening depends on the orientation of the crystal and is qualitatively similar to the hardening observed in unidirectional straining. 7 ref. (Q24; 14-61, Al)

11-Q.* Effect of Atmospheric Corrosion on Metal Fatigue. N. J. Wadsworth and J. Hutchings. *Philosophical Magazine*, v. 3, Oct. 1958, p. 1154-1166.

Polycrystalline specimens of Cu, Al and Au were fatigued in reversed bend in various pressures of air and in water vapor and inert gases. The ratio of life in atmosphere of air to that in vacuum (about 10^{-5} mm. Hg) at lives of about 10^6 cycles was 1:20 for Cu, 1:5 for Al and about 1:1 for Au. Small cracks a few microns deep formed in the first few hundredths of the life in air and after the same number of cycles in vacuum. Effect of air was to speed the propagation of cracks in Cu and Al but not in Au. 5 ref. (Q7; R3, Cu, Al, Au)

12-Q.* (German.) Behavior of Ferritic and Austenitic Steels at the Temperature of Liquid Air. H. Schumann. *Technik*, no. 6, 1958, p. 417-427.

Embrittlement of carbon steels observed at 0°C, while a normalized and low-Mn alloy steel shows a distinctly diminishing notch impact strength at about -50°C. Neither an austenitic Mn-Cr steel nor a 5% Ni steel nor a Cr-Ni heat treatable steel showed a satisfactory strength at -180°C. An austenitic Cr-Ni steel, however, proved to be resistant to low temperatures, retaining almost the same strength. 9 ref. (Q26s, Q27a, 2-63; CN, AY)

13-Q.* (Japanese.) Studies on the Standard Indentation Hardness Tester. Pt. 1. Design of the Tester. Kentaro Yamamoto, Hiroshi Yano and Nobuaki Yajima. *Central Inspection Institute of Weights and Measures, Tokyo, Report*, v. 7, no. 2, 1958, p. 10-14.

New lever-type hardness tester employs two weights which are connected to the lever with knife edges. These weights are floated in tanks and by draining water from the tanks the load of indentation increases up to its subscribed value for testing. Accuracy of indentation measurement is 0.2 micron when magnification of micrometer-microscope is 200 and that of the load measurement is 0.3%. Range of measured values of standard hardness specimens less than 0.5 Rockwell hardness number. (Q29b)

14-Q.* (Japanese.) Study on the Micro-Indentation Hardness Measurement by New

Testing Apparatus. Pt. 1. Kentaro Yamamoto, Namiteru Hida and Seizo Koizumi. *Central Inspection Institute of Weights and Measures, Tokyo, Report,* v. 7, no. 2, 1958, p. 15-22.

New microhardness apparatus continuously records depth of indentation and elastic recovery. Indentation load is controlled by bouyancy. Vertical displacement of the indentor is picked up by differential transformer, amplified and recorded. Accuracy of measurement of indentation is 0.1 micron and that of indentation load is within 2 g. while maximum load of indentation is 2 kg. (Q29q)

15-Q.* (Japanese.) Study on Plastic Deformation of Aluminum at Low Temperatures (-196°C.) Jiro Wada and Masanobu Sasagawa. *Light Metals,* no. 31, July 1958, p. 5-12.

Fragmentation of polycrystalline Al at low temperatures studied by X-ray diffraction. Deformation of single crystals at -196°C and at room temperature investigated by optical microscope, electron microscope and X-ray diffraction. Differences among slip bands, deformation bands and cross slip formation provide basis for discussion on mechanism of low-temperature deformation. 11 ref. (Q24, Q26, 2-63; Al)

16-Q.* (Japanese.) Heterogeneous Properties of Commercially Pure Aluminum Under Rolling Process. Takashi Ikeno, Kizo Shibata and Tyogo Keiji. *Light Metals,* no. 31, July 1958, p. 16-21.

Change in hardness and microstructure of 2S slab ingots made by semicontinuous casting when hot rolled to various reductions and then cold rolled without intermediate annealing. Hardness of hot rolled sections generally tended to be lowest at the surface and higher toward the center. Recrystallized grains appeared on outer parts of hot rolled stock but not inner parts. The heterogeneity of hot rolled stock affected the property of sheets cold rolled without intermediate annealing. 5 ref. (Q29n, M27, 3-68; Al-a, 4-53, 5-59)

17-Q.* (Russian.) Some Data on Effects of Cold Formed Hardened Structure on Temper Brittleness of Steel. F. P. Stepanov. *Fizika Metallovi Metallovedenie,* v. 6, no. 8, 1958, p. 483-486.

Cold plastic deformation (by elongating 1.5%) after hardening raises the resilience and considerably lessens the tendency to temper brittleness; raising the cold plastic deformation to 4% entirely eliminated this tendency. 9 ref. (Q26s, 2-64, 3-68; AY, *Cr*)

18-Q.* (Russian.) Structure Transformations of Nickel-Chromium Alloy by Creep. G. Ya. Kozyrskii, V A. Kononenko and P. N. Okrainets. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* Aug. 1958, p. 90-92.

Rapid crystalline transformation and creep was found with alloys in metastable state that show increased strength at low temperatures. Transformations caused by creep go faster than transformations caused by temperature. 6 ref. (Q3, Q24m, 2-61; Ni-b, *Cr*)

19-Q.* The Engineering Properties of Commercial Titanium Alloys (Revision.) M. W Mote, R. B. Hooper and P. D. Frost. Titanium Metallurgical Laboratory. *U.S. Office of Technical Services,* PB 121647, June 1958, 248 p. $4.

General characteristics of mill products. Engineering properties have reached a comparatively stable state, thus permitting design and fabrication of production items to an extensive degree. Three new alloys, Ti 16V-2.5Al, Ti-6Mo-3Al and Ti-4Al-3Mo-IV. (Q-general; Ti-b)

20-Q. Development of Tough, High-Strength Quarternary Titanium-Base Alloys of the Ti-Al-V-X System. W. F Kirk and H. Margolin. New York University. (Watertown Arsenal Laboratories.) *U. S. Office of Technical Services,* PB 131502, Nov. 1956, 100 p. $2.75.

Nine alloys of the Ti-Al-V-X system showed promise of meeting yield strength requirements of 150,000 psi. or greater. Research to develop alloys of high yield strength and with adequate ductility and toughness was performed on a group of 20 1 1/4-lb. ingots. Al varied from 4 to 8%, V from 2 to 4%, other additions from 2 to 4%. The aging behavior for four solution temperatures and four aging temperatures was studied. Jominy end-quench tests and a few tensile tests were also carried out. Three alloys fell below the 150,000 psi. requirement but showed

high ductility. (Q23b, Q23p, Q27a, J5, 2-64; Ti-b, *Al, V*)

21-Q. The Effect of Structure and Interstitials on the Impact Strength of Titanium and Titanium Alloys. C. B. Dittmar, G. W. Bauer and D. Evers. Mallory-Sharon Titanium Corp. *U. S. Office of Technical Services,* PB 131541, Dec. 1956, 29 p. $ .75.

Production, heat treating and testing procedures employed to produce and evaluate three heats of Ti-6A1-4V, two heats of Ti-3Mn complex and one heat of Ti-16V-2.5 alloy in 5/8 in. diameter bar. Plates 5/8 x 6 x 6 in. were also obtained for Navy ballistics testing. (Q6n, 2-64, 3-69, 3-71; Ti-b, *Al, Mn, V*)

22-Q. Investigation of Heat Treatments and Mechanical Properties of High Strength Steel Castings. J. W. A. Tyler and P. J. Ahearn. Watertown Arsenal. *U. S. Office of Technical Services,* PB 131638, Aug. 1957, 33 p. $1.

Aim was to produce castings with the transverse physical properties of steel forgings. Two heats of steel of different composition were cast into 5-in. diameter finned cylindrical coupons and heat treated to high strength levels. Testing was conducted at the fin, midwall and center of the coupons to ascertain the effect of increasing casting thickness on properties. SAB 4340 steel castings modified with 0.15% V can be heat treated to a strength of 280,000 psi. with a yield stress at 0.1% offset of 200,000 psi. High-silicon steel castings can be heat treated to a strength level of 290,000 psi. with a yield stress at 0.1% offset of 215,000 psi. (Q27a, Q23b, 2-64, 3-73; ST, *Si, V,* 5-60)

23-Q. The Effect of Cadmium Plating on SAE 4340 Steel in the Presence of Stress Concentrations at Elevated Temperatures. E. M. Kennedy, Jr. Wright Air Development Center. *U. S. Office of Technical Services,* PB 131814, Mar. 1958, 40 p. $1.25.

Plating on steel heat treated from 240,000 to 260,000 psi. tensile strength causes a sharp decrease in the rupture strength at or near the melting point of Cd (612° F). However, exposure of unstressed Cd-plated parts to these temperatures causes no decrease in the tensile strength at room temperature. (Q3m, Q27a, 2-62, 3-66; ST, *Cd,* 8-62)

24-Q. Fatigue Strength Reduction Factors for Inclusions in High Strength Steels. H. N. Cummings, F. B. Stulen and W. C. Shulte. Curtiss-Wright Corp. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131816, Apr. 1958, 38 p. $1.

Effect of nonmetallic, nonmalleable inclusions on the fatigue strength of specimens of SAE 4340 steel and 4350 steel in the tensile strength range 140,000 to 300,100 psi. "Fatigue strength reduction factors" for the inclusions found in the single-nucleus origins of fracture of specimens tested in rotating bending machines. Values of the factors depend on the size of the inclusions and hardness level of the steel. For very small inclusions (less than 0.00025 in.) other inhomogeneities inherent in the steel itself may dominate the failure of a specimen. (Q7a, Q27a, Q29n; ST, 9-69)

25-Q. Lubrication of Titanium. N: Fatica. Clevite Research Center. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 131981, May 1958, 78 p. $2.25.

Two testers, the Shell Four Ball and the Falex, used to obtain information about the frictional properties of modified Ti coatings. Comparison of the wear resistance of the best surface treatments with various lubricants. It appeared possible to obtain equivalent wear resistance in many cases using electroless Ni plates, cyanided, nitrided, carburized, oxidized or carburized Fe-plated Ti. The higher the halogen content of the lubricant, the better its lubricating properties. (Q9n, Q9p, 2-61; Ti-b, 8-62, NM-h)

26-Q. Development of Niobium-Base Alloys. R. T. Begley. Westinghouse Electric Corp. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151004, May 1958, 113 p. $2.50.

Potentialities of Cb-base alloys for structural applications above 1800°F. Creep-rupture properties, flow and fracture characteristics, oxidation behavior and weldability of commercially pure Cb. Cb was found to undergo a ductile to brittle transition in the range -125 to -196° C., and its transition temperature range was less affected by the presence of interstitial impurities than many other body-centered cubic metals. Creep-rupture

studies at 982 and 1093° C. showed that the 100-hr. rupture strength of commercial Cb in vacuum is significantly greater than that of unalloyed Mo. (Q-general, 2-60, 2-62, 3-69; Cb-a, SGA-h)

27-Q.* Beam and Column Tests of Welded Steel Tubing With Design Recommendations. Don S. Wolford and M. J. Rebholz. *ASTM Bulletin,* no. 233, Oct. 1958, p. 45-51.

Tests were performed on 3/8 to 3-in. diameter tubing made by forming and welding Armco Zincgrip flat rolled steel of sheet gages from 20 to 12. Yield strengths in tubing were higher than the flat rolled steel stocks from which they were made. 12 ref. (Q27; 4-60, ST, 7-51)

28-Q.* Alloy Ductile Irons Promise Better High Temperature Strength. *Materials in Design Engineering,* v. 48, Oct. 1958, p. 97.

Superior creep and rupture properties have been developed in Mo iron, Ni-Cu iron, Ni-Cr iron and Ni-Cr-Mo iron. Mo-containing irons have the higher stress-rupture strength. At 1100° F., adding 0.7-1% Mo to Ni-Cr irons raises 1000-hr. rupture stress by 6000 psi. Raising Ni content from 30% to 35% provides another increase of 1500-2000 psi. (Q3m; CI-q, *Mo, Ni, Cu, Cr*)

29-Q.* Some Observations on the Fatigue Behaviour of Aluminium-7% Magnesium in Various Conditions of Heat Treatment. C. A. Stubbington. *Metallurgia,* v. 58, Oct. 1958, p. 165-171.

Grain size is important in determining fatigue, extruded material with fine grain size having better fatigue properties than solution treated material (in which grain growth had occurred) in all aged conditions. As-extruded 7% Mg alloy gives a steel-type S-N curve, but any form of heat treatment, whether aging or solution treatment, produces S-N curves typical of those obtained on other Al alloys. Cold working improves the properties of solution treated material. 4 ref. (Q7, 2-64; Al, *Mg*)

30-Q.* (Japanese.) Studies on Material for Gas Turbine Wheels. Pt. 2. Taro Hasegawa and Osamu Ochiai. *Sumitomo Metals,* v. 10, Apr. 1958, p. 68-80.

Influence of heat treatment and cold working on mechanical properties at room temperature and at 650°C. of Timken 16-25-6 Cr-Ni-Mo steel. Creep-rupture life and yield strength at 650° C. increased and creep ductility decreased by long-time solution treatment before cold working. Pre-heat treatment below 1050° C. or precipitation hardening before cold working decreased creep-rupture life and increased creep ductility. Cold working after solution treatment at 1150° C. gave longest creep-rupture life and low creep ductility. Rupture time decreased and ductility increased as working temperature was raised from 700 to 850° C. Creep-rupture life increased with cold working up to 25% reduction but decreased with higher percentages of deformation. 7 ref. (Q-general, Q3, 2-60, 2-64, 3-68; SS)

31-Q.* (Japanese.) Effects of Iron and Silicon on Some Aging Characteristics of Chromium Copper. Keiichi Mizuno. *Sumitomo Metals,* v. 10, Apr. 1958, p. 93-104.

Effects of solution treating temperature, aging time and temperature, Si and Fe content and intermediate cold working on the electrical conductivity and hardness of Cu alloys containing 0.18 to 0.89% Cr. Addition of Fe decreased conductivity, hardness and rate of precipitation hardening at low temperature. Precipitation hardenability increased by intermediate cold working after solution treatment. Si additions decreased conductivity and precipitation rate but resulted in retention of hardness for longer periods during aging at 475° C. 16 ref. (Q29, P15g, N7a, 2-60; Cu-b, *Cr, Fe, Si*)

32-Q. (Russian.) Effect of Phosphorus and Nickel on Cold Fracture of Medium Carbon Steel. V. N. Svetchnkov and Yu. B Yakovtchuk. *Fizika Metallov i Metallovedenie,* v. 6, No. 8, 1958, p. 505-511.

As C contents increase (0.44-0.54%) the damaging effect of P on cold fracture is increased, while the beneficial effect of Ni is lessened. 11 ref. (Q26, 2-60; CN, *Ni, P*)

33-Q. (Russian.) Dampening Oscillations of a Cylinder. V. S Postnikov. *Fizika Metallov i Metallovedenie,* v. 6, no. 8, 1958, p. 522-523.

From point of view of a vibrating medium possessing plastic properties. 18 ref. (Q8)

34-Q. (Russian.) Determining Impact Hardness and Constants in Steels. B. A. Vandyschev and F. S. Savitsky. *Fizika Metallov i Metallovedenie*, v. 6, no. 8, 1958, p. 534-539.

Energy loss is proportional to impact force; dynamic coefficient depends on C content of the steel; medium C steels give the lowest dynamic coefficient. 11 ref. (Q6s; CN)

35-Q. (Russian.) Long-Time Strength and Creep. L. M. Kachanov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk*, Aug. 1958, p. 26-31.

Theory of calculation. 11 ref. (Q3m)

36-Q. (Russian.) Characteristics of Curves in Bi-Axial Deformation. A. M. Zhukov. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk*, Aug. 1958, p. 32-40.

Stress-strain calculations on bi-axial deformation, based on experiments with steels 30 KhNZA, 45 and pure Al. 11 ref. (Q25n, Q24; ST, Al-a)

37-Q. (Russian.) Testing Titanium for Wear Resistance. E. S. Reinberg. *Zavodskaya Laboratoriya*, v. 24, no. 9, 1958, p. 1107-1110.

Tests conducted by bending rotating console-shaped specimens 5-7.5 mm. in diameter, with frequent variations in stress of 1370-1430 cycles per min. Testing base was set at 10^7 cycles. 4 ref. (Q9n,; Ti-b)

38-Q. (Russian.) Plasticity and Brittleness of Structural Steels Arising From Off-Center Elongation of Cut Specimens. V. A. Bykov. *Zavodskaya Laboraboriya*, v. 84, n. 9, 1958, p. 1116-1119.

Testing of cut specimens subjected to off-center expansion makes it possible to determine more precisely many mechanical properties of steel, particularly plasticity and ductility. 5 ref. (Q-general, Q23, 1-54; ST)

39-Q.* Creep Properties of Three Low-Shrinkage Copper-Base Casting Alloys. *American Society for Testing Materials, Proceedings*, Reprint, v. 58, 1958, 14 p.

Creep evaluation conducted on cast specimens of 80-10-10, 85-5-5-5, and Navy "M" alloys at 350, 450, and 550° F. Short-time, room-temperature tension tests made on creep tested specimens to determine residual tensile properties after long-time exposure to stress and temperature. (Q3, 2-62; Cu-b, Cu-s)

40-Q.* Creep Under Changing Complex Stress Systems. Pt. 1. A. E. Johnson, J. Henerson and V. Mathur. *Engineer*, v, 206, Aug. 8, 1958, p. 209-216.

Generalized relationships concerning creep of carbon steel, Al and Mg alloys under changing stress systems. (Q3; CN, Al-b, Mg-b)

41-Q.* Variation in Fatigue Properties Over Individual Casts of Steel. Pt. 2. E. Ineson, J. Clayton-Cave and R. J. Taylor. *Iron and Steel Institute, Journal*, v. 190, Nov. 1958, p. 277-283.

Variations in fatigue properties within an ingot and between ingots of the same cast of steel determined for a typical cast of basic electric steel. Metallurgical information concerning composition variations, distribution of nonmetallic inclusions, hardenability and tensile properties. Fatigue properties of material with a tensile strength of 125 tons per sq. in. were inferior to those of the same material with a tensile strength of 85 tons per sq. in. 13 ref. (Q7; CN-b, 5-59)

42-Q.* An Evaluation of Structural Sheet Materials in Missile Applications. George Gerard. *Jet Propulsion*, v. 28, Aug. 1958, p. 511-520.

Short-time tensile and compression tests at elevated temperatures, strain rate under tensile loads given for Mg, Al, Ti, alloys, PH steels and Be. 19 ref. (Q-general, T24e; Mg-b, Al-b, Ti-b, Be, SGA-h, SS, 17-57)

43-Q.* On the Fatigue Limit of Metals. P. Feltham. *Philosophical Magazine*, v. 3, Aug. 1958, p. 806-810.

Ratio of fatigue limit to critical tensile strength is shown to be independent of temperature for Cu, Au, Ag, Mg and Cd. Al acts anomalously. 6 ref. (Q7b; 2-61, Cu, Au, Ag, Mg, Cd, Al)

44-Q.* Static and Dynamic Strength of a Carbon Steel at Low Temperatures. C. J. Maiden and J. D. Campbell. *Philosophical Magazine*, v. 3, p. 872-885.

Low-carbon steel investigated in the range 15 to -121° C. exhibits increased

upper and lower yield stresses as temperature is decreased. 13 ref. (Q27, 2-63; CN-g)

45-Q.* Titanium Alloys Developed for Aircraft-Missile Applications. *Automotive Industries*, v. 119, Aug. 15, 1958, p. 65.

High-temperature strength characteristics and formability of Crucible C-105VA, Crucible C-115 A MoV and Crucible B-120VCA. (Q27a, 2-62, T24, 17-52; Ti-b)

46-Q.* Modified Keel-Block Design for Acceptance Testing of Ductile Iron. Gilbert McGlothlin. *Foundry Trade Journal*, v. 105, Nov. 6, 1958, p. 563-566.

Modification of standard shape reduces casting and machining costs, gives equivalent results (Q27d, 1-60; CI-r)

47-Q.* (French.) Study of Heterogeneity in Tensile Tested Metals. W. Truszkowski. *Revue de Metallurgie*, v. 55, Aug. 1958, p. 716-724.

Plastic deformation of samples of 99.9% Cu, Monel metal and carbon steel containing 0.55% C studied. A formula was deduced which permits calculation of coefficient of heterogeneity, which the experiments showed to be influenced by impurities at grain boundaries, grain size and impurities scattered throughout the metal. Method permits calculation of coefficient of uniform elongation of perfectly homogeneous material. 9 ref. (Q27a, 3-69, 3-71; Cu-a, CN, Ni-b)

48-Q.* (French.) Influence of Crystal Orientation on the Bending Fatigue Limit and the Formation of Slip Lines in Alpha-Iron Monocrystals. M. Hempel and E. Hillnhagen. *Revue de Metallurgie*, v. 55, Aug. 1958, p. 749-760.

Determination of S-N curves of single crystals and of bi and tricrystalline specimens of Armco iron with 0.006% C. Relation between bending fatigue limits and static strength; influence of crystal orientation; metallographic study with optical and electron microscopes of influence of conditions of loading on formation of slip lines on surface of cyclic-stressed specimens; crystal orientation and formation of slip lines in single and multiple slip; connection between position of fatigue cracks and direction of grain boundaries in bi and tricrystalline specimens. 36 ref. (Q7g, Q24a, 3-72; Fe)

49-Q.* (French.) Theory of the Changes in Metals During Fatigue. Variation of the Spatial Distribution of the Stability of Obstacles to Plastic Slip. *Revue de Metallurgie*, v. 55, Aug. 1958, p. 761-777.

It is theorized that fracture of metals is the result of process of distribution of internal reactions to external forces among ever smaller and fewer domains during application of mechanical stress. This stress, whether slowly or rapidly applied, and whether permanent or cyclic, causes increasingly greater differentiation between plastic rigidity and spatial distribution of stability of metastable atomic or molecular configurations, returning certain domains to their original condition (recrystallization and polygonization) or a new condition, and increasing disorder of others. 56 ref. (Q24, M25m, Q7, 3-68)

50-Q.* (French.) Remarks on Cumulative Damage in Fatigue. W. Weibull. *Revue de Metallurgie*, v. 55, Aug. 1958, p. 778-784.

The theory of linear fatigue damage becomes invalid under certain conditions because of incorrect assumption that endurance limit of metals does not vary during development of fatigue. A new method is proposed which takes into account the effect of prestressing of fatigue tested materials. Some results obtained with this method. (Q7, 3-68)

51-Q.* (French.) Statistical Study of Fatigue. F. Bastenaire and M. Weisz. *Revue de Metallurgie*, v. 55, Aug. 1958, p. 785-796.

Influence of tensile properties on relative scatter of fatigue results as reported in literature. Statistical study of phenomenon of underloading. There is a possibility of a marked underloading effect (from 6 to 8 kg. per sq.mm.) in a heat treated steel, a moderate effect in the presence of notches; increased scatter of results is noted in case of underloaded specimens. 6 ref. (Q7, Q27a, S12)

52-Q.* (Italian.) Cracks in the Thermally Altered Zone of Welds Made on Self-Hardening Alloy Steels. H. Sekiguchi and T. Kobayashi. *Rivista Italiana della Saldatura*, v. 10, May-June 1958, p. 108-114.

Toe cracks, underbead cracks, transverse and longitudinal cracks were found on transverse and longitudinal sections of small square specimens of Ni-Cr-Mo steel on which welding beads were deposited. From frequency of different types of cracks, it appears that hydrogen has marked influence only on underbead type. Intervals between end of welding operation and crack initiation were determined and related to degree of martensite transformation in joints. Pre and postheating techniques designed to prevent crack formation. 4 ref. (Q26q, N8p; ST, *Ni, Cr, Mo,* 7-51)

53-Q.* Steels for Use in the Chemical, Petroleum and Allied Industries. *British Standard Specification,* BS 1501-1506, 1958, 84 p.

Chemical composition, tensile tests, bend tests, mechanical properties for all carbon and alloy steel plates; sections; bars; forgings; castings; bolting materials. Comparable British and American specifications and repairs by welding to castings. (Q27, Q5, S22, T29, 17-57, CN, AY, SS)

54-Q.* Steels for Use in the Chemical, Petroleum and Allied Industries. *British Standard Specification,* BS 1510, 1958, 6 p.

Low-temperature requirements shown by statistics concerning heat treatment, chemical composition, selection and number of impact tests, test specimens and their properties. (Q6, T29, 17-57; ST, SGB-r)

55-Q.* Glide Path Effects and Work Hardening in Aluminium Single Crystals. N. A. McKinnon. *Commonwealth of Australia, Dept. of Supply, Aeronautical Research Laboratories,* Report ARL/MET 29, Mar. 1958, 25 p.

Specimens were of rectangular cross-section and the primary slip direction was parallel to either the large or the small side of the prism. Metallographic and X-ray techniques used to study the influence of length of glide path on the work hardening of Al single crystals oriented within the basic sterographic triangle. The important factor altering the hardening characteristics was the relative length of the secondary slip systems with respect to the primary systems and not the absolute length of glide path in the primary slip direction. 32 ref. (Q24a; Al, 14-61)

56-Q.* Heat Treated Ductile Iron Offers Wide Property Range. C. A. Anderson. *Iron Age,* v. 182, Nov. 20, 1958, p. 102-104.

Compares ductile iron with steel; how heat treatment affects properties; tensile and yield strength, elongation, wear resistance. (Q-general, 2-64, CI-r)

57-Q.* (Dutch.) Aging of Aluminum-Magnesium Casting Alloys. L. J. G. van Ewijk. *Metalen,* v. 13, Oct. 31, 1958, p. 360-365.

Test bars aged at various temperatures, after which mechanical properties were determined at room temperature. Aging is more severe and the loss in mechanical properties is greater, the higher the Mg. Plastic deformation accelerates aging. 18 ref. (Q-general, 2-65; Al-b, *Mg*)

58-Q.* (Russian.) Influence of Internal Friction on the Rupture of Parts Subject to Cyclic Strain. Ya. S. Podstrigach and M. I. Chaevskii. *Doklady Akademii Nauk SSSR,* v. 121, no. 2, 1958, p. 268-270.

With cyclic torsional strains thermal stresses are caused by internal friction resulting in flaws in tangential and axial direction. With diameter of the sample increased from 10 to 200 mm., the fatigue strength decreases to 40-50% of the original value. 10 ref. (Q7, Q22)

59-Q. Development of Plastic Theory Methods in Structural Steel Design. L. K. Stevens. *Australian Welding Journal,* v. 1, Feb. 1958, p. 7-11.

6 ref. (Q23; ST, SGB-s, 17-51)

60-Q. Recent Survey in the Research Field of Fatigue and Creep of Materials. Yokobori Takeo. *Japan Science Review,* v. 4, no. 1, Oct. 1958, p. 135-138.

Literature review. 58 ref. (Q7, Q3, 10-54)

61-Q. (Japanese.) Strength of Tire Thread. Naoteru Oda and Kunio Nishioka. *Sumitomo Metals,* v. 10, Apr. 1958, p. 81-92.

Shelling or spalling of locomotive wheels. Factors determining contact area

and contact pressure between wheel and rail. 11 ref. (Q9, T23q; ST)

62-Q.* The Failure of Metals Under Load--Some Recent Research in Melbourne Laboratories. Hugh Muir. *Australian Institute of Metals, Journal,* v. 3, May 1958, p. 44-60.

Research projects on yielding, brittle fracture, creep, stress-corrosion and fatigue. Dislocation theory provides a method of integrating the different modes of failure in terms of four basic processes: elastic deformation, plastic deformation, crack formation and crack propagation. Australian discoveries include: production of ductile Cr, cell formation and grain displacement effects in creep, explanation of grain boundary cavitation in metals stressed at high temperatures and crack initiation at intensified slip bands under fatigue conditions. 67 ref. (Q26, Q24, Q23, Q21, Q3; Cr)

63-Q.* (German.) High-Strength Structural Steels. Stefan Kronmarck. *Neue Hutte,* v. 3, July 1958, p. 433-442.

Prerequisites for required properties (more than 33 kg. per sq. mm. yield strength). In rolling, properties are influenced by drawing temperature of ingots, Al treatment, rolling temperature, cooling conditions, normalizing, annealing, cold work hardening. Survey on composition and properties of high-strength constructional steels. 54 ref. (Q-general, 2-60, 2-61, 3-68; ST, SGB-a)

64-Q.* (Russian.) Method of Conducting Tests for Thermal Failure. S. V. Serensen and P. I. Kotov. *Zavodskaya Laboratoriya,* v. 24, no. 9, 1958, p. 1097-1106.

Progressive failure of metal subject to repeated heating and cooling. Analysis of process of deformation during thermal failure; factors influencing distribution of thermal stresses; speed of deformation during cyclic heating; crack formation during thermal failure and methods to determine resistance of materials to thermal failure. 40 ref. (Q25p)

65-Q.* (Russian.) Investigation of Influence of Change in Frequency of Stress on Wear Resistance of Armco Iron. V. I. Shabalin. *Zavodskaya Laboratoriya.* v. 24, no. 9, 1958, p. 1110-1112.

By keeping all conditions the same, except variations in cyclical stress, curves show that increasing frequency from 20 to 3000 cycles per min. resulted in an insignificant change in endurance limits of Armco iron (from 22 to 23 kg. per sq. mm.) (Q9n, 2-66; Fe-b)

66-Q.* (Russian.) Testing Quality of Sheet Steel by Means of Impact Toughness Experiments. V. G. Chernashkin, A. M. Gofner and M. A. Sivryukova. *Zavodskaya Laboratoriya.* v. 24, no. 9, 1958, p. 1112-1115.

Traces failure of welded cylindrical petroleum tanks to formation of small cracks in weld seams during cooling which caused embrittlement in steel frame. Tests were aimed at finding type of steels for this purpose that would localize cracks in welds and prevent further embrittlement. (Q6, Q26s, T26q; ST, 7-51, 9-72)

67-Q.* Pressure Vessels and the Problem of Brittle Fracture. H. Harris. *Metallurgia,* v. 58, Nov. 1958, p. 213-217.

Brittle fracture at low applied loads occurs when there are residual welding stresses, a defect of sufficient severity is present and the structure is at a low temperature. Effect of irradiation also considered. (Q26s; 2-61, 2-67, ST)

68-Q.* Properties of a Large Extrusion Supplied to Specification D.T.D. 363. T. R. G. William, S. W. Hallwood and R. W. Hayden. *Metallurgia,* v. 58, Nov. 1958, p. 219-224.

Static and fatigue testing on a large heat treated extrusion in an Al-Zn-Mg-Cu type alloy. The center showed a lower tensile strength than the surface. (Q27a, Q7a; Al-b, 4-58)

69-Q.* Thermal Fatigue of Ductile Materials. Pt. 1. Effect of Variations in the Temperature Cycle on the Thermal Fatigue Life of S-816 and Inconel 550. Francis J. Clauss and James W. Freeman. *National Advisory Committee for Aeronautics,* NACA TN 4160, Sept. 1958, 61 p.

Effect of maximum cycle temperature, temperature difference of cycling, cycling time of exposure at the maximum cycle temperature cyclic plastic strain. Tensile specimens were heated and cooled while constrained in a manner that prevented their free axial expansion and

contraction, and the number of cycles to fracture was determined. Hardness measurements and microstructural studies were made. Cycles to failure was more sensitive to changes in the maximum cycle temperature than to changes in the temperature difference. 21 ref. (Q7j; ST, Ni-b)

70-Q.* Thermal Fatigue of Ductile Materials. Pt. 2. Effect of Cyclic Thermal Stressing on the Stress-Rupture Life and Ductility of S-816 and Inconel 550. Francis J. Clauss and James W. Freeman. *National Advisory Committee for Aeronautics*, NACA TN 4165, Sept. 1958, 43 p.

Experimental study of changes in stress-rupture life, ductility, hardness and microstructure of S-816 and Inconel 550 specimens exposed to varying amounts and conditions of thermal fatigue. Exposure to thermal fatigue conditions strengthened S-816 in stress-rupture and weakened Inconel 550. 33 ref. (Q7j, Q7f, Q3q; Ni-b)

71-Q.* An Investigation of the Effects of Atmospheric Corrosion on the Fatigue Life of Aluminum Alloys. Herbert A. Leybold, Herbert F. Hardrath and Robert L. Moore. *National Advisory Committee for Aeronautics*, NACA TN 4331, Sept. 1958, 17 p.

Specimens of 2024-T3 and 7075-T6 Al alloys in both the bare and clad forms were tested. Atmospheric effects shortened the average lives by a factor of about 3 for 7075-T6 and 2024-T3 in the bare condition and by a factor of about 1.5 for 7075-T6 in the clad condition. (Q7, R3; Al-b)

72-Q.* Plastic Creep of Germanium Single Crystals. H. G. Van Bueren. *Physica*, v. 24, Oct. 1958, p. 831-837.

Temperature and stress dependence of the creep rate of Ge single crystals, loaded in tension. Three parts in the creep wave. The initial part is explained in terms of the liberation of dislocation sources from impurity atoms, whereas the stationary creep rate attained in the second part is determined by the mobility of the dislocations themselves. 5 ref. (Q3, 2-61, 3-66; Ge, 14-61)

73-Q.* Properties of Whiskers. S. S. Brenner. Paper from "Growth and Perfection of Crystals", John Wiley & Sons, Inc., New York, 1958, p. 157-190.

Elastic behavior of whiskers, effect of size and temperature on strength; plastic behavior, creep in the elastic strain region; dekinking of whiskers; magnetic, electric and surface properties. 61 ref. (Q-general, P-general; 14-61)

74-Q.* (Dutch.) Brittle Fracture. G. M. Boyd. *Lastechniek*, v. 24, Sept. 1958, p. 177-186.

Confined to fractures in low-carbon steel. Most fractures are attributed to fatigue, elastic or plastic instability, corrosion or brittleness. Discussion of different kinds of fracture; factors favoring the occurrence of brittle fractures; influence of temperature; connection between toughness and strength; influence of welding; protective measures. 14 ref. (Q26s; CN-g)

75-Q.* (French.) Plasticity and Creep. Note 3. Gustavo Colonnetti. *Comptes Rendus*, v. 247, Sept. 22, 1958, p. 840-842.

Only one half of the plastic deformation undergone by a material disappears, the other half remaining permanent, regardless of speed of variation of loads, provided that this speed remains constant during test. (Q24, Q3)

76-Q.* (German-French.) Temperature Influence on Cold Drawn and Heat Treated Aluminum. E. von Burg. *Aluminium Suisse*, v. 8, Sept. 1958, p. 151-160.

Tests on rods made of pure Al and a number of Al alloys using apparatus for rupture tests plus manometer. Tests of behavior at low temperatures show increase of strength and plasticity. Sintered Al superior in heat resistance, but low in tensile strength. 12 ref. (Q-general, 2-61, 2-64, 3-68; Al-a, Al-b, 4-55, 6-72)

77-Q.* (Polish.) Investigation of Plastic Deformation of Sintered Carbides. Edmund Bryjak, Stanislaw Piaskowski and Zbigniew Borjarski. *Hutnik*, v. 25, July-Aug. 1958, p. 295-303.

Investigated by application of special equipment and pressure up to 100 tons per sq. cm. Prints were measured and controlled metallographically and by X-rays. Sintered carbides containing below 10% Co may undergo plastic deformation in strictly specified conditions. (Q24; Co, W, 6-69)

78-Q.* (Rumanian.) Properties of Low-Alloy Manganese-Molybdenum Structural Steels. B. Rotenstein. *Studii şi Cercetări de Metalurgie*, v. 1, July-Dec. 1956, p. 261-282.

Simultaneous presence of several alloying elements in small quantities is more effective than influence of each one of them in an amount equivalent to the sum of these elements. Investigation of the influence of Mn, Cr, Mo, Cu and C on properties and structure of Cr-Mn-Mo steel. Influence of chemical composition and conditions of heat treatment studied by great variety of tests. Conclusion: Low-alloy Mn-Mo steel with slight additions of Cu and Si can be used for machines and ships instead of Cr-Ni or Cr-Mo steels. 21 ref. (Q-general; ST, *Cr, Mo, Cu, Si*, 2-60, 2-64)

79-Q. More Surface Polishing—Less Galling. William H. Moore. *Product Engineering*, v. 29, Nov. 24, 1958, p. 63-65.

Test results showing why components should be "worn-in" before they take loads. (Q9q, L10b)

80-Q. (French.) Fatigue Fracture. *Revue de la Soudure*, v. 14, no. 3, 1958, p. 155-157.

Studied on welded parts of steel with 0.5 to 0.55% carbon. (Q7; ST, 7-51)

81-Q. Some Mechanical Properties of Graphite in the Temperature Range 20 to 3000° C. C. P. Wagner, A. R. Driesner and E. A. Kmetko. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/702, 1958, 28 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Strength in tension and compression, tensile and compressive creep, coefficient of friction, coefficient of thermal expansion, thermal conductivity. Measurements performed to study effects of temperature, stress level, anisotropy and graphite type. (Q-general; P11, 2-61, 3-66, NM-k36)

82-Q. Effect of Quenching and Neutron Irradiation on Internal Friction of a Super-Purity Al-5% Mg Alloy. W. G. Nilson. Chalk River, Ontario. CRMet-801, Sept. 1958, 16 p. (Available from Atomic Energy of Canada Limited, Chalk River, Ontario) $.50.

Low-frequency internal friction peak near 150° C. is probably due to stress-induced local ordering of the solute atoms. Its movement to lower temperatures after either quenching or neutron irradiation, corresponding to a reduction in relaxation time for the damping process, is compatible with the idea that the Mg atoms act as traps for the vacancies produced by these treatments. 23 ref. (Q22, 2-67; Al, *Mg*)

83-Q.* (French.) Mechanical Properties and Structures of Magnesium and Its Alloys. M. B. Boudouresques. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p. 57-72.

Studies on pure (99.8%) Mg, a 0.56% Zr alloy and a 0.85% Zn, 0.59% Zr alloy. When exposed to cyclic torsion stress at 400° C., a pure Mg sheath on a U rod for a nuclear reactor broke and showed strong grain growth, while the grain growth of the alloys was moderate. (Q-general, N3, 2-60, Mg-a, Mg-b, *Zr, Zn*)

84-Q.* (French.) Development of Mechanical Properties and Structure Changes in the Stress Relieving of Titanium Sheet After Cold Rolling. A. Saulnier and R. Develay. Paper from "Symposium on Special Problems in Metallurgy", Presses Universitaires de France, Paris, France, 1958, p 89-101.

Accepted theory on the recrystallization of Ti gives only a rough approximation. After strong cold deformation (to the order of 100%) a very fine polygonization grain is obtained by heat treating at 550-600° C. for 30 min. (Q24m, J1a, N5, 2-61; Ti-a)

85-Q.* (German.) Reaction of Some Light Metal Alloys to Cyclic Temperature Stress. K. Lohberg. *Aluminium*, v. 34, Nov. 1958, p. 634-642.

Leads to considerable structural changes, limited to relatively thin surface layer, which can be reversed by appropriate subsequent heat treatment. 8 ref. (Q26p; Al-b)

86-Q.* (German.) Results of Static Notch Bending Tests Compared With Notch Impact Tests. G. Kruger. *Fertigungstechnik*, v. 8, Aug. 1958, p. 370-376.

Static notch bending tests preferred to notch impact tests in determination of susceptibility to brittle fracture. 6 ref. (Q26s, Q5, Q6, 1-54; ST)

87-Q.* (German.) Thermal Stresses in Toolsteels During Hot Upsetting and Die Forging. Gunter Beck. *Stahl and Eisen*, v. 78, Oct. 30, 1958, p. 1556-1563.

Calculation on temperature field patterns and temperature changes during the working process. Heat conduction influenced by surface properties, disturbed by heat cracks. Reduction of thermal stresses by an adequate preheating is suggested. 9 ref. (Q25p, F22j, F22p; TS)

88-Q.* (Russian.) Atomic Concentration of Cr, Mo, W and the Properties of Their Solid Solutions With Nickel. I. I. Kornilov and N. T. Domotenko. *Doklady Akademii Nauk SSSR*, v. 120, no. 2, 1958, p. 311-313.

Solubility limit in at. % at eutectic temperature: Cr 50.0, Mo 23.0, W 18.1; at 7000° C.: Cr 40.0, Mo 14.9, W13.0. Ni alloys with 10 at. % Cr, Mo or W, respectively, showed a hardness of 124, 166 and 142 kg. per sq. mm. at 20° C., and of 26, 64 and 42 at 1000° C. The Mo-alloy shows also the highest hot strength. (Q-general; Ni, Cr, Mo, W, 14-67)

89-Q.* (German.) Microhardness of Iron and Its Alloys Influenced by Temperatures up to 1000° C. Hermann Schenck, Eugen Schmidtmann, Helmut Brandis and Karl Winkler. *Archiv fur das Eisenhuttenwesen*, v. 29, Oct. 1958, p. 653-660.

Microhardness of pure Fe, Fe-C-Mn alloys and nitrided pure Fe was tested at different temperatures. Hardness of pure Fe decreased uniformly up to about 650° C. (recrystallization limit), then a faster decline appeared. 38 ref. (Q29q, 2-61; Fe, *Mn*)

90-Q.* (German.) Heating Speed and Critical Strain of Tin With Traces of Alloying Elements. F. Erdmann-Jesnitzer and R. Krumpholz. *Metall*, v. 12, Oct. 1958, p. 891-900.

Samples water quenched, hammered to 10 mm. thickness, rolled to 1 mm., heat treated at 50° C. for 20 min. in air; heated at different speeds; influence of these on critical strain limit. 44 ref. (Q25, N3, 2-61, 2-64, 3-68; Sn-a, *Bi, Sb, Cd*)

91-Q.* (German.) Strength Tests With Hard Metals. W. Spath. *Metall*, v. 12, Oct. 1958, p. 925-929.

Compressive strength of a tungsten-carbide-cobalt alloy shows highest values for low Co content. Bending strength behaves inversely increasing from lower Co content. 8 ref. (Q28g, Q5g, 2-60, 3-66; W, Co, 6-69)

92-Q.* (Slovak.) Embrittlement of Austenitic Cr-Ni Steels of 18-8 and 16-13 Type. Alois Zapletalek. *Zvaranie*. v. 7, Sept-Oct. 1958, p. 298-300.

Formation of sigma phase thought to be the cause of embrittlement. This phase found to develop from the alpha or gamma phase. Unstable carbides, rich in Cr, may be nuclei for sigma phase. (Q26s, 2-60, 2-61; SS, *Cr, Ni*)

93-Q.* On Indentation of Ball. Pt. 1. Experiments on Specimens of Finite Dimensions. Shigehiko Yazawa, Kiyoshi Sato, Masao Unno and Go Yaguchi. *Journal of Mechanical Laboratory of Japan*, v. 4, no. 1, 1958, p. 1-5.

Indentation is basic process for indentation hardness testing and die-hobbing. (Q29b; CN)

94-Q.* Severe Wear of Pearlitic Steel Weld Metal. Sukemitu Ito, Kozo Honda and Kikuzo Ishiyama. *Journal of Mechanical Laboratory of Japan*, v. 4, no. 1, 1958, p. 15-21.

Relationship between wear and microstructure or chemical composition. By microscopic examination of the wearing surfaces, it was possible to form a picture of the movement of the wear debris. (Q9p; ST)

95-Q.* The Random Abrasion of a Cu (110) Face. Y. N. Trehan and A. Goswami. *Journal of Scientific & Industrial Research*, v. 17B, June 1958, p. 209-212.

A Cu (110) face subjected to random abrasion under various cooling conditions. Dry abrasion resulted in appreciable diorientation of surface layers accompanied by the formation of CuO and Cu_2O. No oxidation occurred when abrasion was carried out in presence of excess benzene. Rotational slip around the <110>axis was observed even though the abrasion direction was not preferential. Formation of oxides ascribed to rise of surface temperature during abrasion. (Q9, Q24a, R1h; Cu)

96-Q.* Pure Torsion Creep Tests on Magnesium Alloy (2% Al) at 20°C. and on 0.2% C Steel at 450° C., at Low Rates of Strain (10^{-6} to 10^{-9} Per Hr.) A. E. Johnson, J. Henderson and V. D. Mathur. *Metallurgia*, v. 58, Sept. 1958, p. 109-117.

The continuously cast Mg alloy at 20° C. and the cast carbon steel at 450° C. displayed similar creep behavior in the range of creep rate 10^{-7} to 10^{-9}. Creep strain for each of the materials showed a dependence on time which did not alter throughout range of creep rate investigated. In the region of low creep rate the log stress/log creep strain curves showed a region of changing shape running eventually to 45° slope corresponding to largely anelastic or recoverable creep. (Q3, 2-61, 3-67, 3-68; CN-g, Mg-b, *Al*)

97-Q.* Deformation Mechanisms in Magnesium and Some Magnesium-Aluminium Alloys. R. D. Stacey. *Metallurgia*, v. 58, Sept. 1958, p. 125-128.

Reviews literature. Mechanism of nucleation and growth of intergranular holes. Development of fine-grain structure adjacent to original grain boundaries and relationship with variation of elongation with temperature. 24 ref. (Q24; Mg-b)

98-Q.* Comparison of Charpy V, Charpy U and Izod Notched Bar Tests on Steel Over Transition Temperature Range. A. W. Johnston. *Metallurgia*, v. 58, Sept. 1958, p. 129-135.

Results on three mild and three alloy steels, for both standard and subsidiary standard test pieces. No simple relationship appeared between results of three tests that could be applied to all six steels. Transition from ductile-to-brittle fracture for V-notch Charpy test pieces occurred at higher temperatures than U-notch. Transition curves obtained respectively from Izod and Charpy U-notch tests extended over approximately the same range of temperature. (Q6r, Q23r, 2-61; CN, SS)

99-Q.* Ductile-Brittle Transition in Steels Irradiated With Neutrons. D. Hull and I. L. Mogford. *Philosophical Magazine*, v. 3, Nov. 1958, p. 1213-1222.

Yield and fracture stresses of unirradiated and irradiated En2 steel were measured at 20 to 78 and 196° C. Effect of irradiation on grain size transition was determined experimentally and an equation relating transition surface with grain size, yield stress and temperature obtained. 7 ref. (Q23r, M27c, 2-67; ST)

100-Q.* On the Delay Time in Plastic Flow of Indium Antimonide. J. W. Allen. *Philosophical Magazine*, v. 3, Nov. 1958, p. 1297-1305.

Delay time before the onset of plastic deformation was studied as a function of temperature and stress for indium antimonide in uniaxial compression. Temperature range was 150-300° C. at a given stress. 8 ref. (Q24, 3-66, 2-61; In, Sb, 14-68)

101-Q.* Design Properties of Sinterings. Pt. 2. Ferrous Alloys. *Precision Metal Molding*, v. 16, Nov. 1958, p. 30-33.

Composition and typical mechanical properties of some 150 ferrous alloys. Variation in mechanical properties is most noticeable in sinterings of relatively low density. (Q-general; 6-72, 17-51)

102-Q.* Scratch Hardness. Pt. 2. X-Ray Investigation of Structural Change. Tomiya Sutoki and Koichi Nakajima. *Tohoku University, Science Reports of the Research Institutes*. v. 10, Aug. 1958, p. 269-275.

X-ray analysis used to study structural changes due to scratching or indenting single or polycrystals of Al and Ag. Diffraction patterns indicate that scratch hardness of metal relates to the annealed state rather than the hardened state. 4 ref. (Q29d, Q29c, M22g, 3-68; Al, Ag)

103-Q.* Attenuation of the Ultrasonic Waves in Metals. Pt. 2. Stainless Steel. Tokutaro Hirone and Kazuo Kamigaki. *Tohoku University, Science Reports of the Research Institutes*, v. 10, Aug. 1958, p. 276-282.

Pulse ultrasonic waves at frequencies ranging from 0.5 to 6 megacycles per sec. were used to measure attenuation of austenitic 19-10 Cr-Ni stainless steels with various grain sizes. Attenuation coefficient increased with frequency and grain size. Attenuation behavior explained by assuming that the traveling ultrasonic waves were scattered by austenite grains in accordance with Rayleigh's law. 4 ref. (Q21f, 1-74, 2-59; SS-e)

104-Q.* The Plastic Theory of Structures. Pt. 3. T. M. Charlton. *Welder*, v. 27, July-Sept. 1958, p. 63-68.

A means of determining correct design and load capacity of continuous beams and single-story mild steel structural frames with rigid joints. (Q24; ST, 7-51, 17-51)

105-Q.* Internal Friction of Load. Pt. 1. Yosio Hiki. *Physical Society of Japan, Journal*, v. 13, Oct. 1958, p. 1138-1144.

Measurement of Pb single crystals with longitudinal vibration in kilocycle range using the composite piezo-electric quartz oscillator. Internal friction is mainly dependent on the strain amplitude, frequency of vibration, purity and temperature. 16 ref. (Q22, 3-68, 3-69, 2-61; 14-61, Pb)

106-Q.* (Czech.) Manufacture and Some Properties of Aluminum-Manganese Alloy Sheet. Miroslav Brzobohaty. *Hutnicke Listy*, v. 13, p. 769-778.

Influence of Mn content and impurities on the mechanical properties of Al sheet in the soft and cold worked conditions. Tendency of Al-Mn alloys currently used in the manufacture of sheet and semicontinuously cast plates to grain coarsening upon annealing. Grain refinement resulting from the heating velocity of 50 to 60° C. per sec. or the addition of Mg or Fe. Homogenizing to prevent grain coarsening upon subsequent annealing. 5 ref. (Q-general, J23, 2-60, 3-69· Al-b, *Mn*, 4-53)

107-Q.* (French.) Study of the Mechanical Properties of Arsenical Copper. Jean R. Marechal. *Metaux-Corrosion-Industries*, v. 33, Sept. 1958, p. 377-383.

Properties and crystal structures of Cu containing up to 8% As. Antiquity of arsenical coppers and bronze; use of "fahlerz" coppers; terminology of these ancient alloys. (Q-general, M26, A2; Cu-b, *As*)

108-Q.* (French.) 5000-Cycle-Per-Second Micromachine for Tension-Compression Fatigue Tests. G. Vidal, F. Girard and P. Lanusse. *Revue de Metallurgie*, v. 55, July 1958, p. 613-619.

New micropulsator capable of producing rupture in steel specimens of 4 sq.mm. cross section and in light alloy specimens of 10 sq.mm. Maximum available load is about ± 250 kg. Using this pulsator and an Amsler machine, fatigue limits of identical specimens of an AU2GN Al alloy were tested at frequencies of 110 and 5300 hertz. Fatigue limits after 10^6, and 10^7 and 10^8 cycles at 5300/hertz are about 10% higher than at 110 hertz. 9 ref. (Q7, 1-53; Al-b)

109-Q.* (French.) Use of the Prot Machine to Determine Slight Variations in the Fatigue Resistance of Different Areas of Machined Carbon Steel Parts. A. Ferro and U. P. Rossetti. *Revue de Metallurgie*, v. 55, July 1958, p. 650-655.

Specimens taken from large crankshaft forgings, including material from joint areas of high deformation, were tested under a single, very low rate of increase of load. Use of Prot machine permits direct expression of results as breaking stresses. With one exception, no significant differences in fatigue resistance were found in different areas of same forging. 10 ref. (Q7a, T21c; CN, 4-51)

110-Q.* (Japanese.) Influence of the Slip Deformation of Aluminum Upon the Paint Film. Hiroshi Asada and Yasuhiro Horiguchi. *Metal Finishing Society of Japan, Journal*, v. 9, Aug. 1958, p. 295-301.

Behavior of films of Zn chromate or mellamin paints on single crystals or coarse grain of Al when Al was subjected to deformation by tension. Breaks occurred in the thin films of chromate or paint with a tensile strain of 3%. With thicker films cracks were not found until deformation was 5%. Soft mellamin films deformed 12 to 15% before breaking. (Q24a; Al, 8-70)

111-Q.* (Russian.) Creep of Single Crystals of Zinc in Low-Melting Metal Melts. V. A. Labzin and V. I. Likhtman. *Doklady Akademii Nauk SSSR*, v. 121, no. 3, 1958, p. 443-445.

Monocrystalline pure Zn wires were coated with a 3-5 micron thin film of Sn, Pb and Sn-Pb-Hg alloy. Creep of crystals was studied under a tension load of 0.7-0.8% yield strength, at room temperature and at steps up to 350-400° C. The ratio of creep-with-film to creep-without-film determined. (Q7, 2-61; Zn, Pb, Sn, 14-61, 14-62)

112-Q.* (Russian.) Superimposed Motion Picture Photography of Internal Metal Movements in a State of Deformation. O. G. Muzelevskii. *Zhurnal Nauchnoi i Pricladnoi Photogrphii i Kinematographii*, v. 3, Sept-Oct. 1958, p. 363-367.

Distribution characteristics of deformation, metal velocity, deformation velocity and tension in the internal reduction zone, during hot rolling of Al castings. (Q24, X5h; Al-b, 5-60)

113-Q.* (Ukrainian.) Arrangement for Testing Endurance of Materials at High Frequency Loading. V. O. Kuzmenko. *Dopovidi Akademii Nauk Ukrainskoi R.S.R.*, v. 9, 1958, p. 946-950.

Employs the resonance principle of inducing longitudinal vibrations of the specimen by means of a magneto-constricted vibrator. Tests are carried out with a symmetrical tension compression cycle with a frequency loading of 20,000 H_z. Steel and cermets were tested. (Q7b; ST, 6-70)

114-Q. Structure of Steel. Edwin Gregory and Eric N. Simons. *Edgar Allen News*, v. 37, Nov. 1958, p. 249-251.

Vickers, Firth, Rockwell and Avery hardness tests. (Q29)

115-Q. Activation Energies for High-Temperature Creep of Polycrystalline Zinc. W. J. M. Tegart. *Philosophical Magazine*, v. 3, Nov. 1958, p. 1287-1296.

22 ref. (Q3, 2-62, P13a; Zn)

116-Q. (Japanese.) Wear of Carbon Steel Weld Metal. Pt. 1. Sukemitsu Ito, Kozo Honda and Kikuzo Ishiyama. *Journal of Mechanical Laboratory*, v. 12, Sept. 1958, p. 12-19.

Microscopic observations of structural changes in the worn surface. 13 ref. (Q9p, M27; CN, 7-51)

117-Q. (Japanese.) Indentation Hardness Testing. Pt. 2. Experiments on Copper. Shigehiko Yazawa, Masao Unno, Go Yaguchi and Iwakichi Sawano. *Journal of Mechanical Laboratory*, v. 12, Sept. 1958, p. 158-161.

Experimental results compared with steel specimens. Straight lines obtained in the diagram of Meyer's hardness against the diameters of impressions; radii of curvature of impressions can be obtained from Hertz's equation. (Q29b; Cu)

118-Q.* Metallurgical Examination of Weld Failures. R. S. Cox and J. W. Shedden. *Australian Welding Journal*, v. 1, Apr. 1958, p. 7-10.

Failures due to fatigue, embrittlement, crack formation in steels. 6 ref. (Q26, Q7, 3-66; ST, 7-51)

119-Q. Strength of Metals Undergoing Rapid Heating. W. K. Smith and A. T. Robinson. Paper from "Short-Time High-Temperature Testing", American Society for Metals, Cleveland, 1958, p. 5-35.

Method and equipment for measuring strength of various metals under conditions of constant load and rapid heating. Metals can be used at higher strength levels than is indicated by results obtained from conventional short-time high-temperature tensile tests. Additional strength is attributed to the time required for the substructure to change as the temperature increases. The concept of yield temperature was introduced as the criterion of high heating rate strength. 10 ref. (Q27, 2-62, 1-53, 1-54)

120-Q. Fluid Analogy to Aerodynamic Heating. T. C. McGill, J. V. Dutzi and W. D. Ayers. Paper from "Short-Time High-Temperature Testing", American Society for Metals, Cleveland, 1958, p. 36-57.

Problems imposed by aerodynamic heating on missile structures. For laboratory simulation of the high heat fluxes experienced by airborne vehicles a molten salt system was developed. Ultra-short-time tension (yield) tests were made for 2024-T4 and T6 Al alloys for two time-duration exposures. Elevated temperature data for AZ91 HTA and HK31-T6 Mg alloys, 4340 steel and 17-7 PH stainless steel sheet. (Q-general, 2-62; SGA-h, Mg-b, Al-b, SS)

121-Q. Short-Time Creep of Structural Sheet Metals. John A. Vanecho. Paper from "Short-Time High-Temperature Testing", American Society for Metals, Cleveland, 1958, p. 58-91.

Comparison of creep strengths of some 37 Mg and Al and Ti alloys, low-alloy

steels, stainless steels, heat resistant alloys, A-286, an iron-base alloy, Inconel X and V-36 and a Co-base alloy. 4 ref. (Q3; Mg-b, Al-b, Ti-b, AY, SS, SGA-h, Fe-b, Ni-b, Co-b, 4-53)

122-Q. Effect of Holding Time and Strain Rate on the Tensile Properties of Structural Metals. J. R. Kattus. Paper from "Short-Time High-Temperature Testing", American Society for Metals, Cleveland, 1958, p. 92-113.

Data for Al, Co, Fe, Mg, Ni and Ti alloys. Tensile strength decreased with increasing temperature. Increasing strain rates resulted in increased strength properties. 4 ref. (Q27, 2-61, 3-68; Al-b, Co-b, Fe-b, Mg-b, Ni-b, Ti-b)

123-Q.* (French.) Results of Tests on Effects of Surface Treatments on Fatigue Resistance of Some Titanium Alloys. R. Develay and H. Richaud. *Revue de Metallurgie*, v. 55, Sept. 1958, p. 853-859.

Rotary bending tests and fragility tests at 20° C. were carried out on unalloyed Ti and T-C3Fe and T-A4M type alloys that had undergone anodic oxidation, Cd, Cr and Ni plating, sulphinuzation and silvering. (Q7; Ti, 8-62, 8-73)

124-Q.* (French.) Damping and Aging of Alloys in the Iron-Carbon-Phosphorus System. W. Dickenscheid and H. J. Seeman. *Revue de Metallurgie*, v. 55, Sept. 1958, p. 872-875.

Damping measurements made by torsional pendulum on artificially aged alloys revealed diminution of maximum value of SNOEK-damping with increasing P content, unchanged temperature of maximum damping, assymetric damping-temperature curves for higher P contents, influence of P and C on residual damping. (Q8, 2-60, 2-64; Fe-b, *C, P*)

125-Q.* (French.) Improvement of Ductility in Low-Alloy Steels. G. Delbart and F. Maratray. *Revue de Metallurgie*, v. 55, Sept. 1958, p. 876-888.

Study of a Cr-Mn-Si steel containing 0.8 to 1% each of these elements. Two series of melts, one of pure dead-soft Fe containing 0.016% S and one of puddled Fe containing 0.006% S, were made. Half of each melt was cast without addition, other half with addition of 0.20% Mo. Sulphur increased ductility; addition of 0.20% Mo is sufficient to reduce differences in ductility at a given hardness. 9 ref. (Q23p, 2-60; AY, *Cr, Mn, Mo*, S, *Si*)

126-Q.* (Russian.) Antifriction Properties of High-Strength Nodular Iron. A. P. Antonov. *Vestnik Mashinostroeniya*, v. 38, Oct. 1958, p. 37-40.

Metal was normalized and hardened at 250, 300, 350 and 450°. High-strength Fe produced in induction furnace by treating melt with 15% Mg, 10% SiCa and 75% FeSi. Lowest friction coefficient, in dry and lubricated state, was bronze OTSS 5-5-5. Of iron and steels the lowest friction coefficient was shown by high-strength normalized and high-strength isothermically hardened iron. (Q9p, 2-64; CI-r, ST)

127-Q.* (Russian.) Stampability of Sheet Steel. L. A. Rubenkova. *Vestnik Mashinostroeniya*, v. 38, Oct. 1958, p. 49-52.

Laboratory investigation shows that major influence on metal behavior is the stressed state arising in stamping process. Three types of stress states studied: (1) uniaxial stress, (2) biaxial stress arising during hydrostatic pressure, (3) compressive stresses combining bending and elongation stresses as well as compression. Metallic structure has great bearing on internal stress state. In the drawing process the friction conditions have considerable effect on stamping results. 3 ref. (Q23q, Q25, 3-66; ST, 4-53)

128-Q. (Book.) Short-Time High-Temperature Testing. 137 p. 1958. American Society for Metals, 7301 Euclid Ave., Cleveland 3, Ohio. $6.

Proceedings of a symposium during the Tenth Metal Congress and Exposition, Los Angeles, Mar. 25-29, 1957. Papers abstracted separately. (Q-general, 2-62, 1-54)

129-Q. (Translation—AIP.) Dynamic Compressibility of Metals Under Pressures From 400,000 to 4,000,000 Atmospheres. L. V. Al'tshuler, K. K. Krupnikov and M. I. Brazhnik. *Soviet Physics JETP*, v. 34, Oct. 1958, p. 614-619.

Method for determining pressures and densities of shock compression based on

measurement of velocities of propagation of shock waves. Method applied to Cu, Zn, Ag, Co, Sn, Au, Pb and Bi. (Q28g; Cu, Zn, Ag, Co, Sn, Au, Pb, Bi)

130-Q. (Translation-Brutcher, 4389.) Internal Transformation Effect on Stress Relaxation During Tempering of Steel 30KNGSNA and Aging of Alloy V-95. A. A. Goldenberg. *Metallovedenie i Obrabotka Metallov,* Oct. 1958, p. 11-17.

Intensity of stress relaxation increases strongly if the metals held at elevated temperatures are undergoing a phase transition. The steel was hardened at 900° C. in oil and tempered at 200, 300 and 500° C.; V-95 alloy was hardened at 470° C. in H_2O and artificially aged at 100, 140 and 200° C. Intensity of stress relaxation depends upon structure stability and when it is not accompanied with interior transformations. (Q25m, Q3a, 2-61, 2-64; ST, Al-b)

131-Q. (Translation-Brutcher, 4390.) Effect of Heat Treating Upon Temperature Curve for Impact Strength of Steel. V. K. Tselikov. *Metallovedenie i Obrabotka Metallov,* Oct. 1958, p. 17-23.

Change in temperature curve after heat treatment is characterized by (1) sharp lowering in impact strength at room temperature and considerable lowering of the critical temperature of brittleness; (2) sharp lowering of impact strength at room temperature without change in the critical temperature of brittleness; (3) sharp drop at room and low temperatures. There is a regular consistency in the curve change during microstructural changes resulting from heat treatment. (Q6, Q26s, 2-61, 2-64; ST)

132-Q. (Translation—Brutcher, 4391.) Failure of High-Strength Alloys During Cyclic Variations of Temperature and Load. G. V. Kurganov and Yu. A. Sutina. *Metallovedenie i Obrabotka Metallov,* Oct. 1958, p. 23-27.

Failure of Ni steels under long loading and high temperature is due to crack formation along grain boundaries. Crack development at high temperature is favored by brittleness of intermetallic phases formed as well as additions of low-melting Pb, Bi, and S, collected along grain boundaries. Cyclic changes of strain and temperature shorten the time prior to failure, because of more intensive crack formation. A small addition of Pb brings premature failure especially during cyclic variations. (Q26, 2-60, 2-61; ST, *Ni, Bi, Pb, S*)

133-Q. (Translation—Brutcher, 4392.) Wear Entailing Spalling. F. Ya. Iokheles. *Metallovedenie i Obrabotka Metallov,* Oct. 1958, p. 28-32.

Steel gears, when starting to mesh, may produce friction causing white layer formation. Study of phase formation, microhardness and wear resistance. Local pressure and heating produce a secondary hardening of the friction surface. Repeated structure transformations, with increased load cycle, increase the number of microcracks and their distribution in depth. White layers represent a highly strained austenite-martensite structure. (Q9, N8p, T7a; 2-61, 3-68; ST)

134-Q. (Translation—Brutcher, 4397.) Improvement of Mechanical Strength of Steels by Torsion. B. V. Panov. *Metallovedenie i Obrabotka Metallov,* Oct. 1958, p. 50-56.

Cold working increases durability and fatigue limit when cold working strain is tangent and working strain is perpendicular to the surface. Cold working is more effective for soft steels, while for hard steels durability is obtained by heat treating. (Q-general, 2-64, 3-68; ST)

135-Q. (Translation—SLA, ASLIB-GB29.) Deformation Forces in Cold Extrusion of Steel. F. Hdrzdil. *Strojirenstvi,* v. 6, no. 3, 1956, p. 180-184.

(Q24, G5; ST)

136-Q. (Translation—SLA, ASLIB-GB41.) Behavior of High-Temperature Steels During Creep Testing at Temperatures of 500-700°C. Pt. 3. Results of Creep Tests on Ferritic Tube Steels. Eduard Jahn. *Archiv fur das Eisenhuttenwesen,* v. 28, May-June, 1957, p. 259-267.

See item 961-Q, 1957. (Q3, 1-54; ST)

137-Q. (Translation—SLA, ASLIB-GB70.) Causes of Irreversible Temper Brittleness in Steels. B. A. Stetsenko. *Metallovedenie i Obrabotka Metallov,* v. 2, no. 7, 1956, p. 35-38.

See item 818-Q, 1956. (Q26s, J29, N8; ST)

138-Q. (Translation—SLA, ASLIB-GB80.) Investigation of the Structure and Strength Properties of Die Stampings of Al-Cu-Mg and Al-Zn-Cu-Mg Alloys. W. Rosenkrantz. *Zeitschrift fur Metallkunde*, v. 48, no. 2, 1957, p. 41-43.

See item 512-Q, 1957. (Q27a, M28k, F22; Al)

139-Q. (Translation—SLA, R-4461.) Mechanical Properties of E1579 Steel After Prolonged Heating at 550 and 700° C. *Metallovedenie i Obrabotka Metallov*, no. 3, 1956, p. 52-55.

See item 497-Q, 1956. (Q-general, J26, J29; ST)

140-Q. (Translation—SLA, R-4842.) Wear Resistance and Hardness of Electrolytic Chromium Coatings. A. V. Shreyder. *Zhurnal Prikladnoi Khimii*, v. 29, no. 1, 1956, p. 73-82.

See item 347-Q, 1956. (Q29, Q9; Cr, 8-62)

141-Q.* Preliminary Investigations on the Properties of Chromium and Chromium Alloys at Elevated Temperatures. G. R. Wims and T. W. Rea. *Institute of Metals, Journal*, v. 87, Nov. 1958, p. 77-78.

Tensile creep tests in air at 950° C. on Cr and alloys with 10% W and with 5% Mo. Structural changes associated with the creep deformation of Cr and Cr alloys are similar to those of other metals. Intercrystalline cavities develop during creep, leading to intercrystalline fractures, although certain differences have been observed between the cavities in the pure metal and those in the alloys. 15 ref. (Q3, 2-62; Cr, *W*, *Mo*)

142-Q.* Cleavage Fracture in Cast Chromium of High Purity. J. F. McNeil and H. R. Limb. *Institute of Metals, Journal*, v. 87, Nov. 1958, p. 79-87.

Fractography, goniometry and X-ray diffraction techniques of investigation. Various types of markings on the cleavage surfaces are explained in terms of the fracture process and where possible related to the crystal lattice. Four types of cleavage grain have been distinguished. Cleavage takes place mainly on {001}, to a minor extent on {112}, and, exceptionally, on or close to {111} planes. 30 ref. (Q26n, M26; Cr-a, 5-60)

143-Q.* The Solid Solutions of Gallium in Lead. Neill Greenwood. *Institute of Metals, Journal*, v. 87, Nov. 1958, p. 91-93.

Hardness of the saturated solution increases from 3.5 DPN. (Pb) to 11.0 DPN. (0.15% Ga). The quenched solid solutions exhibit aging characteristics. Hardness determinations were made after quenching and holding at 22 and 100° C. for 100 days and also after quenching and cold rolling and holding at 22° C. 4 ref. (Q29c, 2-65; 14-67, Ga, Pb)

144-Q. Effect of Copper, Nickel, Iron, and Chromium on the Tensile Properties of Preferentially Oriented Beryllium Sheet. F. M. Yans, A. D. Donaldson and A. R. Kaufmann. Nuclear Metals Inc. *U. S. Atomic Energy Commission*, NMI-1192, Feb. 14, 1958, 46 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Be was mixed with Cu, Ni, Fe and Cr to form binary alloys in powder form, then extruded and cross rolled. Effect of each alloying element was determined by tensile testing. In solid solution, small amounts of Fe and Ni had an embrittling effect while Cu in solution increased the strength but had no effect on ductility. 7 ref. (Q27, 2-60; 4-53, Be, *Cu, Ni, Fe, Cr*)

145-Q.* Manganese Joins Aluminum to Give Strong Stainless. J. L. Ham and R. E. Cairns, Jr. *Product Engineering (Design Edition)*, v. 29, Dec. 22, 1958, p. 50-51.

Austenitic Al-Mn-C steel with ductility for forming, and strength at high temperatures. (Q27, Q23p, 2-62; SS, *Al, Mn*)

146-Q. Early Detection of Fatigue in Aluminum Alloys by Ultrasonics. K. Sittel, M. Herman and R. C. Good, Jr. Franklin Institute. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151019, May 1958, 45 p. $1.25.

Effects which occur during early stages in the fatigue life of a specimen, and advantages of using ultrasonic waves in the megacycle frequency range. Possibilities of using the attenuation temperature relationship for detecting dislocation motion and of applying ultrasonic waves to incipient fatigue detection. Design and construction of a resonant-type fatiguing machine and an electro-acoustic driving system for ultrasonic waves. (Q7, M26b, 1-74; Al-b)

147-Q. Role of Subgrains in High-Temperature Creep. L. A. Shepard and J. E.

Dorn. University of California. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151208, May 1958, 38 p. $1.

Contribution of the substructure to high-temperature creep resistance is small relative to other factors. Origin of subgrains; specific deformation modes which produce the variety of observable substructures. Effect of creep variables on subgrain development, size and structure. Manner in which the subgrain structure affects creep rate, recovery and grain-boundary shearing. 72 ref. (Q3m, Q3n, 2-62, 3-71)

148-Q. Compressive Creep Buckling of Metal Columns. Pt. 5. Cyclic Loading. A. Rudnick, R. L. Carlson and G. K. Manning. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151218, June 1958, 68 p. $1.75.

Linear relationship found between time to creep buckling under constant load, and reciprocal of minimum creep deflection rate. Effect of load cycling shown to be dependent upon the properties of the material at the testing temperature. (Q3c, 2-61, 3-66; Al-b, Ti-b)

149-Q. Investigation of the Compressive, Bearing, and Shear Creep-Rupture Properties of Aircraft Structural Metals and Joints at Elevated Temperatures. Pt. 3. L. A. Yerkovich. Cornell Aeronautical Laboratory, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131977, May 1958, 115 p. $2.75.

High-temperature creep strengths of a number of structural aircraft alloys determined under the influence of compression, bearing and shear stresses. Creep behavior of 15 sheet, plate and bar alloys creep tested in tension, compression, bearing and shear. Test alloys had creep characteristics under compression, bearing and shear stresses similar to those obtained in tension creep testing. (Q3, 2-62, 3-66)

150-Q.* (Russian.). Internal Friction in Nickel in Magnetic Field. Karel Misek. *Czechoslovak Journal of Physics*, v. 8, no. 8, 1958, p. 129-130.

Maximum internal friction depends on the amplitude of alternating field in Ni. Lessening of internal friction is due to the fact that in presence of large amplitude the sample is in state of saturation during the entire process. This brings about lessening of interaction of alternating field and eddy current vibrations. (Q22j, P16; Ni)

151-Q. Evaluation of Non-Ferrous Materials. N. E. Promisel. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 16-68.

Failures appear to be primarily due to one or a combination of fatigue, brittle behavior and stress or other special types of corrosion. Alloy systems analyzed are Al, Mg and Ti. Laboratory tests and their relationship to performance. (Q7, Q26s, R1d; Al, Mg, Ti)

152-Q. Plasticity and Fracture. R. Beeuwkes. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 89-153.

Quantitative, macroscopic, semi-empirical treatment of basic engineering plasticity and fracture problems. Basic factors involve form of the stress-strain-fracture diagram (including unloading and cyclic loading anisotropy, temperature and rate of strain change during stressing, stress concentration and hydrostatic stress effects), effect of notches, crack growth. (Q23, Q26)

153-Q. A Survey of the Low-Temperature Brittle Fracture Problem. J. D. Lubahn. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 154-190.

Brittleness and tendency toward brittle crack propagation in mild steel considered as functions of temperature, size, strain rate and part geometry. As the temperature is lowered the ductility and the ability to tear fibrously either remain constant or increase slightly over a certain range of temperature, then begin to drop off rather rapidly with further lowering of temperature. 21 ref. (Q26, 2-61, 3-73, 3-68; CN)

154-Q. Toughness of Titanium Alloy Sheet. S. V. Arnold. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 192-206.

Several thicknesses of sheet are joined to form a laminated blank from which a notched specimen is machined. Thickness of an individual lamina is plotted against the transition temperature of the laminated impact specimen and the minimum energy of the individual lamina in ductile fracture. Materials investigated were alpha-beta alloy sheets. (8% Mn, and 5% Al, 2.5% Sn). (Q26, Q6; Ti, 4-53)

155-Q. Notch-Tension Testing. E. J. Ripling. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 207-233.

Variables influencing the notch properties of steels, including strength level, notch geometry, eccentricity and testing temperature. Notch tensile characteristics of nonferrous metals, both face-centered cubic, as well as hexagonal Zn and Ti alloys. 16 ref. (Q27d; ST, Al-b, Ti-b)

156-Q. Bucket Failure Mechanisms and Problems in Correlation of Laboratory Data With Gas-Turbine Bucket Performance. J. W. Weeton, G. M. Ault and F. B. Garrett. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 235-263.

Life predicted from stress-rupture data is the longest that a turbine bucket material can be expected to run in the engine. Other factors such as vibratory and thermal stresses lower the life below that predicted by stress-rupture alone. Bucket life given for Nimonic 80, Inconel X, N-155, Hastelloy B, cast S-816 and HS 21. 6 ref. (Q3q, Q26, T7h; Ni-b)

157-Q. Material Properties and Their Use in Design. M. J. Manjoine. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 264-278.

Influences of state of stress, strain rate, temperature and time on plastic flow, creep, initiation of fracture and propagation of fracture. Tests include standard mechanical tests under uniaxial stress and constant temperature to determine the strength of materials and its statistical variation. 30 ref. (Q3, Q24, Q26q, 3-66, 3-68, 2-61; ST)

158-Q. Prediction of Creep and Creep Buckling of Thin Symmetrical Shells From Tensile Creep Test Data. C. C. Bigelow. Paper form "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 279-301.

Use of isochronous stress-strain curves in conjunction with the Hencky conditions of plasticity to predict creep deformation of axially symmetrical shells under internal pressure. Creep in both Pb and 1500° F. Inconel shells are compared with computed creep with fair agreement. (Q3, Q3c; Ni-b)

159-Q. Application of Laboratory Test Data to Design of Aircraft Gas Turbine Blade Fastening Models. W. F. Brown, A. J. Meyer and M. H. Jones. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 302-335.

Data obtained from elevated-temperature tensile tests on actual blade roots are compared with results predicted on the basis of plastic models. Creep-rupture strength of S-816 and 16-25-6 was calculated from 1200° F. notch-tensile and shear creep-rupture data. 14 ref. (Q2, Q3m, Q27d, T7h, 2-62; SS)

160-Q. Application of Laboratory Fatigue Data to Gear Design. D. W. Dudley and W. F. Diffin. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 337-354.

Data on type 4340 steels of two different quality levels with strengths in the 180,000 to 210,000-psi. range; carburized and hardened 9310 steel; normalized and tempered 1040 steel; and normal 3% Ni steel. Data analyzed by statistical techniques. 7 ref. (Q7, T7a; AY)

161-Q. Design Aspects of High Speed Rotating Parts. R. G. Anderson. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 355-382.

Effects of geometry on rupture speed of a high-speed rotating part fabricated from Al alloys. Influence of stress concentrations and accompanying strength reduction resulting from materials having different combinations of mechanical properties. The magnitude of the stresses set up by inertia in a rotating part of a given shape is directly proportional to the density of the material. (Q25k, 3-73; Al-b)

162-Q. Development and Testing of Magnesium Alloy Wheels. R. L. Atkin and J. G. Mezoff. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services*, PB 131783, p. 383-440.

Design considerations, static and dynamic testing techniques, fatigue and stress analysis in wheels of AZ80A-F, ZK60A-F and AZ31C-F Mg alloys. 8 ref. (Q7, Q6, T21c; Mg-b, 17-51)

163-Q. High-Temperature Properties in Relation to Design. J. R. Weir, R. V. Meghreblian and D. A. Douglas. Paper from "Materials Evaluation in Relation to Component

Behavior". *U. S. Office of Technical Services,* PB 131783, p. 441-457.

Structural problems arising in high-temperature design involve the creep, relaxation, thermal shock and strain-cycling properties of materials. Coefficient of thermal expansion, thermal conductivity, stress-strain characteristics, geometry, time-rate of change of temperature and time at temperature are correlated. (Q-general, P11g, P11h, 2-62, 17-51)

164-Q. Studies of Hydrogen Embrittlement Produced by Electrolysis. A. Brenner and G. B. Wood. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services,* PB 131783, p. 476-495.

Embrittlement resulting from the use of hydrogen isotopes. Steel was embrittled by the discharge of deuterium to a slightly less extent than by hydrogen, while the period of electrolysis required by the embrittlement to appear was somewhat longer. 10 ref. (Q26s; ST, 1-59, H)

165-Q. Test Methods for Evaluating Hydrogen Embrittlement. George Sachs. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services,* PB 131783, p. 496-516.

Comparative advantages of tension, bend and notch-tension tests. General acceptance of the notch-tension test for evaluating hydrogen embrittlement is primarily due to notch strength being a very sensitive measure of ductility, yet the notch-tension test only responds to low ductilities and may not show the existence of little or moderate embrittlement. 10 ref. (Q26s, Q27d; H)

166-Q. Stress-Rupture Behavior of Weldments and Brazed Joints. John G. Sessler. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services,* PB 131783, p. 582-600.

Stress-rupture data provide a comparison of parent and weld metal strength and ductility at various strength levels, any notable change in the notch properties due to welding, effects of heat treat variations on stress-rupture properties and an appraisal of structural stability. (Q3q, 2-64; 7-51, 7-52)

167-Q. Elevated Temperature Properties of 2024-T3 Aluminum Alloy. Donald R. Adolphson. Sandia Corp. *U. S. Atomic Energy Commission,* SCTM298-58 (16), Sept. 16, 1958, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.60.

Effects of time at temperature, rate of loading and rate of heating in relation to thermal conductivity, specific heat, tensile ultimate strength, tensile yield strength, modulus of elasticity, ultimate shear and compression yield strength. (Q-general, P11h, P12r, 2-61, 3-66; Al-b)

168-Q. Tensile Properties of Niobium. H. G. Vaughan and R. G. Rose. *United Kingdom Atomic Energy Authority,* IGR-TN/C-583, July 11, 1958, 22 p.

Effect of surface oxidation on the ultimate tensile strength. Cb retains its strength up to 500° C., while the elongation decreases to a minimum at 500° C. Surface oxidation does not alter the room-temperature tensile strength, while O in solution in Cb increases the ultimate tensile strength and emphasizes the brittle nature of fracture at 500° C. (Q27a, 2-61; Cb)

169-Q. How to Evaluate Formability of Sheet Metal. D. A. Stewart. *Materials in Design Engineering,* v. 48, Dec. 1958, p. 100-102.

Tests available. (Q23q, Q5k, G4; 4-53)

170-Q. (French.) Process of Relaxation at Elevated Temperature. Christian Boulanger. *Revue de Metallurgie,* v. 55, Sept. 1958, p. 889-898.

Hysteresis meter used to study elastic modulus and internal friction as a function of temperature for various metals and alloys. 7 ref. (Q21a, Q22, 1-53, 2-61)

171-Q. (French) Influence of Size on Fatigue of Notched Specimens. P. Kuhn. *Revue de Metallurgie,* v. 55, Sept. 1958, p. 860-864.

Given the fatigue limit of an unnotched specimen, it is possible to calculate fatigue limit of a notched specimen if a constant of the metal is known. Two curves give this constant for steels and Al alloys. Life of alloys can also be calculated. 12 ref. (Q7; ST, Al-b)

172-Q. Various Aspects of the Distribution of Fatigue Lives. E. J. Gumbel. Columbia University. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151211, July 1958, 45 p. $1.25.

Asymptotic probability function of limited smallest values used for the representation and interpretation of both constant stress-amplitude and random fatigue tests and for the estimate of minimum fatigue life of structural materials. (Q7b, S12)

173-Q.* (English.) Study on the New Indentation Hardness. Pt. 1. Proposal of the New Hardness. Jun-itiro Hashimoto. *Metropolitan Technical College, Memoirs,* no. 5, 1958, p. 8-16.

New hardness number, which is determined independently of the magnitude of load and the shape of an indentor, is based on indentation hardness test in comparison with other hardness numbers. 10 ref. (Q29; ST)

174-Q. Elevated Temperature Properties of 7075-T6 Aluminum Alloy. Donald R. Adolphson. Sandia Corp. *U. S. Atomic Energy Commission,* SCTM299-58(16), Sept. 16, 1958, 23 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .60.

Effects of time at temperature, rate of loading and rate of heating in relation to thermal conductivity, specific heat, tensile ultimate strength, tensile yield strength, modulus of elasticity, ultimate shear and compression yield strength. (Q-general, P11, 2-62, 3-67; Al-b)

175-Q. Elevated Temperature Properties of 2014-T6 Aluminum Alloy. Donald R. Adolphson. Sandia Corp. *U. S. Atomic Energy Commission,* SCTM300-58(16), Sept. 16, 1958, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .60.

Effects of time at temperature, rate of loading and rate of heating in relation to specific heat, thermal conductivity, tensile ultimate strength, tensile yield strength, modulus of elasticity, ultimate shear and compression yield strength. (Q-general, P11, 2-62, 3-67; Al-b)

176-Q.* (Russian.) Impact Fatigue During Concentrated Strain. S. V. Tolkachnik. *Izvestiya Akademii Nauk SSR,* May 1958, p. 63-68.

Properties of impact fatigue are similar to those of ordinary fatigue, whether the tension is concentrated or not. The basic factor determining the order of magnitude of ultimate impact fatigue resistance is ordinary fatigue. (Q7d, Q6; ST)

177-Q.* (Russian.) Mechanical Properties and Weldability of Vacuum Treated Bessemer Steel. A. I. Krasovskii and V. D. Kodolov. *Svarochnoe Proizvodstvo,* Oct. 1958, p. 8-11.

Industrial tests prove feasibility of using bessemer steel vacuum treated in ladle. Nitrogen, oxygen and hydrogen have positive influence on base metal. Vacuum treatment reduced gas content by 2-3 times as compared to ordinary bessemer rimming steel. Greatest effectiveness of vacuum is on steel with more than 1% C. Tests confirm possibility of obtaining very cheap bessemer rimmed steel equal in quality to killed openhearth steels. 4 ref. (Q-general, K9s, D9m, 1-73; ST-d)

178-Q.* MST-881 Holds Properties to 1100° F. *Light Metal Age,* v. 16, Dec. 1958, p. 21.

Properties of new high-temperature Ti alloy. (Q-general, P-general; Ti-b, SGA-h)

179-Q. The Failure of Structural Metals Subjected to Strain-Cycling Conditions. R. W. Swindeman and D. A. Douglas. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission,* ORNL-2619, Nov. 1958, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Isothermal strain-cycling capacity of Inconel, Hastelloy "B" and Be. Data on Inconel illustrate the effect of grain size, specimen geometry, temperature and frequency. Above 1300° F., grain size and frequency exert a pronounced effect on rupture life. Fine-grained metal survives more cycles before failure than coarse-grained material. (Q7j, 2-59, 2-61, 3-68; Ni-b, Be)

180-Q. V-Notch Charpy Impact Testing Welded Joints. C. E. Hartbower. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services,* PB 131783, Washington 25, D. C., p. 557-581.

V-notch impact test provides excellent method for evaluating relative toughness of weld, heat affected zone and base metal providing that due consideration is given to selecting a significant criterion of performance and definition of transition temperature. 19 ref. (Q6; 7-51, ST)

181-Q. Effect of Precipitate Particles on Creep of Aluminum-Copper Alloys During Age Hardening. E. E. Underwood, L. L. Marsh and G. K. Manning. *National Advisory Committee for Aeronautics,* NACA TN 4372, Sept. 1958, 56 p.

Effects of controlled size and distribution of particles determined by creep, tensile and hardness measurements, by quantitative metallographic evaluation of particle characteristics and by X-ray and electron-microscope examinations. 37 ref. (Q3n, N7a, 2-66; Al-b, *Cu*)

182-Q.* (Russian.) Dependence of Durability of Ingot Molds on Design and Working Conditions. D. M. Slonim. *Stal'*, v. 18, Oct. 1958, p. 894-899.

The heavy wear on ingot molds when used in single-row arrangement can be reduced by thickening their wide planes. Increased durability of single-row and single-groove mold bottoms may be achieved by using the displaced arrangement of the groove and reinforcing mold bottoms. The molds were 2200 mm. in height, and weighed 12.65 to 16.10 tons. (Q9, W19c; ST)

183-Q.* (Russian.) Influence of Alloying Elements Contained in Metal Within the Limits of Specified Composition on Properties of IXI8H9T and 4X14H14B2M Steels. V. M. Doronin. *Stal'*, v. 18, Oct. 1958, p. 938-942.

Statistical investigation of test data at 20 and 700° C. showed that increase of C, Mn, Ti, W and Mo content (within the limits of specified composition) strengthens the steel. Increasing Si content has little effect on strength. Ni, Mn and Cr improve ductility while C lowers it. All above elements reduce resilience although Ni and Mo do so to lesser extent. 5 ref. (Q-general, 2-60; ST, AD-n)

184-Q.* (Russian.) Influence of Alloying Elements and Calculation of Strength of Low-Alloy Steel. M. S. Mikhalev and M. I. Gol'dshtein. *Stal'*, v. 18, Oct. 1958, p. 942-946.

Empirical formula for calculating ultimate strength and yield point of low-alloy steel according to its chemical composition (with correction based on thickness of part). Tests were made of almost carbonless steel (up to 0.04% C) and low-carbon steel (up to 0.20% C). Exactness of method is proven by fact that in 50% of tests margin of error was only ± 1 kg. per sq. mm. 9 ref. (Q27a, 2-60; AY, AD-n)

185-Q.* Activation Energies for Creep of an Alpha Solid Solution of Magnesium in Aluminum. N. R. Borch, L. A. Shepard and J. E. Dorn. *American Society for Metals, Transactions*, v. 52, Preprint no. 117, 30 p.

Activation energies of Al-3.2% Mg alloy over a temperature range from 78° K. to the melting point. Over the range of 200 to 300° K. activation energies of a 3.2% Mg alloy are greater than those for pure Al. A peak activation energy was obtained at 325° K. This peak is analyzed in terms of Cottrell's mechanism for strain aging and solute atom locking, with further postulate that locking occurs while the dislocation is arrested at a barrier. 29 ref. (Q3, M26b, P13a; Al-b, *Mg*)

186-Q.* Influence of Static Stress and Temperature on Internal Damping. J. W. Clark and W. C. Hagel. *American Society for Metals, Transactions*, v. 52, Preprint no. 118, 30 p.

Internal damping of fixed-beam AISI 403, Ti and ferromagnetic austenitic alloys at vibratory stresses from zero to 35,000 psi at static tension stresses from zero to 19,000 psi in the temperature range of 75 to 1100° F. Ti shows very low internal damping under all test conditions. Although damping of ferromagnetic austenitic alloys decreases less rapidly with increasing temperature than it does in the case of AISI 403, the influence of static stress of magnetic fields causes a more drastic reduction. 12 ref. (Q22, 2-61, 3-66, SS-e, Ti)

187-Q. Development of a Ferromagnetic Cobalt-Base High-Temperature Alloy. A. Cochardt. *American Society for Metals, Transactions*, v. 52, Preprint no. 119, 31 p.

Damping behavior, aging characteristics, creep and fatigue properties and oxidation resistance of precipitation-hardened alloys with Ti and containing 62 to 88% Co. Optimum composition range of these alloys for blade material in steam turbines is 22 to 24% Ni, 1.8 to 2.0% Ti, 0.15 to 0.25% Al and the balance Co. 11 ref. (Q22, Q3, Q7, N7a, R1h, 2-60, 2-62; Co-b, *Ni, Ti, Al*)

188-Q. Fatigue Properties of High-Strength Steels. H. E. Frankel, J. A. Bennett and W. A. Pennington. *American Society for Metals, Transactions*, v. 52, Preprint no. 121, 36 p.

Rotating beam fatigue strengths of four steels with C content ranging from 0.44 to 1.06% determined for a number of quenched and tempered conditions. Fatigue strength is a linear function of hardness up to some liniting value which is a function of C content. Refrigeration prior to tempering improves fatigue properties of steel; amounts of retained austenite up to about 10% lowered fatigue strength. 22 ref. (Q7c; CN, SGB-a)

189-Q.* Properties of Copper-Base Alloy Castings. F. Hudson, D. R. Wood and J. F. Gregg. *British Foundryman*, v. 51, Oct. 1958, p. 469-485.

Step bar and wedge shaped castings were cast from Cu, Sn, Zn, Pb, Ni alloys and Cu-Sn-Zn alloy. Effect of section thickness, Ni and Pb content, on mechanical properties and microstructure. Influence of composition on sensitivity of gunmetal to section thickness. 6 ref. (Q27a, Q29n, M27, 2-60, 3-73; Cu-b, *Ni, Pb, Sn, Zn*, 5-60)

190-Q. Brittle-Ductile Transition in Vanadium. Benny A. Loomis and O. N. Carlson. Iowa State College. *U. S. Atomic Energy Commission*, ISC-1037, Mar. 1958, 99 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.50.

Mechanical tests on two grades of V over a range of temperatures below 25° C. Brittle-ductile transition in V of 99.85% purity at -65 ± 10° C. Effect of small additions of either H, O, N or C is to raise the transition temperature. H is most effective in raising this temperature. Transition is apparently due to the interaction of dislocations with minute amounts of the interstitial solule atoms H, O, N or C. 28 ref. (Q23r; V, 2-60, *H, O, N, C*)

191-Q.* (Czech.) Influence of "F" Fracture on Mechanical Properties of Large Forgings. Vaclav Koudela. *Hutnicke Listy*, v. 13, no. 8, 1958, p. 687-691.

Statistical analysis determining influence of "F" fractures occurring during rupture tests on the mechanical properties of large steel forgings. (Q26r, Q27a, S12; ST, 4-51)

192-Q.* (English.) Creep and Relaxation of Steel at Room Temperature. F. Campus. *Univ. Bruxelles, 9th Congres Interm Mecan. Appl.*, v. 8, 1957, 312-315.

Experiments on mild steel to hard cold drawn steel wire. Steel without yield point, value of the creep after strain for equal stress and for steel with a yield point; yield elongation is the significant quantity and not yield stress. (Q3, 2-61; ST, 4-61)

193-Q.* (German.) Influence of Silicon and Phosphorus on the Temper Brittleness of Blackheart Malleable Iron Castings. Paul Bastien, Pierre Azou and Christiane Winter. *Giesserei*, v. 45, June 5, 1958, p. 325-333.

Tensile tests, impact tests, dielectric measurements and X-ray analysis used to study influence of Si and P on temper brittleness; hypothesis explaining results. (Q26s, 2-60, 2-61; CI-s, *P, Si*)

194-Q.* (German.) Investigations on the Formation of Pits. F. Erdmann-Jesnitzer and K. Weigel. *Werkstatt und Betrieb*, v. 91,

Formation of pits on the end surfaces of two cylindrical steel specimens rapidly struck against one another. Influence of lubricant, material composition, grain size, combination of specimens and surface finish on pitting. Metallographic and electron microscope observations. Avoidance of pitting. 44 ref. (Q9, 2-59, 2-60, 2-66; ST)

195-Q.* (Japanese.) Fracture of Cadmium Plated Bolts. Toshiichi Nakamura and Tetsuo Tanaka. *Metal Finishing Society of Japan, Journal*, v. 9, Sept. 1958, p. 342-346.

Hardness of carburized layer on steel bolts increased due to Cd plating while elongation decreased slightly. Elimination of hydrogen embrittlement by heating at 150° C. Effects of metallurgical properties of base metal, heat treatment conditions and mechanical working on fracture of plated bolts. 7 ref. (Q26s, T7f; CN, *Cd*, 8-62)

196-Q.* (Russian.) Reducing Spoilage From Hardening Cracks. P. P. Zuev. *Metallurg*, v. 3, Nov. 1958, p. 34-37.

Cracks arise during rapid cooling and transformation from martensite to pearlite accompanied by a significant increase in volume and stresses. When the force of the stresses exceeds the strength limit of steel, cracks occur. To eliminate cracks it is necessary to cool slowly. (Q26, F23, 2-61, 9-71; ST)

197-Q.* Importance of the Hydrogen Content of Steel Slabs and Its Determination in Sheet Steel. C. E. A. Shanahan. Paper from "Physical Chemistry of Steelmaking", Technology Press, Massachusetts Institute of Technology, and John Wiley & Sons, Inc., New York, 1958, p. 203-208.

Hydrogen found in sheet arises from atmospheric contamination during preparation of the sample. Effect on ductility of steel with a straining of the steel structure as judged by metallographic examination and load-elongation curves. (Q-general, 2-60, ST, *H*)

198-Q.* Contraction Stresses in Sprayed Metal Deposits. W. E. Stanton. *Metal Industry*, v. 93, Dec. 19, 1958, p. 509-511.

Investigation by deflection measurements on thin mild steel strips. (Q25h; ST, 8-67)

199-Q.* Problems of Brittle Fracture. H. Hains. *Iron and Coal Trades Review*, v. 177, Dec. 12, 1958, p. 1395-1400.

Influence of residual stresses; test methods; crack severity; effect of welding electrodes; limitations of radiography; effects of irradiation. (Q26s, 3-66, 2-67)

200-Q.* Dislocation Model of Low-Temperature Creep. J. Weertman. *Journal of Applied Physics*, v. 29, Dec. 1958, p. 1685-1689.

Low-temperature dislocation creep model of the exhaustion type is proposed to account for the temperature independent activation energies often found. Logarithmic creep can be obtained from the model if a Gaussian distribution function of Frank-Read sources is assumed. The theory can be extended into the liquid He temperature range with the aid of Glen-Mott quantum-mechanical dislocation tunneling. (Q3, M26b, 2-63)

201-Q.* Mechanical Properties of Uranium-Molybdenum Alloys. M. B. Waldron, R. C. Burnett and S. F. Pugh. *Nuclear Power*, v. 3, Dec. 1958, p. 599-600.

U-Mo alloys are susceptible to a wide variety of heat treatments. Three groups of alloys exist in which hardening is due to solid solution of Mo in alpha U; to formation of alpha + gamma dispersions and to solid solution of Mo in gamma U. Effects of irradiation are not clear. (Q-general, 2-64, 2-67; U-b, *Mo*)

202-Q.* Adhesion of Evaporated Aluminum Films. C. Weaver and R. M. Hill. *Philosophical Magazine*, v. 3, Dec. 1958, p. 1402-1410.

Increase in adhesion obtained for Al films by the pre-deposition of films of Cr. Adhesion varies with thickness of Cr film and with time. The variation with time suggests that the nature of the increase in adhesion is primarily one of alloying at the metallic interface and subsequent age hardening. 11 ref. (Q10c; Al, 14-62)

203-Q.* Grain Boundary Extrusion and Deformation During the Fatigue of Lead in a Partial Vacuum. K. U. Snowden. *Philosophical Magazine*, v. 3, Dec. 1958, p. 1411-1413.

Observations of slip, grain-boundary migration and grain-boundary extrusion. Initial effect of cyclic straining caused slip and some grain boundaries to migrate. After about 10^4 to 10^5 cycles migration rate slowed down and almost stopped. (Q24a, Q7, 3-68; Pb)

204-Q.* Elastic Constants of Zinc Between 4.2 and 670° K. G. A. Alers and J. R. Neighbours. *Physics and Chemistry of Solids*, v. 7, Oct. 1958, p. 58-64.

The five adiabatic elastic constants of single crystals of Zn measured from 4.2 to within 20° K. of the melting point, using the ultrasonic-pulse technique. Although the temperature variation is not exactly linear, no very rapid changes occur even as the melting point is approached. 20 ref. (Q21e; 14-61, Zn)

205-Q.* (French.) Fatigue of Nickel-Chromium Alloys at High Temperatures. A. W. Franklin and E. D. Ward. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 927-938.

Fatigue strength found to vary with the tensile strength and to depend on structure resulting from heat treatment. Examination of the fracture allows determination of cause—creep or fatigue. 10 ref. (Q7a, Q3m, Q27a, 2-62, 3-71; Ni, Cr)

206-Q.* (German.) A New Rough Surface Hardness Test for Metals Based Upon Full Indentation of a Ball. G. U. Oppel. *Forschung auf dem Gebiete des Ingenieurwesens*, no. 5, 1958, p. 149-153.

Reliable results are achieved independently of surface condition. Technique permits hardness to be measured by the force required for a ball to make a full indentation to a depth where asperities of the surface do not influence the results. (Q29b)

207-Q.* (Russian.) Load-Deformation Diagrams of Crystal Lattices. B. M. Rovinskii and V. M. Sinaiskii. *Zavodskaya Laboratoriya*, v. 24, no. 11, 1958, p. 1366-1370.

Method of constructing diagrams is based on continuous X-ray exposures of the deformed sample. Permits observance of deformation process of separate crystallites; determination of their degree of perfection. (Q24, M21f)

208-Q.* (Russian.) Determination of Adhesion of Lacquer Coating to Metallic Bases. I. I. Kletchenkov. *Zavodskaya Laboratoriya*, v. 24, no. 11, 1958, p. 1376-1377.

Depends on presence of a solvent in the coating resulting in a lowering of electrostatic interaction between the coating and the metal surface. Metallic

bases used: Al foil, Sn foil and Cu foil; Cu with Ni plate, Cd and Cr. (Q10c; Al, Sn, Cu, Ni, Cd, Cr, 4-56, 8-70)

209-Q.* (Russian.) Linear Interpretations of Accumulated Failure and Resistance Characteristics to a Fatigued and Prolonged Static Breakdown. S. V. Serensen and L. A. Kozlov. *Zavodskaya Laboratoriya,* v. 24, no. 11, 1958, p. 1378-1391.

Characteristics of fatigue resistance and prolonged static durability during cyclic overloads and superheating. (Q7a, Q7j; SS)

210-Q.* (Russian.) Method of Determining Localized and Uniform Plasticity During Elongation. G. I. Pogodin-Alekseev and A. G. Vasil'eva. *Zavodskaya Laboratoriya,* v. 24, no. 11, 1958, p. 1394-1395.

Method for constructing diagrams of deformation distribution during any condition of static testing, including high temperature. (Q27, 2-62)

211-Q.* (Russian.) Determination of Dynamic Error During Bend Tests for Fatigue. M. E. Garf and P. M. Puban. *Zavodskaya Laboratoriya,* v. 24, no. 11, 1958, p. 1403-1406.

In machines used in bend testing, as well as in tension, compression or torsion testing, the magnitude of the dynamic error is independent of the actuating load, or the magnitude of actuating mass. (Q27, Q28, Q1, Q5)

212-Q.* (Russian.) Determinations of Elastic Constants in Materials With Longitudinal Ultrasonics. V. A. Kus'menko. *Zavodskaya Laboratoriya,* v. 24, no. 11, 1958, p. 1407-1408.

Mathematical derivation of Young's modulus of elasticity E; modulus of shear G and Poisson's ratio. (Q21a, Q21c, Q21d)

213-Q.* A High-Temperature, Vacuum, and Controlled-Environment Fatigue Tester. G. J. Danek, Jr., and M. R. Achter. *ASTM Bulletin,* no. 234, Dec. 1958, p. 48-52.

Equipment for reverse bending fatigue testing at elevated temperatures in vacuum using high strain amplitudes at low frequency to produce failures in approximately 10^5 cycles. Construction details; use of magnetic coupling for transmission of motion. Fatigue data for Type-316 stainless steel. 7 ref. (Q7g, 1-53, 1-66, 1-73; SS-e)

214-Q.* A Toric Bending Specimen for Investigation of Geometrical Factors in Fatigue. J. A. Bennett and J. G. Weinberg. *ASTM Bulletin,* no. 234, Dec. 1958, p. 53-56.

Bending fatigue test specimen with an anticlastic surface in the reduced section. Results with annealed 5052 Al alloy indicate lack of restraint at corner of a cross-section does not significantly reduce resistance to fatigue crack initiation. Effects of transverse stress in middle of wide plate and stress amplitudes on crack initiation. 6 ref. (Q7g, 1-60, 3-73; Al-b)

215-Q.* High-Temperature Fatigue Testing With Application to Uranium. Jack R. Bohn and Glenn Murphy. *ASTM Bulletin,* no. 234, Dec. 1958, p. 57-60.

Protection methods to prevent oxidation during high-temperature testing including plating or encasement of specimen in flexible envelope. Equipment for encasement with flexible stainless steel capsule. Results at 600° C. with encapsuled U specimen. (Q7, 2-66, 1-60; U-a)

216-Q.* Fatigue Strength of Magnesium Alloy HK31 as Modified by a Weld Joint. J. E. Breen and Arthur S. Dwyer. *ASTM Bulletin,* no. 234, Dec. 1958, P-6063.

Effects of weld direction and weld bead geometry on fatigue strength of HK31 alloy sheet. (Q7a, 3-73; Mg-b, 7-51)

217-Q.* A Note on the Effect of Pressurization on the Fatigue Life of Metals. L. W. Hu. *ASTM Bulletin,* no. 234, Dec. 1958, p. 63-65.

Change in the fatigue life of carbon steel C1045 and Al alloy 2017-T4 following a period of exposure to hydrostatic pressures of up to 100,000 psi. 6 ref. (Q7b, 3-74; Cn, Al-b)

218-Q.* Fatigue Damage of Plain Carbon Steels. Effect of Reheating. T. Yokobori. *ASTM Bulletin,* no. 234, Dec. 1958, p. 66-67.

Annealed specimens damaged by exposure to cyclic stress beyond their endurance limit. Reheating of overstressed specimens at stress relief temperature failed to increase fatigue life beyond that of damaged specimens which had not been reheated. Repair of fatigue damage by understressing. (Q7, 2-64, 3-66, 3-68; CN)

219-Q.* Designing With Stainless Steel. *Electrical Manufacturing,* v. 62, Dec. 1958, p. 79-86.

Composition, structure, properties, applications of stainless stee. (Q-general, 17-57; SS)

220-Q.* Creep in Steels. J. Glen. *Iron & Steel*, v. 31, Dec. 24, 1958, p. 622-625.

Abstracts of papers presented at autumn meeting of Iron and Steel Institute. Estimating long-time properties of steel using strain-rate method of plotting. Effect of alloy elements on creep behavior of alloy steels, Ti, Ni and Mg alloys. Ductility in high-temperature rupture tests. Recent developments in creep testing by cantilever bending method. (Q3; ST, Ti-b, Ni-b, Mg-b)

221-Q.* Effect of Internal Flaws on the Fatigue Strength of Aluminum Alloy Rolled Plate and Forgings. J. L. Waisman, Leo Soffa, P. W. Kloeris and C. S. Yen. *Nondestructive Testing*, v. 16, Nov-Dec 1958, p. 477-489.

Defect size and defect location versus fatigue effect in 7075-T6 and 7069-T6 Al alloys. Ultrasonic tests for quantitative evaluation of discrete flaws. (Q7, 9; Al-b, 4-51, 4-53)

222-Q.* Velocity of Ultrasound in Molten Tin-Bismuth Alloys and Their Compressibility. I. G. Polotskii and E. L. Khodov. *Soviet Physics Acoustics*, v. 4, no. 2., 1957, p. 185-187.

Concentration dependence of the velocity of ultrasound has a linear character with varying slope relative to the axis of concentrations. Adiabatic compressibility curves and ultrasound velocity intersect in eutectic concentration region. 9 ref. (Q21f, Q28; Sn-b, *Bi*, 14-60)

223-Q.* Lower Airframe Weights With Heat-Treated Titanium Alloys. E. F. Erbin. *Space Aeronautics*, v. 30, Dec. 1958, p. 42-47.

Efficiency versus mechanical properties of Ti alloys improved with heat treating. (Q-general, 2-64, T24, 17-57; Ti-b, *Al, Mo, V*)

224-Q.* Coefficient of Friction of Metals. C. Rubenstein. *Wear*, v. 2, Nov. 1958, p. 85-96.

The coefficient of friction of In is load-dependent at light normal loads. Explanation in terms of the work hardening of In at these loads and of surfaces slipping prior to complete work hardening. This suggests that the coefficient of friction of higher-melting-point, oxide-free metals, when measured at sufficiently high temperatures, will exhibit a load-dependence similar to that shown by clean In at room temperature, provided seizure does not occur. 17 ref. (Q9p; In)

225-Q.* (English.) Creep Tests on Mild Steels at Room Temperature. Ake Josefsson and Goran Lagerberg. *Jernkontorets Annaler*, v. 142, no. 9, 1958, p. 570-584.

Creep properties of steels in which ferrite is the main component. Only if the dissolved C and N in the ferrite is reduced to very low values by the addition of Ti, so as to eliminate the yield point, is a continuous creep observable over long periods. In ferrite in which C and N (or C alone) exists in solid solution, and which therefore exhibits a distinct upper yield point, no creep is observable so long as the stress does not attain the upper yield point determined by normal testing. 14 ref. (Q3; CN, *N*, Ti, 2-60)

226-Q.* (German.) Torsion Testing of Tinned Wires. Ove Flack Holm. *Draht*, v. 9, Nov. 1958, p. 458-459.

Shear ductility expressed by number of revolutions to failure in a length equal to 100 diameters for hot tinned wires shows marked decrease over original base wire. Comprehensive tests on coated steel wires during various stages of manufacture show small decrease in tensile strength and increase in shear ductility after preheating (drying) followed by considerable reduction of shear ductility after hot coating. Removal of coating by acid or mechanically restores original properties. (Q1, Q2, Q27a; ST, *Sn*, 4-60, 8-65)

227-Q.* (German.) Properties of Aluminum Killed Deep Drawing Steel Strip. Karlheinz G. Schmitt-Thomas, Heinz Borchers and Vincens Seul. *Stahl und Eisen*, v. 78, Dec. 11, 1958, p. 1798-1808.

Effect of heat treatment, carbon content, deformation and cooling temperature. 39 ref. (Q27, F23, J-general, 2-60, 2-61, 3-68; ST, 4-53)

228-Q.* Comparison of Parameter Methods for Extrapolating High-Temperature Data. R. M. Goldhoff. *American Society for Mechanical Engineers*, Paper no. 58-A-121, 1958, 15 p.

Materials examined were eight alloys, S-590, A-286, Nimonic 80A and 1 Cr, 1 Mo, 1/4 V steel. Three parameter methods are compared on a statistical basis for their ability to reproduce the isothermal data on which they are based and in particular the longest time data currently available and usable for this purpose. 7 ref. (Q3, 2-62; Ni-b, AY)

229-Q.* The Wear of Abrasives in Grinding. G. J. Goepfert and Josephine L. Williams. *American Society of Mechanical Engineers*, Paper no. 58-A-157, 1958, 5 p.

Chemical reactions between metal and abrasive, their effect on abrasive wear and their modification by grinding fluids. Special attention is paid to the silicon-carbide-ferrous systems since wear rates and chemical reactions are more pronounced. 7 ref. Q9, G18; NM-j)

230-Q.* Multiaxial Creep Studies on Inconel at 1500° F. C. R. Kennedy, W. O. Harms and D. A. Douglas. *American Society of Mechanical Engineers*, Paper no. 58-A-193, 1958, 9 p.

Effecf of multi-axial stresses on creep rate and rupture life. Results of rupture tests appear to support the maximum principal-stress criteria for time-dependent fracture under multi-axial stress conditions. Compensation must be made for the reduction in rupture life caused by changes in the stress rate associated with deformation. 11 ref. (Q3, 3-66; Ni-b)

231-Q.* The Failure of Structural Metals Subjected to Strain-Cycling Conditions. R. W. Swindeman and D. A. Douglas. *American Society of Mechanical Engineers*, Paper no. 58-A-198, 1958, 6 p.

Isothermal strain-cycling of Inconel, Hastelloy B and Be. Data for Inconel on the effect of grain size, specimen geometry, temperature and frequency establish that at temperatures above 1300° F. grain size and frequency exert a pronounced effect on rupture life. Fine-grained metal survives more cycles before failure than coarse grained material. 9 ref. (Q3m; Ni-b, Be, 2-59, 2-61, 3-73)

232-Q.* (Polish.) Inclusions of Martensitic Structure in Drawing Steel Wire. Zygmunt Steininger and Jerzy Binder. *Hutnik*, v. 25, Sept., 1958, p. 357-359.

Martensitic structure found in wire from steel with average or more than average content of carbon. Profiled wires are especially sensitive to such inclusions. (Q26, N8p, 3-71; ST, 4-61, 9-69)

233-Q.* (Polish.) Physical and Mechanical Properties of Tellurium Copper. Z. Misiokek. *Prace Instytutow Ministerstwa Hutnictwa*, v. 9, no. 5, 1957, p. 181-189.

Precipitation and aging resulted in a hardness of H_B=69.5 kg. per sq. mm., which did not change when heated to 400° C. for 2 hr. Good machinability was indicated. 13 ref. (Q29n, G17k, 2-65; Cu-b, *Te*)

234-Q.* (Polish.) X-Ray Method of Stress Determination in Metals. Z. Ziokowski. *Prace Instytutow Ministerstwa Hutnictwa*, v. 9, no. 5, 1957, p. 203-225.

Modified method of "oblique screen photographs" worked out and photographs taken by means of a gap screen. 88 ref. (Q25k, 1-54)

235-Q. (Russian.) Use of a Composite Piezo Resonator for Determining Modulus of Elasticity and Internal Friction of Hard Bodies. B. I. Kisin. *Zavodskaya Laboratoriya*, v. 24, no. 11, 1958, p. 1400-1403. (Q21a, Q22, X28)

236-Q.* Molybdenum Effect on Gray Iron Elevated Temperature Properties. G. K. Turnbull and J. F. Wallace. *Modern Castings*, v. 34, Jan. 1959, p. 81-92.

Stress-rupture and tensile strength measured for fracture times up to 100 hr. at 800, 1000 and 1200° F. Improved high-temperature properties. 20 ref. (Q-general; CI-n, *Mo*, 2-62, 2-60)

237-Q.* (Hungarian.) Influence of Iron and Silicon Impurities on Al-Mg Alloy. Laszlo Fldor, Rezso Herendi, Otto Szermek and Marton Voith. *Kohaszati Lapok* v. 13, Feb-Mar. 1958, p. 145-149.

Experiments with Hidronalium (Al-Mg) to determine plasticity, annealing and recrystallization properties. Diagrams show effect of duration of heat treatment and deformation on hardness. (Q23, N5, J23, Q29n; Al-b, *Mg, Fe, Si*)

238-Q.* (Hungarian.) Mechanical Properties of Gray Cast Iron. Statistical Analysis. Nandor Hajto. *Kohaszati Lapok-Ontode*, v. 9, Feb-Mar. 1958, p. 47-52.

Some 2400 tests performed to determine tensile and bending strengths, as well as hardness of castings, having known chemical composition and produced by different methods. 5 ref. (Q-general, S12; CI-n)

239-Q. (Book.) Elevated Temperature Properties of Chromium Steels. 124 p. Oct. 1958. American Society for Testing Materials, STP 228, 1916 Race St., Philadelphia 3, Pa. $4.25.

Data on tensile strength, yield strength, elongation, rupture and creep properties. Twenty-three alloys are covered ranging from 12 to 27% Cr. (Q-general, 2-62; SS, *Cr*)

240-Q. (Book.) Role of Molybdenum in Steel Castings for Industrial Equipment. John Wallace. 36 p. 1958. Climax Molybdenum Co., 500 Fifth Ave., New York 36, N. Y.

Hardenability, tensile properties, fatigue, hardness, wear and impact resistance, machinability and weldability of cast steels. 41 ref. (Q-general; ST, *Mo*, 5-60)

241-Q. (Book.) Creep of Engineering Materials. Iain Finnie and William R. Heller. McGraw-Hill Book Co., 330 W. 42nd St., New York 36, N. Y. $11.50

Combines fundamentals of material behavior with important engineering applications. Creep testing, factors in choosing design stress, engineering calculations. (Q3)

242-Q. (Book.) Materials Evaluation in Relation to Component Behavior. Syracuse University Research Institute. *U. S. Office of Technical Services*, PB 131783, 1958, 613 p. $8.

Papers and Proceedings of Third (1956) Sagamore Ordnance Materials Research Conference held at Duke University, Durham, N. C., Dec. 5-7, 1956. Papers abstracted separately. (Q-general, 17-57)

243-Q. (Translation—BISI, 795) Influence of Cold Hardening of the Edges of Cold Rolled Transformer Sheet Samples on the Electromagnetic Characteristics. A. I. Belyakov. *Stal*, no. 2, 1957, p. 185-187.

See item 1050-Q, 1958. (Q23a, P16, 2-64; ST, SGA-n)

244-Q. (Translation—BISI, 812.) Effect of Hydrogen Content on the Mechanical Properties of Converter Steels Blown With Oxygen and Steam. Alfred Kruger and Eugen Schmidtman. *Stahl und Eisen*, v. 77, Dec. 26, 1957, p. 1868-1873.

See item 246-Q, 1958. (Q-general; ST-g)

245-Q. (Translation-Brutcher, 4429.) Study of Failure of Steel in Creep. I. I. Trunin and I. L. Mirkin. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 25-32.

Continuous rupture at high temperature is preceded by formation of rupture zone with a stepped up concentration of accumulated vacancies in the lattice. This process leads to weakening the interatomic bonds in the more highly strained metal; this in turn creates favorable conditions for formation of micro and macrocracking nucleus. 14 ref. (Q26, Q3; ST)

246-Q. (Translation—Brutcher, 4430.) Effect of Temperature and Preceding Heat Treatment on Rupture Strength of As-Cast and Wrought Alloy. A. A. Bochvar, M. E. Drits, Z. A. Sviderskaya and E. S. Kadaner. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 32-37.

Rupture strength of cast alloys varies linearly with temperature. Wrought alloys are even more sensitive to temperature. Heat treatment of cast alloys increases tendency to creep, while for wrought alloys it improves creep resistance. 4 ref. (Q3q, 2-61, 2-64; ST)

247-Q. (Translation—Brutcher, 4434.) Contact Fatigue of Medium Carbon Noncarburizing Steel Quenched After Induction Heating. T. N. Nazarova. *Metallovedenie i Obrabotka Metallov*, Nov. 1958, p. 57-59.

Contact fatigue occurs when two surfaces are under contacting pressures, such as occur in gears of tractor transmissions, resulting in chipping of metal surface. Studies were made of steel 45 with 0.44% C and of steel 45 kH with 0.43% C. (Q7a, T7a, 2-64; CN)

248-Q. (Translation—Columbia.) Influence of Elastic Stresses and Thermomechanical Treatment on the Magnetic Properties of High-Coercivity Alloys. Ia. S. Shur, M. G. Luzhinskaia and L. A. Shubina. *Academy of Sciences of the USSR, Bulletin*, v. 21, no. 9. 1957, p. 1263-1267.

Experimental data for Vicalloy (12% V, 52% Co, 36% Fe). (P16, 3-66; Co-b, V, Fe, SGA-n)

249-Q.* The Sulphides, Selenides and Tellurides of Titanium, Zirconium, Hafnium and Thorium. Pt. 4. Lubrication Properties of the Graphitic Chalcogenides. F. K. McTaggart and A. Moore. *Australian Journal of Chemistry*, v. 11, Nov. 1958, p. 481-486.

Majority of the chalcogenides of Ti, Zr, Hf and Th having layer lattice structures and/or graphitic nature were tested for possible lubricating properties. Although none of these materials adheres to the common metals, the shearing forces necessary to cause sliding between layers are, in general, low and comparable to those involved in molybdenum disulphide and graphite. 7 ref. (Q9, M26q, Ti, Zr, Hf, Th, *S, Se, Te*, 14-68)

250-Q.* Elastic Constants of Thorium Single Crystals in the Range 77-400° K. P. E. Armstrong, O. N. Carlson and J. F. Smith. *Journal of Applied Physics*, v. 30, Jan. 1959, p. 36-41.

Constants were determined at ultrasonic frequencies employing both resonance and pulse-echo techniques. The anisotropy factor at room temperature is 3.6 which is comparable to the values of Pb and Au. (Q21; Th, 14-61)

251-Q.* (Italian.) Properties of a New Type of Aluminum Bronze Containing Manganese. G. Panseri and M. Leoni. *Alluminio*, v. 27, Nov. 1958, p. 481-493.

Micrographic study of a complex alloy and a ternary alloy containing approx. 8% Mn. Structural changes resulting from heat treatment and influence of these changes on physical and mechanical properties. 18 ref. (Q-general, P-general, M27; Cu-s, *Al, Mn*

252-Q.* (Italian.) Low-Temperature Mechanical Properties of Aluminum Alloys. L. Mori. *Alluminio*, v. 27, Nov. 1958, p. 495-501.

AP 5, Pe 35, Ac 11, Av 24 and Eg 55 alloys were tested at 0, -25, -70, -115, -138 and -195° C. (Q-general, M23p, 2-63; Al)

253-Q.* (Japanese.) Experimental Studies on Temperature Increase in Specimens During Fatigue Test. Kichiro Endo, Seimi Yoshikawa and Atsushi Yamada. *Japan Society of Mechanical Engineers, Transactions*, v. 24, Nov. 1958, p. 767-771.

Temperature increase is a function of the magnitude of cyclic stresses, and a relationship between the increase and life of the specimen is found. Damping constant is influenced by the temperature of the specimen and has no relation to the magnitude or the cyclic number of stresses. 9 ref. (Q7f, Q8k, 2-61, 3-66)

254-Q.* (Japanese.) Fatigue Strength and Stress Distribution. Jun'etsu Niisawa. *Japan Society of Mechanical Engineers, Transactions*, v. 24, Nov. 1958, p. 784-790.

Fatigue strength is influenced by notch effect due to stress concentration. Fatigue failure occurs when the mean stress over a certain depth from the surface reaches the fatigue strength of uniform specimen under alternating load of tension and compression. 10 ref. (Q7a, 3-66)

255-Q.* (Japanese.) Three-Shear Theory of Plasticity. Fujio Nakanishi and Yasuo Sato. *Japan Society of Mechanical Engineers, Transactions*, v. 24, Nov. 1958, p. 791-797.

Plastic deformation can be divided into shearing stress in three directions. A new theory is presented which accounts for the relation between tension and pure shear, hysteresis loops, anisotropy due to plastic deformation, the relation between the yield point of mild steel and plastic deformation. (Q23p, Q24; CN)

256-Q.* (Russian.) Brittle Fracture of Monocrystalline Zinc. V. I. Likhtman, L. A. Koganova and L. S. Bryukhanova. *Doklady Akademii Nauk SSSR*, v. 120, no. 4, 1958, p. 758-760.

Comparative study of regularity in deformation and fracture in strong-surface-active fused metals with an analogous regularity of same metals in brittle state but in non-active conditions. Hg was used as a surface active element and liquid nitrogen as a non-active but brittle producing medium. (Q26s, Q24; Zn, 14-61)

257-Q.* (Russian.) Effect of Polarization on Mechanical Properties of Steel. T. V. Karpenko and R. I. Krpyakevich. *Doklady Akademii Nauk SSSR*, v. 120, no. 4, 1958, p. 827-829.

Ultimate elasticity; ultimate yield point; true tension, relative elongation and relative reduction of area of steel during the polarization process. (Q-general, P15; ST)

258-Q.* (Russian.) Micromechanism of Brittle Fracture of Steel. B. S. Kasatkin. *Izvestiya Akademii Nauk SSSR*, May 1958, p. 63-68.

Analysis of microstructures showed crushing of grains, mutual shifts of grains toward each other and crack formation. (Q26s, M27; ST)

259-Q.* (Russian.) Measurement of Modulus of Elasticity. M. G. Lozinskii and A. E. Fedorovskii. *Izvestiya Akademii Nauk SSSR*, June 1958, p. 20-29.

Survey of dynamic methods to measure modulus of elasticity and internal friction of metals and alloys; specially constructed testing machine to learn temperature relation of these properties. (Q21a, Q22, 2-60, 2-61; ST, Fe, *N, Mo, V, W*)

260-Q.* (Russian.) Effect of Hydrogen on the Structure and Properties of Titanium and Its Alloys. S. G. Glasunov, I. I. Kornilov and A. M. Yakimov. *Izvestiya Akademii Nauk SSSR*, June 1958, p. 30-36.

Review of work in USSR and abroad. Mechanism of brittleness effect determined by alloy structure. Brittleness on Ti and its alloys caused by precipitation of the hydrated phase. (Q26s; Ti-b, H)

261-Q.* (Russian.) Fatigue Strength of I-Beam Butt Joint. P. Z. Manilova. *Svarochnoe Proizvodstvo*, Dec. 1958, p. 9-13.

Butt joints, where flanges are welded first and the web is welded afterwards,

have higher fatigue strength than beams where the web is welded first and the flanges afterwards. 5 ref. (Q7a; 7-51)

262-Q.* (Russian.) Investigation of Mechanical Aging of Steel Through Comparison of Actual Tension Diagrams. L. I. Gladstein, P. I. Sokolovskii and A. V. Rudchenko. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1236-1239.

Mechanical and natural aging of strain hardened steel have different characteristics; rapid quenching of austenitic carbon steel does not diminish its disposition to mechanical aging. (Q27, N7a, N7e; ST)

263-Q.* (Spanish.) Residual Stresses in Metals; Determination of Stresses. Pt. 1. Generalities. Methods of Determination. J. M. Sistiaga. *Revista de Ciencia Aplicada*, v. 12, Sept-Oct. 1958, p. 385-396.

Theoretical and mathematical study. State of stress at a given point; conditions of equilibrium in a body; origin, kinds and effects of residual stresses. Qualitative and quantitative methods of determination in symmetrical cylindrical bodies. (To be continued.) (Q25h)

264-Q. (German.) Resistance to Deformation of Alloy and Plain Steels. H. Meyer. *Werkstattstechnik und Maschinenbau*, v. 48, Dec. 1958, p. 673-676.

4 ref. (Q24; ST)

265-Q. (Russian.) Activating Energy of Diffused Creep of Metallic Solid Solutions. Ia. E. Geguzin. *Doklady Akademii Nauk SSSR*, v. 120, no. 4, 1958, p. 819-822.

(Q3; 14-67)

266-Q. (Russian.) Possibility of Separate Value of Metal Strength and Plasticity During Toughness Tests. Yu. Ya. Voloshenko-Klimovitskii. *Izvestiya Akademii Nauk SSSR*, v. 32, June 1958, p. 42-46.

Materials possessing different resistance to failure and different in their plastic diffusion subjected to the same toughness, failure and plasticity test. Measuring the amplitude and duration of impact impulse of the load, under which the sample fails is suggested. (Q23)

267-Q. (Russian.) Bending Test for Determination of Deformation Properties of Metals. T. L. Danilov, A. P. Ivanov, A. A. Krashkin, I. A. Razov, E. M. Shevandin and I. L. Shimelevich. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1233-1236.

6 ref. (Q5)

268-Q. (Russian.) Tension Diagram of Steel Under Direct Load. A. B. Litvin. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1239-1242.

Oscillograms and tables comparing tests conducted on conventional and direct-load tension machines. (Q27;ST)

269-Q. (Russian.) Investigation of Plastic Flow During Simultaneous Tension and Torsion of Metallic Samples Made Out of Thin-Walled Tubes. Ya. I. Yagn and O. A. Shishmarev. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1243-1245.

Improved method and apparatus. (Q24, 3-66; 4-60)

270-Q. (Russian.) Determination of Strength of Oxide Films. V. N. Gulyaev. *Zavodskaya Laboritoriya*, v. 24, Oct. 1958, p. 1245-1246.

Durability of common oxide film of sample pairs was established by tension, shear, compression and torsion. (Q-general; Fe, *O*, 14-62)

271-Q. (Russian.) Determination of Strength of Parts Pressed From Metallic Powders. G. N. Semenov. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1246-1247.

Pressed samples were radially compressed in a 4-ton hydraulic press. Fracture was in diametric plane. Tear resistance of pressed samples is 2 to 4 times greater than of rolled samples. (Q26; 6-72)

272-Q. (Russian.) Testing Methods for Heat Resistant Materials Under Variable Temperatures and Stresses. L. B. Getsov. *Zavodskaya Laboritoriya*, v. 24, Oct. 1958, p. 1247-1251.

Survey of foreign literature. 21 ref. (Q-general, 2-61, 3-66; SGA-h)

273-Q. (Russian.) Apparatus for Precise Determination of Temperature Dependence of Young's Modulus and Damping Decay. G. I. Kataev. *Zavodskaya Laboritoriya*, v. 24, Oct. 1958, p. 1258-1261.

(Q21a, Q7j, 2-61, 1-53)

274-Q.* The Case Against the Tension Test. John B. Caine. *Foundry*, v. 86, Sept. 1958, p. 78-85.

Various methods of evaluating casting strength and serviceability; validity of tests. 10 ref. (Q-general; CI)

275-Q.* Friction and Wear Properties of Titanium. P. D. Miller and J. W. Holladay. *Wear*, v. 2, Nov. 1958, p. 133-140.

All lubricants, with the possible exception of fluorocarbons, are ineffective in reducing the galling of bare Ti metal, although many of the wear problems can be minimized by coating the surface of the metal and then lubricating this surface. Wear resistance of the metal is improved by oxide, nitride and carbide case hardening and coatings. Chemical conversion coatings such as fluoride, phosphate and anodized coatings help retain the lubricant and improve the resistance to galling. 24 ref. (Q9; Ti, 8, NM-h)

276-Q.* (French.) Hot Deformation of Steel. A. Gueussier and R. Castro. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1023-1041.

Steel samples exposed to tensile and bending deformation up to approximately 1400° C. It was shown that during hot deformation harmful precipitation or desirable recrystallization can occur. 26 ref. (Q24, Q5, Q27, 2-61, 2-60; AY, SS)

277-Q.* (French.) Scattering Observed in Rotary Bending Fatigue Tests. R. Castro and A. Gueussier. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1042-1047.

Scattering within ±8% on both sides of the fatigue limit observed. No significant evidence was found to indicate influence by machining, sampling conditions or inclusions. (Q7; AY)

278-Q.* (French.) Effect of Recrystallization on Fatigue Strength of Aluminum Alloys. F. Gatto. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1079-1084.

Samples not undergoing recrystallization heat treatment showed a higher resistance against fatigue. Alloying elements thought to retard recrystallization. 4 ref. (Q7a, N5, 2-60; Al-b)

279-Q.* (French.) Structural Changes in Al-Cu Alloys During Fatigue. F. Gatto. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1085-1090.

Rotary bending fatigue tests showed diffusion of Cu to zones of highest stress. 16 ref. (Q7, N1e, 2-60; Al-b, *Cu, Sn*)

280-Q.* Product Design for -300°F. P. E. Loveday. *Product Engineering (Design Issue)*, v. 30, Feb. 2, 1959, p. 60-62.

Embrittlement, atmospheric moisture, insulation, conduction, shrinkage, lubricants, vaporized, combustion, and asphyxiation hazards. (Q-general, 2-63; SS, Cu-b, Al-b, Ag-b, 17-51)

281-Q.* Magnesium Forgings Save Weight. Lester E. Wilensky. *Materials in Design Engineering*, v. 49, Jan. 1959, p. 92-94.

Mechanical properties of AZ80A, M1A, AZ31B and AZ61A alloy forgings. Effect of heat treatment on properties of ZK60A alloys. 9 ref. (Q-general, 2-64; Mg-b, 4-51)

282-Q.* How to Select a Stainless Steel. John L. Everhart. *Materials in Design Engineering*, v. 49, Jan. 1959, p. 95-110.

Resistance of different stainless steels to various types of corrosive attack at ordinary and elevated temperatures. Mechanical properties at low, ordinary and elevated temperatures. Hardenability, physical properties, nominal compositions and fabricating processes applicable to stainless steels. Applications and costs. 15 ref. (Q-general, R-general, 17-57; SS)

283-Q.* High Temperature Solid Film Lubricants for Uses Above 1000° F. Ralph E. Crump. *Society of Automotive Engineers*, Preprint 4S, Jan. 1959, 11 p.

Coefficients of friction with ceramic bonded solid film lubricants on several metal combinations at temperatures from 75 to 1100° F. Lead oxide and graphite as lubricants. 6 ref. (Q9p, 1-54, 2-62; SS, Ni-b, NM-h)

284-Q.* Irradiation Creep of Alpha Uranium. *Metal Industry*, v. 93, Dec. 26, 1958, p. 536, 539.

Influence of neutron irradiation at temperatures up to 100° C. on creep and its relation to irradiation growth. Effect of irradiation on thermal creep at 450° C. (Q3m, Q3n, 2-61, 2-67; U-a)

285-Q. Mechanical Properties of Uranium-Molybdenum Alloys. M. B. Waldron, R. C. Burnett and S. F. Pugh. *United Kingdom Atomic Energy Authority*, AERE M/R 2554, 1958. 35 p.

Tensile properties and hardness of U-Mo alloys in the composition range 0.14% Mo at room and elevated temperatures. At lower concentrations the breakdown of the gamma solid solution to unstable microstructures leads to pronounced aging effects. Above 5.5% Mo the gamma solid solution is retained to room temperature and shows enhanced properties as temperatures up to 800° C. (Q-general; U-b, *Mo*)

286-Q.* (Swedish.) Accuracy of the Erichsen Cupping Test. V. Kokkonen and G.

Nygren. *Jernkontorets Annaler*, v. 142, no. 10, 1958, p. 638-660.

Influence of surface roughness and radius of the punch on depth of cup in Erichsen tests and in stretch forming tests made with special tools. Differences between various Erichsen machines would appear to be only partly explainable by variations in depth of cup deriving from differences in surface roughness and radius of the punches. 12 ref. (Q23q, 1-54; ST)

287-Q.* High-Temperature Alloys. Michel Urbain. *Cobalt*, no. 1, Dec. 1958, p. 13-32.

Properties necessary to meet operating conditions in aircraft engines, rocket engines, airframes, marine and land gas turbines. Composition, structure, classification, high-temperature tensile and stress-rupture properties; fatigue resistance, oxidation resistance, thermal shock resistance of heat resisting Fe-Cr-Ni alloys, Fe-Cr-Ni-Co alloys, Ni-base alloys and Co-base alloys. Influence of Co content. 32 ref. (Q-general, 2-60, 2-62; Co-b, Fe-b, Ni-b, SS, SGA-h)

288-Q.* (French.) Properties of Aluminum Alloy A-S7G. Claude Mascre. *Fonderie*, no. 155, Dec. 1958, p. 577-580.

Most favorable mechanical properties observed with a Si content between 6.5 and 7%. Grain size for sand castings was approximately 4 grains per sq. mm. and 8 grains per sq. mm. for permanent mold casting. Permanent mold castings show better mechanical properties than sand castings. 5 ref. (Q-general, M27c; Al-b, 5-60, 5-63)

289-Q.* (Italian.) Influence of Heat Treatment on the Fatigue Behavior of Avional 14 Alloy. D. Morri. *Alluminio*, v. 27, Sept. 1958, p. 387-390.

Fatigue tests on Av 14 alloy in age hardened, over-aged and annealed conditions confirm hypothesis that structural changes caused by fatigue stress are similar to those caused by over-aging at high temperature. 3 ref. (Q7a, 2-64; Al-b)

290-Q.* (Italian.) Nature of the Friction Products of Aluminum Surfaces. M. Paganelli. *Alluminio*, v. 27, Oct. 1958, p. 429-434.

Radiocrystallographic, micrographic and analytical examination of dark powder formed by friction between surfaces of AP-5 alloy showed that this powder consists of tiny particles of metallic Al coated with natural oxide. Particles are produced solely by mechanical wear of areas in contact and by abrasion provoked by products of wear and of the abrasion itself. 10 ref. (Q9p; Al-b)

291-Q.* (Russian.) Peaks of Internal Friction in Chromium-Nickel Base Solid Solutions. Yu.S. Avraamov, L. N. Belyakov and B. G. Livshitz, *Fizika Metallov i Metallovedenie*, v. 6, No. 1, 1958, p. 116-121.

In series of alloys aging confirmed that after hardening a complete change takes place in physical characteristics, although the alloys appear to be single phase according to diagram. For studying this phenomenon the relationship of temperature to internal friction was measured. In Ni-Cr-Ti-Al alloys, development of internal friction is associated with presence of Ti atoms in solid solution. 8 ref. (Q22, 2-61, 2-64; Cr-b, *Ni, Al, Ti*, 14-67)

292-Q.* (Russian.) Effect of Static Distortion of Crystalline Lattice on Mechanical Properties of Aluminium-Magnesium Alloys. Pt. 2. Dependence of Complete and Uniform Deformation on Temperature and Rate of Deformation. A. V. Grin', V. A. Pavlov and I. A. Pereturina. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 110-115.

Complete and uniform deformation investigated in 80 to 700° range while changing rate of deformation 1000 times. Static distortion of crystalline lattice promoted by Mg atoms lowers plasticity. Diffusion process produced under tension within deforming alloys increases plasticity and affects temperature dependence of complete and uniform elongation. 9 ref. (Q23, 2-61, 3-68; Al-b, Mg)

293-Q.* (Russian.) Distribution of Plastic Deformation in Polycrystalline Metals. P. O. Pashkov and V. A. Bratukhina. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 128-134.

Quasi-periodicity in the distribution of residual deformation is consequence of irregular deformation of grains in polycrystalline metals. It is deduced that the deformation of the mass is the result of alternation between weak and strong deforming zones. 6 ref. (Q24, M27c)

294-Q.* (Russian.) Effect of Phase Disintegration of Solid Solutions on Plastic Deformation. Pt. 2. Irregular Deformation. N. F. Syutkin. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 135-140.

Serrated plastic deformation was detected in samples subjected to tension which on the diagram is considerably less than the usual limit of fluidity. Mutual processes of phase disintegration and plastic deformation cause resistance to tension in aging alloys. Internal strains are introduced by formation of new phases. 8 ref. (Q24, 3-68; 14-67)

295-Q. Discontinuity in the Fatigue Curve for Duralumin. P. G. Morgan. *Metal Industry*, v. 94, Jan. 2, 1959, p. 11.

Note on recently recorded Russian work. Stresses within elastic and within elastic-plastic ranges. (Q7a, Q7e, 3-66; Al-b)

296-Q. Structural Vibration. Wilbur Du Bois. *Product Engineering (Design Issue)*, v. 35, Feb. 2, 1959, p. 52-53.

Scope screen shows when resonance occurs, locates trouble spots and indicates what causes them. (Q9, X25j)

297-Q. (French.) Determination of the Fatigue Strength by L. Locati Method. C. Daubertes, M. Renout and R. Cazaud. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1048-1056.

One part of a production series is exposed to three stages of cycling and the fatigue limit is calculated with curves based on the results. (Q7a; ST)

298-Q.* Internal Friction of Annealed Copper at Low Temperature. D. H. Niblett and J. Wilks. *Physical Society, Proceedings*, v. 73, Pt. 1, Jan. 1, 1959, p. 95-99.

Amplitude-dependent and amplitude-independent contributions to the decrement increase with increasing temperature. 16 ref. (Q22, 2-63, 3-66; Cu)

299-Q.* Mechanical Properties of the Ferrite Crystal. N. P. Allen. *Iron and Steel Institute, Journal*, v. 191, Jan. 1959, p. 1-18.

Elastic properties of alpha iron crystals. Influence of interstitial atoms; nature of plastic flow; yield point phenomena; dislocation theory; twinning; theoretical consideration of fracture behavior; relation between yield stress and fracture stress; formation and spread of cracks; effect of temperature on fracture stress. 39 ref. (Q-general; Fe)

300-Q.* A Modified Bend Test for Hardened Tool Steels. G. Hoyle and E. Ineson. *Iron and Steel Institute, Journal*, v. 191, Jan. 1959, p. 44-45.

Bend test apparatus designed for testing fully hardened toolsteels at room or elevated temperatures. Calculation of stresses; application of bending formula; relation of experimentally determined properties to "toughness" of toolsteels; effect of temperature and heat treatment on properties of toolsteels of plain carbon, low-alloy or high-speed types. 28 ref. (Q-general, Q5g, 2-61, 2-64, 3-66; TS)

301-Q.* Problems of Brittle Fracture. H. Harris. *Metal Treatment and Drop Forging*, v. 26, Jan. 1959, p. 15-20.

Occurrence of brittle fracture with reference to construction of pressure vessels. Relationships of residual stress, temperature, steel composition, electrode composition and weld defects with brittle fracture. (Q26s, T26q, 2-60, 2-61, 3-66; ST)

302-Q.* Hardness Testing. *Metal Treatment and Drop Forging*, v. 26, Jan. 1959, p. 28-30, 32.

Hardness concepts, elasticity, plasticity, time element, mass defects, strain hardening and other factors influencing indentation. Application of Brinell, Rockwell and 136° diamond pyramid testing method. (Q29)

303-Q. Study of Physical Characteristics of Thin Film Resistance Elements. D. W. Moore. Servomechanisms, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 131703, Dec. 1957, 48 p. $1.25.

Instability of Nichrome films is due to slow oxidation and strain caused by unequal contractions of film and substrate on cooling from the deposition temperature. (Q25h, R1h; Ni-b, Cr, Fe, Ti, 14-62)

304-Q. Delayed Failure and Hydrogen Embrittlement in Titanium. R. D. Daniels, R. J. Quigg and A. R. Troiano. Case Institute of Technology. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151139, Feb. 1958, 62 p. $1.75.

Hydrogen-induced failures occurred by a process of crack initiation and controlled crack growth. Delayed failures resulting from creep were encountered, even in notched specimens. At both high and low temperatures, hydrogen-induced delayed failure disappeared and the time required for failure as well as the minimum stress at which failure could occur increased at elevated temperatures. (Q26s, Q3, 2-60, 2-61; Ti-b, H)

305-Q.* (Dutch.) Effect of Residual Stress on the Behavior of Steel Constructions. W. Soete. *Lastechniek*, v. 25, Jan. 1959, p. 15-19.

Residual stress in welded steel constructions. Effect of residual stress on deformation, proportional limit, flow limit and rupture. Stress peaks. Stress relief by heat treatment or adequate design. (Q25h; ST, 7-51)

306-Q.* (German.) Development of High Strength in Castings. Hans Reininger. *Giesserei-Praxis*, Dec. 10, 1958, p. 453-457.

Influence of shaping process, tension, grain structure, tears due to shrinking or tension. (Q23b, Q29, S13; 5-60, 9)

307-Q.* (Russian.) Determination of Residual Stresses Caused by Sudden Cooling in Shafts. A. V. Podzei and G. Z. Serebrennikov. *Stanki i Instrument*, Dec. 1958, p. 18-20.

Formulas for computing residual stresses in solid shafts, spindles, axles and other cylindrical machine parts, subjected to sudden cooling. These formulas may be applied with great accuracy in cooling processes that do not cause change in specific volumes because of phase transformation. Such conditions take place in a dozen of various steels including heat resisting and stainless steels. (Q25h, 2-63; ST, SS)

308-Q. (German.) Stress Measurements Based on Variations in the Conductivity of Thin Wires Under Stress. H. Petrick. *Draht*, v. 9, Dec. 1958, p. 499-504.

Measurement of stresses in built-in construction by means of resin-coated paper strips glued to the surface and containing thin wires carrying current. (Q25h, P15g, 1-54)

309-Q. (Russian.) Resistance of Hardened Steels Under Irregular Volumetric Compression. E. E. Surikova and F. S. Savitskii. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p.173-175.

6 ref. (Q28, 2-64; ST)

310-Q. (Russian.) Influence of Notch on Bending. Yu. E. Bondarev. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 181-183.

(Q5h)

311-Q. (Russian.) Initial State of Plastic Deformation of Metals. B. A. Sidorov. *Fizika Metallov i Metallovedenie*, v. 6, no. 1, 1958, p. 191-192.

4 ref. (Q24)

312-Q. (French.) Survey on Soviet Research Concerning Rupture Behavior of Metals. J. B. Friedmann. *Revue de la Soudure*, v. 14, no. 4, 1958, p. 188-200.

69 ref. (Q3q)

313-Q.* Mass Effect on Castings Tensile Properties. G. W. Form, P. J. Ahearn and J. F. Wallace. *Modern Castings*, v. 35, Feb. 1959, p. 45-49.

Section-size data were converted to solidification times, and the influence of this latter casting condition on tensile properties was evaluated. Formulation of a hypothesis for predicting the sensitivity of tensile strength to solidification time. 17 ref. (Q27a, E25n; 5)

314-Q. Effect of Prior Creep on Mechanical Properties of Aircraft Structural Metals. Pt. 3. C110M Titanium Alloy. J. V. Gluck, H. R. Voorhees and J. W. Freeman. University of Michigan. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151145, May 1958, 96 p. $2.25.

Prior creep exposure had little effect on the fracture strength or ductility in either tensile tests or tension-impact tests. (Q-general, 2-61, 3-68; Ti-b, *Mn*)

315-Q.* (Czech.) Strength Limit States of Steel. Jaroslav Nemec. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1111-1116.

Theoretical studies on imperfections, development of deformation and rupture. 6 ref. (Q-general, M26s, 10-51; ST)

316-Q.* (Czech.) Initial Stages of Fatigue in Carbon Steel. Mirko Klesnil and Premysl Rys. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1116-1123.

Shaped samples heat treated in a vacuum and oven cooled. After cycling cohesion defects were detected by micrographs. They were exclusively on the surface and probably caused by stress concentrations. 19 ref. (Q7, M26s; CN-p)

317-Q.* (Czech.) Wear and Wear Testing. Antonin Benes and Vladimir Vrzal. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1123-1129.

Among the gray cast irons tested, alloy irons proved to be more wear resistant than the unalloyed. In general, a cast iron of 160 Brinell hardness will wear excessively; one of 230 will show good wear resistance. With Brinell values between 160

and 130, wear resistance is also influenced by the structure. 8 ref. (Q9n; CI-n, CI-q, *Cr, Ni,* CN)

318-Q.* (Czech.) Phenomenon of Conchoidal Fracture. Zdenek Eminger. *Hutnicke Listy,* v. 13, Dec. 1958, p. 1141-1152.

Nickel-vanadium steels tested to determine reasons for conchoidal fracture which is observed only with cast steel, not with forged steel. Phenomenon depends on primary crystallization and is retarded in vacuum casting of ingots where the hydrogen content decreases; the column of long-axis dendrites becomes narrower and the formation of a globular structure is favored. 12 ref. (Q26r, N12; ST, *Ni, V*)

319-Q.* (Dutch.) Copper and Copper Alloys. Pt. 18. Hydrogen Embrittlement. W. G. R. de Jager. *Metalen,* v. 14, Jan. 15, 1959, p. 10-14.

Copper 99.40 to 99.90% pure with different amounts of oxygen heated in hydrogen and, for comparison, nitrogen. Electric resistance micrographs and bend tests. 9 ref. (Q26s, 1-54; Cu-b)

320-Q.* (French.) Study of the Friction and Surface Properties of Solids. F. P. Bowden. *Revue de Metallurgie,* v. 55, Dec. 1958, p. 1126-1132.

Friction mechanism of metals and other solids at very high gliding speeds. Use of reflection and scanning electron microscopy to study surface properties of solids. Recent applications of highest resolution electron microscopes to reveal molecular array in crystals and dislocations in metal lattice. 6 ref. (Q9p, M21e)

321-Q.* (French.) Study of Elevated-Temperature Fatigue of Steel. J. de Fouquet. *Revue de Metallurgie,* v. 55, Dec. 1958, p. 1133-1144.

Alternate-torsion fatigue test on dead soft steel, with 0.05% C at temperatures from 20 to 700° C. Character of fracture changes, being in ranges up to 400° C. intercrystalline following slip bands, up to 650° C. intercrystalline at grain boundaries and above 650° C. grain growth causes genuine creep. Micrographs, X-ray diagrams and mechanical tests show preponderant influence of temperature on crystalline behavior of steel when subjected to fatigue. 4 ref. (Q7, Q3, 2-61; ST)

322-Q.* (French.) Brittle Fracture. G. M. Boyd. *Revue de la Soudure,* v. 14, no. 4, 1958, p. 175-186.

Characteristics and mechanism influencing factors; flaws resulting from weldments, residual stress, low temperature, shock, geometric shape. 14 ref. (Q26s, 2-63, 3-66, 3-73; ST)

323-Q.* (French.) Fatigue Rupture. *Revue de la Soudure,* v. 14, no. 4, 1958, p. 222-225.

In a flanged pipe of a compressor, fatigue rupture caused by vibrations of the motor took place in the vicinity of weld between flange and pipe. (Q7a; ST)

324-Q.* (German.) The Crystal Lattice and Metal Forming. E. Schmid. *Metall,* v. 13, Jan. 1959, p. 1-11.

Review of experimental results regarding plastic properties of metals. Theory of molecular transposition as means for understanding plastic behavior. Particle bombing of metals, its importance for the construction of reactors and rockets. 82 ref. (Q24, M25)

325-Q.* (Russian.) Effects of Phosphorus and Arsenic Upon Parameter of Crystallitic Lattice and Hardness of Alpha Iron. V. H. Svechnikov, V. M. Pan and A. K. Shurin. *Fizika Metallov i Metallovedenie,* v. 6, no. 4, 1958, p. 662-664.

P decreases and As increases the lattice parameter in alpha-iron. Both increase the hardness. 12 ref. (Q29n, M26, 3-69; Fe-b, *P, As*)

326-Q.* (Russian.) Relation of Shear Modulus to Temperature in Some Pure Metals, Solid Solutions and Alloys. V. S. Postnikov. *Fizika Metallov i Metallovedenie,* v. 6, no. 4, 1958, p. 707-716.

Shear modulus relation to temperature in Ti, Fe, Co, Ni, Mo. Solutions of Be, B, C, Ti, Cr, Mn, Fe, Zr, Cb, Mo and W in Ni and its alloys investigated by low-frequency rotating vibrations of small amplitudes. Coefficient of shear modulus less in alloys and solid solutions than in pure metals. 22 ref. (Q21d, 2-61; Ni-b, Fe, Co, Ti, Cr, Mo, 14-67)

327-Q.* (Russian.) Mechanical Properties of Nickel-Copper Alloy. V. A. Pavlov and I. A. Pereturnina. *Fizika Metallov i Metallovedenie,* v. 6, no. 4, 1958, p. 717-724.

Effect of temperature and deformation rate of pure Ni and Ni alloy. 30 ref. (Q-general, 2-61, 3-68; Ni-a, Ni-b, *Cu*)

328-Q.* (Russian.) Transverse Deformation of Carbon Steels. A. V. Gur'ev. *Fizika*

Metallov i Metallovedenie, v. 6, no. 4, 1958, p. 725-733.

Explanation as to why with the increase of stress the magnitude of deformation coefficient is increased. 18 ref. (Q21c, 3-66; CN)

329-Q.* (Russian.) Magnesium Iron Crankshafts for Diesel Engines in Tractors. A. A. Gorshkov, A. I. Toropov and M. V. Voloshchenko. *Liteinoe Proizvodstvo*, Nov. 1958, p. 1-3.

Crankshaft of pearlite-ferrite Mg iron was tested from 3 to 5 years under industrial conditions and showed 40% greater wear resistance. Fatigue strength of circular 40-mm. test pieces is 28-30 kg. per sq. mm. (Q21c, Q9n, Q7a; CI-r, Mg)

330-Q.* A Review of Intergranular Fracture Processes in Creep. P. W. Davies and J. P. Dennison. *Institute of Metals, Journal*, v. 87, Dec. 1958, p. 119-125.

Intercrystalline fracture is explained in terms of stress-concentration effects at triple points and transversely stressed boundaries; condensation of vacancies to form cavities at grain boundaries and the subsequent merging of the cavities to form cracks; cavity formation at grain boundaries due to jog formation followed by boundary sliding. 37 ref. (Q26, Q3)

331-Q.* Influence of Annealing Twins on Intergranular Creep Cracking. C. W. Weaver. *Institute of Metals, Journal*, v. 87, Dec. 1958, p. 126-127.

The progress of an intergranular creep crack along a transverse boundary may be delayed by, or even stopped at, the vertical intergranular boundary of an annealing twin. This arrest is ascribed to the lower surface free energy of the coherent twin boundary lying in the path of the crack, which requires larger amounts of shear to propagate the crack than does the normal grain boundary. 4 ref. (Q3, M27e)

332-Q.* Can Fe-Cr-Al Alloys Ever Replace Stainless? P. M. Unterweiser. *Iron Age*, v. 183, Feb. 5, 1959, p. 90-92.

Resistance of Fe-Cr-Al alloys to corrosive attack by fuel oil residues at high temperatures. Hot strength, elongation, drawability and other properties. (Q23p, Q27, R7d, 2-60, 2-62; Fe, *Cr*, *Al*, SGA-g)

333-Q. Creep of Magnesium Alloy AZ80-T5 at Low Temperatures. L. G. Bell. Chalk River, Ontario. *Atomic Energy of Canada Ltd.*, CRMet-794, Sept. 1958, 21 p.

Mg alloy AZ80 in the T5 or age hardened condition creep tested at 50° C. and at various stresses. Creep rates were measured at the termination of tests of 600 to 1000 hr. Extrapolation of results shows that a constant creep rate is obtained at a stress of 10,000 psi. 6 ref. (Q3; Mg-b)

334-Q. Modes of Deformation Leading to Fracture of Metals: a Review of Progress to January 1958. R. Doldon and R. F. Lumb. *United Kingdom Atomic Energy Authority*, IGR-TN/C-919, May 21, 1958, 17 p.

Certain crystals of polycrystalline super-purity Al specimens deformed in tension exhibit a banded slip surface. The stress axis of these crystals is <123>. Microradiography is used for investigating the effect of strain rate and temperature on the formation and initial propagation of cavities instigated by deformation. 9 ref. (Q24a, 2-61, 3-68; Al-a)

335-Q. Design and Materials as Affected by Elevated Temperatures. D. R. Adolphson. Sandia Corp. *U. S. Atomic Energy Commission*, SCTM-225-58(16), Aug. 5, 1958, 32 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Influence of elevated temperature on structural design and mechanical and physical properties of metallic materials. Materials which are commercially applicable for structural use up to 1200° F. include Al, Mg alloys, ferrous alloys, alloy steels, stainless steels, age-hardened stainless steels, and Ti alloys. (Q-general, 2-62, Al, Mg-b, SS, Ti-b)

336-Q. Ductility in Beryllium Related to Grain Orientation and Grain Size. Jacob Greenspan. Nuclear Metals Inc. *U. S. Atomic Energy Commission* NMI-1174, Aug. 9, 1958, 39 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Be with grain orientations resulting from hot working either unidirectionally or bidirectionally is ductile or brittle in directions given by the anisotropy and orientation of the grains. Both texture and fine grain size are required to obtain high-tensile elongation. Ultimate tensile strength and elongation are both correlated with grain diameter. Unusually high tensile elongations of 30 to 40% are obtained when basal planes are oriented to

carry little or no tensile stress. 18 ref. (Q23p, Q27, 2-59; Be)

337-Q. Development of a Weldable Titanium-Base Alloy of Medium Strength. J. P. McAndrew and D. W. Levinson. Illinois Institute of Technology. (Wright Air Development Center.) *U.S. Office of Technical Services*, PB 151214, June 1958, 33 p. $1.

Research to find a Ti-base sheet alloy having a minimum room-temperature tensile yield strength of 130,000 psi, which would be weldable without requiring a post-welding heat treatment to restore ductility or strength. (Q23b, 2-60, 2-61; Ti-b, *Sn, Zr, Al, Mo, Mn, Cr*)

338-Q. Effect of Static Prestrain on the Prot-Fatigue Properties of Unnotched and Notched Materials at Room and Elevated Temperature. F. H. Vitovec. University of Minnesota. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151280, July 1958, 67 p. $1.75.

Main factors influencing the Prot-failure stress were residual stresses, metallurgical reactions and cracks from prestraining. Strain hardening and relaxation of residual stress is reported to be of secondary importance. (Q7, Q3, N7e, 2-62, 3-66; SS, Al-b, Co-b, 9-72)

339-Q. Research on Ferrous Materials Fatigue. H. N. Cummings, F. B. Stulen and W. C. Schulte. Curtiss-Wright Corp. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151243, Aug. 1958, 114 p. $2.50

Effect of fatigue stressing on R. R. Moore rotating-beam steel specimens. Statistical study of laws of propagation of fatigue cracks in SAE 4340 steel, using photographic technique for measuring crack propagation; investigation of the effect on fatigue strength of surface hardening by shot peening and plating, by carburizing and by nitriding; investigation of the transverse strength of SAE 4340 aircraft quality steel. (Q7, Q27, 2-64, 3-68; ST, 9-72)

340-Q.* The Problem of Metal Fatigue. George Sines and J. L. Waisman. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 3-6.

Importance of fatigue, guide to literature. 17 ref. (Q7)

341-Q.* Factors Affecting Fatigue Strength. J. L. Waisman. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 7-35.

Load spectrum of assemblies, principal stress, stress concentrations, mean stress, residual stresses, rest periods, stress frequency and other factors for design predictions. Effect of surface roughness, microstructure, internal defects, corrosive environments, directional characteristics, temperature, cold working, surface finish and coatings on fatigue life. 41 ref. (Q7a, Q7b, 2-61, 2-66, 3-66, 3-67, 3-68, 3-71, 3-72; SS, ST, Al-b)

342-Q.* Basic Concepts of Fatigue Damage in Metals. Thomas J. Dolan. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 39-67.

Microscopic deformation and accumulation localized damage prior to appearance of visible cracks in metals subjected to dynamic stressing. Statistical nature of fatigue strength; relation of grain size, metallurgical structure and temperature with basic fatigue damage. Improvement of fatigue strength. 44 ref. (Q7a, Q7b, 2-59, 2-61, 3-66, 3-68, 3-71, 3-72; ST, Cu-n, Al-b)

343-Q.* Fatigue Cracks and Fracture Surfaces—Mechanics of Development and Visual Appearance. R. E. Peterson. Paper from "Metal Fatigue". McGraw-Hill Book Co. Inc., 1959, New York, p. 68-86.

Formation, direction and distribution of slip bands and relation to applied stress. Development from slip plane separations into gross cracks in metals under tension, torsion or compressive stresses. Types of markings found on surfaces fractured by fatigue. 42 ref. (Q24a, Q26p, Q7a; ST, Al-b)

344-Q.* Laboratory Fatigue Testing of Materials. E. C. Hartmann and F. M. Howell. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 89-111.

Types of machines and specimens; test procedures and techniques; interpretations and significance of results of fatigue tests made on metallurgical specimens or on components. (Q7c, Q7d, Q7h, 1-54)

345-Q.* Statistical Planning and Interpretation of Fatigue Tests. Frank A. McClintock. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 112-141.

Statistical techniques for sorting out sources of variability; estimating linear relations between variables; minimum service life, mean and standard deviation of population, both near and above endurance limits. 17 ref. (Q7k, Q7b, S12j)

346-Q.* Behavior of Metals Under Complex Static and Alternating Stresses. George Sines. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 145-169.

Nature of fatigue stresses; behavior of materials under various combinations of alternating and static stresses and effect on fatigue life. Analysis of combined stress. Stress criterion for fatigue failure, its graphical presentation and comparison with test results. 32 ref. (Q7b, Q7d, Q25k; ST, CI-n, Al-b)

347-Q.* Influence of Residual Stress on Fatigue. Daniel Rosenthal. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 170-196.

Origin of residual stresses and methods of measurement. Relief of residual stress by cyclic loading. Evidence reported in the literature concerning effect of residual stress on fatigue; predicting influence of residual stress on fatigue. (Q7b, Q25h, 3-66; ST, Al-b)

348-Q.* Techniques of Surface Stressing to Avoid Fatigue. Henry O. Fuchs. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 197-231.

Surface nature of fatigue, techniques for compressive stresses of surfaces including overloading, cold forming, hammer peening, shot peening, tumbling, surface rolling, burnishing, heat softening under stress, quenching, welding, quench hardening, carburizing, nitriding and plating. Stresses induced and effect on fatigue resistance. 46 ref. (Q7b, 3-66, 3-68, G23q; ST)

349-Q.* Fatigue of Materials at High Temperatures. Horace J. Grover. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 232-243.

Creep, stress-rupture and fatigue behavior of metals subjected to dynamic loading at elevated temperatures. Effect of stress concentrations and metallurgical changes at elevated temperatures. Combining fatigue data and creep data for use in design evaluation. 11 ref. (Q7a, Q7k, Q3m, Q3q, 1-62; ST, Al-b)

350-Q.* Operational Loads on Aircraft. R. L. McDougal. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 247-277.

Measurement of strains and accelerations in operating aircraft. Statistical analysis of data. Estimation of load spectrum of aircraft from data on atmospheric turbulence and operating conditions. 43 ref. (Q7k, T24a, 1-54)

351-Q.* Estimation of Fatigue Life With Particular Emphasis on Cumulative Damage. Milton A. Miner. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 278-289.

Predicting fatigue life of structures under varying magnitudes of load. Concept of cumulative damage; its graphical presentation and use in predicting life. Modifications of concept. Examples of aircraft dust loading and fatigue analysis. 15 ref. (Q7b, Q7e, Q7k, 3-66; Al-b, ST)

352-Q.* Notch-Sensitivity. R. E. Peterson. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 293-306.

Effect of notches on fatigue behavior, notch sensitivity of oil-quenched and tempered steels, normalized and annealed steels and Al alloys. Variation with notched radius. Design formulas for notch sensitivity. 21 ref. (Q7a, Q23s, 3-73; ST, Al-b)

353-Q.* Estimation of Fatigue Life of Welded, Riveted, and Bolted Structures. Horace J. Grover. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, 307-324.

Available data on fatigue behavior of various types of joints and connections including continuous fusion welds, riveted joints, spot welded joints, bolted joints and composite structures. Factors affecting fatigue. 63 ref. (Q7b; Al-b, ST, 7-51, 7-53, 7-54, 7-55, 7-59)

354-Q.* Detail Design for Fatigue in Aircraft Wing Structures. E. H. Spaulding. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 325-354.

Importance of design detail on fatigue life of airplanes. Load distribution, factors affecting stress concentration. 15 ref. (Q7k, T24a, 17-51; Al-b)

355-Q.* Fatigue in Rotary-Wing Aircraft. Clay C. Boswell, Jr., and R. A. Wagner. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 355-375.

Source of fatigue; determination of stress levels; fatigue test programs; examples of fatigue failures. (Q7k, T24a, T24b; Al-b, Mg-b, ST)

356-Q.* Fatigue Cracking, Fatigue Damage, and Their Detection. R. H. Christensen. Paper from "Metal Fatigue". McGraw-Hill Book Co., Inc., 1959, New York, p. 376-412.

Initiation and propagation of fatigue cracks. Effect of stress gradient on crack growth; measuring fatigue damage and structures; effect of fatigue cracks on residual strength of structures. Stress and crack area relationship for fast fracture. Techniques for crack detection including use of fatigue monitors. 18 ref. (Q7k, Q26p, Q26q, S13; Al-b)

357-Q.* (Japanese.) Effect of Mean Stress on the Flexural Fatigue Properties of Titanium Sheet Specimens With a Central Hole. Shoji Shimamura, Tetsuo Suda, Keinosuke Ooshima and Yoshitane Shindo. *Journal of Mechanical Laboratory*, v. 12, Nov. 1958, p. 177-183.

Ultimate tensile strength, flexural fatigue limit, fatigue strength reduction factor, stress concentration factor and notch sensitivity. 20 ref. (Q7, 3-66; Ti-b, 4-53)

358-Q. (Pamphlet.) Effect of Shot Peening Prior to Electroplating on the Fatigue Properties of an Alloy Steel. N. B. Brown. *Dept. of Mines and Technical Surveys, Ottawa, Canada, Mines Branch Research Report, R3*, Sept. 18, 1958, 12 p. $.25.

Fatigue strength of a modified SAE 3140 alloy steel. Eight S-N curves are given for steel with the following surface conditions: machined, shot-peened, electroplated on a machined surface, and electroplated on a shot-peened surface. Curves show that specimens shot-peened prior to electroplating with Cr, Ni and Cd have higher fatigue properties than specimens not previously peened. 4 ref. (Q7a, G23n; 8-62, AY, *Cr, Ni, Cd*)

359-Q. (Book.) Metal Fatigue. George Sines and J. L. Waisman, Editors. 415 p. 1959. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $12.50.

Fatigue failure mechanisms; analysis of load and influencing factors; fatigue in structures and machines. Papers abstracted separately. (Q7)

360-Q. (Translation—AIP.) Effect of Rate of Deformation and Relaxation on Internal Friction in Aluminum. Chen Khun-i, Bao Sen-ke and L. I. Vasil'ev. *Soviet Physics Doklady*, v. 3, Jan-Feb. 1958, p. 163-165.

Increase in plastic deformation rate leads to increase of internal friction. Relaxation at various temperatures. 27 ref. (Q22, 3-68; Al)

361-Q. (Translation—AIP.) Diagram of the Fatigue Failure of Metals. V. S. Ivanova. *Soviet Physics Doklady*, v. 3, no. 2, 1958, p. 378-381.

First, second and third fatigue periods and diagram for Armco iron and Cu. 10 ref. (Q7a, Q7b; Fe, Cu)

362-Q. (Translation—AIP.) Mechanism of Plastic Flow of Lead and Tin in Conditions of Simple Shear. V. I. Likhtman and V. S. Ostrovski. *Soviet Physics Doklady*, v. 3, no. 2, 1958, p. 406-408.

Maximum absorption effect in facilitating flow for Sn and Pb is at stresses corresponding to upper limit of region of constant viscosity. (Q24, 3-66; Sn, Pb)

363-Q. (Translation—AIP.) Investigation of the Temperature Stability of Strain Distortions and the Kinetics of the Softening of Friction Surfaces. K. V. Savitskii and M. P. Zagrebennikova. *Soviet Physics Doklady*, v. 3, no. 2, 1958, p. 411-414.

Variations in external parameters of friction result in a variation in the distribution of strain distortions according to degree of their temperature stability. (Q9p, J23, 2-61, 3-68; Cu)

364-Q. (Translation—AIP.) Some Results of an Investigation of Elastic State Limits of Plastically Drawn Ni Samples. Iu. I. Iagan and O. A. Shishmarev. *Soviet Physics Doklady*, v. 3, no. 2., 1958, p. 431-433.

Magnitudes of plastic flow on annealed Ni tubes. 6 ref. (Q21, Q24; Ni, 4-60)

365-Q. (Translation—AIP.) Brittle Fracture of Single Crystals of Zinc. V. I. Likhtman, L. A. Kochanova and L. S. Brinkhanova. *Soviet Physics Doklady*, v. 3, no. 3, 1958, p. 599-602.

Deformation and fracture in mercury melt with liquid nitrogen used as embrittling but inactive medium. 15 ref. (Q26s, Q24; Zn, 14-61)

366-Q. (Translation—AIP.) Distortion of the Crystal Structure of Copper and Its Solid Solutions on Deformation. L. N.

Guseva and A. A. Babareko. *Soviet Physics Doklady*, v. 3, no. 3, 1958, p. 643-645.

Study of influence of concentrations and dimensions of dissolved atoms on development of distorted fine structure of alloys and what influence filing has on distortion compared with rolling. 8 ref. (Q24; Cu-b, *Zn*, *Al*, 14-67)

367-Q. (Translation—BISI, no. 1093.) Observations on the Bauschinger Effect on Mild and Medium-Hard Steels. H. Hoff and G. Fischer. *Stahl und Eisen*, v. 78, Sept. 18, 1958, p. 1313-1320.

See item 1246-Q, 1958. (Q27a, 2-64, 3-66; ST)

368-Q. (Translation—BISI, no. 1104.) Use, Manufacture, and Heat Treatment of Alloy Cast Steel Rolls. Pt. 1-2. Heinz Uhlitzsch and Gerhard Radomski. *Neue Hutte*, v. 2, Nov. 1957, p. 655-664, Jan. 1958, p. 10-20.

See item 315-Q, 1958. (Q25m, J-general, W23k; ST, 5-60)

369-Q. (Translation—BISI, no. 1160.) Problem of the Formation of Longitudinal Cracks in Rail Flanges After Straightening. S. Horejs. *Hutnicke Listy*, June 1958, p. 517-526.

See item 974-Q, 1958. (Q26q, T23q; ST)

370-Q. (Translation—Brutcher, no. 4442.) Mechanical Properties of Tool Steels. Ya. B. Fridman and V. P. Konoplenko. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 2-9.

Methods for durability testing of low temper toolsteels and mechanical properties during static and cyclic loads. (Q-general; TS)

371-Q. (Translation—Brutcher, no. 4443.) High-Temperature Properties of Multi-Alloy Ferrite. A. M. Borzdyka and A. B. Merlina. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 10-16.

Characteristic steels with ferrite structure, containing Cr, W, Mo and Cb. Multiple alloy ferrite steel possess high mechanical properties at room as well as elevated temperatures. Heat stability is excellent but ferrite steel enriched with Cb loses impact strength at lowered temperatures, as well as plasticity during prolong stressing at elevated temperatures. (Q-general; 2-62; SS-d, SGA-h)

372-Q. (Translation—Brutcher, no. 4445.) Residual Stresses Set Up in Surface Hardening. V. V. Abramov. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 21-28.

Attempt to generalize and define the system of residual stress formation. Calculation of stresses in a membrane, taking into the effect of the modulus of elasticity change and coefficient of expansion thru the membrane section along the internal strain distribution. 10 ref. (Q25h, 2-64)

373-Q. (Translation—Brutcher, no. 4451.) Frictional Wear Resistance of Steel to Caprone Fiber. P. T. Basxo. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 56-57.

Wear resistance tested by mooring a caprone fiber over hardened steel. Wear resistance is proportional to the magnitude of fiber tension and the length that passes over the steel surface. (Q9; ST)

374-Q. (Translation—Brutcher, no. 4452.) Study of Boron-Alloyed Sormait-Type (Cast) Hard Metal. G. S. Kachalkin. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 58-61.

Optimum content of elements in alloy of "Sormait" type to assure a higher degree of wear resistance. 4 ref. (Q9; SS, *B*, 5)

375-Q.* Effect of Specimen Form on the Tensile Strength of Cast Iron. C. N. J. Gilbert. *British Foundryman*, v. 52, Jan. 1959, p. 28-42.

Tensile tests on specimens with substantial parallel gage length and on specimens with notches of varying severity. Results indicate a need for parallel gage length in cast iron test bars. 8 ref. (Q27a, Q27d, 1-60, 3-73; CI)

376-Q.* Mill Sampling of Ship Plate Steel. Charles L. Staugaitis. Digest from "Mill Sampling Techniques for Quality Determination of Ship Plate Steel." Report No. SSC-106, Ship Structure Committee, Jan. 31, 1958, 44 p. *Metal Progress*, v. 75, Feb. 1959, p. 152, 154, 156.

Data on the variations among plates, ingots and heats from the point of view of notch toughness characteristics, static tensile properties, ferrite grain size, chemical composition, severity and extent of segregation. (Q23s, Q27, S12h, F-general; 4-53, ST)

377-Q.* Notch Sensitivity and Directionality in Fatigue in Light Alloy Extrusions as Shown by Endurance and Progressive Loading Tests. J. McKeown. *Metallurgia*, v. 59, Jan. 1959, p. 31-38.

Progressive loading fatigue test could, with considerable saving of time, replace conventional endurance testing in assessment of such factors as notch sensitivity, changes in design and suitability of materials used in components and structures. (Q7, Q23s, 3-72; Al-b)

378-Q.* (English.) Studies on Surface Layer of Polished Metals by Means of Electron Diffraction and Electrical Contact Resistance Measurements. Masahisa Matsunaga. *University of Tokyo, Institute of Science, Report,* v. 7, March 1958, 28 p.

Surface changes due to polishing; measurement of film resistance using a graphite slider; electrical properties of the oxidized surface. 41 ref. (Q9, P15, M22g; SS, Al, Cu)

379-Q.* (Japanese.) Strain Age Embrittlement in Mild Steels. Shigeo Hasebe. *Sumitomo Metals,* v. 10, July 1958, p. 155-166.

Effect of room-temperature aging after cold working is studied by flattening, flaring and bending tests on steel pipes. Low-carbon Al-killed steels of various Al content are examined after forging, normalizing and aging by Charpy impact, impulsive and static test is achieved by adding 0.012 to about 0.0015% and 0.04 to about 0.06% Al respectively. The effect due to slow cooling from above the A_2 point is alike both for low-C killed and rimmed steel. (Q26s, 2-60, 2-61, 2-64, 3-68; CN, *Al*)

380-Q. Fracture Mechanism of Semi-Brittle Steels in Torsion. J. B. Hunt. *Journal of Mechanics and Physics of Solids,* v. 6, July 1958, p. 321-326.

With increasing twist a local plastic zone first appeared and plastic strain increased until microcracks formed at the surface. Separation at that time did not take place as the core offered too high a resistance but the stress distribution was affected. At fracture primary tensile failure appeared at the core and surface, followed by separation by shear in between. (Q1; CN)

381-Q. Effect of Environment on Creep-Rupture Properties of Metals. P. Shahinian and M. R. Achter. *Naval Research Laboratory Report,* Apr. 1958, p. 18-24.

Metals are stronger in air than in vacuum at high temperatures and low stresses but the reverse is true at low temperatures and high stresses, in that they are stronger in vacuum. Factors which modify this atmosphere effect are oxidation resistance and ductility of the material. (Q3q, 2-61, 2-66, 3-66; Ni-b)

382-Q. (Russian.) Structural Changes in Nickel-Chromium Alloys During Creep. G. Ya. Kozyrskii and V. A. Kononenko. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* Aug. 1958, p. 90-92.

Speed of creep is dependent not only on temperature and stress but also on state of deformed alloy. Speed of creep proceeds most rapidly in metastable state at low temperatures. 6 ref. (Q3, 2-61, 3-67, 3-68, Ni, Cr)

383-Q. (Russian.) Hydrogen Embrittlement of Steel Exposed to Hydrogen Sulphide. *Zhurnal Prikladnoi Khimii,* v. 31, Aug. 1958, p. 1181.

Etching with aqueous H_2S solution shows possibility of hydrogen embrittlement, due to sulphide film formation on surface of metal. 24 ref. (Q26s; ST, *H*)

384-Q.* (German.) Wear Resistant Castings With Acicular Structure. Walter Feicke and Peter Rack. *Freiberger Forschungshefte,* no. B31, 1958, p. 129-159.

Heat treatment of Mo cast iron, Cu-Mo iron and Mn iron with nodular graphite in salt baths, providing homogeneous acicular structure, hardness and wear resistance. 9 ref. (Q29n, Q9n, J2j; CI-q)

385-Q.* (German-French.) Experiences With Welded Railroad Bridges. Pt. 1. R. Becker. *Zeitschrift fur Schweisstechnik,* v. 48, Dec. 10, 1958, p. 318-322.

Material used, thickness of welded joints, prevention of accumulation of tension, failures. Requirements are steel with resistance to cohesion ruptures; influence of rolling, structure, weldability; importance of size. (Q-general, T26p, 3-66, 3-71; ST, 7-51)

386-Q.* (Japanese.) Study on Wear Resisting Properties of Deoxidized High-Grade Cast Iron. Pt. 1. Wear of Flake Graphite Cast Iron. Masao Homma and Hiroshi Meguro. *Japan Foundrymen's Society, Journal,* v. 30, Nov. 1958, p. 859-866.

Properties due to pearlitic matrix which is made resistant by deoxidation or desulphurization; flake graphite or spheroidal graphite being created, which acts as lubricant. Eutectic graphite cast iron does not have the resistivity under heavy load. (Q9; CI)

387-Q.* (Japanese.) Effect of Ferrite in the Matrix on Wear Resistance of Spheroidal

Graphite Cast Iron. Kunio Okabayasi, Seizo Saito and Fumitosi Nakamura. *Japan Foundrymen's Society, Journal*, v. 30, Nov. 1958, p. 866-873.

Tested by sliding friction, spheroidal graphite cast iron being in contact with ordinary cast iron or carbon steel with no lubrication. Pearlitic matrix has the best resistivity, and increasing amounts of ferrite reduces it. (Q9, 2-60, 3-74; CI-r)

388-Q.* (Japanese.) Investigation of Plastic Deformation of Aluminum and Aluminum-Copper (3%) Alloys by Extrusion. Yoshikazu Hosoi. *Light Metals*, v. 8, Nov. 1958, p. 11-23.

Four kinds of specimens extruded at various temperatures were studied by micrography and X-ray photographs. For 99.80% Al forged billets, at 550° C., crystalline grains are separated into small domains and slip is observed. At 325° C. slip deformation exceeds the formation of fine grain domains. (Q24, F24; Al-b, Cu)

389-Q.* (Japanese.) Properties of Titanium Welded Tubing. Hidetake Kusamichi, Toru Yukawa, Kazuo Miyamoto, Masaaki Teragaki and Ryosuke Kuramoto. *Light Metals*, v. 8, Nov. 1958, p. 74-81.

Mechanical properties and microstructure of KS-50 Ti which is welded in an inert gas chamber. Deviation of wall thickness and concentricity of the tube are very small and the tube has good appearance. Microstructure and hardness of the tube are uniform in welded and unwelded zones after cold drawing and annealing. (Q-general, M27; Ti-b, 4-60, 7-51)

390-Q.* (Russian.) Effect of the Condition of Steel Surface Upon Its Wear Resistance. P. I. Igntenko and Yu. S. Terminasov. *Vestnik Mashinostroeniya*, Dec. 1958, p. 10-12.

The main factor in wear resistance is the degree of prior cold working; however, the initial condition of the surface is a factor. (Q9n, 3-68, 3-71; ST)

391-Q.* (Russian.) Bend Tests of Forgings Used in Turbines and Turbo-Compressors. I. G. Generson. *Vestnik Mashinostroeniya*, Dec. 1958, p. 35-37.

Names of parts tested, type of steel and angle bends. (Q5, T7h; ST, 4-51)

392-Q.* (Russian.) Determination of the Degree of Local Deformation by Microhardness Tests. V. D. Lisitsyn. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1490-1494.

A more accurate functional relationship obtained between microhardness and deformation intensity. Mathematical formulas. 5 ref. (Q25, Q24, Q29q)

393-Q.* (Russian.) Parameter Methods to Evaluate Ultimate Strength of Heat Resisting Alloys. L. Ya. Liberman. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1501-1509.

Review of investigations using parameter methods to determine ultimate strength of steel. Comparative results of actual tests and those calculated by parameter methods. 17 ref. (Q27a, 1-54; ST, SGA-h)

394-Q.* (Russian.) Mechanical Properties of Uranium. G. Ya. Sergeev, V.V. Tyumova and E.M. Savitskii. *Atomnaya Energiya, Akademiya Nauk, SSSR*, v. 5, Dec. 1958, p. 618-623.

Allotropic transformations and difference in modified crystal structure of U sharply affect mechanical properties. (Q-general, N-general; U)

395-Q. (German-French.) Permissible Tensions for Steel Structures Exposed to Dynamic Stresses. A. Neumann and H. Ziethe. *Zeitschrift fur Schweisstechnik*, v. 48, Dec. 10, 1958, p. 323-329.

Standard practice for using steel ST37 in Switzerland, Germany, Austria, Soviet Union, Poland and Czechoslovakia. (Q27, S22, T26; ST)

396-Q. (Russian.) Comparison of Brinell and Meyer Scales of Hardness. P.A. Gorezko. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1496.

(Q29e)

397-Q. (Russian.) Machine to Test Metals for Friction and Impact Wear. M.P. Prishchepa, V.I. Karpov and A.F. Kolesnikov. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1512.

Machine tests metals for friction wear under dynamic load, thus reproducing actual conditions of machine elements in motion under load. (Q9p, 1-53)

398-Q. (Russian.) Machine to Test Ultimate Strength of Pipes. B.V. Zver'kov. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1514-1516.

Produces simultaneous internal static pressure and cyclic bending moment, thus simulating pipelines and boilers. (Q27a, Q5, 1-53, T26q; 4-60)

399-Q. (Swedish.) Bend Testing of Gray Cast Iron. *Gjuteriet*, v. 48, Dec. 1958, p. 195-197.

Testing method with standard test pieces. Formula for computing bending strength and directions for the casting of test pieces. (Q5, 1-54, CI-n)

400-Q. A Comparison of the Properties of Titanium-5% Aluminum-2½% Tin Alloys in the Recovered and Recrystallized Conditions. R. Haynes and G.F. Bidmead. *Institute of Metals, Journal*, v. 87, Jan. 1959, p. 136-140.

Metallographic and X-ray diffraction examination and room-temperature tensile and Izod tests on production rolled rod after annealing at 500-950° C. Specimens in stress relief and recrystallized conditions compared in short-time tensile and creep tests at 300 and 400° C. and in Wohler fatigue tests at room temperature using both notched and unnotched specimens. (Q-general, M22g, 2-64; Ti, *Al, Sn*)

401-Q.* The Damping of Quench-Aging Duralumin Vibrating at About 1 Cycle Per Second. K.J. Williams and K.M. Entwistle. *Institute of Metals, Journal*, v. 87, Jan. 1959, p. 141-145.

Damping changes during quench-aging at constant temperatures. Damping of freshly quenched specimens during heating at constant rate. Experimental evidence establishing existence of two distinct damping contributions in quench aging duralumin and suggestions on their origin. 5 ref. (Q8g, 2-61, 2-65; Al, *Cu*)

402-Q.* The Dependence of Microcreep Properties on the Development of Fatigue in Lead. A.J. Kennedy. *Institute of Metals, Journal*, v. 87, Jan. 1959, p. 145-149.

Torsional microcreep measurements on Pb wires subjected to tensile fatigue stresses. Strain amplitude of microcreep measured at different stages in fatigue life with fatigue stress superimposed and with fatigue stress absent. Activation energy of microcreep process. 19 ref. (Q3m, Q7b, 3-68, 3-70; Pb-a)

403-Q.* Fatigue of Metals Caused by a Relatively Few Cycles of High Load or Strain Amplitude. P.P. Benham. *Metallurgical Reviews*, v. 3, no. 11, 1958, p. 203-234.

Aspects of low endurance fatigue in carbon steel, alloy steel and Al alloys. Behavior under constant load or constant strain cycling. Relationships between stress-cycle and strain-cycle curves. Types of fracture at low endurance; effect of speed, stress concentration, temperature and corrosion. Changes in ductility, energy, hysteresis and other properties caused by plastic cycling. Effect of prior cycling on stress-strain curves to failure. 51 ref. (Q7b, Q7d, 3-66; Al-b, ST, SS)

404-Q.* Research on the Mechanical Properties of Metals at Liquid-Helium Temperatures. H. M Rosenberg. *Metallurgical Reviews*, v. 3, no. 12, 1958, p. 357-379.

Elastic moduli, work hardening, strength, brittle fracture, stress-strain relationships, creep, fatigue and internal friction of metals at temperatures down to 4.2° K. Fundamental mechanisms involved. 62 ref. (Q-general, 2-63)

405-Q.* Structure of Metals and the Strength of Structures. Maxwell Gensamer. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 2-18.

Brittle fracture in Zn crystals, rheotropic embrittlement, low-temperature stress-strain curves, mechanical twinning, low-temperature tensile tests, Charpy test, transition temperature and Griffith theory. 34 ref. (Q-general, Q26s, M26, 2-63; ST, Fe-b, *Ni*, Zn, 14-61)

406-Q.* Effects of Solid Solution Alloying on the Creep Rupture Strength of Alpha and Beta Titanium. L. S. Richardson and N. J. Grant. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 18-23.

Effect of Al or O in Ti structure at high temperature. Strength of hexagonal vs. bcc. phase. 6 ref. (Q3m, 2-60, 2-62; Ti-b, *Al, O*, 14-67)

407-Q.* Comparison of the Creep Rupture Properties of Nickel in Air and in Vacuum. P. Shahinian and M. R. Achter. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 37-41.

Reversal in relative strengths with variations in stress. Mechanism involving two competing processes in terms of oxidation strengthening and weakening by surface-energy reduction explains reversal. 12 ref. (Q3q, 1-73; Ni)

408-Q.* Deformation Characteristics of Certain Dilute Copper Base Solid Solution Alloys. N. G. Ainslie, R. W. Guard and W. R. Hibbard, Jr. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 42-48.

Solid solutions having equal grain sizes, no preferred crystallographic orientation, equal electron atom ratios and close initial yield strength, need not have identical

stress-strain curves at strains greater than 0.04. 15 ref. (Q25, Q24; Cu-B, *Zn, Al, Si,* 14-67)

409-Q.* Deformation Resulting From Grain Boundary Sliding. H. Brunner and N. J. Grant. *Metallurgical Society of AIME, Transactions,* v. 215, Feb. 1959, p. 48-56.

Equations relate elongation to the amount of shear taking place both along grain boundaries and in slip planes of polycrystalline aggregates during creep of an Al-Mg alloy. 17 ref. (Q24, Q3, M24f; Al-b, *Mg*)

410-Q.* Effect of Changes in Slip Direction on the Creep of Magnesium Crystals. H. Conrad. *Metallurgical Society of AIME, Transactions,* v. 215 Feb. 1959, p. 58-63.

Strain hardening, associated with creep at room temperature, investigated by shear tests proved to be anisotropic. 22 ref. (Q3m, Q24a, N7e; Mg)

411-Q.* Magnetostrictive Contribution to Endurance Life. K. Winterton. *Metallurgical Society of AIME, Transactions,* v. 215, Feb. 1959, p. 72-74.

Near saturation unidirectional magnetic field decreased the endurance of annealed Armco iron. (Q7a, P16b; Fe-a)

412-Q.* Effect of High Temperature Strain on Crack Formation and Ductility in Commercially Pure Nickel. D. Krammer and E. S. Machlin. *Metallurgical Society of AIME, Transactions,* v. 215, Feb. 1959, p. 112-114.

Low-temperature (-196° C.) ductility decreases linearly with an increase in prior high-temperature (920° C.) creep strain. Effect correlated with intercrystalline crack and void formation at 920° C. strain. Magnitude of effect as a function of notch sensitivity. 4 ref. (Q26p, Q23p, Q3n, 2-62, 2-63, 3-70, 3-68; Ni-a)

413-Q.* (Swedish.) Properties of Gray Cast Iron. *Gjuteriet,* v. 48, Dec. 1958, p. 185-190.

Strength, hardness, wear, heat resistance, corrosion, machinability and weldability of the Swedish cast irons SIS 0115, SIS 0125, SIS 0130 and SIS 0135. Effects of wall thickness and heat treatment on strength; optimum heat and surface treatments. (Q-general, R-general, G17k, K9s, 2-64, 3-73; CI)

414-Q.* Flow, Fracture and Twinning of Commercially Pure Vanadium. W. R. Clough and A. S. Pavlovic. *American Society for Metals, Transactions,* v. 52, Preprint no. 125, 1958, 36 p.

Specimens prepared directly from massive V reguli and from hot work and annealed rods were subjected to tensile tests at temperatures from -196 to +200° C., to Charpy V-notch impact test, to metallographic and X-ray diffraction examinations. Temperature of ductile to brittle transition. Relation of tensile properties to temperature. Fracture characteristics and mechanisms; mechanical twinning and existence of second phase, V_2C. 32 ref. (Q24, Q27, Q26, Q23, 2-63; V-a)

415-Q.* A Study on the Relationship Between State of Aging and Notch-Fatigue Performance of a High-Strength Aluminum Alloy. G. W. Form. *American Society for Metals, Transactions,* v. 52, Preprint no. 126, 1958, 20 p.

Fatigue tests carried out on duralumin (2014 alloy) in an axial-loading-type vibrator under a nominal stress of 28,500 psi at room temperature and -110° F. 13 ref. (Q7b, 2-65; Al-b)

416-Q.* Effect of Uranium Hydride Distribution and Recrystallization on the Tensile Properties of Uranium. H. R. Gardner and J. W. Riches. *American Society for Metals, Transactions,* v. 52, Preprint no. 127, 1958, 26 p.

Effects of hydrogen concentration, beta-U hydride formation, hydride particle size and cooling rate from recrystallization temperature on tensile properties of U over a temperature range of -20 to 200° C. 7 ref. (Q27a, N5, 2-64, 3-69; U-a)

417-Q.* Effect of Interstitial Carbon Plus Nitrogen and Precipitation Reactions on the Properties of Austenitic Cr-Mn-C-N Steels. C. M. Hsiao and E. J. Dulis. *American Society for Metals, Transactions,* v. 52, Preprint no. 128, 1958, 40 p.

Effects of interstitial solid solution elements and types of precipitation reaction on creep-rupture properties, hardness, lattice parameter, room and elevated-temperature tensile properties for steels containing 0.09 to 0.79% C, 10 to 28% Mn, 12 to 25% Cr and 0.09 to 0.84% N. 22 ref. (Q3m, Q29, Q27a, 2-60, 2-65; SS, *Cr, Mn*)

418-Q.* Effect of Deformation Prior to Transformation on the Mechanical Properties of 4340 Steel. Eric B. Kula and Joseph M.

Dhosi. *American Society for Metals, Transactions,* v. 52, Preprint no. 129, 1958, 35 p.

Change in tensile and impact properties of 4340 steel resulting from rolling in the austenitic state at 1000 and 1550° F. prior to transformation to martensite. 10 ref. (Q27a, Q6n, N8p, 3-70, 3-68; AY)

419-Q.* Historical Development of Research on the Fatigue of Materials and Structures. J. Y. Mann. *Australian Institute of Metals, Journal,* v. 3, Nov. 1958, p. 222-241.

Summary of past and present research activity devoted to effects of influencing factors, mechanical and metallurgical, theories of fatigue, testing techniques, service failures, service load measurement, crack detection. 148 ref. (Q7)

420-Q.* Metallurgical Function Stability of Arc Welded Connections in Unalloyed and Low-Alloy Structural Steels. T. M. Noren. *Jernkontorets Annaler,* v. 142, no. 11, 1958, p. 661-719.

"Functional stability" signifies the stability of welded joints and of a welded construction as a whole in relation to application and calculated lifetime. Factors influencing functional stability during the various phases of the development of a welded construction are discussed in connection with the risk of brittle fracture failure. 36 ref. (Q26s; AY, SGB-s, 7-51)

421-Q.* Determination of the Transition Temperature and the Notch Brittleness of Steels by Static Tensile Tests. C. Pfeiffer. *Jernkontorets Annaler,* v. 142, no. 11, 1958, p. 720-730.

Pressing of a very sharp notch (without subsequent tempering) gives rise to sufficient embrittlement under the notch to cause a brittle fracture to start. The temperature at which notch brittleness occurs can be determined by measuring the lateral contraction of the test bar as a function of the temperature and by calculation of the yield strength and nominal tensile strength. These values plotted against temperature give curves, which intersect at the transition temperature. 11 ref. (Q26s, Q23s, Q23r, Q27; ST)

422-Q.* Wrought Magnesium-Thorium Alloys for Elevated Temperature Applications. *Magnesium,* Feb. 1959, p. 8-9.

Tensile strength, yield strength and elongation of HM21A and HK31A alloys at temperatures ranging up to 800° F. Physical properties of alloys. (Q27a, P-general, 2-62; Mg-b, *Th,* SGA-h)

423-Q.* Vibration Damping Capacity of Magnesium Alloys. D. F. Walsh, J. W. Jensen and J. A. Rowland. *Magnesium,* Feb. 1959, p. 10-11.

Damping and mechanical property data for wrought alloy in the extruded or hot rolled condition and for heat treated alloys. (Q8g, 3-66; Mg-b)

424-Q.* Pressure Required for Transformation Twinning in Explosively Loaded Low Carbon Steel. D. R. Curran, S. Katz, J. J. Kelly, and M. E. Nicholson. *Metallurgical Society of AIME, Transactions,* v. 215, Feb. 1959, p. 151-153.

Two-dimensional oblique shock produced on surface of wedges of 1020 steel. 7 ref. (Q24b, Q24m, 3-74; CN-g)

425-Q.* Ductility in Beryllium Related to Grain Orientation and Grain Size. J. Greenspan. *Metallurgical Society of AIME, Transactions,* v. 215, Feb. 1959, p. 153-163.

Texture and fine grain size needed for high tensile elongation. Basal plane orientation function of rolling direction, reduction and temperature. 18 ref. (Q23p, M27c, 3-72, 2-59; Be)

426-Q.* (English.) Heat Resisting Steels and Alloys. *Aciers Fins & Speciaux Francais,* no. 30, Dec. 1958, p. 24-28.

Resistance of Fe-Cr and Fe-Ni-Cr alloys to oxidation and creep at elevated temperatures. Applications and maximum temperature of usefulness for various heat resisting alloy steels. (Q3m, R1h, 2-62; SS, SGA-h, Fe-b, *Cr, Ni*)

427-Q.* (German.) Tensile Strength of Patented and Cold Drawn Steel Wire. L Mankher. *Acta Technica,* v. 22, no. 3-4, 1958, p. 265-283.

Tensile strength as determined by patenting and by degree of cold deformation during drawing. Mathematical data presented to facilitate process control. 22 ref. (Q27a, J25, G4, 1-67; ST, 4-61)

428-Q.* (German.) Structural Stability of Weld Deposited Sealing Alloys Used in Steam Power Plants. K. Lobl, J. Jezek and H. Tuma. *Neue Hutte,* v. 4, Jan. 1959, p. 46-50.

Influence of the carbide-producing elements Zr, Cb, Ti and W on the structure of Ni-Fe Stellite and related alloys on Co-Cr-W base, exposed to high temperatures. 4 ref. (Q9n, 2-62, 2-60; Co-b, *Ni, Fe, Zr, Cb, Ti, W,* AD-p)

429-Q.* (German.) Fatigue Strength of Flame Cut Specimens After Weld Repair of

the Cut Edge. A. Matting, H. Wolf and H. D. Steffens. *Schweissen und Schneiden*, v. 11, Jan. 1959, p. 8-16.

Samples of low-carbon steel sheet 15 mm. thick were flame cut, and resulting grooves on the edges filled by arc welding in order to avoid stress concentration. After cycling tests weld-repaired edges were found to be of the same strength as flame cut edges without defects. 20 ref. (Q7a, G22g, K1a; CN-g, 4-53)

430-Q.* (Russian.) Melting and Deoxidizing Processes Affecting Distribution of Sulphide Inclusions in Openhearth Steel. S. I. Levin and I. P. Kazachkov. *Liteinoe Proizvodstvo*, Dec. 1958, p. 7-8.

Mechanical properties of steel as affected by iron oxide, Fe-Si, Fe-Mn and Al in the melt. (Q-general, D2c, D2d, 3-69; ST, *Al, Si, Mn*, 5-59, AD-r, 9-69)

431-Q.* (Russian) Evaluating Plasticity of Heat Resisting Alloys When Testing for Rupture. V. Z. Tseitlin. *Zavodskaya Laboratoriya*, v. 25, Jan 1959, p. 87-90.

It is more correct to determine deformation by evaluating the reduced area of the sample neck since it characterizes the degree of deformation of the most deformed part. 4 ref. (Q21, Q26, Q27a; SGA-h)

432-Q.* (Russian.) Determination of True Strength Characteristics of Plastic Metals. P. S. Sokolov. *Zavodskaya Laboratoriya* v. 25, Jan. 1959, p. 95-99.

Method of constructing true stress curves, without measuring the curvature of the neck's profile. Formulas derived enabling construction from ordinary mechanical properties of a curve of monoaxial elongation of plastic metals up to point of rupture. (Q27a, F2)

433-Q.* Effect of a Ceramic Coating on the Creep Behavior of Some High-Temperature Alloys. John R. Cuthill, Joseph C. Richmond and Nancy J. Tighe. *American Ceramic Society Bulletin*, v. 38, Jan. 15, 1959, p. 4-12.

Ceramic coating was found to markedly decrease the creep or extension in most cases but the coating appeared to have a detrimental effect at certain combinations of temperature and stress. 14 ref. (Q3, 2-61, 3-66; SS, SGA-h, 8-71)

434-Q.* Brittle Fracture. *Automobile Engineer*, v. 49, Jan. 1959, p. 8-9.

Failure of iron and mild and low-alloy steels, without measurable deformation, under relatively light load. (Q26s; Fe, CN, AY)

435-Q.* Creep, Stress-Relaxation, and Metallurgical Properties of Steels for Steam Power Plant Operating With Steam Temperatures Above 950°F. (510°C.) A. I. Smith, E. A. Jenkinson, D. J. Armstrong and M. F. Day. *Institution of Mechanical Engineers, Proceedings*, v. 171, no. 34, 1957, p. 918-942.

Long-time tests on alloy and stainless steels suitable for high-temperature service as turbine casing bolts, steam pipes, superheater tubes and turbine casings. 11 ref. (Q3, 2-60, 2-62, 2-64; AY, SS)

436-Q.* Internal Friction of Copper and Copper Alloys. Daniel N. Beshers. *Journal of Applied Physics*, v. 30, Feb. 1959, p. 252-258.

Effect of adding small amounts of Au to Cu on dislocation damping at 37 kc. in longitudinal resonance. Damping strain amplitude and time are related to temperature and composition. 23 ref. (Q22, 2-61, 2-60; Cu-b, *Au*)

437-Q.* Cast Iron Research and Development: Where the Search for Ductility Is Leading. *Mechnical World and Engineering Record*, v. 139, Jan. 1959, p. 17-18.

Notch ductility of nodular iron, properties of nodular iron at high temperatures, heat treatment of nodular iron. Notch ductility of malleable iron, rupture of gray iron, dry wear of cast iron. (Q-general, J-general, 2-62; CI-n, CI-r, CI-s, AD-p36)

438-Q. Research on Heat Resistant Alloys Strengthened at Elevated Temperatures by Incorporation of Fine Particulate Substances. Sintercast Corp. of America. *U. S. Office of Technical Services*, PB 131846, Dec. 1956, 26 p. $1.

Production of materials of high density consisting of an 80-20 Ni-Cr alloy matrix containing uniform dispersions of hard phase addition agents. At 1500°F. the stress-rupture properties of this matrix material were increased considerably. The most favorable results were obtained with additions of Ti carbide and Linde B alumina. (Q3q, 2-62; Ni-b, Cr, *Ti, C, Al, O*)

439-Q.* (German.) Testing Ductility of Sheet Metals. W. Engelhardt. *Fertigungstechnik*, v. 8, Dec. 1958, p. 530-537.

Reproducibility of deep drawing tests requires special equipment. Comparative accuracy of various types of equipment. 23 ref. (Q23p, 1-54; 4-53)

440-Q.* (German.) Influence of Impurities on the Properties of Aluminum. P. Brenner. *Metall*, v. 12, Dec. 1958, p. 1075-1084.

Influence of Fe, Si, Ti, Cu, Zn and trace impurities of Na, Ga, Ca, Ba, Sn, K, Li, P, S, C and O on crystal structure, texture, electrical conductivity, resistance to corrosion, Brinell hardness, ultimate strength elongation of pure Al and Al alloys. 58 ref. (Q-general, P-general, M26, 3-69; A1-a, A1-b, *Fe, Si, Ti, Cu, Zn, Na, Ga, Ca, Ba, Sn, K, Li, P, S, C, O*)

441-Q.* (German.) Tabulated Properties of Bearing Metals. R. Kuhnel. *Metall*, v. 12, Dec. 1958, p. 1101-1107.

Physical and mechanical properties of white metals, Cd alloys, Zn alloys, Al alloys, Pb bronze, Sn bronze, special brass, Al bronze. (Q-general, P-general; Al-b, Cd-b, Cu-b, Cu-n, Cu-s, Pb-b, Zn-b, SGA-c)

442-Q. Measuring Machine Tool Wear. Eli I. Goodman. *Atomic World*, v. 10, Jan. 1959, p. 28-30.

The use of radioactivity gives a sensitive and rapid method for the determination of machine tool erosion under different conditions of cutting speed, feed rate and lubrication. 5 ref. (Q9, W25, 1-59)

443-Q. Compression and the Alpha-Beta Phase Transition of Plutonium. P. W. Bridgeman. *Journal of Applied Physics*, v. 30, Feb. 1959, p. 214-217.

(Q24m, N6p, 3-74; Pu)

444-Q. Magnesium Alloy Properties: Titanium Alloy Properties. *Magnesium*, Feb. 1959, 2 p.

(Q-general; Mg-b, Ti-b)

445-Q. (Japanese.) Adhesiveness and Thermal Shock Properties of Flame Sprayed Porcelain Enamel. Hideo Nagasaka and Takeshi Takei. *Metal Finishing Society of Japan, Journal*, v. 9, Oct. 1958, p. 365-370.

Internal stress is larger than that found in ordinary baked coating. This defect is avoided by spraying at high temperature, 650-750° C., so that a moderately thick intermediate layer is formed between the base and the coating. Adhesion and shock resistance are comparable to ordinary baked coatings. (Q10a, Q25p, L27; 8-71)

446-Q. Internal Stresses and Fatigue in Metals. A. M. Freudenthal. *Physics Today*, v. 12, Feb. 1959, p. 16-19.

Report of the symposium held at the General Motors Laboratories, Sept. 3-5, 1958. (Q7, Q25h)

447-Q. Evaluating Tool Life. D. Peckner and H. Ginsburg. *Tool Engineer*, v. 42, Mar. 1959, p. 75-79.

Principles of statistical analysis illustrated in a study on form cutters used to machine slots. (Q9, T6n; TS)

448-Q. (Russian.) Estimation of Dislodged Grain Boundary in General Deformation During Creep. V. M. Rosenberg. *Zavodskaya Laboratoriya*, v. 25, Jan. 1959, p. 53-57.

8 ref. (Q24, M27f, Q3)

449-Q. (Russian.) Estimating Duration of Relaxation Stability at High Temperature. E. A. Khein. *Zavodskaya Laboratoriya*, v. 25, Jan. 1959, p. 83-87.

Methods for extrapolation of relaxation curves. (Q3; ST; Cr-b, Ni-b)

450-Q.* Probing the Causes of Piston-Ring Wear by the Radiotracer Technique. Richard Abowd, Jr. *Society of Automotive Engineers*, Preprint no. 8U, Jan. 1959, 15 p.

Continuous pre-ignition was found to cause extremely high adhesive wear of top piston rings. 33 ref. (Q9, T21b, 1-59; Fe, Cr)

451-Q.* (German.) Hot Strength of Compacts. I. N. Franzewitsch. *Neue Hutte*, v. 3, Dec. 1958, p. 732-739.

Hot strength, resistance to thermal shock and oxidation, are dependent on the strength of the atomic binding forces in the crystal lattice. Hot strength of metals, metal carbides and bromides. 12 ref. (Q27a, Q10a, M25h, R1h, 2-62; 6-72, Fe-b, *Cu*)

452-Q.* (German.) Behavior of Cast Iron Guideways Influenced by the Treatment and Condition of Surface. K. Muller. *Werkstatt und Betrieb*, v. 92, Jan. 1959, p. 17-26.

Mechanism of friction and attrition wear. Friction and wear measurements on various materials selected as matching pairs, submitted to different methods of heat treatment. 41 ref. (Q9n, Q9p, 2-64; CI)

453-Q.* (Spanish.) Determination of Residual Stresses in Metals. Pt. 2. Jose M. Sistiaga. *Revista de Ciencia Aplicada*, v. 12, Nov-Dec. 1958, p. 496-507.

Quantitative methods of determination of stress in plane elements. Stresses in

electrodeposits, disks and rings. Semi-destructive methods; X-ray diffraction methods; determination of tri-axial stresses. 115 ref. (Q25h, 1-54, F2, G25)

454-Q.* Metallographic Changes Associated With Fatigue Deformation in the Interior of Aged Ternary Aluminum-Zinc-Magnesium Alloys. I. J. Polmear and I. F. Bainbridge. *Australian Defense Scientific Service Aeronautical Research Laboratories, Report, ARL/MET 31,* Oct. 1958, 34 p.

With alloys in which the Zn:Mg ratios were high the fatigue process was essentially a grain-boundary phenomenon and cracking was completely intercrystalline. Little or no evidence of deformation was found associated with the fatigue process in alloys with a low Zn:Mg ratio. This is attributed to the relatively high Mg content. These alloys had the best fatigue properties. 29 ref. (Q7, M27f, Q24a, 2-60; Al-b, *Zn, Mg,* 9-72)

455-Q.* Creep Properties of Austenitic Nickel-Chromium Steels Containing Niobium. W. H. Bailey, M. G. Gemmill, H. W. Kirkby, J. D. Murrary, E. A. Jenkinson and A. I. Smith. *Institution of Mechanical Engineers, Proceedings,* v. 171, no. 34, 1957, p. 911-917.

Compilation of data on rupture and 1% plastic strain. Recommendation for the determination of stresses in steam pipe service. (Q3m; SS, *Ni, Cr,* 4-60)

456-Q.* Embrittlement of Alloy Steels. *Mechanical World and Engineering Record,* v. 139, Feb. 1959, p. 61-62.

Types of embrittlement, causes, suggested remedies. (Q26s, 2-60, AY)

457-Q.* Radioisotope Study of the Effect of Surface Conditions During Wear of Tungsten Carbide. J. Golden and G. W. Rowe. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 343-361.

Wear of W carbide sliders which were activated to produce predominantly W^{187} Active fragments are detached by the sliding process and can be quantitatively assessed by a scintillation counter or by autoradiography. 5 ref. (Q29n; 1-59; Cu, W, 6-69)

458-Q.* On the Structure and Wear Resistance of Case-Hardened Steel. L. S. Palatnik, I. M. Ljubarsky and A. P. Ljubchenko. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 375-387.

Wear testing of gears after heat treatment under various conditions. Besides carbon diffusion, the case-hardening process involves a "back" diffusion of metal atoms to the surface of the specimen resulting in an elevated vacancy concentration in the crystal lattice. 8 ref. (Q9r, M27, J28, T7a, 1-59; ST)

459-Q. The Elevated Temperature Characteristics of Internally Oxidized Titanium-Cerium Alloys. R. H. Hiltz, Jr. Watertown Arsenal. *U. S. Office of Technical Services,* PB 131788, n.d., 15 p. $.50.

Solid solution Ti-Ce alloys cold rolled to 0.010-in. thickness and annealed were internally oxidized to produce a fine dispersion of CeO_2 in the Ti matrix. An improvement in strength was noted over that of pure Ti. (Q3m, R2s, 2-62, 2-64, 3-68; Ti-b, Ce)

460-Q.* (French.) Improvement of Part Life by Hardening and Prestressing of Necked Areas. J. Pomey, J. P. Georges and A. Royez. *Revue de Metallurgie,* v. 56, Jan. 1959, p. 2-10.

Service life of machine components is limited by notch effect caused by changes in diameter. Life can be lengthened appreciably by appropriate design and local mechanical and heat treatments which set up residual compressive stresses in zones subject to notch effect. Effects of different types of heat treatment and mechanical working on the fatigue limit of specimens of steel and on necked components such as crankshafts. (Q7, G23q, T7, 2-64; ST)

461-Q.* (French.) Relation Between the Distance of an Inclusion From the Surface and Its Influence on Fatigue Cracking. H. de Leiris and E. Frappier. *Revue de Metallurgie,* v. 56, Jan. 1959, p. 11-24.

Fatigue cracks in steel appear to start from inclusions located just below the surface itself. Phenomenon was investigated by a photoelastic study of the influence of the distance between a circular hole in a steel plate and the edge of the plate on concentration of stresses around hole. In a certain area greater stresses are, in fact, found around hole than around a circular notch at edge of plate. 11 ref. (Q26, Q7; ST, 9-69)

462-Q.* (French.) Fatigue Micromachine for Tension-Compression Tests at 92,000 Cycles Per Second. G. F. Girard and G. Vidal. *Revue de Metallurgie,* v. 56, Jan. 1959, p. 25-39.

Vibrating system consisting of piezoelectric exciter and amplifiers producing alternate stresses capable of causing specimen rupture. Only alloys with low damping capacity can be broken by this machine. 16 ref. (Q7, 1-53)

463-Q.* (French.) Creep of Hard, Prestressed Steels in the So-Called "Ordinary" Temperature Range. Influence of Temperature and of Variations in Stress. Robert de Strycker. *Revue de Metallurgie*, v. 56, Jan. 1959, p. 49-54.

Study of steel wire in various heat treated conditions. Stress variations at normal temperature do not greatly influence creep during short periods of time. Influence of temperature is significant, but not the same for all varieties of hard steel. 6 ref. (Q3, 2-61, 2-64, 3-66; ST, 4-61)

464-Q.* (French.) The Problem of the Ductility of Beryllium and Its Use in Reactors. G. C. Ellis. *Revue de Metallurgie*, v. 56, Jan. 1959, p. 75-82.

Lack of ductility of Be causes fabrication and joining difficulties and results in unfavorable properties for reactor use. Pure Be has not yet been produced, and embrittlement apparently results from impurities in form of interstitial atoms. Ductility might be improved by control of grain structure and orientation during fabrication, or by improvement in purity. (Q23p, T11, K-general, 3-69, 3-72; Be, 17-57)

465-Q.* (French.) Contribution to the Physical Study of Fatigue Damage. M. Weisz. *Revue de Metallurgie*, v. 56, Jan. 1959, p. 83-105.

Influence of prior damage on average fatigue limit of steels. Influence of damage on low-temperature rupture properties. Evolution during damage of energy released per cycle and per unit of volume, and of maximum stress at deformation; relationship to damage. 22 ref. (Q7, Q26, Q24; ST)

466-Q.* Crystals That Bend. *Advanced Materials Technology*, v. 1, Dec. 1958, p. 2-3.

Fused MgO as ductile ceramic refractory. Applications include crucibles where low contamination is needed and in missiles. (Q5g, Q23p; Mg-b, 17-57, 6-70)

467-Q.* Test Bar and Casting Properties. W. J. Reichenecker. *Foundry*, v. 87, Mar. 1959, p. 64-68.

Minimum values for separately cast test bar properties are shown along with average values in relation to section size for aluminum bronze, tin bronze and an Al alloy. (Q-general, 1-60; Al-b, Sn, Cu-s, 5-60)

468-Q. High-Temperature Mechanical Properties of Hastelloy B and Hastelloy W. C. R. Kennedy and D. A. Douglas. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission, ORNL-2402*, Nov. 28, 1958, 81 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.25.

Both alloys exhibit a severe loss of hot ductility at temperatures where the beta transformation occurs. The change in composition found in Hastelloy W results in a suppression of the beta and gamma transformation. (Q-general, N-general, 2-62; Ni-b)

469-Q. (Russian.) Study of Cracks in Cast Steel Anvils. N. I. Kon, G. A. Maksimenko and P. G. Novikov. *Liteinoe Proizvodstvo*, Jan. 1959, p. 44-46.

Following isothermal annealing vertically distributed cracks were formed as a result of thermal pressures in the cast block during heat treatment. (Q26q, Q22c; 9-72, ST, 5-60)

470-Q.* Steels' Fatigue Strength Loss Linked to Retained Austenite. P. M. Unterweiser. *Iron Age* v. 183, Mar. 19, 1959, p. 115-118.

Under severe stress, retained austenite transforms into untempered martensite, causing microcracks. Rotating beam fatigue tests on SAE 4340, two low-alloy toolsteels, and SAE 52100 after various heat treatments, and refrigeration. (Q24m, Q7, N8n; ST)

471-Q.* Six Precautions in Using High Strength Steels. Edward A. Loria. *Materials in Design Engineering*, v. 49, Feb. 1959, p. 90-93.

Limitations in tensile properties, fatigue and stress-rupture properties of 422, 218, 56, 17-7 PH, PH 15-7 Mo, AM 350, AM 355, HNM and A-286 steels. (Q27, Q3, Q7; SS)

472-Q.* AM350 and AM355—Properties and Heat Treatment. R. A. Lula. *Metal Progress*, v. 75, Mar. 1959, p. 116-120.

Two new high-strength stainless steels have similar compositions but different properties. Chromium and carbon are adjusted so that one grade contains delta

ferrite while the other is completely martensitic. Both steels are readily formed when annealed; heat treatment imparts high strength with good ductility at room and elevated temperatures. (Q-general, 2-62; SS)

473-Q.* PH15-7 Mo: More Strength at Elevated Temperatures. M. W. Marshall and Harry Tanczyn. *Metal Progress,* v. 75, Mar. 1959, p. 121-125.

Addition of 2% Mo to 17-7 Ph greatly enhances the mechanical properties of the original stainless steel. The new stainless, known as PH 15-7 Mo, can withstand up to 1000° F. in jet airframes and missiles. (Q-general, 2-62, 2-60; SS, *Mo*)

474-Q.* Processing Variables and M-252 Properties. R. G. Stuligross, J. Luchok and D. S. Chambers. Digest from paper presented at A.I.M.E. Meeting, Feb. 20, 1958. *Metal Progress,* v. 75, Mar. 1959, p. 170, 172, 174.

Finish rolling temperatures, solution temperatures and boron content influence the grain size and mechanical properties of M-252. (Q-general, M27c, 2-60, 2-61, 2-64, 3-68; Ni-b, *B*)

475-Q.* Hardness Testing. *Metal Treatment and Drop Forging,* v. 26, Feb. 1959, p. 60-62.

Comparison between Rockwell, Brinell, Vickers and Shore rebound tests. Possibilities for achieving comparability of measured hardness values on the basis of these hardness testing methods. (Q29e)

476-Q.* Metal Fatigue. N. Thompson and N. J. Wadsworth. *Philosophical Magazine Supplement, Advances in Physics,* v. 7, Jan. 1958, p. 72-170 + 13 plates.

Crack initiation, crack growth, relation of slip to fatigue cracking; temperature dependence of fatigue hardening; motion of dislocations. 140 ref. (Q7, Q26a, M26b)

477-Q.* Residual Stresses Resulting From the Forming of High Strength Aluminum Alloys. G. A. Hawkes. *Royal Aeronautical Society, Journal,* v. 63, Feb. 1959, p. 90-94.

Apart from the degree of straining, the residual stresses are affected by the heat treatment (cold or hot quench) and the amount (if any) of controlled stretching that the alloy receives between solution treatment and precipitation. (Q25h, 2-64, 3-68; Al-b)

478-Q.* Hardness Testing of Titanium Sponge: Equipment and Procedure. D. H. Baker, Jr. *U. S. Bureau of Mines, Report of Investigations,* no. 5440, 1959, 18 p.

Methods used in preparing test samples for chemical analysis and hardness testing, method of melting and surfacing test ingots, technique of reading Brinell hardness impressions. (Q29, 1-52, Ti, 6-74)

479-Q.* Surface Damage Caused by Polyvinyl Chloride Sliding on Steel. D. I. James. *Wear,* v. 2, Feb. 1959, p. 183-194.

Various types of debris and surface damage encountered during friction experiments. The most prominent feature is the formation of rolls which lie at right angles to the direction of motion. A critical temperature exists below which rolls do not form. Above this temperature rolls form very freely and frequently the coefficient of friction falls. (Q9p; ST)

480-Q.* The Interactions of Wear Debris With Fatty Additives in Lubrication. Yasukatsu Tamai. *Wear,* v. 2, Feb. 1959, p. 228-236.

Interaction between the worn oxide debris of rubbing steel and certain fatty additives in hydrocarbon lubricants. The coefficient of friction and the electrical contact resistance were measured simultaneously, and the latter found to be very sensitive to the presence of wear debris between the sliding surfaces. The influence of smooth and damaged surfaces and of various surrounding atmospheres was compared experimentally. 11 ref. (Q9; ST, NM-h)

481-Q.* (French.) Behavior of Siliconated and Hypersiliconated Al Alloys Under Thermal Stress. *Revue de l'Aluminium,* v. 36, Jan. 1959, p. 69.

Eutectic and hypereutectic alloys of Al-Si, containing 12.73 to 20.22% Si, 1.11 to 4.87% Cu, 0.85 to 3.79% Ni and 0.80 to 1.01% Mg subjected to temperature changes from room temperature up to 200° C. to determine resistance to fatigue. (Q7; Al-b, *Si, Cu, Ni,* Mg)

482-Q.* (German.) Structure and Tensile Strength of Iron Whiskers. H. Weik. *Metall,* v. 13, Feb. 1959, p. 114-119.

Tensile strength testing; surface examination; whisker cross sections; measurement of Ni plated whiskers. 29 ref. (Q27, M26b; 14-61, Fe)

483-Q.* (Russian.) Mechanical Properties of Welded and Soldered Butt Joints of Copper and Copper-Nickel Alloys. V. P. Abramovich. *Svarochnoe Proizvodstvo,* Feb. 1959, p. 31-33.

Tensile strength of Cu and Cu-Ni alloy depends on the quality of the metal surface. Tensile strength of machined welds of Cu-Ni alloys is about 8% lower than machined base metal but 5% higher than nonmachined base metal. Butt soldered joints of Cu fail on static and fatigue testing at small stresses. (Q27a, Q7; Cu-b, *Ni,* 7-51, 7-52)

484-Q. (Pamphlet.) Role of Molybdenum in Abrasion-Resistant Materials. 36 p. 1959. Climax Molybdenum Co., 500 Fifth Ave., New York 36, N. Y. Free.

Types of wear, examples of gouging abrasion, grinding or high-stress abrasion, and scratching or low-stress abrasion in mining and mineral benefication. Performance of various wear resistant alloys. Production, treatment and properties of 12% Mn, 2% Mo alloy steel; 7% Cr, 1% Mo steel, 15% Cr, 3% Mo high-alloy iron and 3% Ni, 2% Cr, 1% Mo alloy iron. (Q9n, T28, W12, W15, 17-57; AY, *Mn, Mo, Cr, Ni,* SS, CI, SGA-m)

485-Q. (Book.) Creep of Engineering Materials. Iain Finnie and William R. Heller. 341 p. 1959. McGraw-Hill Book Co., 330 W. 42nd St., New York 36, N. Y. $11.50.

Creep testing and measurement of creep variables such as temperature, strain and load; creep of nonmetallic materials; mechanisms of creep and behavior of specific metals. Stress analysis under creep conditions for one strain variable for steady state multi-axial stress and for nonsteady state multi-axial stress; choice of design stress; specific design applications. 500 ref. (Q3, Q24, Q25, 17-51; CN, AY, SS, Ni-b, Al-b, Mg-b, Cu-b, Ti-b, Zr-b)

486-Q. (Translation—AIP.) X-Ray Diffraction Study of the Structural Distortion of Metals Under Static and Dynamic Compression at Room Temperature and Low Temperature. Iu. S. Terminasov and V. F. Mindukshev. *Soviet Physics, Crystallography,* v. 2, no. 4, 1958, p. 510-514.

The deformation of metals at low temperatures produces a considerable reduction in the effect of thermal rest. With deformation in low-temperature conditions, there is a more pronounced fragmentation of the crystalline blocks and higher crystallite stresses in comparison with the deformation of metals at room temperature. 15 ref. (Q24, 2-61, 3-66; Cu, Al-b, 9-74)

487-Q. (Translation—BISI no. 808.) Influence of Arsenic on the Properties of Steel. F. Benes. *Hutnicke Listy,* v. 12, no. 1, 1957, p. 85-96.

See item 1282-Q, 1958. (Q-general, 2-60; AY, *As*)

488-Q. (Translation—BISI no. 825.) Study of Internal Friction in Gamma and Alpha Phases of High Chromium Steel. V. Piguzov. *Doklady Adademii Nauk SSSR,* v. 112, 1957, p. 636-639.

See item 1217-Q, 1958, (Q22; AY, *Cr*)

489-Q. (Translation—BISI no. 842.) Behavior of Heat-Resisting Steels During Creep Testing at 500-700° C. Pt. 4. Results of Long-Time Creep Tests on Ferritic and Austenitic Steels. Andre Constant. *Archiv fur das Eisenhuttenwesen,* v. 28, Nov. 1957, p. 695-715.

See item 408-Q, 1958. (Q3, 2-62; ST)

490-Q. (Translation—BISI no. 1034.) Development of Thick-Walled Steel Castings With High Mechanical Properties. Hans Buhler. *Giesserei,* v. 45, Feb. 1958, p. 87-92.

See item 366-Q, 1958. (Q23s, Q23b, 3-71; AY, *Cr*)

491-Q. (Translation—Brutcher no. 4453.) Effect of Ingot Weight Upon Quality of Structural Steels. M. I. Kolosov. *Stal',* v. 18, May 1958, p. 411-414.

See item 764-Q, 1958. (Q-general, M28, AY)

492-Q. (Translation—Brutcher no. 4475.) High-Strength Austenitic Steels. A. P. Gulyaev, C. V. Lepnev and Ya, M. Potak. *Metallovedenie i Termicheskaya Obrabotka Metallov,* Jan. 1959, p. 10-15.

Transition steels possess singular combinations of mechanical properties not encountered in other types of steels. Mechanical properties of transition steels depend mainly upon the capacity of the austenite to be converted into martensite during deformation, and on their rupture resistance. 4 ref. (Q3m, Q24m, 2-62; SS-e)

493-Q.* Properties of Extruded Alloys. Table 7. Comparative Properties of Extrudable Copper-Base Alloys. *Precision Metal Molding,* v. 17, Mar. 1959, p. 36.

Mechanical properties of pure Cu and 17 alloys. (Q-general; 4-58, Cu-b)

494-Q.* (Russian.) Reversible Temper Brittleness Affected by the Temperature of Re-Austenitization. B. Rotenshtein and N. Dregan. *Revue de Metallurgie (Bucharest)*, v. 3, no. 3, 1958, p. 5-31.

The brittleness observed after tempering (with slow cooling) following a prior tempering of a hardened steel with rapid cooling is influenced by the temperature of the second austenitization. 22 ref. (Q26s, N8; AY)

495-Q.* Effects of High Strain Rates and Rapid Heating on the Tensile Properties of Titanium Alloys. F. R. Schwartzberg. *Light Metal Age*, v. 17, Feb. 1959, p. 11-12.

Increasing strain causes an increase in strength, most pronounced at high temperatures, a general decrease in ductility and no appreciable change in modulus of elasticity. Effect of increasing temperature decreases strength and elasticity. 7 ref. (Q27a, Q23p, Q21a, 2-60, 2-61, 3-66; Ti-b)

496-Q.* Fatigue Life as Influenced by Short Periods of Overstress. G. M. Sinclair and H. T. Corten. *University of Illinois (Office of Naval Research)*, T. & A.M. Report no. 85, June 1955, 19 p.

Application of a 50,000 psi. alternating stress for as little as 100 cycles out of every 10,000 cycles, seriously reduces the mean fatigue life of the material at a test stress of 30,000 psi. 6 ref. (Q7b, 3-66; Al-b)

497-Q.* Shape as a Factor in Flexural Fatigue Strength. H. T. Corten and T. J. Dolan. *University of Illinois (Office of Naval Research)*, T. & A. M. Report no. 84, May 1955, 22 p.

Sharp edges decreased the fatigue strength approximately 10% as compared to $\frac{1}{8}$-in. radius rounded edges, and the fatigue strength decreased approximately as the logarithm of the area of material exposed to peak stress. 12 ref. (Q7a, 3-73; Al-b)

498-Q.* Investigation of the Behavior of Materials Under Repeated Stress. T. J. Dolan. *University of Illinois (Office of Naval Research)*, T. & A. M. Report no. 89, June 1955, 32 p.

Influence of size and shape, stress, amplitude, structure, prior plastic deformation, and strain aging. (Q7, 3-66)

499-Q. Theory of High Temperature Deformation of Metals. Gunther Schoeck. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services Washington 25, D. C., p. 3-21.

Processes which occur during creep and which contribute to the deformation are crystallographic slip, subgrain formation, grain-boundary flow and diffusion of vacancies. Equations are formulated to explain how the movement of dislocations is controlled by a thermally activated process. 10 ref. (Q3, Q24a, M26b, 2-62)

500-Q. A Survey of Recent Results on Experimental Determinations of Activation Energies for Creep. John E. Dorn. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 30-68.

Typical creep curve for high-purity Al at constant stress with an initial plastic strain that is obtained immediately upon stressing reveals three different time-dependent ranges of creep. Over the primary stage creep rate decreases with increasing time or strain as a result of the production of a more creep resistant substructure. Rate of recovery in the secondary stage equals the rate of strengthening leading to a steady state secondary creep rate, while over the tertiary range creep rate increases as a result of microfracturing which finally terminates in rupture. 51 ref. (Q3, 3-67; Al-a)

501-Q. The Relation of Microstructure and High Temperature Strength. A Synopsis. Ray W. Guard. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 90-104.

Bend tests on ternary Ni-base alloys reveal that ductility is highest if the compound is finely dispersed and the matrix is continuous; more compound can be present if there are pro-eutectic particles of solid solution; "strength" of alloys containing large volumes of intermetallic compound is limited by the ductility. Optimum strength is obtained from a fine dispersion of intermetallic compound in a solid solution matrix. (Q5g, M27, 2-62; Ni-b, 14-67)

502-Q. Tensile Properties of Some Structural Sheet Materials Under Rapid-Heating Conditions. George J. Heimerl. Paper from "High Strength Materials, Their

Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington, 25, D.C., p. 112-145.

Materials were heated to failure at temperature rates from 0.2 to 100° F. per sec. under constant load conditions. Yield and rupture stresses obtained under rapid-heating conditions are compared with the results of conventional elevated-temperature tensile tests. Relation between rapid-heating tests, short-time creep tests and conventional creep tests. 10 ref. (Q27, Q3, 2-62; SGB-s; 4-53)

503-Q. Mechanical Properties of Structural Materials Under Conditions of Rapid Heating and Rapid Loading. J. R. Kattus and J. B. Preston. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 146-172.

Strength of metals tends to increase with increasing heating rates under constant load and with increasing loading rates. Data for short-time tensile, high heating-rate and short-time creep tests. (Q3, Q27; SGB-s)

504-Q. Thermal Fatigue of Ductile Materials. Francis J. Clauss. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 174-192.

Effect of the cyclic temperature variables—maximum cycle temperature, temperature difference and time of holding at the maximum cycle temperature on the thermal fatigue life; extent of changes in the stress-rupture strength and ductility caused by varying amounts and conditions of thermal fatigue prior to fracture; experimental observations on specimens of S-816 and Inconel 550 alloys heated and cooled through various temperature cycles. (Q7j, Q3q; Ni-b, SS)

505-Q. Plastic Strain Absorption as a Criterion for High Temperature Design. C. R. Kennedy. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 193-218.

Isothermal strain-cycle properties for Inconel at elevated temperatures. Variables studied in relation to strain-cycling criteria were temperature, grain size, specimen geometry and fabrication history. Total plastic strain per cycle can be used to predict the number of cycles to failure. (Q7e, Q25p, 2-62; Ni-b)

506-Q. Strain Cycling and Thermal Stress Fatigue. L. F. Coffin, Jr. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 219-256.

Relationship between the behavior of materials to cyclic strain-constant temperature condition vs. cyclic strain-cyclic temperature conditions. The two modes of testing are compared by examining the effects of cyclic temperature on materials in the absence of external stress. Various effects exist, depending on the particular nature of the structure, including change of shape, as in U, or crystalline distortion as in certain other noncubic metals. 12 ref. (Q7j, Q3q, 3-73)

507-Q. An Approach to Design Under Conditions of Relaxing Complex Stress Concentrations. Howard R. Voorhees. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 263-280.

Investigation of variables affecting rupture-life response to a stress concentration indicates that all influences are exerted through yield, creep, rupture and ductility properties or through an effect on the stability of these properties during service or test. Experimental results are given for relative rupture life of notched and unnotched specimens of aircraft engine alloys. (Q3, Q24h, 17-51; SGA-h)

508-Q. A Survey of the Effects on Nonsteady Load and Temperature Conditions on the Creep of Metals. S. S. Manson and W. F. Brown, Jr. Paper from "High Strength Materials, Their Strength Potential and Limitations". PB 131834, 1958. U. S. Office of Technical Services, Washington 25, D.C., p. 281-338.

Material behavior under nonsteady creep conditions is complex and dependent on anelastic effects on the creep flow, loss in strain hardening, changes in the microstructure, thermal stresses arising from nonuniform heating of the body, intergranular oxidation or corrosion and thermally induced internal distortions. 38 ref. (Q3, Q25p)

509-Q.* (Japanese.) Dynamic Strength of Steel Wire. Pt. 1. Fatigue Strength Under Pulsating Plane Bending. Shigeki Aoki and

Kitaro Iijima. *Nagoya Government Industrial Research Institute, Reports,* v. 8, Feb. 1959, p. 69-73.

Dynamic strengths of steel wires studied by a fatigue testing machine of buckling type. Several experiments on pulsating plane bending fatigue strengths of drawn steel wires. Static stress under buckling based on the measurement of strain at the middle point of a wire is nearly equal to the theoretical value calculated for a wire fixed at both ends. 4 ref. (Q7a, 1-54; ST, 4-61)

510-Q.* (Rumanian.) Effect of Heat Treatment on the Susceptibility of Manganese Alloy Construction Steels to Reversible Temper Brittleness. N. Dragan and B. Rotenstein. *Studii si Cercetari de Metalurgie,* v. 3, no. 4, 1958, p. 465-476.

After holding at 500, 550 and 700° C. the susceptibility decreased when the holding time was prolonged, while it increased with the holding time at 450° C. 14 ref. (Q26s, 2-64; AY, *Mn*)

511-Q.* (Russian.) Fatigue Strength of Electroslag Welds in Large Steel Castings. I. V. Kudryabtsev and N. E. Naumchenkov. *Svarochnoe Proizvodstvo,* Jan. 1959, p. 4-9.

Resistance to rupture of electroslag welded joints under fluctuating loads, in medium-carbon cast steel 35L. Ultimate strength of welded joints is not lower than the corresponding value of the base steel. 7 ref. (Q7a; CN-p, 7-51)

512-Q.* (Russian.) Properties of Type 1KH15N25M5 Austenite Welds at High Temperatures. V. A. Toropov. *Svarochnoe Proizvodstvo,* Jan. 1959, p. 12-16.

Electrodes with a basic composition of 1KH15N25M5, (Ni-Mo-Cr) assure stable properties and structure for prolonged service at 650° C. 7 ref. (Q-general, 2-62, W29h; SS-e, *Ni, Mo, Cr,* 7-51)

513-Q.* Recent Developments in Centrispinning High-Alloy Steels and Other Materials. A. E. Thornton. *British Foundryman,* v. 52, Feb. 1959, p. 80-90.

Mechanical properties and metallurgical characteristics of a range of heavy-duty components produced by centrifugal casting process in Cr steels, Cr-Ni steels and Ni-base alloys. (Q27a; SS, Ni-b, 5-65)

514-Q.* Wire Fatigue Machine for Investigation of the Influence of Complex Stress Histories. H. T. Corten and G. M. Sinclair. *University of Illinois (Office of Naval Research),* T. & A. M. Report. no. 81, Apr. 1955, 27 p.

Equipment for investigation of fatigue life for complex stress histories, particularly those consisting of repeated blocks of cycles. Results for constant stress amplitude tests of steel wire. 6 ref. (Q7b, Q7c; ST, 4-61, 1-52)

515-Q.* Why and How to Use Malleable Iron Castings. Hans J. Heine. *Modern Castings,* v. 35, Mar. 1959, p. 27-29.

Mechanical properties. 8 ref. (Q-general; CI-s, 17-57)

516-Q.* Why and How to Use Nonferrous Castings. Herbert F. Scobie. *Modern Castings,* v. 35, Mar. 1959, p. 36-38.

Mechanical properties of Al, Cu, Mg, and Zn castings. (Q-general; Al-b, Cu-b, Mg-b, Ni-b, Zn-b, 5-60)

517-Q.* Ductile Iron-As-Cast and Annealed Tensile Properties. A. H. Rauch, J. B. Peck and E. M. McCullough. *Modern Castings,* v. 35, Mar. 1959, p. 111-116.

Accurate prediction of tensile properties requires knowledge of both hardness and composition. 7 ref. (Q27, Q29n, 2-60; CI-r)

518-Q.* Properties of Zircaloy-2. L. S. Rubenstein. *Nucleonics,* v. 17, Mar. 1959, p. 72-76.

Corrosion, mechanical and physical properties. 18 ref. (Q-general, P-general, R-general; Zr-b)

519-Q.* Factors Influencing Fretting Fatigue Strength. H. T. Corten. *University of Illinois (Office of Naval Research),* T. & A. M. Rept., no. 88, June 1955, 31 p.

Strength reduced to approximately 50% of the unfretted fatigue strength due to clamping between Al clamping pads at a nominal pressure of 4000 psi. 17 ref. (Q7a, Q9q; ST, Al, Cu-n)

520-Q.* Influence of Strain Aging on the Shape of the S-N Diagram. F. C. Rally and G. M. Sinclair. *University of Illinois (Office of Naval Research),* T. & A. M. Report, no. 87, June 1955, 34 p.

Position of the knee in the S-N diagram was influenced by the carbon and nitrogen content of the steel and also by the temperature at which the tests were conducted. 16 ref. (Q7b, 3-66; ST)

521-Q.* (French.) Copper Alloys for Springs. André Roos. *Cuivre, Laitons, Alliages,* v. 46, Nov-Dec. 1958, p. 21-30.

Beryllium bronzes and their mechanical properties at room and high temperatures; effects of heat treatment and composition on spring properties of bronzes. Physical and mechanical properties of Cr-Cu and Cd-Cu. Some characteristics of special brasses and efforts to improve their usefulness as spring materials. (Q-general, 2-60, 2-64; Cu-b, Cu-s, Cu-n, *Be, Cr,* Cd, SGA-b, 17-57)

522-Q.* (Italian.) Determination of the Mechanical and Technological Properties of Thin Aluminum Sheet. L. Mori. *Alluminio,* v. 27, Dec. 1958, p. 541-545.

Amount of elongation at rupture was determined by tensile and deep drawing tests on specimens of Al sheet under 0.5 mm. thick. Influence of heat treat condition, thickness of specimen and diameter of die. 7 ref. (Q-general, 2-64; Al, 4-53)

523-Q.* (Italian.) Nickel Steels for Low-Temperature Applications. E. T. Gill. *Metallurgia Italiana,* v. 50, Dec. 1958, p. 522-528.

Effects of low temperature on mechanical properties; influence of various alloying elements; effects of heat treatment. Production and working of semiwrought steels containing 3.5% to 9% Ni; heat treatments in relation to mechanical properties obtainable. 6 ref. (Q-general, J-general. 2-63, 2-64; AY, *Ni*)

524-Q.* (Russian.) Creep Calculations in the Design of Machine Components. N. N. Malinin. *Vestnik Mashinostroeniya,* v. 39, Jan. 1959, p. 6-13.

In creep caused by cyclic tension changes, fatigue rupture proceeds simultaneously with fatigue cracking. Creep deformation is the sum of elastic and plastic deformations when it is caused by forces less then the metals proportional limit. 21 ref. (Q3, Q7a, Q24, 17-51)

525-Q.* (Russian.) Brittle Failure of Welded Structures. V. V. Shevernitskii and F. V. Zhemchuzhikov. *Vestnik Mashinostroeniya,* v. 39, Jan. 1959, p. 24-28.

Effects of stress concentrations and residual stresses upon weld strength of mild carbon steel M165 at a temperature of -60° C. 4 ref. (Q25h, Q26s, 2-63; CN-p, 7-51)

526-Q.* (Russian.) Notch Sensitivity of Cyclically Loaded Steels. I. A. Oding and S. E. Gurevich. *Vestnik Mashinostroeniya,* v. 39, Jan. 1959, p. 30-35.

Knowing the magnitude of the effective coefficient of stress concentration at ultimate fatigue and the magnitude of the overloading coefficient, permits the determination of the effective coefficient of concentration stresses for stress overloading. 4 ref. (Q25h, Q23s, Q7; ST)

527-Q.* (Russian.) Fatigue Strength Influenced by Stress Concentration and Absolute Dimensions. V. P. Kogaev. *Vestnik Mashinostroeniya,* v. 39, Jan. 1959 p. 35-42.

Reduction of steel or cast iron quality as the forging or casting component increases in size; mechanical treatment; defects and grain stresses in large components affect strength. 20 ref. (Q5m, Q7k, 3-68, 3-73; CI, ST)

528-Q.* (Russian.) Fatigue Strength of Large Components. E. V. Kudryavtsev and N. M Savina. *Vestnik Mashinostroeniya,* v. 39, Jan. 1959, p. 42-47.

Effect of absolute size on strength of low-carbon rolled steel. Surface cold working in presence of concentration stresses is very effective in raising fatigue strength in small as well as in large components. (Q7a, Q25k, 3-73; CN-g)

529-Q.* Thermal Fracture Resistance of Ceramic Coatings Applied to Metal. Pt. 1. Elastic Deformation. J. H. Lauchner and D. G. Bennett. *American Ceramic Society, Journal,* v. 42, Mar. 1959, p. 146-150.

Elastic characteristics of the coating-metal composites, effective coefficient of linear expansion, temperature at which the coating and base metal were at dimensional equilibrium, temperature differential sufficient to induce coating fracture when water quenched. 15 ref. (Q26, Q21; Fe, 8-71)

530-Q.* Ductility and Strength of High-Carbon Gray Irons. E. M. Stein and H. O. McIntire. *Modern Castings,* v. 35, Mar. 1959, p. 103-110.

Ductility decreased with increasing Mn contents above 0.5%. Inoculation of low-Mn (0.3-0.5%) irons produced up to 50% increase in elongation, but the effect of inoculation decreased with increasing Mn content. 9 ref. (Q23p, Q27a, 2-60; CI; Mn, AD-q40)

531-Q.* Significance of Residual Stress in Fatigue. Jodean Morrow. *University of Illinois (Office of Naval Research),* T. & A. M. Report no. 96, Apr. 1956, 34 p.

For members with a hard surface layer residual tension on the surface was detrimental and residual compression beneficial. Literature review. 65 ref. (Q7, 3-66)

532-Q.* Study of the Mechanism of Fracture in Torsion. P. G. Jones and T. J. Dolan. *University of Illinois (Office of Naval Research)*, T. & A. M. Report no. 97, May 1956, 41 p.

Influence of amount of available elastic strain energy on the shear fracture characteristics of several metals. Torsion tests were made on solid $\frac{1}{2}$-in. cylindrical specimens. 9 ref. (Q1, Q26)

533-Q.* (Rumanian.) Effect of Phosphorus on the Mechanical Properties of Nodular Cast Iron. Iulian Cazacu and Alexandru Fechete. *Studii si Cercetari de Metalurgie*, v. 3, no. 3, 1958, p. 397-401.

Samples with various amounts of phosphorus tested for tensile strength, Brinell hardness and elongation. (Q-general, 2-60; CI-r, ADq-40, *P*)

534-Q. (German-French.) Data on Welded Railroad Bridges. Pt. 2. R. Becker. *Zeitschrift fur Schweisstechnik*, v. 49, Jan. 1959, p. 17-23.

Stress and design considerations. (Q25, T26p, 17-51)

535-Q.* Fretting of Hardened Steel in Oil. J. R. McDowell. Paper from "Lubrication Science and Technology". v. 1, no. 2. Pergamon Press, Inc., New York, 1958, p. 287-295.

To determine effect of hardness on fretting wear AISI 4340 was tested in oil bath using new machine. Wear tests measuring depth of pit and height of deposit of galled areas showed small defects due to hardness, whereas nitrided specimens produced smaller fretted areas and roughening of surfaces was shallow. 11 ref. (Q9q, Q29; ST)

536-Q.* Wear and Frictional Characteristics of Some Nickel-Base Alloys. R. A. Kozlik. Paper from "Lubrication Science and Technology". v. 1, no. 2. Pergamon Press, Inc., New York, 1958, p. 296-303.

Relative resistance to wear and galling of variety of wrought and cast Ni-base alloys. Chromium, molybdenum disulphide or sulphurized protective coatings and their limitations. 5 ref. (Q9; Ni-b)

537-Q.* Investigation of Wear by Electron Diffraction. L. M. Niebylski, M. Antler and L. O. Brockway. Paper from "Lubrication Science and Technology". v. 1, no. 2. Pergamon Press, Inc., New York, 1958, p. 304-311.

Electron diffraction theory and technique with its scope and limitations in study of lubrication. Results of wear studies of molybdenum isobutylxanthate on ring and bore wear with respect to fuel and fuel additives. 32 ref. (Q9, M22h)

538-Q.* Study of the Effect of Wear Particles and Adhesive Wear at High Contact Pressures. E. B. Sciulli and G. M. Robinson. Paper from "Lubrication Science and Technology". v. 1, no. 2, Pergamon Press, Inc., New York, 1958, p. 312-318.

Wear rate curves and coefficients of friction for combination of Co alloys and stainless steel under pressures up to 300,000 psi. in demineralized water at room temperature and in the presence and absence of wear particles. Defects of sliding-surface geometry in trapping wear particles. (Q9, 3-74; Co-b, SS)

539-Q.* Wear of Cobalt Base and Stainless Materials in High Purity Water. N. B. Dewees. Paper from "Lubrication Science and Technology". v. 1, no. 2. Pergamon Press, Inc., New York, 1958, p. 319-328.

Wear tests were performed by various methods and machines at room temperature and at 500° F., with velocity of machine stress pressure, and size of contact areas considered. These tests were compared in terms of "specific wear". 4 ref. (Q9; Co-b, SS)

540-Q.* Cross-Rolled Plate Vs. Hand Forgings of Similar Section. W. H. Meyer. *Western Machinery and Steel World*, v. 50, Mar. 1959, p. 66-68.

Mechanical properties of cross rolled plate and hand forgings of 4300 series steels. Degree of isotropy obtainable by each process. (Q27a, 3-72; AY, 4-51, 4-53)

541-Q.* (French.) Brittle Fracture of Steel. J. B. Lean. *Metaux Corrosion-Industries*, v. 34, Jan. 1959, p. 1-13.

Steel transition temperature as influenced by loading rate, cold working, aging, grain size, rolling conditions, heat treatment and alloying elements. Brittle fracture in relation to dislocation theory. 143 ref. (Q26s, Q24, M26b, 2-59, 2-64; ST)

542-Q.* (Polish.) Deformation of Metals With Face-Centered Cubic Structure. Aleksander Krupkowski. *Archiwum Hutnictwa*, v. 3, no. 4, 1958, p. 241-254.

Deformation of round test pieces with various orientation while maintaining circular cross-section in relation to multiple slip in single crystals of fcc. structure. (Q24a; 14-61)

543-Q.* Propagation of Sound in Liquid Metals: the Velocity in Lead and Tin. R. S. Gordon. *Acta Metallurgica*, v. 7, Jan. 1959, p. 1-7.

Constant linear decrease of sonic velocity with increasing temperature. Acoustic data used to evaluate diffusion phenomena and simple hole theory. 12 ref. (Q21f, N1, 2-62; Pb, Sn, 14-60)

544-Q.* Overshooting in Quenched Aluminum Crystals. L. E. Tanner and R. Maddin. *Acta Metallurgica*, v. 7, Feb. 1959, p. 76-82.

Single crystal quenched from annealing treatments at 600° C. and strained in tension exhibited effects in deformation process. Overshooting due to hardening of conjugate slip system. 25 ref. (Q24, Q23a; Al, 14-61)

545-Q.* AM-355: High-Strength Stainless. G. N. Aggen. *Iron Age*, v. 183, Apr. 2, 1959, p. 74-77.

Recommended primarily for applications requiring high strength-to-weight ratios and good corrosion and oxidation resistance up to about 900° F. (Q-general, R-general; SS)

546-Q.* Metals Under High Speed Loading. John S. Rinehart. *Mines Magazine*, v. 49, Feb. 1959, p. 19-25, 40.

Failure under impulsive loading, duration of the load being a few microseconds and its intensity as high as several hundred pounds per square inch. 11 ref. (Q26, Q6; ST, Fe)

547-Q.* High Temperature Metals Target. Nat Wood, Editor. *Western Metalworking*, v. 17, Mar. 1959, p. 40-45.

Development in steels, aluminum alloys, titanium and molybdenum. (Q-general, 2-62; ST, SS, Al-b, Mo, Ti)

548-Q.* (Czech.) Effect of Deformation and Subsequent Heating on Tantalum. Jiri Vacek. *Hutnicke Listy*, v. 14, Feb. 1959, p. 127-132.

Samples were exposed to deformation of 40 and 70% by rolling and then heat treated at various temperatures. Effects on hardness, tensile strength, ductility and electrical resistance. 11 ref. (Q29n, Q27a, P15g, 3-68, 2-64; Ta)

549-Q.* (German.) Work Hardening of Aluminum Single Crystals (99.99%). W. Staubwasser. *Acta Metallurgica*, v. 7, Jan. 1959, p. 43-50.

Orientation and temperature dependence of work hardening. Orientation dependence is related to the amount of slip in additional glide systems. 26 ref. (Q23a, 2-63, 2-61, 3-72; Al, 14-61)

550-Q.* (German.) Slip Planes in the Plastic Deformation of High-Purity Aluminum of Medium Grain Size. R. J. Hartmann and E. Macherauch. *Naturwissenschaften*, v. 45, Nov. 1958, p. 540-541.

In samples of grain size 0.04 to 0.25 sq.mm. and 99.99% purity about 40% of slip planes are not {111} - planes, after elongation of 8%. Technique used combined optical microscopy with X-ray diffraction. (Q24, 2-59; Al-a)

551-Q.* (Japanese.) Photoelastic Examination of Stress Concentration Factor for U-Notched Tension Bar. Yosio Ohasi. *Japan Society of Mechanical Engineers, Transactions*, v. 24, Nov. 1958, p. 798-803.

Stress concentration factor does not always increase with an increase of notch depth, but is larger for notches of medium depth than for very deep notches, the base radius of the notch and minimum section of the bar being kept constant. (Q25k)

552-Q. Bending Techniques for Evaluation of Cast Materials and Structures. J. C. Graddy. *Modern Castings*, v. 35, Mar. 1959, p. 90-96.

(Q5, Q27; Al, Mg, 5)

553-Q.* Early Stages of Plastic Deformation in Copper. D. A. Thomas and B. L. Averbach. *Acta Metallurgica*, v. 7, Feb. 1959, p. 69-75.

Plastic extension observed at stresses above 1000 psi. and plastic strain at given stress depend on third power of grain size. 25 ref. (Q24, 2-59; Cu)

554-Q.* Metallography of Deformed Iron. D. G. Brandon and J. Nutting. *Acta Metallurgica*, v. 7, Feb. 1959, p. 101-110.

Slip lines produced on polycrystalline surface examined by electron microscope and carbon replica. Passage of dislocations disperses small segregated regions and so changes the rate of chemical attack. 27 ref. (Q24a, M27, Fe)

555-Q.* Cobalt in Steels. L. Habraken and D. Coutsouradis. *Cobalt*, no. 2, Mar. 1959, p. 11-22.

Effect on hardenability, brittleness and other mechanical properties. 31 ref. (Q-general, 2-60; ST, *Co*)

556-Q. Crystal Plasticity. Pt. 1. Theory of Glide in Metal Crystals. D. A. Aboav. University of Palermo, Italy. (Office of Scientific Research.) *U. S. Office of Technical Services,* PB 131759, Dec. 1957, 61 p. $1.75.

Accounts qualitatively for the main glide phenomena such as the existence of a critical shear stress, work-hardening and recovery. (Q24a, N4)

557-Q. Fundamental Mechanism of Wear and Friction of Unlubricated Metallic Surfaces at High Sliding Speeds. F. M. Sauer. Stanford Research Institute. *U. S. Office of Technical Services,* PB 131963, Apr. 1957, 62 p. $1.75.

Study aimed at determining mechanisms which would permit accurate prediction of wear and friction of metals under extreme pressure and velocity. (Q9, 3-74; Mo, SS)

558-Q. Fracture Strengths Relative to Onset and Arrest of Crack Propagation. G. R. Irwin, J. A. Kies and H. L. Smith. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 151131, Nov. 1958, 26 p. $.75.

Methods developed for duplicating both the plane-strain and plane-stress conditions in laboratory measurements of fracture strength. (Q26, Q26q, 1-54)

559-Q. Study of Beta Embrittlement in High-Strength Titanium Alloys. A. J. Griest, A. P. Young, H. A. Robinson and P. D. Frost. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services* PB 151278, Aug. 1958, 114 p. $2.25.

Primary cause of beta embrittlement in Ti alloys and the characteristic loss of ductility is the large grain size obtained rapidly in many alpha-beta alloys when heated into the beta field. (Q26s; Ti-b)

560-Q.* (German.) Ultrasonic Investigation of the Plasticity of Metal Crystals. F. Blaha and B. Langenecker. *Acta Metallurgica,* v. 7, Feb. 1959, p. 93-100.

Decrease in shearing stress caused by ultrasonic irradiation is same order of magnitude for plastic deformation of Al, Cd and Zn crystals, temperature constant. 18 ref. (Q24, Q2, 1-74; Al, Cd, Zn)

561-Q.* (Italian.) Influence of Microstructure on the Fatigue Resistance of Nodular Cast Iron Crankshafts. D. Fortino. *Fonderia Italiana,* v. 8, Jan. 1959, p. 3-8.

Formation of pseudo-lamellar graphite improves static and fatigue properties as compared with those of gray cast iron with normal lamellar graphite. A further linear improvement occurs when degree of spheroidization increases. 4 ref. (Q7a, M27, T7j; CI-r)

562-Q.* Fracturing Under Explosive Loading. John S. Rinehart. *Chemical Engineering Progress,* v. 55, Feb. 1959, p. 59-64.

Significant features of the fracture process. 11 ref. (Q26)

563-Q.* Special Report on 9% Nickel Alloy Steel. *Design News,* v. 14, Mar. 2, 1959, p. 14-15.

Moderate strength alloy for low-temperature service reduces material cost up to 40%. (Q-general, 2-63; SS, *Ni*)

564-Q.* New Look at the Refractory Metals. *Fansteel Metallurgy,* Mar. 1959, p. 1-8.

Properties of Cb, Mo, Ta and W. (Q-general, 2-62; Cb, Mo, Ta, W, EG-d37)

565-Q. Research and Development on Determination of Coefficients of Friction Between Dry Metallic Surfaces. E. W. Gaylord and H. Shu. Carnegie Institute of Technology. (Watertown Arsenal.) *U. S. Office of Technical Services,* PB 131943, Oct. 1957, 49 p. $1.50.

Coefficients of static friction between dry metallic surfaces under high normal pressures, and coefficients of kinetic friction under high normal pressures and high sliding velocities. (Q9p, 3-74; ST, U, Ti, Be)

566-Q. Metallurgical Investigation of Aluminum Alloy X2219-T6. P. L. Hendricks. Wright Air Development Center. *U. S. Office of Technical Services,* PB 151235, June 1958, 27 p. $.75.

New alloy exhibited tensile properties of 20,000 psi ultimate tensile strength, 15,000 psi. tensile yield strength and 25% elongation. (Q27a, 2-62; Al-b)

567-Q.* (French.) Comparisons Between the Damping Capacity of Electrolytic Iron and Zone Melted Iron. F. Dabosi, B. Migaud and J. Talbot. *Comptes Rendus,* v. 248, Jan. 26, 1959, p. 553-555.

Higher damping capacity of zone melted iron is attributed to its very high purity. 6 ref. (Q8g; Fe-a)

568-Q.* (Russian.) Effect of Phosphorus on Wear of Metalworking Equipment. A. V.

Portugeis. *Liteinoe Proizvodstvo*, Feb. 1959, p. 38-39.

Least satisfactory results were achieved in cast iron with 0.359% phosphorus. Hardness and wear resistance depends very little upon the sum of C and Si content. A higher phosphorus content is indicated in many cases. 8 ref. (Q9, W25n, 2-60; CI, *C*, *Si*, *P*)

569-Q.* (Russian.) Steel Endurance Increased as a Result of Carburizing. D. C. Elenevskii. *Vestnik Mashinostroeniya*, v. 39, Feb. 1959, p. 20-24.

Resistance to fatigue is determined basically by high fatigue resistance of the carburized layer while the compressive residual stresses that take place after hardening have a subordinate effect. 18 ref. (Q7a, Q25h, J28g)

570-Q. Timken 17-22-AV (High-Temperature Constructional Steel). *Alloy Digest* SA-82, Apr. 1959, 2 p.

Composition and mechanical properties of new low-alloy steel. (Q-general, 2-62; AY)

571-Q.* (Russian.) Impact Strength at Low Temperatures and Formation of Flaws. L. S. Livshits and A. S. Rakhmanov. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 190-192.

Mechanical testing of a killed low-carbon steel at low temperatures. (Q6n, 2-63; CN-g)

572-Q.* (Russian.) Effect of Deformation Speed in the Tension Testing of the Mechanical Properties of Nonferrous Metals. G. M. Volkonov and L. V. Primatova. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 196-197.

Experiments with sheets of Cu, brass, Ni and NiAg. 5 ref. (Q27, 3-67; *Ag*, Cu, Cu-n, Cu-b, Ni)

573-Q.* (Russian.) Effects of Loading Rate and Testing Temperature on the Plasticity of Steel. I. A. Razov and E. M. Shevandin. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 198-202.

Bending tests under static load and impact tests performed at temperatures from +20° to -196° C. If the material shows no cold brittleness, the loading velocity has no remarkable influence on plasticity. 5 ref. (Q23p, Q5, Q6, 2-61; ST)

574-Q. (Russian.) Delay in the Yielding of Steel Under Dynamic Loading. A. I. Golubkov and V. M. Panov. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 209.

Steel samples exposed to dynamic tensile loading. Yield delay time is influenced by the degree of loading, but does not change remarkably with loading velocity. (Q27b; ST)

575-Q.* (Slovakian.) Fatigue Strength of Automobile Parts. Vladimir Gregor and Oskar Izdinsky. *Zvaranie*, v. 8, Jan. 1959, p. 2-6.

Riveted and welded wheels, axles with V-welds and fillet welds exposed to torsional cycling. (Q7h, T21; ST, 7-51)

576-Q.* Fatigue Tests of Joints of High Strength Steels. Norman G. Hansen. *American Society of Civil Engineers, Proceedings, Structural Division, Journal*, v. 85, ST3-Pt. 1, Mar. 1959, p. 51-69.

The most important variable governing the fatigue strength of a joint is clamping force. In riveted joints, as tested, the variations and the distribution within a joint of those variations of clamping force, subordinate whatever superiority one steel has over another. Joints having uniformly high clamping force, such as the bolted joints, have high fatigue strength. (Q7a; ST, 7-53, 7-54)

577-Q.* Selection Guide to Heat-Resistant Cast High Alloys. E. A. Schoefer. *Machine Design*, v. 31, Apr. 2, 1959, p. 118-125.

Surface stability, structural stability, mechanical properties, design considerations. 6 ref. (Q-general; SS, Ni-b, SGA-h, 17-51)

578-Q.* New Precipitation-Hardening Stainless Steel. Allen C. Gilbraith. *Metal Treatment and Drop Forging*, v. 25, Mar. 1959, p. 91-94.

Mechanical properties of PH 15-7 Mo, a material suitable for honeycomb structures. (Q-general, J27; SS, Mo, 7-59)

579-Q.* Production Aids in the Use of Malleable Iron. William E. Hoffman. *Tooling & Production*, v. 25, Apr. 1959, p. 44-46.

Mechanical properties, design. (Q-general; CI-s, 17-51)

580-Q. Deflection and Rupture of Zircaloy-2 Plate Compartments Under Internal Pressure. R. D. Leggett. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 73-92. U. S. Office of Technical Services, Washington 25, D. C.

Deformation of compartments in plate-type fuel elements. Elastic and plastic

behavior of five compartment sizes pressurized at room temperature with measurements made on one compartment size pressurized at 600° F. (Q3q, 3-74, T11g; Zr-b)

581-Q. The Torsional Properties of Zircaloy-2 and Zircaloy-3. R. E. Johnson. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct, 1958, p. 49-56. U. S. Office of Technical Services, Washington 25, D. C.

Mechanical properties under shearing stress. The elastic torsional properties of base-annealed and hot rolled specimens were determined from SR-4 strain gage measurements. For both materials the torsional yield strength is near 30,000 psi. 4 ref. (Q1; Zr-b)

582-Q.* (Russian.) Damping Decrement Influenced by the Order of Transverse Vibration. A. P. Yakovlev. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 206-208.

Rods of cermet or steel were vibrated by electromagnets. The logarithmic damping decrement is diminished with a higher order of vibrations. (Q8; 6-70, ST)

583-Q. A Simple Bend Test to Measure Uniformity of Ductility in Sheet Metal. S. V. Arnold. Watertown Arsenal. *U. S. Office of Technical Services*, PB 131947, n.d., 6 p. $.50.

Correlates bend angle with the first visible evidence of rupture. (Q5; Ti, 4-53)

584-Q. Analysis of a One-Dimensional Nonlinear Mechanical Model and Its Application to the Qualitative Explanation of the Visco-Elastic Behavior of Aluminum From Sonic Tests. John A. Mital and Tien S. Chang. *Virginia Polytechnic Institute, Bulletin*, v. 51, Oct. 1958, 44 p.

Analysis of the visco-elastic behavior of Al as observed from sonic tests. 128 ref. (Q21; Al)

585-Q. (Russian.) Testing Apparatus for Thermal Cycling. A. A. Zuikova. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 170-172.

5 ref. (Q7j, 1-53)

586-Q. (Russian.) The Oscilloscope in the Impact Testing of Weldments. M. H. Gapchenko. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 193-195.

9 ref. (Q6, X25j; 7-51)

587-Q. (Russian.) Removal of Thin Layers From Samples to Determine Residual Stress. V. Ya. Sevast'yanov. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 202-203.

Stress is determined by measuring thickness and deformation. 6 ref. (Q25h, 1-54)

588-Q. (Russian.) Device for Testing Fracture in Metals. N. N. Popova. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 230. (Q26, 1-53)

589-Q.* Tough Ship Plate. William J. Harris Jr., and Clyde Williams. *Metal Progress*, v. 75, Apr. 1959, p. 66-71.

A review of the enormous amount of work done since 1946 by the Ship Structure Committee leads to the conclusion that a vanishing number of failures need be expected in normal service of welded ships properly designed and constructed of steels meeting the revised specifications of the American Bureau of Shipping. (Q26s, T22g; ST, 4-53, 7-51)

590-Q.* Surface Fatigue of Carbo-Nitrided Steel. G. W. Powell, M. B. Bever and C. F. Floe. *Metal Progress*, v. 75, Apr. 1959, p. 88-90.

Carbo-nitrided cases must be thick enough to withstand service-induced stresses and to possess maximum resistance to surface fatigue. Otherwise, fatigue life is determined mainly by the core properties rather than those of the case. (Q7, J28m; ST)

591-Q.* Titanium Alloys Today—How Commercial Alloys Compare. Paul D. Frost. *Metal Progress*, v. 75, Apr. 1959, p. 91-96.

Divided into alpha, alpha-beta and beta types, commercial Ti alloys have widely varying properties. Alpha alloys have high strength and good oxidation resistance at elevated temperatures but cannot be heat treated readily. Alpha-beta and beta alloys respond to heat treatment and are more formable than alpha alloys. Research and development programs will broaden applications. (Q-general, 17-57; Ti-b)

592-Q.* Fabricating and Finishing Toolsteels for Aircraft Parts. P. E. Ruff. *Metal Progress*, v. 75, Apr. 1959, p. 97-102.

H-11 maintains high strength at elevated temperatures. Formability is similar to that of 4130, and weldability is like that of 4340. Parts are limited to a 4-in. thick section to obtain through hardening on air cooling. Most parts require coatings for corrosion protection. Procedures for processing H-11. (Q-general, J-general, G17k, K9s; TS, SGA-h)

593-Q.* Aircraft Quality Steels. Digest of Aircraft Quality Steels-Medium and Low-Alloy Type". L. F. Barnhardt and P. Adams. Paper presented at the A.I.M.E. Electric Furnace Steel Conference, Pittsburgh, Dec. 1957. *Metal Progress*, v. 75, Apr. 1959, p. 135-136, 138, 140.

Factors necessary for toughness at high strength levels are a temperad martensitic structure, low carbon content, consistent with desired strength; avoidance of brittle-range tempering temperatures; careful control of melting and pouring operations. (Q-general; AY, SGB-a)

594-Q.* Pressure Equipment for Low Temperature Service. C. R. Soderberg, Jr. *Welding Journal*, v. 38, Jan. 1959, p. 39s-44s.

From information on brittle fracture, design basis for ferritic material in atmospheric and low-temperature work is given. 12 ref. (Q26s, 2-63, 2-74; CN, Fe-b, SS, 7-51)

595-Q.* Effect of Residual Stress on Fatigue Strength. D. S. Dugdale. *Welding Journal*, v. 38, Jan. 1959, p. 45s-48s.

Rotating tests reported on notched bars preloaded to introduce residual stress. Effect depends on material and notched sharpness. (Q7a, Q25, 2-60, 3-68; CN, AY, *Ni*)

596-Q.* (German.) High-Quality Copper Wire. Karl Robert Vassel. *Zeitschrift fur Metallkunde*, v. 50, Feb. 1959, p. 112-117.

Effect of various elements, drawing conditions and cold deformation on mechanical properties and conductivity. 12 ref. (Q-general, P15g; Cu, 4-61)

597-Q.* (Spanish.) Behavior of Ultrasonic Vibrations When Penetrating Metallic Media. Jose Ors. *Instituto del Hierro y del Acero*, v. 11, Oct-Dec. 1958, p. 263-281.

Determination of speed of propagation of vibrations and elastic constants in gray cast iron and steels of different structures. Coefficient of damping of vibrations in Fe is high due to presence of graphite. Compared with cast iron, variations of longitudinal and transverse speed of propagation are generally minor in steel. 8 ref. (Q21f; CI-n, ST)

598-Q.* Complex Stress Creep Relaxation of Metallic Alloys at Elevated Temperatures. A. E. Johnson and J. Henderson. *Aircraft Engineering*, v. 31, Mar. 1959, p. 76-79.

Nature of relation between complex stress creep under conditions of relaxation and complex stress creep under conditions of steady stress. (To be continued.) (Q3a; Al-b, Mg-b)

599-Q.* Why Metals Fail. *Australasian Engineer*, v. 51, Feb. 7, 1959, p. 45-53.

Embrittlement, fatigue, creep and other mechanical characteristics. (Q-general, A9)

600-Q.* Radiography, Microstructure and Mechanical Properties of Cast Magnesium-Thorium-Zirconium Alloy HK-31A. T. R. Bergstrom and R. G. Bassett. *Modern Castings*, v. 35, Apr. 1959, p. 79-87.

Autoradiographic, radiographic, metallographic and spectrographic investigation of segregation of alloying elements. Effect of segregation on mechanical properties at room temperature and at 500° F. (Q27, S13e, M27c, M28h; Mb-b, *Th, Zr*, 9-69)

601-Q.* Martensitic White Irons for Abrasion-Resistant Castings. T. E. Norman, A. Solomon and D. V. Doane. *Modern Castings*, v. 35, Apr. 1959, p. 104-118.

Composition, structure, mechanical properties and relative resistance to gouging abrasion, high-stress or grinding abrasion and scratching abrasion or erosion of martensitic white irons. Comparison with pearlitic white irons. Effect of solidification rate, heat treatment and carbon, Si, Mo, Cr, Mn, Ni and Cu additions on the suppression of pearlite. Control of retained austenite. 20 ref. (Q9n, Q27, Q29, 3-71, 2-64, 2-60; CI-p, Si, Mo, Cr, Mn, Ni, Cu)

602-Q.* Thermal and Elastic Properties of Eight Cast Irons. D. Fitzgeorge and J. A. Pope. *North East Coast Institution of Engineers and Shipbuilders*, Preprint, Mar. 23, 1959, p. 285-330.

"Quality factor" in investigating materials for marine engine combustion chambers. 14 ref. (Q-general, P11g, T22h, 2-61; CI)

603-Q. (Book.) High Temperature Materials, Their Strength Potentials and Limitations. Syracuse University Research Institute, *U. S. Office of Technical Services*, 3PB 131834, 1958, 353 p. Washington 25, D. C. $5.

Proceedings of the Fourth Sagamore Ordnance Materials Research Conference, Raquette Lake, N. Y., Aug. 21-23, 1957. Papers abstracted separately. (Q-general; SGA-h)

604-Q. (Translation.) Life of Ingot Molds and Stools. D. M. Slonim. *Iron & Coal Trades*

Review, v. 178, Feb. 27, 1959, p. 487-492. (From *Stal'*, v. 18, Oct. 1958)

See item 182-Q, 1959. (Q9, W19c; ST)

605-Q. (Translation—BWRA.) Impact Strengths of Standard Doors for Open Rail Wagons. A. A. Kazimirov, V. P. Morgun, G. E. Olifer, G. Ya. Ivanushkin, E. V. Kapustyanov, I. T. Svinarenko and A. A. Tyagun. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 45-56.

Number of impacts to fracture on arc spot welded and resistance spot welded doors fabricated from 09G2D high-tensile steel. The use of low-alloy, high-tensile, corrosion resistant steel enables the weight to be substantially reduced with increases in stiffness and strength. (Q6, Q26, T23p; 7-51, AY)

606-Q. (Translation—BWRA.) Some Fatigue Strengths of Type St 3 Rimming Steel Under Vibrating Load. A. A. Bat. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 60-65.

Single-value fluctuating stress tests on beams of hardened rimming steel, Type ST 3 in crane gantry girders. Hardened steel is less sensitive to stress raisers than Type NL2 steel. Stress concentrations discussed in relation to fatigue cracking. 4 ref. (Q25k, Q26q, Q7a; ST-d)

607-Q. (Translation—BWRA.) Influence on Residual Stresses of Local Heat Treatment of Transverse Butt Welds in Tubes. V. V. Shevernitskii and V. A. Kovtunenko. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 78-82.

Specimens composed of seamless steel tubing (0.21% C, 0.63% Mn, 0.22% Si, 0.11% Ni, 0.66% Cr). Local heating to 600-650° C. results in considerable reduction of stresses and their more even distribution along the weld; no essential difference exists between the stresses acting along the welds for heated zones of different extent. (Q25h, 2-64; ST, 7-51, 4-60)

608-Q.* Effect of Various Factors on the Mechanical Properties of Magnesium Alloy Castings. J. W. Meier. *Canadian Dept. of Mines and Technical Surveys, Mines Branch Research, Report*, no. R38, 1958, p. 225-240. $.25.

Procedure for evaluating strength of castings. 10 ref. (Q-general, 1-54; Mg, 5)

609-Q. Clad Steels for Nuclear Applications. Digest of "Applicability of Clad Steels to Heavy Wall Piping". J. H. Proctor. A.S.M.E. Paper no. 57, NESC-108, Mar. 1957, *Metal Progress*, v. 75, Apr. 1959, p. 178, 180, 182.

Serviceability of clad steels in which the bond is produced during rolling by the combination of heat and pressure. Experiments were conducted on flat plates and cylinders to test the strength of the bond against the stresses caused by the differential expansion of the cladding and the backing material under severe temperature fluctuations. (Q-general, T11, 2-62; AY, 8-66)

610-Q.* Investigation Into the Creep Properties of Two Cast Irons. C. Wheatley and J. A. Pope. *North-East Coast Institution of Engineers and Shipbuilders*, Preprint, Mar. 23, 1959, p. 331-354.

4 ref. (Q3; CI)

611-Q.* Ultrasonic Wave Propagation in a Nickel Single Crystal. J. de Klerk. *Physical Society, Proceedings*, v. 73, pt. 3, Mar. 1, 1959, p. 337-344.

Behavior of the dynamic elastic constants and the energy losses with and without an applied magnetic field. 15 ref. (Q21f, Ni, 14-61)

612-Q.* Brittle Fracture Tests of Steel Plates Containing Residual Compressive Strain. S. T. Rolfe, W. J. Hall and N. M. Newmark. *Welding Journal*, v. 38, Apr. 1959, p. 169s-175s.

Methods for producing a residual compressive strain field in the center of a 2-ft. wide plate, and propagation of brittle fractures. 4 ref. (Q26s, Q25h, Q28k; ST, 4-53, 7-51)

613-Q.* The Role of the Basis Metal in the Production of Stressed Electrodeposits. Joseph B. Kushner. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 28-32.

The early layers of a depositing metal reproduce the crystal structure of the underlying metal provided the substrate is clean and both metals are not too dissimilar in crystal structure. The forces controlling the isomorphic growth or epitaxing of the deposit are atomic in nature and do not act over distances larger than about ten atom layers or so. Lattice constants are discussed in relation to stress. 14 ref. (Q25, M26; 8-62)

614-Q.* Effect of Shot-Peening Prior to Chromium Plating on the Fatigue Strength of High Strength Steel. Bennie Cohen. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 33-36.

Shot peening is very effective in overcoming the harmful effect of Cr plating on fatigue. High-strength steel specimens showed only a slight decrease in fatigue strength due to plating. Shot peening of medium-strength steel specimens not only counteracts the harmful effects of Cr plating but results in an increase in fatigue strength. 5 ref. (Q7a, L17, G23n; ST, *Cr*)

615-Q.* Heavy Electrodeposited Metallic and Flame-Sprayed Ceramic Coatings in a High Heat Transfer Aerothermal Environment. Stanley Zirinsky and Dodd S. Carr. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 97-104.

Behavior of Ni, Ni + Pt, Ni + Pd, Ni + Rd, Ni + Cr, Ni + aluminum oxide, Cr, aluminum oxide coatings on Ni and Cu heat sink materials. (Q-general, 2-62; Ni, Pt, Pd, Rh, Cr, Cu, 8-71, 8-62)

616-Q.* (Dutch.) Copper and Copper Alloys. W. G. R. de Jager. *Metalen*, v. 14, Mar. 14, 1959, p. 70-71.

Copper with and without various oxygen contents was tested by alternating bending after heating through $\frac{1}{2}$ hr. in a hydrogen or, for comparison, in a nitrogen atmosphere and at temperatures from 400-800°C. When the sample contained oxygen, even after heating at 400°C. hydrogen unsoundness was observed. (Q26s, Q5; Cu, *H, O*)

617-Q.* (German.) Cracking and Fracture Phenomena in Steels in the Presence of Hydrogen. Paul Bastien. *Bergakademie*, v. 11, Feb. 1959, p. 70-81.

The formability of steel with alpha structure is reduced by hydrogen absorption. Brittleness is increased if deformation speed is slow enough for hydrogen diffusion. Location of the hydrogen atoms is mainly in the {122} planes. New explanation for hydrogen brittleness is presented. 41 ref. (Q23q, Q26; ST, 2-66, *H*)

618-Q.* (German.) Influence of Flame-Cutting on Fatigue Strength. H. D. Steffens. *Schweissen und Schneiden*, v. 11, Mar. 1959, p. 93-97.

Materials and shapes of test specimens; factors influencing fatigue strength; geometric and mechanical factors; changes in crystalline structure. (Q7, G22g; ST, CN, AY, Cr, *Ni*)

619-Q.* Classifying the Precipitation Hardening Stainless Steels. *Industrial Heating*, v. 26, Mar. 1959, p. 532, 534, 536, 538.

Classification arranged according to microstructure. Group I, martensitic as solution treated and as aged, includes stainless W and 17-4 PH; group II, austenitic as solution treated and martensitic as transformed and aged, includes 17-7 PH, PH 15-7 Mo, AM-350, AM-355; group III, austenitic as solution treated and as aged includes 17-10 P and HNM steels. 6 ref. (Q-general, M27; SS)

620-Q. Effect of Backup Variables on Series Spot Welding of Steel. E. F. Nippes, W. F. Savage and K. E. Dorschu. *Welding Journal*, v. 38, Feb. 1959, p. 49s-56s.

Effect of backup bar and stool combinations of varying electrical conductivity upon the shunting current and tensile-shear strength of spot welded joints. (Q27a, Q2g, K3n; ST, 7-51)

621-Q. Properties Affecting Suitability of 9% Nickel Steel for Low Temperature Service. T. N. Armstrong, J. H. Gross and R. E. Brien. *Welding Journal*, v. 38, Feb. 1959, p. 57s-65s.

Double normalized and stress-relieved steel retains notch toughness at liquid nitrogen temperature. Welds, resistant to low-temperature embrittlement and design stress, made by metal-arc or inert-gas metal-arc process. 6 ref. (Q-general, K1, 2-63; SS, *Ni*)

622-Q. Effects of Martensite, Bainite and Residual Stresses on Fatigue of Welds. R. E. Keith. *Welding Journal*, v. 38, Mar. 1959, p. 142s-143s.

Dislocation theory and plasticity applied to welds. Martensite and bainite do not constitute internal notches. Residual stresses are important in fatigue depending on material and conditions. 12 ref. (Q7a, Q25h, Q24; ST, 7-51)

623-Q. Internal Stress Distribution of Single Spot Welds in Relation to Their Fatigue Life. G. Welter and A. Choquet. *Welding Journal*, v. 38, Apr. 1959, p. 145s-158s.

Strain-gage measurements of internal strains in spot welds on stainless steel. Improvement in fatigue resistance of welds by hydrodynamic treatment. 11 ref. (Q25, Q7b, K3n; SS, 7-51)

624-Q. Effect of Residual Stress on Brittle Fracture. Hiroshi Kihara and Koichi Masubuchi. *Welding Journal*, v. 38, Apr. 1959, p. 159s-168s.

Residual welding stress, having no effect on ductile fracture of carbon steel, may affect brittle fracture. Fracture at low stress level when materials have low notch toughness, sharp notch and high tensile residual stress. Preloading at high temperature investigated. 10 ref. (Q26s, (Q25h; CN, 7-51)

625-Q. Effect of Heat Treatment and Fabrication on Heavy-Section Pressure Vessel Steels. A. I. Rubin, J. H. Gross and R. D. Stout. *Welding Journal*, v. 38, Apr. 1959, p. 182s-187s.

Notch toughness, strength and ductility in carbon and alloy steel affected by stress relief. Steels susceptible to strain aging. (Q23s, Q23p, Q27, 2-64, 2-65; CN, AY)

626-Q. Effects of Hydrogen Brazing on Properties of High-Temperature Alloys. G. A. Hoppen and E. N. Bamberger. *Welding Journal*, v. 38, Apr. 1959, p. 194s-201s.

Eight alloys used for fabricated jet-engine components subjected to brazing thermal cycles and then tested for tensile and stress-rupture properties. (Q27a, Q3q, K8, 2-64; Fe-b, Ni-b, Co-b, SGA-h)

627-Q.* (English.) Effect of Shot-Peening on Fatigue Strength of Metals. Pt. 1. Effects on Polished State. Sakae Takeuchi and Tsuneo Homma. *Tohoku University, Science Reports of the Research Institutes*, v. 10A, no. 6, 1958, p. 426-434.

Endurance life of all the materials tested was prolonged by several times, and the fatigue strength at 10^7 cycles was increased by 3 to 13% by shot-peening. 4 ref. (Q7a, G23n; Fe, Al-b, Cu-b, Cu-n, ST, *Si, Mn*)

628-Q.* (Russian.) Relief of Lattice Distortions and Its Effect on the Kinetics of Initial Creep. Ya. E. Geguzin. *Fizika, Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 825-831.

Investigations aimed to discover correlations between initial creep and diffusion processes occurring in metals under load, and to study the effect of lattice distortions caused by plastic deformation or the preparation of a metal from an electrolyte. (Q3, 3-68, N1, M26s)

629-Q.* (Russian.) Internal Friction of Pure Nickel in Relation to Temperature. O. I. Datsko and V. A. Pavlov. *Fizika Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 900-904.

Maximum internal friction of pure recrystallized Ni in the 440-460° C. range depends upon stress relaxation along grain boundary. With increase of annealing temperature the maximum friction is reduced and is not displaced noticeably from the high-temperature region. 14 ref. (Q22, Ni-a, 2-64, 2-61)

630-Q. (Russian.) Yield Point in Metallic Crystals. P. I. Kuleshov. *Fizika Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 924-928.

Analysis under complex loading. 9 ref. (Q24c; 14-61)

631-Q. Welded Cantilever Wedge Beams. W. J. Krefeld, D. J. Butler and G. B. Anderson. *Welding Journal*, v. 38, Mar. 1959, p. 97s-112s.

Experimental determination of critical stresses at which steel beams buckle elastically. Tests conducted on beams having both I and channel sections, with various dimensions, span lengths and degrees of taper. (Q23b, 3-73, 1-54; ST, 7-51)

632-Q. Elastic Constants of Vanadium Single Crystals. E. Sandor and W. A. Wooster. *Acta Crystallographica*, v. 12, Apr. 10, 1959, p. 332-336.

Elastic constants of single crystals of 99.7% pure V studied using diffuse X-ray reflections. 14 ref. (Q21; V, 14-61)

633-Q. Which Method for Extrapolating Stress-Rupture Data? R. M. Goldhoff. *Materials in Design Engineering*, v. 49, Apr. 1959, p. 93-97.

Comparison of three different parameters and master curves. (Q3q)

634-Q. Wear of Lubricated Surfaces. Nicholas Chironis. *Product Engineering (Design Edition)*, v. 30, Apr. 13, 1959, p. 74-75.

Report on ASME symposium covering gear wear. (Q9n, T7a, 18-73)

635-Q. Cast-Pin Tear Test for Susceptibility to Hot Cracking. F. C. Hull. *Welding Journal*, v. 38, Apr. 1959, p. 176s-181s.

Hot cracking during freezing of weld bead, or solidification of a casting evaluated by new test. 10 ref. (Q27, 1-54; SS, 9-72, 7-51)

636-Q. (German.) H. M. Schnadt's Strength Hypothesis for Metallic Materials. Alfred Krisch. *Archiv fur das Eisenhuttenwesen*, v. 30, Mar. 1959, p. 169-185.

33 ref. (Q3m, 10-51)

637-Q.* Influence of Sulphur and Oxygen in Causing Red-Shortness in Steel. A. Josefsson, J. Koeneman and G. Lagerberg. *Iron and Steel Institute, Journal*, v. 191, Mar. 1959, p. 240-250.

Influence of thermal history on red shortness in steels containing 0.02-0.08% S, <0.02-0.09% Mn, and high carbon content (up to 0.8%) studied by impact testing. Sulphur causes red shortness by hardening the austenite and forming intergranular sulphide precipitates. Both phenomena lead to intercrystalline fracture and may be eliminated by heat treatment. 23 ref. (Q26s, 2-64; CN, *Mn, C, S*)

638-Q.* Longitudinal Panel Cracking in Ingots. S. C. Desai. *Iron and Steel Institute, Journal*, v. 191, Mar. 1959, p. 250-256.

Cracks are largely confined to steels of a composition range such that the pearlite grains are enveloped in a more or less continuous thin boundary of ferrite. Within this range, the susceptibility of any particular steel to panel cracking is greatly influenced by its Al and nitrogen contents. 3 ref. (Q26q, 2-60; ST, 5-59, Al, N)

639-Q.* (German-French.) Properties and Weldability of New Metals and Alloys. C. G. Keel *Zeitschrift fur Schweisstechnik (Journal de la Soudure)*, v. 49, Mar. 10, 1959, p. 70-78.

Heat resistant alloys with Fe, Co, Ni, Cu, Cr and Ti as base metal used in nuclear reactors, gas turbines, jet engines, pumps, heat exchangers and valves. Use of pure Cu, Ni alloys, Inconel 702, R-235, L-605 and N-155 alloys as brazing materials for high-temperature steels. (Q-general, 2-62, K9s, T11; SGA-h, Fe-b, Co-b, Ni-b, Cr-b, Ti-b, SGA-f)

640-Q.* (Russian.) Structural Changes in Metals at a Very Slow Rate of Deformation. L. M. Rybakova and B. M. Rovinskii. *Fizika Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 874-878.

Technically pure Ni and steel were studied under tensile deformation both at a normal and a very slow rate. On the basis of radiographs a process of mutual transfer of crystal grains and elements of their substructures is assumed. 9 ref. (Q3, 3-68, M26; Ni, ST)

641-Q.* (Russian.) Modulus of Elasticity and Hardness of Copper-Beryllium Aging Alloys. I. N. Frahtsevitch and P. I. Mel'nichuk. *Fizika Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 912-918.

Be has a weakening effect on the interatomic bond of Cu-Be Alloys. The aging effect is intensified in alloys with a weakened atomic bond. 8 ref. (Q21, Q29, N7a, M25h; Cu-b, *Be*)

642-Q.* (Russian.) Mechanical Properties of 10G2SD Steel Weldments. V. Yu. Shishkin, V. A. Makurin, D. I. Navrotskii and V. N. Savel'ev. *Svarochnoe Proizvodstvo*, Mar. 1959, p. 12-15.

Weld joints tested for elongation by cyclic loading at 300 cycles per min. Failure occurred in base metal, away from weld. Weld strength compares favorably with steel 3 and high -Cr steel 15KHSND. (Q-general, AY, 7-51)

643-Q.* (Russian.) Effect of Impurities on Development of Hot (Intercrystalline) Cracks in Weld Deposited Metal. M. V. Pridantsev and A. S. Astaf'ev. *Svarochnoe Proizvodstvo*, Mar. 1959, p. 18-22.

Presence of B up to 0.014% increases the development of intercrystalline tears in the weld deposit. Ca in the amount 0.042-0.4% does not depress the formation of intercrystalline tears. Increase of Ca concentration, depending on type of flux used, may either reduce or increase the intensity of intercrystalline tear formation. Ba has no effect. 8 ref. (Q26p, 3-69; ST, 7-51, *B, Cu, Ba, Ca*)

644-Q.* (Russian.) Effect of Spacing on Fatigue Strength on Spot Welds. M. A. El'yashev. *Svarochnoe Prozvodstvo*, Mar. 1959, p. 22-23.

The fatigue strength of a weldment decreases nonproportionally as the distance between spots is increased. Tabular survey on tensile strength, fatigue limit and strength coefficient for various materials. (Q7a, Q27a; 7-51)

645-Q.* (Ukrainian.) Effect of Preheating Temperature on Residual Stresses of the First and Second Kinds and on Fatigue Strength of Rolled Steel. A. I. Yatsyuk and M. M. Shved. *Dopovidi Akademii Nauk-Ukrainskii RSR*, Jan. 1959, p. 18-20.

A rise in preheating temperature of rolled steel 45 (pearlite and ferrite) up to 300° C. causes an increase in the residual compression stresses of the second kind. A further rise in the preheating temperature leads to a decrease in their magnitude and at 500° C. residual stresses vanish. 5 ref. (Q25h, Q7a, 2-61)

646-Q.* Unified Interpretation of Room-Temperature Strength of Notched Specimens as Influenced by Their Size. B. M. Wundt. *American Society of Mechanical Engineers*, Paper no. 59-MET-9, May 1959, 13 p.

Relationship derived between notch strength and relative notch depth for cylindrical tension bars with different outside diameters. (Q23s)

647-Q.* Delayed Failure of High Strength Steels. Alexander R. Troiano. *Corrosion*, v. 15, Apr. 1959, p. 207t-212t.

Influence of applied stress, hydrogen concentration and notch radius on time to fracture of statically loaded specimens of cadmium plated AISI 4340 steel. Kinetics of crack initiation and propagation. Effect of thickness of Cd plate, time and temperature on hydrogen removal by baking treatments. 14 ref. (Q26s, Q26q, Q27d; AY, *Cd*, 8-62, SGB-a)

648-Q.* Some Observations on the Portevin-LeChatelier Phenomenon. R. Tamhankar. *Indian Institute of Metals, Transactions*, v. 11, Dec. 1958, p. 37-53.

Mechanical instabilities of Armco iron and 35 Ni, 10 Cr austenitic steel occurring during tensile tests at 2 to 700° C. Effect of grain size, temperature and strain rate on occurrence and nature of serrations in load-elongation curves. 25 ref. (Q24j, Q27a, 2-61, 2-59; SS-e, CI)

649-Q.* Friction and Frictional Wear. B. N. Das and R. Choubey. *Indian Institute of Metals, Transactions*, v. 11, Dec. 1958, p. 67-77.

Wear of rail and wheel steels during laboratory tests. Variation of rate of wear with load, time and surface hardness. Effect of load on dynamic frictional torque. 14 ref. (Q9n, Q9p; CN)

650-Q.* Four New Stainless Alloys. Norman S. Mott. *Iron Age*, v. 183, Apr. 16, 1959, p. 118-121.

Composition of precipitation hardening PH 55 stainless steels. Mechanical properties of castings at room and elevated temperatures. Wrought forms. Corrosion rates in calcium hypochlorite, ferric chloride and sulphuric, hydrochloric, nitric, acetic and phosphoric acids. (Q-general, R6g, R6p; SS)

651-Q.* Design With Non-Ferrous Sinterings. *Precision Metal Molding*, v. 17, Apr. 1959, p. 32-33.

Density, tensile properties and hardness of sintered copper-base powdered compacts. Nonferrous metal powders. (Q27a, Q29n, P10a; Cu, 6-72, EG-a38)

652-Q.* Properties of Die Casting Alloys. *Precision Metal Molding*, v. 17, Apr. 1959, p. 36-38.

Chemical composition, mechanical and physical properties of Zn, Al and Mg-base die-casting alloys. Tensile properties of Al alloys at 75 to 500° F. (Q-general, P-general; Al-b, Zn-b, Mg-b, 5-61)

653-Q.* Designing for Investment Casting. *Precision Metal Molding*, v. 17, Apr. 1959, p. 39-41.

Chemical composition and typical mechanical properties of standard investment casting alloys. Carbon steel, low-alloy steel, stainless steel, Co, Al, Mg and Cu alloys. (Q27; Al-b, Mg-b, Co-b, Cu-b, ST, SS, 5-62, 17-51)

654-Q.* Properties of Permanent Mold Casting Alloys. *Precision Metal Molding*, v. 17, Apr. 1959, p. 42-45.

Composition, mechanical and physical properties of Al and Mg permanent mold casting alloys. Tensile properties of Al alloys at 75 to 700° F. (Q-general, P-general, 2-62; Al-b, Mg-b, 5-63)

655-Q. Annealing in Slip Bands in Copper Fatigued at 90° K. D. Hull. *United Kingdom Atomic Energy Authority*, AERE M/R 2306A, Jan. 1958, 6 p.

When specimens are fatigued at 90° K., and heated to room temperature at intermediate stages, the rate of increase of slip bands is much smaller than for specimens kept entirely at 90° K. The intermediate heating effectively makes the slip bands softer than the surrounding regions so that on further fatiguing more slip occurs near or within the slip band. Results are attributed to movement of point defects formed in the slip bands by the fatigue deformation. 11 ref. (Q24c, Q7; Cu)

656-Q. The Effect of Neutron Irradiation on the Impact Properties of En2 Mild Steel. I. L. Mogford, A. T. Churchman and D. Hull. *United Kingdom Atomic Energy Authority*, AERE M/R 2485, Feb. 1958, 9 p.

An increase in the transition temperature exists which is approximately proportional to the cube root of the irradiation dose. At the maximum dose the rise in transition temperature is 75° C. There

exists a reduction in the energy absorbed in the ductile fracture after irradiation which is approximately 50% for specimens given higher doses. 16 ref. (Q6, Q26, 2-67; CN)

657-Q. The Effect of Cadmium Plating on SAE 4340 Steel in the Presence of Stress Concentrations at Elevated Temperatures. E. M. Kennedy, Jr. Wright Air Development Center. *U. S. Atomic Energy Commission,* WADC-TR-58-108 (Pt. 1), Dec. 1957, 40 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.) $1.25.

SAE 4340 investigated in the annealed and heat treated conditions. The annealed material was investigated at 600 and 611° F., and effects on the properties of the heat treated material observed at 500, 600 and 611° F. The properties of Cd plated steel in both conditions, annealed and heat treated, were compared with the properties of unplated steel subjected to the same test conditions. (Q25k, 2-64; ST, 8-62, *Cd*)

658-Q. A Preliminary Study of High-Strength Zirconium-Base Alloys. S. R. Maloof. Nuclear Metals Inc. *U. S. Atomic Energy Commission,* NMI-1205, Aug. 1, 1958, 36 p. (Available from U.S. Office of Technical Services, Washington 25, D.C.) $1.

Tensile tests at room temperature and at 500° C. on five experimental Zr-base alloys indicate that ultimate tensile strengths of around 190,000 psi. and elongations of 3 to 9% are possible at room temperature, and at 500° C. tensile strengths greater than 100,00 psi. High-strength Zr-base alloy claddings restrain the growth of unalloyed U during thermal cycling. (Q27, Q7j; Zr-b, SGB-a)

659-Q.* (German.) Influence of Grain Structure on the Fatigue Strength of Nitrided Steels. H. Wiegand. *Draht,* v. 10, Mar. 1959, p. 94-95.

Grain structure has strong influence on fatigue strength but little effect on surface hardness. (Q7a, J28k, 2-59; ST)

660-Q.* (German.) Influence of Nitriding on Fatigue Strength. A. Juenger. *Draht,* v. 10, Mar. 1959, p. 95.

After nitriding or carburizing the endurance bending strength is increased and is no longer influenced by surface condition. (Q7a, A7g, 2-64, J28k; ST)

661-Q.* (German.) Corrosion Protection of Nickel Coatings Produced by the Chemical Process. *Galvanotechnik,* v. 50, Mar. 15, 1959, p. 148-149.

Due to the phosphorus content the hardness of Ni coat amounts to 650 Vickers. Heating 1 hr. at 400° C. increases the hardness to 1200 Vickers—similar to that of hard Cr coatings. Heating for 5 hr. in inert atmosphere at 750° C. and slow cooling to 200° C. makes the surface corrosion resistant. (Q29n, R-general; Ni, 8-62, *P*)

662-Q.* (German.) Material Tests in Modern Machine Design. L. Gillemot. *Periodica Polytechnica-Engineering Series,* v. 2, no. 4, 1958, p. 251-273.

Material quality can be characterized by work of deformation per unit volume which can be calculated from traction test data. Values depend on the multi-axial stress condition. Test is useful in design to avoid brittle fractures. 18 ref. (Q25, Q26s, 17-51)

663-Q.* High-Nickel Airframe. *Aircraft Production,* v. 21, Apr. 1959, p. 122-126.

Mechanical properties and fabrication of Inconel X. (Q-general, G17, K3n, T24a, 2-62; Ni-b, 17-57)

664-Q.* Serviceability of Welds Containing Discontinuities. William L. Green. *News in Engineering,* v. 31, Feb. 1959, p. 13-16, 27.

Static load characteristics of the mild steel welds were not affected by porosity in amounts reducing the cross section area up to about 7%. (Q-general; CN, 7-51, 9-68)

665-Q.* Surface Film May Be Clue to Low Wear of Alloy CI Tappets. George H. Robinson, Robert F. Thomson and Fred J. Webbere. *SAE Journal,* v. 67, Apr. 1959, p. 80-83.

Wear tests with various lubricants on cast iron and carburized steel. (Q9, T21b; CI-q, ST, NM-h)

666-Q.* (Japanese.) Effect of Aluminum on the Hot Workability of Low-Carbon Steel. Takeshi Akutagawa, Yoshitsugu Michima, Eiichiro Asano and Akizi Suseki. *University of Tokyo, Faculty of Engineering,* v. 17, Mar. 1959, p. 54-59.

Aluminum oxide, in form of inclusions, interferes with deformation by hot rolling. (Q23q, F23; CN, N, 9-69)

667-Q.* Influence of Arsenic Content in Copper Crystals on Easy Glide at -183° C.

K. Schroder. *Physical Society, Proceedings*, v. 73, Apr. 1, 1959, p. 674-676.

Addition to a pure metal of a soluble impurity increases the range of easy glide observed in tensile tests of single crystals. Shear stress, orientations, shear strain curves for crystals. 8 ref. (Q24a, Q2j, 2-63, 2-60; Cu-b, *As*, 14-61)

668-Q.* (French.) Present Knowledge of Brittle Fracture. C. Miklosi. *Metalurgia si Constructia de Masini*, 1958, p. 21-27.

Theory of the mechanism of plastic deformation. Difference in the behavior of welded assemblies from that of riveted assemblies is caused by residual stress, precipitation from supersaturated solutions under thermal shock and incomplete transformations. 30 ref. (Q26s, K9n; 7-51, ST)

669-Q. (German.) Increase of the Fatigue Life of Crankshafts by Bath Nitriding. B. Finnern. *Draht*, v. 10, Mar. 1959, p. 95.

Elimination of straightening after heat treatment. Increase of fatigue strength and wear resistance. (Q7a, J28k, T7; ST)

670-Q. (German.) Radiographic Measurement of Stress in Hardened Gears. U. Wolfstieg. *Draht*, v. 10, Mar. 1959, p. 96-97.

Use of a Geiger tube goniometer instead of photographic film increases accuracy and enables measurement of internal stress. (Q25, T7a, X2m; ST)

671-Q. (German.) Possibilities of Multi-Axial Stress Measurement by X-Ray Diffraction. I. S. Szanto. *Periodica Polytechnica-Engineering Series*, v. 2, no. 4, 1958, p. 275-289.

Statistical observation of lattice changes. Description of new X-ray deformograph. (Q25, M22g, 1-53)

672-Q. Quenching Studies on Mechanical Properties of Pure Gold. M. Meshii and J. W. Kauffman. *Acta Metallurgica*, v. 7, Mar. 1959, p. 180-186.

Yield stress increases with cooling rate, aging and quenching temperature 500-1050° C. Activation energy measured at increases in yield stress. Cooling rates were 1000 to 6000° C. per sec. 17 ref. (Q23b, Q25p, J26, 2-65; Au-a, 4-61)

673-Q.* Deformation Mechanisms During Creep in Metals. R. Widmer. *Brown Boveri Review*, v. 45, Nov-Dec. 1958, p. 575-581.

Mainly crystallographic slip is experienced at high stresses accompanied by severe distortion of the lattice. In contrast, at medium and light stresses it is usually possible to find a cellular mechanism for which, in the process of deformation, the crystals may be subdivided into subgrains whose lattice is undisturbed. 7 ref. (Q3; SS-e)

674-Q.* Properties and Heat Treatment of Cast Austenitic Steel Containing Ferrite. G. Faber. *Brown Boveri Review*, v. 45, Nov-Dec. 1958, p. 582-588.

Difficulties experienced when welding stabilized cast austenitic steel, due to segregation at the grain boundaries, can be avoided if the steel is alloyed in such a manner that a small percentage of ferrite is produced during solidification. If, by appropriate heat treatment, the initially coherent ferrite is broken up into separate islands, the serious embrittlement which results from formation of the sigma phase at temperatures of 600 to 800° C. is no longer possible; at the same time resistance develops to intercrystalline corrosion. 9 ref. (Q26s, R2h, J-general; SS-e, 9-69)

675-Q.* Refractory Materials. D. R. Williamson and Lorraine Burgin. *Colorado School of Mines Mineral Industries Bulletin*, v. 2, Mar. 1959, p. 1-16.

Problem of high-temperature service, properties of high-temperature materials. 19 ref. (Q-general, P-general, 2-62; EG-d37, SGA-h)

676-Q. Theory of the Low-Temperature Maximum of the Internal Friction of Metals. H. Donth. *United Kingdom Atomic Energy Authority*, AERE Lib/Trans 789, Jan. 1959, 21 p.

Pairs of over-dislocations can be continuously formed by the concentration of energy from the normal vibrations of the dislocation line. The energy concentration is produced by interaction with the thermal lattice waves. By means of this interaction the energy of vibration of the dislocation is increased and decreased by small amounts in an irregular fashion. 38 ref. (Q22, 2-63)

677-Q. Tensile Properties of Pure Plutonium. H. R. Gardner and J. M. Jefferes. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission*, HW-57130, Aug. 6, 1958, 16 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.

Tensile, hardness and density data, typical stress-strain curves. Yield

strength was determined on the basis of 0.02% offset, an acceptable criterion for brittle materials. A delta phase anneal did not significantly alter the tensile properties of as-cast Pu. (Q27a, Q29n; Pu-a)

678-Q. Radiation Damage Studies of Boron Stainless Steel. Interim Report. H. T. Watanabe and W. O. Schaffbit. Phillips Petroleum Co., Atomic Energy Division. *U. S. Atomic Energy Commission,* IDO-16483, Sept. 18, 1958, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Tensile specimens of 18-8 stainless steel containing 1% boron, enriched to 93% in boron-10, were fabricated and irradiated to 15 and 25% burnup of boron-10. As a result of irradiation large changes occur in total elongation, yield strength and ultimate tensile strength. Further increase in dosages increase brittleness at a reduced rate with a lesser increase in tensile strength. (Q-general, 2-67; SS, *B*)

679-Q. Multiaxial Creep Studies on Inconel at 1500° F. C. R. Kennedy, W. O. Harms and D. A. Douglas. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission,* ORNL-2622, Feb. 5, 1959, 38 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Creep rate and rupture life of axially loaded pressurized Inconel tubes studied at 1500° to develope failure criteria based on properties measured in the conventional uni-axial tension test. Creep rate results are compared on the bases of established theories of stress analysis and good correlation is shown between uni-axial test results and the results of tests with multi-axial stress states. (Q3; Ni-b)

680-Q. Mechanical Properties of Certain Aircraft Structural Metals at Very Low Temperatures. R. L. McGee, J. E. Campbell, R. L. Carlson and G. K. Manning. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151459, Nov. 1958, 63 p. $1.75.

Alloys tested were 17-7PH and AM-350 stainless steels, AISI 4340 and Tricent steels, 7079-T6 Al and ZK60A-T5 Mg alloys and A110AT, C110M and 6A1-4V Ti alloys. Notched impact energies were determined on the two steels and the Al and Mg alloys. Values for hardness, elastic modulus, yield strength and tensile strength of these materials tended to increase as the temperature was reduced to -235° C. (Q-general, 2-63; ST, SS, Mg-b, Ti-b)

681-Q.* (French.) Construction of the "Atomium" in Brussels. F. Hebrant. *Revue de la Soudure Lastijdschrift,* v. 15, Jan. 1959, p. 1-18.

Impact tests and other mechanical tests made at various temperatures on sheet steel used in the construction. Determination of embrittlement temperatures. 9 ref. (Q-general; CN-g, 4-53)

Techniques for producing quantities of zone-refined Fe; fatigue tests on zone-refined Fe. (Q7, 3-69, C28k; Fe)

699-Q. Investigation of the Strength and Ductility Relationships in Titanium-Aluminum Alloys Between 6 and 15% Aluminum for Application at Elevated Temperatures. Manufacturing Laboratories Inc. (For Wright Air Development Center), Mar. 31, 1959, 7 p.

Striation markings represent subboundaries derived from the original martensitic platelets that form on cooling through the beta-alpha transus. Tests show that there is no improvement in bend ductility when the striations are eliminated by cold work and recrystallization. Kinetic studies based on room-temperature bend ductility tests and elevated-temperature electrical resistance measurements indicate that the activation energy for embrittlement is about 34,000 cal. per mol for temperatures above about 650° F. (Q5g, 2-62; Ti-b, *Al*)

700-Q. Test of 61S-T6 Aluminum Sheet Under Short-Duration, High Rate of Rise, Heating. J. A. Barber. Sandia Corp. *U. S. Atomic Energy Commission*, SCTM3-58(16), Jan. 20, 1958, 16 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Elongation and ultimate strength of 61S-T6 sheet metal in both welded and unwelded specimens in the 400 to 900° F. range. 30% of total specimen elongation occurs at 700° F. Elongation due to thermal expansion is a straight-line function from approximately 480 to 800° F. Welded samples exhibit more variation in ultimate strength than solid samples. (Q27; Al-b, 4-53)

701-Q. Research Program on the Investigation of Seal Materials for High Temperature Applications. R. H. Baskey. Horizons Inc. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151451, June 1958, 74 p. $2.

Best alloys contain tungsten boride or chromium nitride as the basic metal. Tungsten boride gives a constant wear rate at all temperatures while wear rate of chromium nitride decreases at the higher temperatures. (Q9n; Cr-b, W-b, B, W, SGA-h)

702-Q. Study of Refractory Materials for Seal and Bearing Applications in Aircraft Accessory Units and Rocket Motors. L. B. Sibley. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151483, Oct. 1958, 59 p. $1.50.

Alumina-chromium-molybdenum cermet, silicon carbide, alumina and a titanium carbide-nickel-molybdenum cermet showed promise for short-life rubbing-seal applications, although rapid wear and erratic frictional behavior were observed. (Q9n, Q9p, R6g; Al, C, Si, Ti, SGA-c, 6-69, 6-70)

703-Q.* (French.) Influence of Hot Working Conditions on the Properties of the Alloy A-U4SG. Pt. 1. Roger Develay. *Revue de l'Aluminium*, v. 36, Feb. 1959, p. 193-197.

Prior homogenization and temperature at which extrusion is performed influence macrostructure and tensile properties. Decreasing extrusion temperature lowers recrystallization temperature. Totally and partially recrystallized as well as unrecrystallized structures are obtainable. (Q27a, F24a, M28, N5h, 2-61; Al-b, *Cu, Si*)

704-Q.* (German.) Burst Testing of Structural Steels Resistant to Brittle Cleavage

Fracture. H. Hauttmann. *Schweisstechnik*, v. 13, Feb. 1959, p. 13-19.

Results obtained with various steels, arc welded with different electrodes. Effect of heat treatment on the properties of welded joints. Burst testing with gradually increasing load and under impact produced by explosion. 4 ref. (Q10b, Q26s, 2-64; 7-51, CN-g)

705-Q.* (German.) Processes Causing Residual Stress. Ulrich Dehlinger. *Zeitschrift fur Metallkunde*, v. 50, Mar. 1959, p. 126-130.

Residual stress is explained by dislocations caused by deformation traveling within the lattice and piling up when obstacles—primary dislocations—prevent their migration. 16 ref. (Q25h, M26b)

706-Q.* (Italian.) High-Silicon Acid Resistant Cast Irons. Berardo Abignente. *Fonderia*, v. 8, Mar. 1959, p. 99-102.

Design and founding of castings; physical and mechanical properties; machinability; comparative corrosion resistances in numerous organic and inorganic acid media. (Q-general, E-general, R6g, R7b, CI-q, *Si*)

707-Q.* (Swedish.) A Study of the Influence of Different Factors on Rockwell C Tests. K. F. Lindstrand. *Jernkontorets Annaler*, v. 143, n. 1, 1959, p. 29-36.

Rockwell C hardness tests on Jernkontorets standard hardness blocks (the generally accepted Swedish standard) by several firms and with different machines and penetrators were analyzed statistically. No pronounced irregularities in the Jernkontorets scale could be found. (Q29)

708-Q.* (Swedish.) Fatigue Tests on a Welded Chromium-Molybdenum Steel. I. Weibull. *Jernkontorets Annaler*, v. 143, no. 1, 1959, p. 37-48.

A 0.25% carbon steel was subjected to various heat treatments before and after welding. The fatigue limit is mainly determined by geometrical factors. For ground test bars of normalized material the fatigue strength was to a certain extent determined by minimum hardness. Reheat treatment after welding improved the fatigue strength, more so for hardened and tempered than for normalized base material. (Q7; CN-p, *Cr, Mo*, 7-51)

709-Q.* Brittleness of Cobalt-Iron Alloys. C. W. Chen and G. W. Wiener. *Journal of Applied Physics*, v. 30S, Apr. 1959, p. 199S-201S.

Experiments on two Co-Fe alloys with the addition of Cr or V establish the embrittling action of hydrogen at the grain boundaries. 14 ref. (Q26s, Q23p; Fe-b, *Co*, H)

710-Q.* Investigation of a Precipitation Hardening Elinvar. F. C. Hawkes. *Journal of Applied Physics*, v. 30S, Apr. 1959, p. 206S-207S.

The decrease in strain-induced magnetostriction as a result of aging in this alloy raised the elastic modulus and changed the shape of the modulus versus temperature curve below the Curie point. 5 ref. (Q21a, Q22, 2-65, P16b; Ni-b)

711-Q.* (French.) New Method for Measuring Poisson's Ratio of Metals and Alloys. Georges Vidal and Francois Girard. *Comptes Rendus*, v. 248, Mar. 2, 1959, p. 1286-1289.

Method permits the determination of the Poisson's ratio of isotropic metals with an accuracy of ± 1% and can be used at all temperatures. Tests conducted to check Poisson ratios of Al, Mg, Be, Fe, Ni and Mo, resulting in known values, prove the accuracy of the method. (Q21c; Al, Mg, Be, Fe, Ni, Mo)

712-Q.* (French.) Mechanism of Plastic Deformation of Metals. Aurel Berghezan and Angeline Fourdeux. *Comptes Rendus*, v. 248, Mar. 2, 1959, p. 1333-1335.

X-ray transmission methods applied to the deformation of monocrystals show that plastic deformation is a consequence of generation and movement of dislocations in the crystals. (Q24, M21e, M26s)

713-Q.* (French.) Application of Some Alloys in Aircraft Construction. P. Egre. *Revue du Nickel*, v. 25, Jan-Feb. 1959, p. 14-17.

Properties and limitations of steels containing C, Mn, Ni, Cr, Mo, Si and Ti and of stainless aircraft steels. (Q-general, T24, SS, AY, *C, Mn, Ni, Cr, Mo, Si, Ti*)

714-Q.* (Italian.) Influence of Iron and Magnesium on the Structure and Mechanical Properties of Inafond S7 and Inafond S71 Alloys. E. Di Russo and D. Gualandi. *Alluminio*, v. 28, Feb. 1959, p. 53-59.

In S7 alloys, reduction of Fe content to under 0.1% does not appreciably improve ductility. The opposite is true of S71 alloys, thus permitting increase in Mg content and lengthening of artificial aging treatment to obtain improved mechanical properties. 5 ref. (Q23p, Q27a, J-general, 2-60; Al-b, *Si, Fe, Mg*)

715-Q. Determination of Tensile, Compressive, Bearing and Shear Properties of Sheet Steels at Elevated Temperatures. J. Robert Kattus, James B. Preston and Herman L. Lessley. *Wright Air Development Center.* Technical Report no. 58-365, Nov. 1958, 274 p.

Data for A-286 austenitic alloy, Thermold J alloy steel, 420 stainless steel, 422 stainless steel, 17-22A(S) alloy steel—all quenched and tempered—and 17-7PH stainless steel, RH 950 condition. Strength properties and moduli of elasticity decreased with increasing temperatures. Decreases in strength are believed to be associated with structural changes produced by tempering. (Q-general, 2-62; SS)

716-Q.* (Russian.) Temperature Stresses in Flat Metallic Forms. O. Yu. Kotsyubinskii. *Liteinoe Proizvodstvo,* Mar. 1959, p. 30-34.

Mathematical method of stress determination. 6 ref. (Q25p)

717-Q.* (Russian.) Effect of Small Barium Additions on the Nonuniform Structure and Heat Resistance of Stainless Steel Castings. N. S. Kreshchanovskii, A. F. Silaev and M. F. Sheshenev. *Liteinoe Proizvodstvo,* Mar. 1959, p. 39-42.

In large stainless steel (12KH11V2NMF-L) castings, addition of small quantities of Ba, in the form of Al-Ba-Ca alloy, considerably improves mechanical and heat resisting properties. (Q-general, E25, 2-60; SS, AD-q40, *Ba*)

718-Q.* (Russian.) Explosive-Type Impact Testing Machine. V. G. Kononenko. *Zavodskaya Laboratoriya,* v. 25, Mar. 1959, p. 343-346.

Rapid tests are possible for elongation, compression, bend and diverse metal treatments at varying rates of deformation and temperature ranges. 9 ref. (Q6q, 1-53)

719-Q. Dynamic Loading: Its Effect on Casting Design. Pt. 2. John B. Caine. *Foundry,* v. 87, May 1959, p. 92-95.

Design to minimize stress concentration in castings which undergo dynamic loading. (To be continued.) 23 ref. (Q25k; 5, 17-51)

720-Q. (English.) Calculation of a Cylindrical Shell of a Standard Vessel Subjected to Internal Pressure. W. P. Kerkhof. *Lastechniek,* v. 25, Mar. 1959, p. 50-52.

Specification of German boiler steels, their composition and properties. (Q25, T26q)

721-Q. (French.) Soviet Research in the Rupture of Metals. J. B. Friedmann. *Revue de la Soudure Lastijdschrift,* v. 15, Jan. 1959, p. 44-51.

Rupture mechanism under short-time and long-time static loads. Fatigue rupture. (Q3q, Q7)

722-Q. (French.) Fatigue Rupture. *Revue de la Soudure Lastijdschrift,* v. 15, Jan. 1959, p. 52-54.

Structural analysis of a welded crankshaft that failed. (Q7, T7j, 7-51)

723-Q. Elevated-Temperature Mechanical Properties and Oxidation Resistance of Columbium and Its Alloys. *Defense Metals Information Center,* Memo. No. 8, Feb. 4, 1959, Columbus, Ohio, 10 p.

Literature review of tensile and rupture properties oxidation behavior over a wide range of temperatures. Ternary and higher alloying gives further improvements in oxidation resistance. Alloys containing Zr-Ti, Ti-Al, Cr-Co, Fe-Al and Cr-Al show up to a 2000-fold improvement in oxidation resistance at 1000° C. 28 ref. (Q-general, R1h, 2-60; Cb-b, Zr, Ti, Al, Co, Cr, Fe)

724-Q. Effects of Inelastic Action on the Resistance to Various Types of Loads of Ductile Members Made From Various Classes of Metals. Pt. 10. T-Section Eccentrically-Loaded Tension Members Made of 17-7PH Stainless Steel and Tested at 1000° F. O. M. Sidebottom and S. Dharmarajan. University of Illinois, Dept. of Theoretical and Applied Mechanics. *Wright Air Development Center,* Technical Report 56-330, Nov. 1, 1958, 25 p.

Theoretical load deflection curves and comparison with experimental values. Tension creep data. Modulus of elasticity determination. (Q27a, Q21a, Q3m, 2-62; SS, 4-57)

725-Q. Partitioning and Microdistribution of Interstitial Alloying in Titanium. New York University College of Engineering, Research Div., Quarterly Progress Report no. 4. *Wright Air Development Center,* Mar. 1959, 3 p.

Effects of oxygen and carbon on grain boundary stress relaxation. Data for alpha Ti and beta-phase alloys of Ti-Cb alloys. (Q3a, 2-60; Ti-b, *Cb, O, C*)

726-Q. Tensile Properties of Aircraft-Structural Metals at Various Rates of Loading After Rapid Heating. Haywood E. Dedman, Edmund J. Wheelahan and J. Rovert Kattus. Southern Research Institute. *Wright Air Development Center,* Technical Report no. 58-440, Nov. 1958, 197 p.

Four steels—Chrow-Mow toolsteel, Thermold-J toolsteel, Peerless-56 toolsteel and AM-350 precipitation-hardening stainless steel—and 6A1-4V Ti alloy were evaluated, the steels being tested at temperatures up to 1200° F. and the Ti alloy up to 1000° F. Test results show that, at the lower temperatures, the strength properties tend to increase slightly or to remain constant with increasing strain rates. Near the maximum test temperatures, the effect of strain rate becomes much greater, the strength properties increasing greatly with increasing strain rates. (Q27, 3-68; SS, TS, Ti-b)

727-Q. Evaluation of Alloys for High Temperature Gear Applications. E. G. Jackson, C. F. Muennch, E. H. Rowe and E. H. Scott. *Wright Air Development Center,* Technical Report no. 58-546, Dec. 1958, 79 p.

Materials investigated were M50 high speed toolsteel, modified M50, L.P.D. hot work die steel, M1 high speed toolsteel, Nitralloy N, Co-Cr die steel, 6A1-4V Ti alloy. High-temperatuae data were obtained on hardness, dimensional stability, tensile, impact and tooth fatigue strengths, corrosion and oxidation and on surface scoring resistance. (Q-general, 2-62, T7a; TS, Ti-b)

728-Q.* (Russian.) Recovery After Deformation in Aluminum, Silver and Platinum After Removal of Testing Load. A. Ya. Samoilova and V. S. Postnikov. *Fizika Metallov i Metallovedenie,* v. 6, no. 6, 1958, p. 1081-1087.

Deformation by low-frequency torsional fluctuations at small amplitude was preceded by deformation caused by elongation. 22 ref. (Q22n; Al, Ag, Pt)

729-Q.* (Russian.) Effect of Heat Treatment on the Shear Modulus and on the Curie Point of Elinvar. V. V. Propastina. *Fizika Metallov i Metallovedenie,* v. 6, no. 6, 1958, p. 1105-1109.

Raising the hardening temperature causes a phase change and considerably influences the magnitude and abnormality of the shear modulus. The value of the shear modulus depends upon the number of carbide phases. Carbon in the carbide binds the alloying elements into a complex triagonal carbide and raises modulus value. Cr, W and Mn alloy additions impoverish the solid solution and help to raise the Curie point, thus increasing the abnormality of shear modulus. 8 ref. (Q21d, 2-64; Fe-b, Ni, SGA-s)

730-Q. Evaluation of High Strength Steels for Elevated Temperature Applications in Aircraft. Pt. 1. Flat Rolled Products. Division of Engineering and Industrial Research, National Academy of Sciences. *Dept. of Defense and the National Academy of Sciences,* Report no. MAB-131-M, Apr. 8, 1958, 67 p.

Survey of mechanical, physical and chemical properties desired by the aircraft industry. Tensile properties, modulus of elasticity, creep properties, hardness, thermal conductivity, coefficient of thermal expansion, corrosion resistance, weldability, machinability, composition of hot work steels, martensitic alloy steels, martensitic stainless, semi-austenitic and austenitic stainless steels meeting aircraft requirements. Influence of temperatures up to 1200° F. on properties. (Q-general, P-general, 2-62, K9s, G17k, T24a; TS, SS, 4-53, SGB-a)

731-Q. Effect of Texture on the Mechanical Properties of Beryllium-Copper Wire. August Freda and B. D. Cullity. University of Notre Dame, Dept. of Metallurgy. *Office of Naval Research,* Technical Report no. 6, June 1958, 8 p.

Texture, grain size and mechanical properties of Be-Cu wire after cold work and heat treatment. (Q27a, Q1a, 3-72, 2-59, M26c, 2-64; Cu-b, *Be,* 4-61)

732-Q. Research on the Delay Time Study of Metal Single Crystals. R. H. Baskey. Horizons Inc. *Office of Naval Research,* July 1, 1958, 70 p.

Single crystals of bcc. beta brass, close-packed-hexagonal Zn and Mg impact tested at +25 to -190° C. Resonance frequency measurement of Young's modulus. Relation of critical resolve shear stress with temperature and strain duration. Effect of precompressing on delay time for yielding. Influence of recovery heat treatment. 26 ref. (Q24a, Q28h, 3-67; Cu-a, Mg-a, Zn-a, 14-61)

733-Q. Engineering Behavior of Structural Metals Under Slow and Rapid Loading. J. M. Massard and R. A. Collins. University of Illinois, Dept. of Civil Engineering, Urbana, Ill. *Office of Naval Research,* Oct. 1958, 105 p.

Time-sensitive stress-deformation characteristics of rimmed semikilled and fully killed mild steels, alloy steels and 6061-T6 Al alloy as determined by slow and rapid application of stress under uniaxial conditions and conditions of pure flexure. Engineering significance. 41 ref. (Q24, Q25n, 3-67; ST, AY, Al-b)

734-Q. Compressive Creep Buckling of Metal Columns. Pt. 6. Effect of Initial Imperfection. Alfred Rudnick, Robert L. Carlson and George K. Manning. Battelle Memorial Institute. *Wright Air Development Center*, Technical Report 52-251, Oct. 1958, 52 p.

Columns of 6A1-4V Ti alloys tested at 750 to 900° F. Interrelationships between column load, lifetime, temperature and initial imperfection. 31 ref. (Q3c, 2-62; Ti-b, *Al, V*)

735-Q. The Relationships Between Transformations and Residual Stresses in Heat Treated Steels. E. P. Klier. Syracuse University Research Institute, Metallurgical Engineering Dept. *Bureau of Aeronautics, Dept. of the Navy*, Final Report no. 2, Aug. 1958, 86 p.

Influence of section size, cooling medium, quenching temperature, martensite temperature range and tempering characteristics on residual stresses in quench cylinders of Mn-Cr toolsteel (0.7% C), Hy Tuf, 218 Halcomb, 4340 and 2340 steels. Residual stress measurement; cooling curves for cylinders; cooling transformation diagrams, hardness, microstructure. 13 ref. (Q25h, Q25m, 2-64; AY, TS)

736-Q. Mechanical Properties of Certain Aircraft Structural Metals at Very Low Temperatures. Robert L. McGee, James E. Campbell, Robert L. Carlson and George K. Manning. Battelle Memorial Institute. *Wright Air Development Center*, Technical Report 58-386, Nov. 1958, 57 p.

Tensile properties and Vickers hardness values of 17-7PH and AM-350 stainless steel sheet stock: AISI 4340 and Inco Tricent steel bar stock, 7-79-T6 Al alloy billets, ZK60A-T5 Mg bar stock and A11OAT, C11OM and 6A1-4V Ti alloy sheets at temperatures from -253 to +25° C. Tensile properties of plain and notched specimens. Charpy impact values for Al, Mg and steel bar stock. (Q-general, 2-63; SS, AY, Ti-b, Al-b, Mg-b, 4-53, 4-55)

737-Q. Heat Treatment Response, Mechanical Properties and Stability of Titanium Sheet Alloys. Eugene Delgrosso, Peter Kuzmenko, Allan Springmeyer, Brian Weldon, A. Richard Zello and James Chafey. Chase Brass and Copper Co., Inc. *Wright Air Development Center*, Technical Report 58-409, Jan. 1959, 104 1.

Effect of solution treatment, aging and interstitial content on mechanical properties and microstructure of Ti-4A1-3Mo-1V, Ti-15V-2.5A1 and Ti-4Al-1Pb-1Sn-1V-IZr alloys. Beta transi, room and elevated-temperature tensile properties, notch sensitivity, bendability and creep properties. Influence of deformation on aging. 28 ref. (Q-general, M27b, 2-64, 2-65; Ti-b, *Al, V, Sn, Mo, Zr, Pb*)

738-Q. Energy of Crack Formation and Crack Propagation Under Impact. W. B. Triplett and C. Wells. Carnegie Institute of Technology, Metals Research Laboratory, *Wright Air Development Center*, Progress Report no. 3, Apr. 15, 1959, 25 p.

Charpy V-notch impact values for longitudinal and transverse specimens of AISI 8740, AISI 87B40 with rare earth additions, AISI 4340, AISI 4340 and Ni-Cr steels tested at temperatures of -321 to +212° F. Estimation of crack formation and crack propagation energies, comparison with experimentally determined values. Tear phenomena. 7 ref. (Q26p, Q26q, Q6n, 2-63; AY)

739-Q.* New Impact Tester Checks Metal Fatigue. S. J. Ziembinski. *Industrial Science and Engineering*, v. 6, Apr. 1959, p. 22-27.

Machine for testing metals under repeated shocks. (Q7, Q6, N7e, 1-53)

740-Q.* Deformation of Metals by Vickers-Type Pyramidal Indenters. T. O. Mulhearn. *Journal of the Mechanics and Physics of Solids*, v. 7, Mar. 1959, p. 85-96.

Mechanism of indentation of a plane surface by a wedge. 10 ref. (Q29c)

741-Q.* Strain-Rate Sensitivity of Uranium. C. J. Maiden. *Journal of the Mechanics and Physics of Solids*, v. 7, Mar. 1959, p. 106-113.

Stress-strain curves obtained in compression tests indicate uranium is slightly strain-rate sensitive. 8 ref. (Q28; U)

742-Q.* Stress-Strain Cycles of Large Amplitude. D. S. Dugdale. *Journal of Mechanics and Physics of Solids*, v. 7, Mar. 1959, p. 135-142.

Strain cycles of constant amplitude were imposed on specimens of Cu, steel and Al alloy while variations in stress amplitude were recorded. For annealed materials the stress increased with successive cycles, but for cold worked materials it diminished, reaching steady values after definite amounts of plastic strain. 6 ref. (Q7; Al, Cu, ST)

743-Q. Slip Theory of Plasticity for Crystalline Aggregates. H. Payne. *Journal of the*

Mechanics and Physics of Solids, v. 7, Mar. 1959, p. 126-134.
5 ref. (Q24a)

744-Q. Note on the Elastic Constants of Uranium. S. J. Rothman and E. S. Fisher. *Nuclear Science and Engineering*, v. 5, Mar. 1959, p. 195-196.
(Q21)

745-Q. (German.) The Upper Yield Point. Ulrich Dehlinger. *Zeitschrift fur Metallkunde*, v. 49, Aug. 1959, p. 416-418.
Theory and mathematics. (Q27a)

746-Q. (German.) Modulus of Elasticity and Damping Capacity of Cd-Mg Alloys. Werner Koster and Walter Lang. *Zeitschrift fur Metallkunde*, v. 49, Aug. 1958, p. 419-423.
Elasticity and damping capacity as a function of temperature and composition. 14 ref. (Q21a, Q8g, 2-61, 2-60; Mg-b, *Cd*)

747-Q. (German.) Poisson's Ratio in Elastic Deformation and in the Beginning of Plastic Deformation. Werner Koster and Johannes Scherb. *Zeitschrift fur Metallkunde*, v. 49, Oct. 1958, p. 501-507.
(Q21c)

748-Q. (German.) Determination of Poisson's Ratio. Hermann Franz. *Zeitschrift fur Metallkunde*, v. 49, Oct. 1958, p. 510-516.
92 ref. (Q21c)

749-Q. (Russian.) Heat Resistant Thin Steel Strip Used in Manufacturing of Pipes. E. Yu. Chemardurova. *Fizika Metallov i Metallovedenie*, v. 6, no. 6, 1958, p. 1095-1099.
Behavior of several steels during plastic deformation in the cold state. Strengthening or increased hardness during deformation in the cold state was determined by basic changed of block sizes and not by distortion of the second order. 6 ref. (Q24m, M25; ST)

750-Q. (Russian.) Strength of Thick Walled Pipes. V. A. Gladkovskii, L. F. Vereshchagin and V. E. Ivanov. *Fizika Metallov i Metallovedenie*, v. 6, no. 6, 1959, p. 1100-1104.
Strength of pipes subjected to ultra-high internal pressures up to 14,000 atmospheres. 5 ref. (Q23b; 4-60, ST)

751-Q. (Russian.) Crack Sensitivity During Impact Bend Tests. V. A. Drozdovskii and Ya. B. Fridman. *Zavodskaya Laboratoriya*, v. 25, Mar. 1959, p. 320-328.
16 ref. (Q5, Q26s)

752-Q. (Russian.) Testing Method for Abrasive Wear Under Impact Cycling. S. S. Ermakov. *Zavodskaya Laboratoriya*, v. 25, Mar. 1959, p. 337-339.
Resistance of steels to abrasive wear depends mainly on structure and hardness and very little on the chemical composition. (Q9n, Q6; SS)

753-Q. (Russian.) Equipment for the Determination of Young's Modulus at High Temperatures. V. A. Kuz'menko. *Zavodskaya Laboratoriya*, v. 25, Mar. 1959, p. 351-353.
(Q21a, X28)

754-Q.* Impact Test for Evaluating Toolsteels. Gary Steven. *Metal Progress*, v. 75, May 1959, p. 76-77, 188.
A shallow ($\frac{1}{2}$-in. radius) notch in the standard Charpy impact specimen is suitable for rating toughness of hardened toolsteels. Several different grades are compared along with the effects of various heat treatments on a single grade (M2). (Q6r; TS)

755-Q.* Metals at Low Temperatures. H. M. Rosenberg. *New Scientist*, Apr. 9, 1959, p. 802-804.
Effect on mechanical properties. (Q-general, 2-63)

756-Q. Determination of Materials Design Criteria for 6A1-4V Titanium Alloy at Room and Elevated Temperatures. J. K. Childs and M. M. Lemcoe. Southwest Research Institute. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151274, Aug. 1958, 275 p. $4.
Effect of high temperature on mechanical properties. (Q-general, 2-61; Ti-b, *V, Al*, 17-51)

757-Q.* (German.) Effect of Deformation on the Mechanical Properties of an Age-Hardening Aluminum Alloy. Herbert Richter and Gunter Wassermann. *Zeitschrift fur Metallkunde*, v. 49, Nov. 1958, p. 549-556.
While the elastic limit shifts to higher values in proportion to the degree of aging, work-hardening effects are diminished. In over-aging, the elastic limit value decreases and work-hardening effects remain unchanged. 12 ref. (Q23a, Q27, N7a, 3-68; Al-b, *Cu, Mg*, 4-68)

758-Q.* (German.) The System Tantalum-Nitrogen. Erich Gebhardt, Hans-Dieter Seghezzi and Wolfgang Durrschnabel. *Zeitschrift fur Metallkunde*, v. 49, Nov. 1958, p. 577-583.

An increase of nitrogen in Ta causes an increase of hardness, tensile strength and the electric resistance and upward shift of the elastic limit, while elongation and cross section reduction noticeably decrease with growing nitrogen content. 29 ref. (Q27a, M24b, 2-60; Ta, *N*)

759-Q.* Coarse Grain. H. B. Grainger and P. B. A. Willis. *Aircraft Production*, v. 21, May 1959, p. 170-176.

Detrimental effects of coarse grain, various attempts to produce consistently fine-grained material by the "peripheral fine grain" or Kynal PFG technique. 23 ref. (Q-general 2-59; Al-b)

760-Q.* Mechanical Properties of Commercial Wrought Iron. R. Jeffrey, J. Seager and J. H. Woodhead. *British Safety in Mines Research Establishment, Research Report*, no. 154, Feb. 1959, 25 p.

Survey of commercial wrought iron and study of the effects of composition and strain aging on its mechanical properties. (Q-general, N7e, 2-60; Fe-c)

761-Q.* Investigation of Hydrogen Embrittlement in Copper. Einar Mattsson and Franz Schuckher. *Institute of Metals, Journal*, v. 87, Apr. 1959, p. 241-247.

When Cu is annealed in a hydrogen-bearing atmosphere, hydrogen embrittlement does not take place during the initial period of annealing but only after a definite period of "incubation". 31 ref. (Q26s, J23a; Cu, *H*)

762-Q. Department of Defense Titanium Sheet-Rolling Program: Thermal Stability of the Titanium Sheet-Rolling-Program Alloys. E. S. Bartlett, D. N. Williams, H. R. Ogden and R. I. Jaffee. Defense Metals Information Center. (Battelle Memorial Institute.) *U. S. Office of Technical Services*, PB 151061, Nov. 1958, 48 P. $1.25.

Mechanical properties under stress during thermal exposure at 500-1000° C. are satisfactory. There are some aging and overaging effects. (Q-general, 2-62, 2-65, 3-66; Ti-b)

763-Q. Development of Active Eutectoid Base Titanium Alloys. R. F. Bunshah, D. Osterberg, E. Ence and H. Margolin. New York University, College of Engineering, Research Division. *Wright Air Development Center*, Quarterly Progress Report no. 3. Feb. 1959, 9 p.

Alloy development studies on Ti-Cu, Ti-Ni and Ti-Ni-Cu base alloys heat treated to an alpha plus compound structure. Effect of forging and heat treatment variables on mechanical properties and stability of these active eutectoid alloys. (Q-general, 2-64; Ti-b, *Cu, Ni*)

764-Q.* Cycle-Dependent Stress Relaxation. JoDean Morrow and G. M. Sinclair. Paper from "Symposium on Basic Mechanisms of Fatigue". American Society for Testing Materials, 1958, p. 83-109.

Stress relaxation in thin-walled tubes of SAE 4340 steel at three levels of hardness when subjected to a constant amplitude of alternating strain about a constant mean strain. Analysis of stress-strain relationship. 12 ref. (Q25n, Q7b, Q3a, Q7e; AY)

765-Q.* Recent Observations on Fatigue Failure in Metals. W. A. Wood. Paper from "Symposium on Basic Mechanisms of Fatigue". American Society for Testing Materials, STP no. 237, 1958, p. 110-119.

Notches, peaks, surface disintegration and resultant crack formation as revealed by small angle taper-sectioning technique. 16 ref. (Q7h, Q24c; Cu-a, Cu-n)

766-Q.* (German.) Effect of Molybdenum on Structure and High-Temperature Strength of Cast Heat Resistant Nickel-Chromium Alloys. Karl Roesch and Hans Zeuner. *Giesserei*, v. 46, Apr. 23, 1959, p. 202-215.

Effect of Mo on age hardenability and toughness in the age hardened state. Effects on carbon and tungsten, present together with Mo. 11 ref. (Q3m, N7a, 2-60, 3-71; Ni-b, *Cr, Mo*)

767-Q.* (German.) Elastic Anisotropy of Transformer Sheet With Two Different Textures. Ferdinand Stangler. *Zeitschrift fur Metallkunde*, v. 49, Sept. 1958, p. 489-490.

Relationship between the directions of easiest magnetization and the modulus of elasticity. 4 ref. (Q21a, P16; SGA-n, AY, 4-53, *Si*)

768-Q. The Dislocation-Oxygen Interaction in Alpha Titanium and Its Effect on the Ductile-to-Brittle Transition. D. Gupta and S. Weinig. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 209-216.

Internal friction techniques using a low-frequency torsion pendulum are used to study the oxygen atom interactions with dislocations in "superpurity" Ti. Both the saturation of the room temperature decrement and the transition from ductile to brittle behavior occurred at 1.5 at.% oxygen. Embrittlement was probably due

to oxygen atoms immobilizing the dislocations. 10 ref. (Q23r, Q26s, M26b; Ti-a, *O*)

769-Q. Dislocation Blocking in Face-Centered-Cubic Metals. I. R. Kramer. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 226-230.

A delay time for yielding in cold worked face-centered-cubic metals was found. Slip on (123) planes was observed while glide on these planes occurred during the delay-time period before slip starts on the (111) planes. 13 ref. (Q24a, M26b)

770-Q. Cause of Cleavage Fractures in Ductile Materials. J. Washburn, A. E. Gorum and E. R. Parker. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 230-237.

Experimental evidence was obtained in support of the idea that cleavage fracture can be initiated by dislocation pile-up. The high ductility of MgO crystals when tested in bending compared to their relative brittleness in tension was explained on the basis that large pile-ups are more likely in a tension specimen. 8 ref. (Q26n, M26b, Q23p)

771-Q. The Effect of Surface Adsorption of Gas on Crack Propagation. M. R. Achter and H. W. Fox. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 295-296.

Oxidation strengthens the metal while adsorption of gas lowers the surface energy, relative to that in vacuum, and reduces the work required to propagate a crack. (Q26q, P13d)

772-Q. Activation Energies for Creep of Single Aluminum Crystals Favorably Oriented for Cubic Slip. Y. A. Rocher, L. A. Shepard and J. E. Dorn. *Metallurgical Society of AIME, Transactions*, v. 215, Apr. 1959, p. 316-320.

From 78 to 780° K. the activation energies agree closely with those previously found for creep by (111) (101) slip. Between 78 and 140° K., the activation energy was identified with the Peierls process, while between 260 and 780° C. the activation energy was close to that for cross-slip. 11 ref. (Q3, Q24a, 3-72; Al, 14-61)

773-Q. Strengthening of Copper Alloys by Internal Oxidation. M. Safdar Ali and V. A. Phillips. *Metallurgical Society of AIME, Transactions*, v. 215, p. 340-344.

Tensile properties of Cu-O.20% Al, Cu-0.45% Mg, Cu-0.27% Cr, and Cu-0.22% Be solid solution alloys were studied at -196, 18, 250 and 500° C. on wires internally oxidized at 900 and 1000° C. Internal oxidation produced marked increases in yield strength relative to pure Cu, particularly at low temperature. 24 ref. (Q27a, R1h; Cu-b, *Al, Mg, Cr, Be*, 14-67)

774-Q.* Internal Friction, Plastic Strain and Fatigue in Metals and Semiconductors. Warren P. Mason. Paper from "Symposium on Basic Mechanisms of Fatigue". American Society for Testing Materials, STP no. 237, 1958, p. 36-50.

Pb, Cu and Ge specimens stressed to fatigue failure using barium titanate transducer attached to tapered brass horn. Determination of internal friction and plastic strain and their variation with stress. Theoretical action of Frank-Read dislocation sources. 11 ref. (Q21e, Q8k, Q7b, Q8g, 3-66; Pb-a, Cu-a, EG-j, Ge)

775-Q.* Slipband Formation and Fatigue Cracks Under Alternating Stress. M. R. Hempel. Paper from "Symposium on Basic Mechanisms of Fatigue". American Society for Testing Materials, STP no. 237, 1958, p. 52-82.

Formation and propagation in slip line in single crystals of bcc. alpha-Fe and in polycrystalline fcc. Al under cyclic stress at room temperatures. Effect of load and orientation; tensile properties. 58 ref. (Q24c, Q26e, Q27a, Q7b; Fe-a, Al-a)

776-Q.* Work of the Task Group on Brittle Failure With Respect to Research. A. O. Schaefer. Paper from "Symposium on Brittle Failure of Rotor Forgings". American Society for Testing Materials, STP no. 231, 1958, p. 12-15.

Correlation between Charpy transition temperature and susceptibility of rotor forgings to brittle failure. Effect of Cr, Ni and Si on transformation characteristics of alloy steels. (Q26s, Q23r, T7h, 2-60; AY, 4-51h, *Cr, Ni, Si*)

777-Q. Development of Active-Eutectoid Base Alloys. R. F. Bunshah and H. Margolin. New York University. *Wright Air Development Center*, Technical Report no. 58-328, Oct. 1958, 43 p.

Ti-Cu alloys form an active eutectoid Ti alloy system in which the decomposition of the beta phase to alpha-plus compound occurs rapidly. Effect of stepwise additions of Al and/or Sn and/or Zr to binary Ti-2Cu, Ti-4Cu and Ti-6Cu alloys. A Ti-6Cu-7Al-6Zr alloy proved outstanding,

showing a tensile strength of 108,900 psi. at 1200° F. 12 ref. (Q-general, N9; Ti-b, *Cu, Al, Sn, Zr*)

778-Q. Mechanical Properties of Chromium. Arthur G. Metcalfe, Sheldon A. Spachner and W. Rostoker. Armour Research Foundation. *Wright Air Development Center,* Technical Report no. 58-342, July 1958, 69 p.

Grain size is shown to have a small influence on the ductile-brittle transition temperature of electrolytic Cr containing 0.5% O. and 0.03% N. Heat treatment is very effective, under some conditions, in reducing the transition temperature, particularly when it reduces the yield stress. Nitrogen alone is not responsible for the brittleness of Cr. 20 ref. (Q-general, Q26s, 2-64, 2-59; Cr, *O, N*)

779-Q.* (Swedish.) Influence of Sulphur and Oxygen on Red-Shortness of Steel. A. Josefsson, J. Koeneman and G. Lagerberg. *Jernkontorets Annaler,* v. 143, no. 2, 1959, p. 53-75.

Influence of thermal history on red-shortness in steels containing 0.02-0.08% S., 0.01 to 0.09% Mn and high carbon contents studied by means of impact testing. Sulphur causes red-shortness by hardening the austenite and forming intergranular sulphide precipitates. Both phenomena lead to intercrystalline fracture. Mn counteracts red-shortness. 23 ref. (Q26s, 2-60; CN-r, *S, Mn*)

780-Q. (Book.) 1958 Book of ASTM Standards Including Tentatives. Pt. 3. Methods of Testing Metals (Except Chemical Analysis). 974 p. 1958. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa.

Property, corrosion, metallographic and nondestructive tests. (Q-general, P-general, S22, R11, M-general)

781-Q. (Book.) Nimonic Alloys. W. Betteridge. 332 p. 1959. Edward Arnold, Ltd., 41 Maddox St., London, W.1, England. 60 s.

High-temperature properties of Ni alloys, with emphasis on creep; fabrication, inspection and applications. (Q-general, Q3, G-general, K-general, S-general, 2-62, 17-57)

782-Q. (Book-French.) Fatigue of Metals. 4th Ed. R. Cazaud. 572 p. 1959. Dunod, 92, Rue Bonaparte, Paris 6, France.

Fatigue fracture; mechanism and theory; tests and testing apparatus; fatigue limits for various metals and alloys; types of loading, shape of part, temperature, corrosion, cavitation and other factors influencing fatigue behavior; fatigue strength of various types of assembly. 916 ref. (Q7)

783-Q. (Translation—AIP) Creep of Zinc Single Crystals Under Liquid Films of Low-Melting Metals. V. A. Labzin and V. I. Likhtman. *Soviet Physics Doklady,* v. 3, July-Aug. 1958, p. 778-780.

See item 111-Q, 1959. (Q3, 2-61; Zn, Pb, Sn, 14-61, 14-62)

784-Q. (Translation—BISI no. 1189.) Experimental Study of Hot Deformation of Steels and Alloys. A. Gueussier and R. Castro. *Revue de Metallurgie,* v. 55, Nov. 1958, p. 1023-1041.

See item 276-Q., 1959. (Q24, Q5, Q27, 2-61, 2-60; AY, SS)

785-Q.* Fatigue Crack Formation in Silver Chloride. P. J. E. Forsyth. Paper from "Symposium on Basic Mechanism of Fatigue". American Society for Testing Materials, STP no. 237, 1958, p. 21-35.

Formation of defects and propagation of cracks in silver chloride specimens stressed to fatigue failure by reverse plane bending. Extrusion and intrusion of slipbands. (Q24a, Q24c, Q26p, Q7g)

786-Q.* (German.) Quality Evaluation of Pure Aluminum Sheet for Deep Drawing. K. R. Vassel. *Aluminium,* v. 35, Apr. 1959, p. 189-191.

Determination of quality by deep drawing tests such as the Erichsen and similar cupping tests. Criteria can also be based on tensile strength, elongation, Brinell hardness, bend values and grain size data. (Q23q, G4b; Al, 4-53)

787-Q.* (German.) Titanium—Preparation, Properties and Applications. Klaus Rudinger. *Industrie-Anzeiger,* v. 81, Jan. 2, 1959, p. 2-5.

Effect of heat treatment on tensile properties; strength of weldments; influence of various testing temperatures on result of impact tests; Erichsen cupping test with sheets of various thickness. (Q27, Q6n, 2-61, 2-64, Q23q; Ti)

788-Q.* (Japanese.) Wear of Carbon Steel Weld Metal. Pt. 2. Sukemitu Ito, Kozo Honda and Kikuzo Ishiyama. *Journal of Mechanical Laboratory (Japan),* v. 13, Jan. 1959, p. 12-17.

Effect of heat treatment upon structurally changed layers and wear volume. Quenched and tempered specimens are tested by dry rubbing. At high speeds the

specimens tempered at 600° C. show the highest wear resistivity. 8 ref. (Q9; 7-51, CN)

789-Q.* (Japanese.) Wear of Carbon Steel Weld Metal. Pt. 3. Sukemitu Ito and Kikuzo Ishiyama. *Journal of Mechanical Laboratory (Japan)*, v. 13, Jan. 1959, p. 18-23.

Relationship between the rubbing conditions and structural changes. Rubbing behavior depends on sliding distance, velocity and load. 6 ref. (Q9; CN, 7-51)

790-Q.* (Japanese.) Indentation of a Ball. Shigehiko Yazawa, Kiyoshi Sato, Masao Unno and Go Yaguchi. *Journal of Mechanical Laboratory (Japan)*, v. 13, Jan. 1959, p. 24-29.

Strain figures in and on the surface of a steel ball 3/8 in. diameter indented into annealed steel specimens containing 0.19% carbon. (Q29b, CN-g)

791-Q.* (Japanese.) Wear of Nickel-Chromium Austenitic Steel Weld Metal. Sukemitsu Ito and Kozo Honda. *Journal of Mechanical Laboratory (Japan)*, v. 13, Mar. 1959, p. 54-60.

Structurally changed layers of the worn surface examined microscopically by the taper sectioning method and microhardness tests. Ni-Cr-steel behaves differently from that of carbon steel due to its work hardening effect. (Q9; 7-51, SS, CN)

792-Q.* (Russian.) Effect of Neutron Irradiation on Structure and Properties of Ferritic-Pearlitic Steels. V. S. Lyashchenko and Sh. Sh. Abragimov. *Atomnaya Energiya*, Mar. 1959, p. 277-280.

At 500-600° C. the mechanical properties of 1Kh17N2, 2Kh13, 30KhMA and 1Kh17 Cb steels were considerably changed by irradiation, an effect which was not noticed in Cb steel. The increased strengthening of the three steels was due to structural changes. 5 ref. (Q-general, N-general, 2-67; SS)

793-Q.* (Russian.) Effect of Hydrogen on Formation of Cold Cracks in Welding Medium Carbon Steel. P. A. Kozlov. *Svarochnoe Proizvodstvo*, Apr. 1959, p. 17-22.

A quantitative relationship exists between hydrogen in the weld metal and the formation of cracks in welded joints of C-Cr-Mo-Ni steel, depending upon the carbon equivalent in the base metal. 7 ref. (Q26, 2-60; CN-p, 7-51, *Cr, Mo, Ni, H*)

794-Q.* Complex Stress Creep Relaxation of Metallic Alloys at Elevated Temperatures. A. E. Johnson, J. Henderson and V. C. Mathur. *Aircraft Engineering*, v. 31, Apr. 1959, p. 113-118.

Results of tests at 50% and 200° C. (Q3a; Al-b, Mg-b)

795-Q.* Effect of Successive Annealing Upon the Room-Temperature Internal Friction of Cold-Compressed Commercially Pure Polycrystalline Aluminum. Genjiro Mima. *Osaka University, Technology Reports*, v. 8, Oct. 1958, p. 373-383.

Internal friction introduced by cold compression diminished with annealing time over the entire range of the cold working levels. 23 ref. (Q22, 2-64, 3-68; Al-a)

796-Q.* Hydrogen Brittleness of Steel. Pt. 2. Iwano Ohnishi, Yoneo Kikuta and Kiyokazu Kawai. *Osaka University, Technology Reports*, v. 8, Oct. 1958, p. 395-404.

Effect of hydrogen embrittlement on tensile properties. 7 ref. (Q26s, Q27a; ST)

797-Q.* Evaluating High-Temperature Materials. Edward A. Loria. *Machine Design*, v. 31, May 28, 1959, p. 121-125.

Creep, stress rupture, fatigue and notch tensile tests used as standards. (Q-general, 1-54; SGA-h)

798-Q.* How to Get the Most From Sheet Metal in High Temperature Service. Harry A. Pearl. *Materials in Design Engineering*, v. 49, May 1959, p. 116-120.

How existing sheet materials can best be used for reusable manned and unmanned vehicles that have to withstand outer skin temperatures of 2000° F. for 1 to 100 hr. in an oxidative environment. (Q-general, 2-62, Al-b, Mg-b, Ni-b, Ti-b, SS, 4-53)

799-Q.* (German.) Influence of Grain Size on Hardness. H. Borchers and H. Jordan. *Metall*, v. 13, May 1959, p. 390-392.

Macrohardness measured in a 6% tin bronze increased in proportion to decreasing grain size, while microhardness within the grain boundaries was not influenced. This is explained by the slip retarding influence of the grain boundaries. 4 ref. (Q29n, 2-59, N5; Cu-s)

800-Q.* (German.) Gas Content and Hot Shortness of Aluminum Alloys. F. Erdmann-Jesnitzer. *Metall*, v. 13, May 1959, p. 405-407.

Relationship between hot shortness, hydrogen content and casting temperature. (Q26s, N16; Al-b, *Mg, H*)

801-Q.* "Whiskers" Research. Arthur R. Lytle. *SAE Journal,* v. 67, May 1959, p. 59.

Strength of filamentary crystals. (Q27a, A9; 14-61)

802-Q. The Effects of Neutron Irradiation on the Ductile-Brittle Transition Temperature of Weldable Structural Steel Plates. R. C. Burnett, J. M. N. Allen, D. R. Harries. *United Kingdom Atomic Energy Authority,* AERE M/R 2536, Apr. 1958, 30 p.

Neutron irradiation effects on the notched-bar properties of a $4\frac{5}{8}$ in. thick welded Ducol W. 30 steel plate. Irradiation induced increases in transition temperatures are accompanied by decreases in the energies to fracture in the slow bend test and increases in the hardness. The decreases in the energies are most marked at temperatures corresponding to the ductile portions of fracture transition curves. 8 ref. (Q23r, Q26, 2-67; SGB-s, 4-53, CN-g)

803-Q. Thermal Stresses in Stainless Steel Box Beams. *U. S. National Bureau of Standards, Technical News,* STR-2340, Apr. 1959, 4 p.

Internal radiant heat transfer investigated as a mechanism for relieving thermal stress in Type 302 stainless steel box beams. Effects of internal radiant heat transfer were related to temperature distribution, thermal stress and beam deflection for temperatures up to 1200° F. (Q25p, P11k, 2-62; SS)

804-Q.* Effects of Irradiation on Type 347 Stainless Steel Flow Separator in the EBR-1 Core. R. E. Bailey and M. A. Silliman. Paper from "Symposium on Radiation Effects on Materials", v. 3. American Society for Testing Materials, STP no. 233, 1958, p. 84-102.

Effects on mechanical properties corrected by annealing. 15 ref. (Q-general, J23, 2-67; SS)

805-Q.* (English.) Comparison of Notched Bar Tests Over the Temperature Transition Range. *Materialprufung,* v. 1, Jan. 20, 1959, p. 13-18.

Izod, Charpy U-notch and Charpy V-notch tests with mild steels and alloy steels carried out at temperatures from -190 to +110° C. Rupture energy varies with the material, temperature and the original position of the sample in relation to the rolling direction. 26 ref. (Q6p, 2-61; CN-g, AY-n)

806-Q.* (French.) Cracking and Brittle Fracture of Hydrogen Charged Steel. Paul Bastien. *Materialprufung,* v. 1, Jan. 20, 1959, p. 3-12.

Possibilities of hydrogen absorption by steel in the liquid and solid states. Decrease in the deformability of alpha-steels caused by hydrogen. Steels with a structure of finely distributed spheroidal carbides were found to be less sensitive to hydrogen embrittlement than steels with laminar carbides. 41 ref. (Q26s; ST, *H*)

807-Q. (Italian.) Mechanical Testing. Roberto Allara. *Macchine,* v. 14, Apr. 1959, p. 345-353.

Elastic and tensile properties. (Q27, Q21)

808-Q.* Notch Toughness of Commercial Ship Plate. R. C. A. Thurston. *Canadian Mining and Metallurgical Bulletin,* v. 52, Apr. 1959, p. 245-254.

Results of tear tests and Charpy V-notch impact tests on manganese steel. 12 ref. (Q26s, Q23s, T22g, 2-63; ST-c, *Mn,* 4-53)

809-Q. Mechanical Properties of 17-7 PH and PH 15-7 Mo Stainless steel. Alton Brisbane. Materials Laboratory. *Wright Air Development Center,* Technical Report no. 58-400, Jan. 1959, 31 p.

Tensile stress-strain test results from room temperature to 100° F. Compression and bearing data were also obtained at room temperature. PH 15-7 Mo gives the best elevated temperature ultimate strength through 1000° F. Both materials display approximately the same percent elongation up to 800° F. (Q-general, 2-62; SS)

810-Q. Mechanical Properties of AM350 and AM355 Stainless Steels. Alton W. Brisbane. Materials Laboratory. *Wright Air Development Center,* Report no. 58-672, Feb. 1959, 45 p.

Results of smooth and notched tension tests and compression, bearing, bending and Charpy V-notched impact tests. Several heat treatments were used to determine the effects on mechanical properties. Varying the aging temperatures had some effect on the strength properties and ductility. Best ductility based on elongation and reduction in area was obtained by a -100° F. + 950° F. heat treatment. (Q-general, 2-64, 2-65; SS)

811-Q.* Deformation of Solids at High Rates of Strain. A. H. Cottrell. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 1-12.

Yield and related subjects, such as elastic and plastic waves, temperature and heating effects, crystal slip, dislocation and cracks. 45 ref. (Q24a, Q24j, M26b)

812-Q.* Yield Strength of Steel at an Extremely High Rate of Strain. E. de L. Costello. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain", Institution of Mechanical Engineers, London, SW1, England, 1957, p. 13-21.

High explosive technique for determining yield strength. Results are compared for mild steel and Vibrac. 21 ref. (Q23b, Q10; CN)

813-Q.* Experimental Techniques Developed in Investigations Into High-Speed Yield in Brittle Fracture. T. S. Robertson. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 22-30.

High-speed photographs in conjunction with high-speed wire resistance strain gages placed near or in path of crack, together with photographs taken after fracture, led to new picture of actual mechanism of brittle fracture. (Q26s)

814-Q.* Plane-Strain and Axially Symmetric Velocities and Pressures in Extrusions. E. G. Thomsen. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 77-85.

Determined velocity fields for the inverted extrusion of Pb. Results obtained by incremental techniques using plane-strain and axial-symmetric inverted extrusions at several strain rates. Compared results with theoretical slip-line solutions. 16 ref. (Q24c, F24, 3-74; Pb)

815-Q.* True Stress-Strain Curves for Steel in Compression at High Temperatures and Strain Rates, for Application to the Calculation of Load and Torque in Hot Rolling. P. M. Cook. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 86-97.

Yield stress-strain curves for 12 types of steel at 900-122° C. with strains of $1\frac{1}{2}$, 8, 40 and 100 per sec. Effects of carbon and alloy content, strain rate, temperature. 8 ref. (Q24, F23; CN)

816-Q.* The Effect of High Strain-Rate in Strip-Rolling. D. G. Christopherson and B. Parsons. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 115-121.

Effects of high strain rate on work done per unit volume, hardness, surface roughness and work hardening of Cu, Al and mild steel. 6 ref. (Q24, F23; Cu, Al, CN, 4-53)

817-Q.* Some Strain-Rate Effects in Drop-Forging Tests. H. L1. D. Pugh and M. T. Watkins. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 122-127.

Effects of strain rate on compression of Cu, Pb and Al obtained and dynamic stress-strain relationships determined. Calculated stress-strain agreed with those measured directly. Comparison of static tests showed effects of friction to be small. 10 ref. (Q24, F22n; Cu, Pb, Al)

818-Q.* Effect of Loading History Upon the Yield Strength of a Plain Carbon Steel. Irwin Vigness, J. M. Krafft and R. C. Smith. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 138-146.

Measured yield strength for three different patterns of load application: constant load with superimposed increasing oscilatory loading; load increasing linearly with time; and load suddenly applied and then held constant. Yield is expressed in terms of delay-time which elapses between static upper yield stress and dynamic yield. 22 ref. (Q23b, 3-68; CN)

819-Q.* Delayed Yield and Other Dynamic Loading Phenomena in a Medium-Carbon Steel. J. D. Campbell and J. Duby. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 214-220.

Compression impact tests and measured yield as a function of time. Interpretation of tests based on dislocation theory. Dynamic stress-strain curves for repeated impacts. 10 ref. (Q24, Q28k, Q6; CN-p)

820-Q.* Non-Uniform Yield in a Mild Steel Under Dynamic Straining. D. B. C. Taylor. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 229-238.

Series of tests made on a number of specimens at different impact velocities, stress levels, with straining being continued until nonuniform yielding of gage length. Mean dynamic stress, rate of plastic yielding and permanent set. 10 ref. (Q24; CN)

821-Q.* On the Elastic-Plastic Strain of Steels Under Longitudinal Impact. G. V. Uzhik and J. J. Voloshenko-Klimovitsky. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 239-243.

Equipment and method to determine small elastic-plastic deformation and evaluate resistance of metal to initial yielding under impact. 4 ref. (Q24; ST)

822-Q.* (French.) Hot Hardness. J. Pomey, A. Royez and J. P. Georges. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 215-228.

Application of high-temperature hardness testing machine operating in an argon atmosphere up to 1000° C. with a diamond indenter for the investigation of isothermal transformations as a function of time and for the study of creep. 6 ref. (Q29p, Q3, 1-53, 3-67)

823-Q.* (French.) Scatter of Fatigue Test Results. R. Esquerre. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 260-266.

Various rotating bend fatigue tests were carried out on steel and light metal specimens showing scattered results. In each case the Wohler curves were drawn following statistical analysis by the Henry line method. (Q7c)

824-Q.* (French.) The "Minimum Life" Phenomenon in Fatigue Under Constant of Varying Stresses. A. M. Freudenthal and E. J. Gumbel. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 295-298.

There exists a minimum number of stress reversals capable of producing a fatigue fracture and a fatigue limit observed under varying reversed stresses. The "minimum life" represents a phenomenon characteristic of fatigue under varying stresses and the endurance limit is strongly reduced by the application of such stresses. 5 ref. (Q7, Q26)

825-Q.* (French.) Effect of Notches on Resistance of Steel to Alternate Stresses Under Varying Temperatures. M. Weisz and R. Cazaud. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 299-310.

Changes in notch sensitivity in reverse bending from room temperature to 625° C. In Cr-Mo steel, annealed-quenched-annealed, a rather close relationship exists between notch sensitivity and various parameters calculated from tensile tests. The reduction of fatigue limit is regular in the temperature range up to 400° C. 16 ref. (Q7, Q23s, 2-61; AY, *Cr, Mo*)

826-Q.* (German.) Application of Magneto-Mechanical Effects for High Damping and High-Strength Alloys. Alexander Cochardt. *Zeitschrift fur Metallkunde*, v. 50, Apr. 1959, p. 203-206.

High damping effect of a steel with 12% Cr, 0.5% Ni and 0.1% C, used for turbine blades, is explained by magneto-mechanical hysteresis. Preparation of a Ni-Co alloy with 35% Ni and small quantities of other elements with a ten times higher damping capacity compared with the commonly used materials. 14 ref. (Q8q; SS, Co-b, *Ni*)

827-Q.* (German.) The Plasticity of Nickel-Cobalt Single Crystals. Joachim Meissner. *Zeitschrift fur Metallkunde*, v. 50, Apr. 1959, p. 207-217.

Stress-shear strain curves were found for single crystals with 0-40 at.% Co in the temperature range 90 and 295°K. A decrease of temperature affects the curves in a similar manner to an increase of Co concentration. 38 ref. (Q24a, 2-61, 2-60; Ni-b, *Co*, 14-61)

828-Q.* (Russian.) Mechanism of Nucleated Crack Development in Crystals During Plastic Deformation. V. N Kozhanskii. *Doklady Akademii Nauk*, v. 123, no. 4, 1958, p. 648-651.

Cracks are formed along the slip planes during partial dissociation of opposite directions and move in closely spaced parallel planes of slip. Formation also occurs in cases when the slip and

cleavage planes coincide. 18 ref. (Q26p, Q24a)

829-Q.* (Russian.) Effect of Surface-Active Agents on the Surface of Cold Worked Metals. G. I. Epifanov, N. I. Glagolev and P. A. Rebinder. *Doklady Akademii Nauk*, v. 123, no. 4, 1958, p. 663-666.

Kinetics of the formation of a strengthening layer of pure Fe in air and in a medium of stearic acid in decalin. Surface-active agents make the flow of plastic deformation easier during the initial stage of cold working and produce intensive strengthening during subsequent stages of cold working. 8 ref. (Q24a, G-general, 1-67; Fe)

830-Q.* Molybdenum as a Structural Material. Julius J. Harwood. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 1-18.

Effect of alloy and impurity content on high-temperature strength properties, recrystallization temperature, ductility, transition temperature and workability. Resistance of sprayed electroplated, clad or chromized coatings to oxidation. 9 ref. (Q3q, Q5g, Q27j, R1h, 2-60, 2-62; Mo-b, *Ti, Zr, Cb, V,* Re, SGB-s)

831-Q.* Development of Molybdenum Base Alloys. George A. Timmons. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 19-38.

Forging, extrusion and working of vacuum-arc cast ingots, resultant mechanical properties, influence of alloying elements on elevated-temperature tensile properties hardness and ductility. Lattice parameters, recrystallization temperature, variation of hardness with hot working, annealing and testing temperatures. (Q3q, Q27a, Q27n, 2-62, 2-60, F22, F23, F24; Mo-b, *Zr, Ti, Cb, W, V*)

832-Q.* Production and Quality of Molybdenum Mill Products. W. L. Bruckart. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 39-62.

Available sizes and tolerances in bar, plate and sheet of Mo and Mo-0.5 Ti alloys. Mechanical properties, anisotropy and grain structure resulting from hot-cold working. (Q23p, Q27a, M27c; Mo-b, *Ti,* 4-53, 4-55)

833-Q.* Elevated Temperature Relaxation Properties of 17-7 PH Stainless Helical Compression Springs. Mason Clogg, Jr. *Draht (English Edition)*, no. 40, Apr. 1959, p. 31-35.

Effect of final hardening temperatures for 17-7 PH and the stress relieving temperature for 18 Cr-8 Ni on relaxation properties. Data on effect of temperature on the torsional modulus of 17-7 PH, 18 Cr-8 Ni, Inconel "X" and music wire. (Q3, T7c, 2-62; SS)

834-Q.* Analysis of the Mechanics of Cold Strip Rolling. Donald Jortner, J. Fletcher Osterle and Carl F. Zorowski. *Iron and Steel Engineer*, v. 36, May 1959, p. 127-133.

Theory takes into account the elastic deformation of the strip and rolls and the effect of applied tensions as well as the plastic strip deformation. Theory has applications in the investigation of causes of nonuniform strip gage and roll fatigue failure. 12 ref. (Q24, Q7, F23, 1-67; ST, 4-53)

835-Q.* Sag Characteristics of Steel Versus Temperature. Robert F. Patrick. *Porcelain Enamel Institute, Proceedings*. v. 20, 1958, p. 8-12.

Importance of sag resistance in the reduction of cost of enameling by use of lower firing temperatures. 6 ref. (Q-general, L27, 2-61, 17-53; ST)

836-Q.* Loaded Beam Stress Measurement. D. C. Bowman. *Porcelain Enamel Institute, Proceedings*, v. 20, 1958, p. 42-49.

New method of measuring compressive stress developed in porcelain enamels. (Q28; ST, 8-71)

837-Q. Dynamic Tensile Testing Machine. A. M. P. Brookes and J. L. Reddaway. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 31-36.

Machine designed to find energy absorbed in fracturing tensile test specimen at strain rates up to 2400 in. per sec. 6 ref. (Q26, 1-53)

838-Q. Photo-Electric Method of Determining Stress and Strain in Rapidly Strained Metals. P. W. Wright and R. J. Lyon. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 37-50.

Photo-electric method which studies behavior of specimen under dynamic

strain by recording and measuring motion of its interfaces. 19 ref. (Q25, X29q)

839-Q Study of Rapid Micro-Yielding in Mild Steel by Scleroscopic Methods. B. J. Vincent, R. Gee and S. C. Hunter. Paper from "Proceedings of the Conference on the Properties of Materials at High Rates of Strain". Institution of Mechanical Engineers, London, SW1, England, 1957, p. 51-65.

Dynamic indentation techniques for investigating microstrain effects in steel. Results explained in terms of dislocation theory of yielding and Hertz theory of elastic collisions. 16 ref. (Q24, Q6; CN)

840-Q.* New Magnesium Alloy Improves Design of Ramjets. C. P. King. *Modern Metals*, v. 15, May 1959, p. 58, 62, 64-65.

Mechanical properties of HM21A-T8 alloy. Good formability and weldability plus high strength-to-weight ratio at 700-900° F. and excellent resistance to creep. (Q-general, P-general, K9s, T2p; SGA-h, Mg-b)

841-Q. Investigation of the Effects of Impurities and Metallurgical Variables on the Notch Sensitivity of Titanium Alloys. Frank C. Holden, Richard W. Douglass, Horace R. Ogden and Robert I. Jaffee. Batelle Memorial Institute. *Wright Air Development Center*, Technical Report no. 58-438, Dec. 1958, 79 p.

Notch tensile properties of three commercial Ti-base alloys, A11OAT (Ti-5.0 Al-2.5 Sn), Ti-6Al-4V, and Ti-140A (Ti-2Fe-2Cr-2Mo) at six interstitial levels, four microstructural conditions, and over a range of temperature from -196 to 200° C. Notch sensitivity generally was increased by increased interstitial content, low temperature and acicular-type microstructures. (Q23s, Q27a, 3-69, 2-61; Ti-b, *Al, Sn, V, Cr, Mo*)

842-Q. The Influence of Ferrite Banding on the Impact Properties of Mild Steel. W. S. Owen, Morris Cohen and B. L. Averbach. Ship Structure Committee Report no. SSC-114. *National Academy of Sciences, National Research Council*, Oct. 6, 1958, 23 p.

Charpy properties at the lower end of the testing temperature range are not appreciably affected by the degree of ferrite banding, direction of specimen axis or orientation of the notch. Evidence suggests that the fracture appearance is not sensitive to specimen orientation even in a severely banded steel, although notch orientation is a factor. Nonpreferred crystallographic orientation of the ferrite was found. (Q26, Q6; CN)

843-Q.* (German.) Determination of the Service Life of Tools. Henning Siebel. *Industrie-Anzeiger*, v. 81, May 5, 1959, p. 549-554.

Service life of hard metal cutting tools. Geometry of the cutting edge, depth of cut, feed, structure of tool material, structure and strength of material machined and the as yet undetermined effect of the furnace charge on the tool material are significant. 24 ref. (Q9, T6n; EG-d)

844-Q.* (German.) Correlations Between the Mechanical Properties of Castings and Cast Test Pieces. Fritz Iske. *Industrie-Anzeiger*, v. 81, May 12, 1959, p. 583-585.

Computations and nomograms permit determination of mechanical properties of castings by cylindrical test pieces if wall thickness, ratio of surface to volume, and composition are given. 10 ref. (Q27, Q29; CI)

845-Q.* (German.) Spheroidal Graphite Cast Iron. *VDI-Zeitschrift*, v. 101, May 21, 1959, p. 594-595.

Mechanical properties, wear resistance and plasticity as influenced by heat treatment and alloying elements. (Q27, Q29n, Q9n, 2-64, 2-60; CI-r)

846-Q.* (Russian.) Improving Mechanical Properties of Carbon Steels. D. A. Smolyarenko. *Metallurg*, v. 4, Apr. 1959, p. 9-11.

Killed steel after heating and quenching in water has higher mechanical properties than hot rolled killed carbon steel, even though their carbon content is the same. (Q-general, 2-64; CN, ST-c)

847-Q.* (Russian.) Corrosion Fatigue During Bend and Torsion Testing. L. A. Glikman, E. N. Kostrov and V. K. Dobrer. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 456-460.

The fixed ratio that exists between bend and torsion ultimate fatigue, when tests are carried out under corrosive conditions (3% NaCl), varies according to the corrosion resistance of the material involved. (Q1, Q5, R4b, R1e)

848-Q.* Work Softening in Irradiated Copper. M. J. Makin. *Acta Metallurgica*, v. 7, Apr. 1959, p. 233-239.

Temperature dependence of the flow stress of polycrystalline Cu, both unirradiated and after neutron irradiation investigated by repeated tensile testing. Temperature sensitivity of the flow stress is very large during the early stages of the deformation; irreversible effects occur

when the temperature of the deformation is changed. 8 ref. (Q24, 2-67, N7e; Cu)

849-Q.* Room Temperature Deformation Processes in Zirconium. E. J. Rapperport. *Acta Metallurgica*, v. 7, Apr. 1959, p. 254-260.

Single crystals were deformed in tension and compression at room temperature. The only slip system observed was $(10\bar{1}0)$ $(12\bar{1}0)$ with a critical resolved shear stress of about 0.65 kg. per sq. mm. in compression. The active twin planes were $\{10\bar{1}2\}$ $\{11\bar{2}1\}$, $\{11\bar{2}2\}$, and $\{11\bar{2}3\}$. 15 ref. (Q24, M26; Zr, 14-61)

850-Q. High-Temperature Mechanical Properties of Tantalum. David C. Drennen, M. Eugene Langston, Charles J. Slunder and Joseph G. Dunleavy. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-1326, Mar. 2, 1959, 32 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Creep and creep-rupture tests performed at 1200° F. in helium on arc cast and sintered rolled Ta sheet to investigate the effect of structure and gaseous contamination on the creep resistance of Ta. The highest creep resistance is found in a fine-grained sintered material which had been degassed 20 to 60 min. at 4500 to 4650° F., cold rolled to an 80% reduction, and then recrystallized 10 to 15 min. at about 2800° F. prior to creep testing. (Q3, 2-62; Ta, 4-53)

851-Q.* (Russian.) Brittle Failure of Metals. V. I. Sappak. *Uspekhi Fizicheskoi Khimii*, v. 67, no. 2, 1959, p. 349-361.

Theoretical strength of metals; Griffith's theory of rupture; dislocation theory of rupture; effect of temperature on yield point; steel structures and susceptibility to brittle rupture. Distribution of cracks and crevices. 78 ref. (Q3q; ST)

852-Q.* The Role of Boron in Cast Austenitic Alloys. R. Wayne Kraft, Jr., and R. A. Flinn. *American Society for Metals, Transactions*, v. 52, Preprint no. 133, 1959, 34 p.

Structures and mechanical properties at 70 and 1500° F. of as-cast and heat treated 18% Ni—20% Cr steels containing up to 2% B. Influence of boron and interpretation of effects. 28 ref. (Q-general, M26r, M27b, 2-60, 2-62; SS-e, B)

853-Q.* The Effect of Grain Size on the Tensile Properties of High-Purity Molybdenum at Room Temperature. A. A. Johnson. *Philosophical Magazine*, v. 4, Feb. 1959, p. 194-199.

Room temperature tensile properties for polycrystalline Mo specimens with grain diameters varying from 0.03 to 0.26 mm. Estimation of effective surface energy for fracture. 6 ref. (Q27a, 2-59; Mo-a)

854-Q.* The Fatigue of Metals at 1.7° K. R. K. MacCrone, R. D. McCammon and H. M. Rosenberg. *Philsophical Magazine*, v. 4, Feb. 1959, p. 267-268.

Fatigue behavior of Cu and Cd between 20.4 and 1.7° K. (Q7a, 2-63; Cd, Cu)

855-Q.* The Deformation of Lithium, Sodium and Potassium at Low Temperatures; Tensile and Resistivity Experiments. D. Hull and H. M. Rosenberg. *Philosophical Magazine*, v. 4, Mar. 1959, p. 303-315.

Tensile tests on Li, Na and K at temperatures down to 4.2° K. Change in electrical resistivity during deformation at 4.2 and 20° K. Martensitic transformation of Li and Na on cold work at low temperatures. 8 ref. (Q27a, Q24m, N6q, P15g, 2-63; K, Na, Li)

856-Q.* Thermally Activated Glide in Face-Centered Cubic Metals and Its Application to the Theory of Strain Hardening. Z. S. Basinski. *Philosophical Magazine*, v. 4, Apr. 1959. p. 393-432.

Influence of temperature down to 1.7° K. and strain rate on the flow stress of polycrystalline Al and single crystals of Al, Cu and Ag. Changes in flow stress resulting from thermally activated surmounting of barriers by glide dislocations. Main types of barriers, distances and forces between dislocations and obstacles. 37 ref. (Q24, Q27a, N7e, 2-63; Al, Cu, Ag, 14-61)

857-Q.* Some New Yield Phenomena in Molybdenum. A. A. Johnson and D. E. Peacock. *Philosophical Magazine*, v. 4, Apr. 1959, p. 528-530.

Load elongation curves of Mo tensile specimens during prestraining treatment and on retesting after annealing. (Q24c, Q27a, 2-64; Mo-k)

858-Q. The Effect of a Brittle Case on the Notched Impact Transition of Unirradiated and Irradiated Steel. D. Hull. *United Kingdom Atomic Energy Authority*, AERE M/R 2432, Nov. 1957, 8 p.

Notched impact specimens with a brittle layer on the outside, produced by nitriding, tested after neutron irradiation. Irradiation raises the transition temperature by 15° C. but does not affect the energy required to propagate a fast running

crack. Specimens with a nitride layer give a sharp transition so that the effect of irradiation on the transition temperature can be determined accurately. (Q26q, 2-67; CN)

859-Q. Lead-Lithium Shielding Alloy—Metallurgical Studies. D. H. Hanse, E. E. Hoffman and D. M. Shepherd. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission,* ORNL-2404, Mar. 23, 1959, 20 p.

Mechanical property tests conducted on a Pb-Li alloy and results compared with those for a Pb-6% Cu alloy. The Pb-Li alloy has superior strength at room temperature but the Pb-Cu alloy has superior creep strength at 110° C. Results indicate that at 110° C. the Pb-Li oxidizes more rapidly than pure Pb. (Q-general, Q3; Pb-b, *Li, Cu*)

860-Q.* Effect on Fatigue Strength of Internal Defects in Welded Joints: A Survey of the Literature. H. P. Newman. *British Welding Journal,* v. 6, Feb. 1959, p. 59-64.

Influence of slag inclusions, internal cracks, porosity, lack of fusion and penetration in butt welds in mild steel plate. 9 ref. (Q7; CN-g, 4-53, 7-51, 9)

861-Q.* Effects of Hydrogen in Wrought Steel and in Ferrous Weld Metal. P. D. Blake and W. I. Pumphrey. *British Welding Journal,* v. 6, May 1959, p. 211-224.

Effects of hydrogen on mechanical properties of steel and weld metal. Effects of hydrogen are qualitatively similar, apparent differences being largely due to inherent difference in microstructure and composition of weld metal and wrought steel. 67 ref. (Q26s; ST, *H,* 7-51)

862-Q.* Radiation Damage in Ferrous Materials. R. E. Smallman. *Iron & Steel,* v. 32, May 1959, p. 175-180.

Effect of neutron irradiation on the mechanical properties of pure iron, ferritic and austenitic steels. The problem of brittle fracture is concerned in terms of the increase in yield stress irradiation. Evidence indicating the structure of irradiation damage and mechanism of radiation hardening is also discussed, together with the recovery behavior of subsequent annealing. 18 ref. (Q-general, 2-67; Fe-a, SS)

863-Q.* (Czech.) New Method of Brittleness Testing. Vladimir Koselev. *Hutnicke Listy,* v. 14, May 1959, p. 409-415.

Relationships between impact strength, testing temperature and composition. Graphs show results of tests with steels containing varying amounts of Mn, Si, Al and Ni. (Q26s, Q6n; AY, *Mn, Si, Al, Ni*)

864-Q.* (Czech.) Properties of Heat Resistant Cr-Mo-W-V-Steels. Richard Pokorny. *Hutnicke Listy,* v. 14, May 1959, p. 442-448.

Tensile tests; micrographs of steels with various compositions. The flow limit is influenced unfavorably by too high Cr content, while hot strength is improved by an adequate vanadium content. Effects of austenitization temperature, cooling rate and annealing temperature. 14 ref. (Q27a, Q27c, 2-60, 2-64; CN, SGA-h, *Cr, Mo, W, V*)

865-Q.* (German.) Cast Alloy "Alzen 305". *Giesserei-Praxis,* no. 9, May 10, 1959, p. 176-177.

Mechanical and physical properties of a Al-Zn-Cu alloy used in the casting of bushings, bars and bearings. (Q-general, P-general; Al-b, *Cu, Zn*)

866-Q.* (Polish.) Some Functions of the Theory of Plasticity. Feliks Tychowski. *Archiwum Hutnictwa,* v. 4, no. 1, 1959, p. 3-43.

Data are applied to the quantitative deformation of errors resulting from an improper expression of strains. 17 ref. (Q23)

867-Q.* (Polish.) Metal Flow and Structural Phenomena in Hot Rolling With High Draught. Zygmunt Wusatowski and Bronislaw Hoderny. *Archiwum Hutnictwa,* v. 4, no. 1, 1959, p. 63-80.

Steel specimen were drilled and filled with steel rods of similar chemical composition and after heating to 1150° C. and 60, 70, 80 and 90% rolling were tested by X-rays. The deformation caused considerable reduction in the grain size. Strain hardening on external surfaces resulting from cooling effect of rolls were observed. 4 ref. (Q24g, F23; ST)

868-Q. (Czech.) The Lenin Steel Mills in Plzen (Czechoslovakia) and Their Research Program. Ladislav Jenicek. *Hutnicke Listy,* v. 14, May 1959, p. 369-391.

Hot strength testing methods; wear tests; physical and mechanical property tests; metallography. 212 ref. (Q-general, P-general, 1-54)

869-Q. (German.) LOS—Fatigue Testing Equipment. Thiele. *Draht*, v. 10, Apr. 1959, p. 160.
(Q7, 1-53)

870-Q. (German.) New Types of Malleable Cast Iron. W. Finger. *Industrie-Anzeiger*, v. 81, May 12, 1959, p. 588-589.
Microstructure and mechanical properties. (Q27a, Q29, M27; CI-s)

871-Q. (Russian.) Dynamic Testing of Geometrically Similar Samples at Low Temperatures. O. F. Stankevich and Yu. E. Bondarev. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 470-472.
In some cases of dynamic testing for impact strength, a departure from standardized shape samples to geometrically similar samples, smaller in size, is recommended at low temperature (+5 and +23° C.) testing. (Q6, 3-73)

872-Q. (Russian.) Electrical Method to Determine Modulus of Elasticity "E". Yu. D. Safronov. *Zavodskaya Laboratoriya*, v. 25, Apr. 1959, p. 472-474.
Electrical device determines Young's modulus of elasticity when the tested sample is used as a cantilever beam. (Q21a)

873-Q. Friction and Wear of Refractory Compounds. K. P. Zeman and L. F. Coffin, Jr. General Electric, Atomic Products Div. *U. S. Atomic Energy Commission*, APEX-454, Apr. 1958, 54 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.
Refractory compounds were investigated as bearings with the possibility of employing liquid metals as lubricants for these materials. Several couples were found which show promise of sliding successfully at temperatures as high as 2000° F. in air. These couples include MgO-SiO_2, MgO-Al_2O_3, Al_2O_3-TiC and SiC-TiC. 9 ref. (Q9n, Q9p, T7d; Mg, Si, Al, Ti, NM-a34)

874-Q.* (Russian.) Fatigue Strength of Heat Treated Rail Heads Containing Arsenic. L. L. Pinkhusovich, R. S. Mar'yanovskaya and Z. G. Fridman. *Stal'*, Apr. 1959, p. 360-363.
Hardening rail heads containing As in water or oil, with careful adherence to optimum conditions, increases their fatigue strength. Quenching in water produces a higher strength than quenching in oil. 6 ref. (Q7a, J26; ST, *As*)

875-Q.* (Russian.) Improving the Mechanical Properties of Reinforcing Steel Bars by Heat Treatment. E. S. Tovpenets, N. I. Goncharenko, A. S. Babit and G. Z. Shcherbina. *Stal'*, Apr. 1959, p. 364-367.
Mechanical properties of low-carbon structural steel ST-5 may be considerably improved by hardening it immediately after rolling (at the temperature of the last rolling pass) followed by tempering. 6 ref. (Q-general, 2-64; CN-g)

876-Q.* Note on the Predication of Relaxation Stress-Time Curves From Static Tensile Test Data. A. E. Johnson, J. Henderson and V. D. Mathur. *Metallurgia*, v. 59, May 1959, p. 215-220.
Static and creep relaxation tests on a Mg alloy at 20° C. Test results provide no evidence for the existence of a mechanical equation of state for this material and indicate that a reasonably close prediction of relaxation stress-time curves from static tensile test data is not possible. 14 ref. (Q3a; Mg-b)

877-Q.* The Low-Temperature Mechanical Properties of Some Cast Stainless Steels. G. Mayer and K. Balajiva. *Metallurgia*, v. 59, May 1959, p. 221-226.
Tensile properties are inferior to those of corresponding types of wrought steel but the cast materials provide good ductility values at low temperatures. At all temperatures the impact values of the cast stabilized steels, and at low temperatures those of the nonstabilized steels, are higher the lower their carbon content. 5 ref. (Q-general, 2-63; SS, 5-60)

878-Q.* Unusual Fracturing of Hard-Drawn High-Conductivity Copper Strand. Clement Blazey. *Metallurgia*, v. 59, May 1959, p. 237-240.
Fracturing of stranded Cu conductor in the interval between lagging the drums at the completion of stranding and opening them for use. Causes of fracturing are correlated with types of wood used for the drums and corrosion data. (Q26, R-general; Cu, 4-61)

879-Q.* (German.) Unalloyed Steel Testing in Various Gases. Max Hempel, Albert Kochendoerfer and Alfons Tietze. *Archiv fur das Eisenhuttenwesen*, v. 30, Apr. 1959, p. 211-218.
Influence of air, oxygen, nitrogen, hydrogen and argon on tensile strength, compressive strength, resistance to alternating stresses and surface conditions of CK10 steel. 19 ref. (Q27, Q28, Q7; ST)

880-Q.* (German.) Failure Mechanism of Steels Subject to the Action of Water Containing H_2S. Friedrich Karl Naumann and Wolfhard Carius. *Archiv fur das Eisenhuttenwesen*, v. 30, Apr. 1959, p. 233-238.

Long-time bending tests were performed on carbon steel, stainless, Cr, Cr-Mo and Cr-Mo-Ni steels of various chemical composition and after various treatments, while the samples were exposed to the action of water containing hydrogen sulphide. There exists a hyperbolic relationship between the endurance on one side and the tensile stress in the extreme fiber and the hardness on the other side. No failure occurs as long as the product of hardness and tensile stress does not surpass a limit. Differences in composition and structure of samples do not affect the endurance as long as the hardness stays the same. 26 ref. (Q10, Q26; SS, CN)

881-Q.* (German.) Effect of Heat Treatment on Some Properties of Corrosion Resistant Nickel-Molybdenum Alloys. Karl Bungardt and Hans Hermann Weigand. *Zeitschrift fur Metallkunde*, v. 56, Jan. 1959, p. 11-18.

Heat treatment effects on microstructure, hardness, strength and corrosion resistance. (Q-general, R-general, 2-64; Ni-b, *Mo*, SGA-g)

882-Q.* Copper in Cast Iron. Albert de Sy. *Modern Castings*, v. 35, June 1959, p. 41-48.

Effects of Cu additions to gray iron castings. Improves crystal structure, strength and hardness properties, machinability and wear resistance. 10 ref. (Q-general, G17k, M26, 2-60; CI-n, *Cu*)

883-Q. Influence of Prolonged Service at Elevated Temperatures and Pressures on the High-Temperature Strength of Chromium-Molybdenum Alloy Tubing. John F. Ewing. *American Petroleum Institute, Proceedings*, v. 38, no. 3, 1958, p. 122-138.

Creep-rupture tests conducted with longitudinal coupon specimens machined from the walls of four 5% Cr, ½% Mo alloy furnace tubes retired from service after periods ranging from 44,000 to 115,000 hr. (Q3m, 2-62; SGA-h, *Cr, Mo*)

884-Q. Investigation of the Impact Properties of Vessel Steels. F. B. Hamel. *American Petroleum Institute, Proceedings*, v. 38, no. 3, 1958, p. 239-257.

Relative merits of A285, A212, A201, A204 and A283 steels. (Q6r; SS, SGA-h)

885-Q. Investigation of Deformation in Armco Iron by Means of Internal Fraction at Megacycle Frequencies. W. J. Bratina. *Canadian Journal of Physics*, v. 37, May 1959, p. 579-590.

5 ref. (Q24, Q22; Fe-a)

886-Q. Relation Between the Critical Alternating Propagation Stress and Crack Length for Mild Steel. N. E. Frost. *Chartered Mechanical Engineer*, v. 6, May 1959, p. 201-203.

(Q26q, 3-66; CN)

887-Q. Effect of Stress Reduction on Secondary Creep of Mild Steel. Toshio Nishihara, Shuji Taira, Kichinosuke Tanaka and Kiyotsugu Ohji. *Japan Society of Mechanical Engineers, Bulletin*, v. 2, no. 5, 1959, p. 102-107.

The transient behavior of 0.14% carbon steel studied at 450° C. Strain rate after partial reduction of stress was found smaller than the true steady creep rate for the reduced stress; however, it gradually increased with time and appeared to tend to the steady creep rate. 6 ref. (Q3; CN-g)

888-Q. Fatigue Tests of Metals at Ultrasonic Frequency. Jobu Awatani and Hiroshi Miyamoto. *Japan Society of Mechanical Engineers, Bulletin*, v. 2, no. 5, 1959, p. 111-115.

Testing equipment and measurements of the fatigue of metals under supersonic frequency. 4 ref. (Q7, 1-74)

889-Q. (English.) Wear of Carbon Steel Weld Metal. Pt. 1. Microscopical Observations of the Structural Changed Layers of the Worn Surface. Sukemitu Ito, Kozo Honda and Kikuzo Ishiyama. *Journal of Mechanical Laboratory of Japan*, v. 4, no. 2, 1958, p. 49-56.

See item 116-Q, 1959. (Q9p, M27; CN, 7-51)

890-Q. (English.) Indentation Hardness Testing on Copper. Shigehiko Yazawa, Masao Unno, Go Yaguchi and Iwakichi Sawano. *Journal of Mechanical Laboratory of Japan*, v. 4, no. 2, 1958, p. 57-59.

See item 117-Q, 1959. (Q29b; Cu)

891-Q. Influence of Order-Disorder on Creep of a Superlattice Alloy. *Physical Society of Japan, Journal*, v. 14, Apr. 1959, p. 463-472.

25 ref. (Q3, N10)

892-Q. (English.) The Workability of Cast Iron With Spheroidal Graphite. Chang Tso-Mei, Shu U-Yung and Gau Tze-Ming. *Scientia Sinica*, v. 8, no. 1, 1959, p. 110-131.

Tensile, compression, Charpy impact, impact tensile, twisting, upsetting tests used to determine workability. (Q23q, Q-general; CI-r)

893-Q. Boron and Zirconium From Crucible Refractories in a Complex Heat-Resistant Alloy. R. F. Decker, John P. Rowe and J. W. Freeman. *U. S. National Advisory Committee for Aeronautics,* Report no. 1392, 1958, 38 p.

Creep-rupture properties at 1600° F. and hot workability of ingots were improved in proportion to the increase in trace amounts of Zr derived from reaction of the melt with zirconia crucible. 49 ref. (Q3m, E10, 2-60, 2-62; SGA-l, 5-59, *Zr, B*)

894-Q. (Russian.) Anisotropy in the Strength of Structural Materials. E. K. Ashkenaze. *Zhurnal Tekhnicheskoi Fiziki,* v. 29, Mar. 1959, p. 374-380.

Computations on the influence of rolling direction on the strength properties of Al and steel. 9 ref. (Q27a; Al, ST)

895-Q. (Japanese.) Properties of Nodular Cast Steel. M. Homma, H. Meguro, A. Minato and Y. Abe. *Japan Foundrymen's Society, Journal,* v. 31, Jan. 1159, p. 9-19.

This type of steel is less affected by careless selection of materials, and has better mechanical properties than that of ductile cast iron or malleable cast iron especially in tensile strength, impact value and fatigue limit, and has far better castability than cast steel and ductile cast iron (Q-general; ST, 5)

896-Q. Effect of Specimen Taper on Determination of Elongation in the Tension Test. Eric B. Kula and Frank R. Larson. *ASTM Bulletin,* no. 238, May 1959, p. 58-61.

A difference of 1% in diameter between the center and ends of the gage length section of round tension. Specimens may lead to local strain differences of over 30%. 8 ref. (Q27, Q23p, 1-60, 3-73)

897-Q. Press-Fit Test Picks Solid Lubricants for Extreme Pressures. A. Sonntag. *Product Engineering (Design Issue),* v. 30, June 22, 1959, p. 64-66.

Determining the coefficient of friction when surfaces slide at high loads and low velocities. (Q9p, 1-53; NM-h)

898-Q. (Russian.) Radiation Effect on Bodies. Yu. N. Solursii. *Atomnaya Energiya,* v. 6, Apr. 1959, p. 403-424.

Steel and structural materials.. 25 ref. (Q-general, 2-67; ST, SGB-s)

899-Q. Physical and Mechanical Properties of Molybdenum and the Mo-0.5% Ti Alloy. *Defense Metals Information Center,* Memorandum no. 14, Apr. 10, 1959, 21 p.

Physical properties in relation to high-temperature applications. Tensile, impact and fatigue properties, creep and stress-rupture over a wide range of temperatures. 18 ref. (Q-general, P-general, 2-62; Mo-b, *Ti*)

900-Q. Mechanical and Physical Property Data on Modified 21% Chromium Martensitic Sheet Steels for Airframe Applications. *Defense Metals Information Center,* Memorandum no. 15, Apr. 18, 1959, 50 p.

Compilation of properties of U. S. Steel 12MoV and Crucible 422. Data on tensile, impact, compressive, fatigue and creep-rupture tests. (Q-general, 2-62; SS-c, 4-53)

901-Q.* (Japanese.) Metal Flow in Forging. Taikichi Awano and Masao Ochiai. *Governmental Industrial Research Institute, Nagoya, Report,* v. 6, Jan. 1957, p. 10-17.

Study of the mechanical properties of plasticine, since its plastic flow is analogous to that of mild steel during forging. Stress-strain relationship, shearing strain, coefficient of friction for various loads, roughness and effects of lubricants; comparison of similar results for mild steel in hot forging. (Q23, F22, 17-52; CN)

902-Q. (Pamphlet.) Kinetics of Deformation and Fracture. S. R. Valluri. Guggenheim Aeronautical Laboratory, California Institute of Technology. Apr. 15, 1959, 15 p.

High-speed camera operating at 70,000 frames per sec. permits observation of fracture in single crystals. (Q26; 14-61)

903-Q. (Book.) Symposium on Basic Mechanisms of Fatigue. 121 p. 1958. American Society for Testing Materials, STP no. 237, 1916 Race St., Philadelphia 3, Pa. $3.75.

Papers abstracted separately. (Q7, Q26p, Q24c, M26b)

904-Q. (Book.) Proceedings of the Conference on the Properties of Materials at High Rates of Strain. 268 p. 1957. Institution of Mechanical Engineers, 1 Birdcage Walk, Westminster, London, SW1, England.

Papers abstracted separately. (Q-general)

905-Q. (Book.) Symposium on Radiation Effects on Materials. v. 3, 164 p. 1958.

American Society for Testing Materials, STP no. 233, 1916 Race St., Philadelphia 3, Pa. $4.25.

Pertinent papers abstracted separately. (Q-general, 2-67)

906-Q.* (Translation—AIP.) Influence of Deformation Conditions on the Mechanism of the Formation of Slip Bands. E. V. Kolontsova and I. V. Telegina. *Soviet Physics, Crystallography*, v. 2, no. 5, 1958, p. 648-652.

Study by an X-ray method of the structure of the slip bands in Sn monocrystals deformed by stretching. 8 ref. (Q24c, 3-68; Sn, 14-61)

907-Q. (Translation—Brutcher no. 4506.) Effect of Hydrogen on Structure and Properties of the Industrial Titanium Alloys VT 2, VT 3, and VT 3-1. S. T. Glazunov, I. I. Kornilov and A. M. Yakimova. *Izvestiya Akademii Nauk SSSR*, June 1958, p. 30-36.

See item 260-Q, 1959. (Q26s; Ti-b, H)

908-Q. (Translation—ConBur.) Deformation Systems of Alpha-Zirconium. Iu. N. Sokurskii and L. N. Protsenko. *Soviet Journal of Atomic Energy*, v. 4, May 1958, p. 579-582.

Deformation systems of alpha-Zr iodide studied in coarse-grained polycrystalline specimens deformed by upsetting. 6 ref. (Q24; Zr)

909-Q.* Residual Stresses in Titanium Carbide-Nickel Cermets. H. W. Newkirk, Jr., and H. H. Sisler. *American Ceramic Society, Journal*, v. 42, June 1959, p. 306-309.

New experimental evidence qualitatively confirms the conclusion that the Ni phase in a titanium carbide-nickel cermet is under considerable tension due to cooling stresses, and indicates that the compressive and extensive stresses in the Ti carbide phase are of approximately equal magnitude, since there is no resultant displacement of the diffraction lines. (Q25h; 6-70, 6-69, Ti, Ni, C)

910-Q.* A Technique for Thermal-Shock and Thermal-Fatigue Testing Based on the Use of Fluidized Solids. E. Glenny, J. E. Northwood, S. W. K. Shaw and T. A. Taylor. *Institute of Metals, Journal*, v. 87, June 1959, p. 294-302.

Laboratory test for studying the behavior of materials under conditions of transient thermal stress, such as may be encountered by the turbine blading of a gas-turbine engine. The most suitable testing technique is by immersion of the test specimen in a bed of powdered refractory substance supported on a permeable plate and fluidized by a stream of air. 18 ref. (Q7j, Q10a, 1-54)

911-Q. (Russian.) Effect of Chemical Composition and Cooling Rate on the Wear Resistance of Gray Cast Iron. N. V. Ivanov. *Liteinoe Proizvodstvo*, Apr. 1959, p. 35-37.

Depending on ferritic, pearlitic or pearlitic-cementite structure, wear resistance of gray iron castings is affected by carbon and silicon content in the first two groups and by combined carbon content in the third group. Wear resistance properties depend also on solidification under conditions of overcooling during crystallization. (Q9n, N12, 2-60; CI-n, *C, Si*)

912-Q. (Russian.) Effect of Minor Vanadium, Tungsten and Boron Additions on the Structure and Mechanical Properties of NAMts 12-9-2 Bronze. A. V. Kurdyumov and K. I. Akimova. *Liteinoe Proizvodstvo*, May 1959, p. 26-28.

Small amounts of vanadium (0.150 to 0 0.175%) in this bronze alloy increased its tensile strength and yield point and decreased relative elongation. Annealing at 600-700° C. raised the tensile strength and yield point still higher and further reduced elongation. Tungsten has practically no effect on mechanical properties, and boron, apart from reducing the relative elongation, has no other effect. Vanadium causes a change in the microstructure in that the dendrite form of beta phase disappears. 4 ref. (Q-general, M27, 2-60, 2-64; Cu-s, *V, W*, B)

913-Q.* Mechanical Properties of 17-4PH. F. Kenneth Iverson. *Precision Metal Molding*, v. 17, June 1959, p. 25-26.

Results of limited tensile testing show that best combination of tensile strength and ductility results from a 1-hr. aging at 900 to 950° F. Cb additions prevent loss of properties due to overaging. (Q27a, 2-60, 2-65; SS, *Cr, Ni, Cb, Cu*)

914-Q.* (French.) Influence of Hot Working on Properties of A-U4SG Aluminum Alloy. Pt. 2. Roger Develay. *Revue de l'Aluminum*, v. 36, Mar. 1959, p. 315-322.

Influence of forging conditions, rolling, forming, homogenization, aging and working on fatigue limit and elongation. Tensile properties. (Q-general, F22, F23, G-general, 2-64; Al-b)

915-Q. Wear of Grinding Wheels. J. Koloc. *Microtecnic*, v. 13, Feb. 1959, p. 12-15.

(Q9n, W25c)

916-Q. (Japanese.) Fatigue and Dynamic Creep Properties of 13% Cr Steel at Elevated Temperature Under Combined Stresses of Static Tension and Alternating Bending. Shuji Taira, Kichinosuke Tanaka, Ryoichi Koterazawa and Mutsuo Inaue. *Japan Society of Mechanical Engineers, Transactions,* v. 25, Mar. 1959, p. 148-155.

Fatigue and dynamic creep tests made under simulated service conditions of turbine blades (i.e., combined stresses of static tension and alternating bending at elevated temperature of 450° C.) 10 ref. (Q3, Q7, 2-62; SS)

917-Q. (Japanese.) Creep of Mild Steel Under Periodic Stresses. Shuji Taira, Kichinosuke Tanaka, Kiyotsugu Ohji and Isao Harumato. *Japan Society of Mechanical Engineers, Transactions,* v. 25, Mar. 1959, p. 155-162.

Creep tests made with 0.14% carbon steel at 450° C. under changing stress levels. (Q3, 2-62; CN-g)

918-Q. (Japanese.) Dynamic Creep Characteristics of Low-Carbon Steel at Elevated Temperatures. Shuji Taira, Kichinosuke Tanaka, Ryoichi Koterazawa, Hideki Tanaka and Yoshiyuki Fujita. *Japan Society of Mechanical Engineers, Transactions,* v. 25, Mar. 1959, p. 163-169.

Rupture and dynamic creep tests made on annealed low-carbon steel at 450° C. 17 ref. (Q3, 2-62; CN-g)

919-Q. (Japanese.) Effect of Combined Alternating Bending and Torsional Stress on the Hardness of Low-Carbon Steel. Zenji Ando, Yozo Kato, Masao Iwata and Takeomi Hasegawa. *Japan Society of Mechanical Engineers, Transactions,* v. 25, Mar. 1959, p. 170-174.

A hardness change noted halfway between the pure plane bending and pure torsion. (Q29, Q5, 3-66; CN-g)

920-Q. (Japanese.) Thermal Characteristics of Metal Wear. Toshio Sata. *Japan Society of Mechanical Engineers, Transactions,* v. 125, Mar. 1959, p. 227-234.

Wear varies according to the temperature of the rubbing surface. (Q9n, 2-61)

921-Q.* (Russian.) Effect of Straightening on Properties of Rails (Type P-65). L. M. Shkol'nik. *Stal',* v. 19, May, 1959, p. 451-456.

Cold straightening of high-carbon heavy steel rail with 0.73% C increased the proportional limit and yield point and to a degree the tensile strength, but decreased the relative elongation. Impact strength remained unchanged. 7 ref. (Q-general, 3-68; CN-r)

922-Q.* Molybdenum in Alloy Steel Castings. G. French and B. H. C. Waters. *Alloy Metals Review,* v. 9, Mar. 1959, p. 2-11.

In the low-alloy steels Mo increases hardenability, toughness and creep resistance and reduces temper brittleness, while in high-alloy steels its use is more specific, as in replacing tungsten in toolsteels and improving corrosion resistance of austenitic stainless steels in certain environments. 15 ref. (Q-general, 2-60, R-general; AY, SS, 5, 17-57)

923-Q.* (Russian.) Effect of Production Processing on Properties of KH25N20 Steel. M. I. Vinograd and B. H. Lyubinskii. *Stal',* v. 19, May 1959, p. 448-451.

Elastic properties of KH25N20 alloy steel electrodes during high-temperature welding are not affected by carbon within the 0.06-0.25% range. Properties are somewhat lessened when Si is increased from 0.4 to 1.0%. 5 ref. (Q21, W29h; AY)

924-Q.* New Developments in Metals and Ceramics for High Temperature Service (Above 1000° F.) Julius J. Harwood. *American Society of Mechanical Engineers,* Paper no. 59-MD-2, 1959, 12 p. $.80.

Comparative evaluation of materials with respect to their high-temperature capabilities, potentialities and limitations. (Q27a, 2-62; SGA-h, 6-70, ST, Mg-b, Al-b, Ti-b, Ni-b, Co-b, Cb-b, Cr-b, Ta-b, Mo-b, W-b, Be-b, SS)

925-Q.* Relations Between the Notch Tensile Strength of Cylindrical and Prismatic Specimens of Titanium Alloys and Heat-Treated Steels. G. Sachs, J. G. Sessler, R. F. Pray and T. H. Yeh. *American Society of Mechanical Engineers,* Paper no. 59-MET-2, 1959, 10 p.

Notched tensile strength of 4340 steel heat treated to various strength levels and of Ti alloys 6 Al-4 V and 5 Al-1.5 Fe-1.4 Cr-1.2 Mo. Effects of notch geometry, specimen shape, type of loading, material history and test temperature. 31 ref. (Q23s, Q27a, Q3q, 1-60, 2-61; AY, Ti-b, *Al, V, Fe, Cr, Mo*)

926-Q.* Nonmetallic Inclusions and Fracture Behavior of Steels. S. Yukawa. *American Society of Mechanical Engineers,* Paper no. 59-MET-10, 1959, 6 p.

Influence of nonmetallic inclusions in plain and notched specimens on room-temperature fracture and fatigue properties of Ni-Mo-V steel and high-temperature rupture properties of Cr-Mo-V steel. 6 ref. (Q26, Q7a, Q3q, 2-61; AY, *Cr, Mo, V, Ni,* 9-69)

927-Q.* Effect of Wall Thickness on Stress-Rupture Life of Tubular Specimens. J. T. Tucker, Jr., E. E. Coulter and L. F. Kooistra. *American Society of Mechanical Engineers,* Paper no. 59-MET-11, 1959, 9 p.

Stress-rupture properties of carbon steel, 2¼Cr-1-Mo alloy steel and Type 321 stainless steel in tubular forms stressed by internal pressure at 850-1200° F. (Q3q, 2-62, 3-73; AY, SS, CN-g, *Cr, Mo*)

928-Q.* Report of Project SP-4 to Steam Power Panel of the ASME-ASTM Joint Committee on the Effect of Temperature on the Properties of Metals. John S. Worth. *American Society of Mechanical Engineers,* Paper no. 59-MET-12, 1959, 13 p. $.80.

Results of short-time tensile tests at 70 to 1000° F., creep and creep rupture tests at 800 to 1000° F. on SA 212 Grade B steel plate. Effect of welding. (Q27a, Q3m, Q3q, 2-62, 2-64; ST, 4-53, 7-51)

929-Q.* Notch Rupture Strength of Type 347 Heat Affected Zone. R. J. Christoffel. *American Society of Mechanical Engineers,* Paper no. 59-MET-13, 1959, 11 p. $.80.

Notch rupture tests at 1100-1200° F. on weldments in both as-welded and solution heat-treated conditions. Hardness and microstructures. Relation of notch rupture strength to service cracking in weld joints. 9 ref. (Q3m, Q3q, Q23s; SS-e, 7-51)

930-Q.* Creep Rupture Tests for Design of High-Pressure Steam Equipment. E. A. Davis. *American Society of Mechanical Engineers,* Paper no. 59-MET-14, 1959, 12 p. $.80.

Creep rupture tests on tubular specimens of Type 316 stainless steel at temperatures of 1200° F. and pressures of 24,000 psi. Tests with pure internal pressure and with equal bi-axial tension. Comparison with results of uni-axial tension tests. (Q3m, Q3n; SS, 4-60)

931-Q.* The Influence of Surface Residual Stress on Fatigue Limit of Titanium. E. C. Reed and J. A. Viens. *American Society of Mechanical Engineers,* Paper no. 59-PROD-1, 1959, 4 p. $.80.

Correlation between endurance limit and surface residual stress for 6 Al-4 V Ti alloy with stresses introduced into surface by various grinding procedures and wet blasting with glass beads. 6 ref. (Q7a, Q25h, L10c, G18k; Ti-b, *Al, V*)

932-Q.* Early Detection of Fatigue in Metal Alloys by Ultrasonics. Karl Sittel. *Nondestructive Testing,* v. 17, May-June 1959, p. 165-171.

Fundamental aspects of fatigue; causes of attenuation of ultrasonic wave energy in metals; possible applications of acoustical methods to the detection and measurement of dislocations during early stages of fatigue. 26 ref. (Q7, Q21f, 1-74)

933-Q.* Yield Point Phenomena in Alpha Brass and Other Face-Centered Cubic Metals. G. F. Bolling. *Philosophical Magazine,* v. 4, May 1959, p. 537-559.

Characteristics of yield points which may be produced in a 70:30 alpha brass at several temperatures. Effects arising from aging under stress are compared with experiments on repeated yielding. Results in brass are supplemented by experiments on Ag, Al, Ni and Pb. 18 ref. (Q24c, 2-65, 3-66; Cu-n, Ag, Al, Ni, Pb)

934-Q.* On the Release of Cold-Work in Cadmium in Terms of Mechanical Properties. R. Kamel and E. A. Attia. *Philosophical Magazine,* v. 4, May 1959, p. 644-653.

Three principal recovery processes were investigated by isothermal internal friction and elasticity measurements on heavily cold worked Cd samples annealed at various temperatures up to 280° C. The first recovery process is room-temperature recovery and was observed immediately after shear deformation. The second process occurred after annealing below the recrystallization temperature at about 150° C., the third was observed above 150° C. 21 ref. (Q22n, N4; Cd)

935-Q.* Temperature Dependence of Fractional Velocity Changes in a Silicon Single Crystal. F. Stein, N. G. Einspruch and R. Truell. *Journal of Applied Physics,* v. 30, June 1959, p. 820-825.

Measurements were carried out as a function of frequency from 10 to 170 mc/sec. for compressional wave propagation along the [100] axis of Si over a temperature range of -60° + 15° C. No frequency dependence was found. 6 ref. (Q21e, Q24j, 2-61; Si, 14-61)

936-Q. Preliminary Experiments on Irradiation Cycling and Partial Beta-Phase Irradiation of Uranium. J. H. Kittel. Argonne National Laboratory. *U. S. Atomic Energy Commission,* ANL-5712, Apr. 1959, 21 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Both highly textured material (300° C. rolled) and nominally randomly oriented material (300° C. rolled and beta-quenched) were studied. Irradiation cycling of both types of material may result in greater elongation than would be anticipated on the assumption that the effects of irradiation and thermal cycling acting alone were additive. (Q7j, M26c, 2-67, P10d; U)

937-Q. Neutron Damage to Metals—a Program Document. A. L. Bement, D. L. Gray and R. L. Hales. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW-59300A, Mar. 1, 1959, 63 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.65.

Recovery of radiation damage occurs over a wide range of temperatures in a series of steps which represent various thermally activated processes. When the temperature ranges for recovery and the number of recovery states are unknown, the isochronous annealing method is used to establish the number of states and their general temperature range prior to detailed isothermal kinetic determinations. (N4, J23, 2-67)

938-Q.* (German.) Friction of Solid Materials as a Physico-Chemical Problem. Adolf Knappwost and Gerhard Rust. *Zeitschrift fur Metallkunde,* v. 50, May 1959, p. 240-247.

Friction between iron and hardenable $AlMg_2Si$ and CuCr alloys is investigated close to the minimum of the Stribeck curve. Friction between iron and AlMg solid solutions is also studied. 19 ref. (Q9p; Al-b, *Mg,* Cu-b, *Cr,* 14-67)

939-Q.* The Dynamic Yielding of a Carbon Steel. C. J Maiden. *Acta Metallurgica,* v. 7, May 1959, p. 297-304.

A criterion for dynamic yielding is developed to give a theoretical relationship between the yield stress and time to yield for any given stress-time function and test temperature. Tests indicate that only a small number of dislocations relock immediately after the application of an impact stress of sufficient magnitude and duration to cause yielding. 13 ref. (Q24c; CN)

940-Q.* A Study of Slip Lines in Alpha Brass as Revealed by the Electron Microscope. J. T. Fourie and H. G. F. Wilsdorf. *Acta Metallurgica,* v. 7, May 1959, p. 339-349.

The frequency of lines with given amounts of glide, the density of slip lines and the average glide per line were determined for various values of stress and strain. 14 ref. (Q24a; Cu-n)

941-Q.* Relationship Between Fatigue Life of Welded Pressure Vessels and Composition of Parent Metal. F. J. Wilkinson and C. L. M. Cottrell. *Welding and Metal Fabrication,* v. 27, June 1959, p. 249-252.

Fatigue test results in 1% Cr-Mo steel. Sulphur and phosphorus reduce fatigue life at high stress levels whereas nickel and carbon increase the life by promoting better hardenability. (Q7, T26q, 2-60; 7-51, AY, Ni, *Cr, Mo, S, P*)

942-Q. (Russian.) Testing of Tubes Under High Gas Pressure for Prolonged Endurance. N. P. Cherhykh. *Zavodskaya Laboratoriya,* v. 25, May 1959, p. 591-595.

Tubes made of E.I.579, E.I.579B and 30KHMA steels were tested under hydrogen and nitrogen gas at 600 atm. pressure and 550° C. The greatest reduction in endurance was shown by 30KHMA steel under hydrogen pressure. Determination of strength was made under actual working conditions. 7 ref. (Q27; AY, *Cr, Mo,* 4-60)

943-Q.* High Temperature Alloys. M. R. Cieslicki. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 326-336.

Mechanical properties of heats made by the vacuum induction process with special reference to Udimet 500. (Q-general, C5j, 1-73; Ni-b, SGA-h)

944-Q. The Case for Charpy Impact Tests. Joseph G. Olivieri. *Machine Design,* v. 31, June 25, 1959, p. 135-136.

Test used to help control metal fabrication and predict serviceability of parts. (Q6)

945-Q. (Russian.) X-Ray Study of an Obliquely Cut Cold Worked Surface. O. N. Shivrin. *Zavodskaya Laboratoriya,* v. 25, May 1959, p. 560-564.

Microhardness studies of cold worked steel and brass surfaces give a less complete picture of distortion distribution than X-ray photography. (Q29q, 9-74; CN, Cu-n)

946-Q. (Russian.) Anistropy Determined With Reference to Hardness and Changes in Contour Outline. V. K. Grigorovich. *Zavodskaya Laboratoriya,* v. 25, May 1959, p. 601-605.

Evaluation of anisotropy of plastic deformation resistance of Zn, Sb and Bi by their hardness and changes in the outline and in micrographs. 4 ref. (Q24q, Q29n; Zn, Sb, Bi)

947-Q.* Theory of Creep Limited by Self-Diffusion. R. W. Christy. *Journal of Applied Physics*, v. 30, May 1959, p. 760-764.

Derivation of theoretical expressions for steady state creep rate at high temperature and stress. Experimental data for Zn and AgBr crystals. 23 ref. (Q3n, N1d, M26b, 2-62; Zn)

948-Q.* Whisker Structure and Tensile Strength. H. Weik. *Journal of Applied Physics*, v. 30, May 1959, p. 791-792.

Influence of layer structure of skin and core of Fe whiskers on tensile strength. Effect of thin Ni coating. 6 ref. (Q27a, M27a; Fe, *Ni*, 14-61, 14-62)

949-Q.* (German.) Armco 17-7 PH Corrosion Resistant and Precipitation Hardening Steel. *Draht*, v. 10, May 1959, p. 222-224.

Parts are subjected to various types of heat treatment and then tested in tension and fatigue. Tabular survey on mechanical and physical properties; methods of descaling. (Q-general, P-general, 2-64, L12; SS)

950-Q.* (Swedish.) Factors Influencing the Strain Embrittlement of Mild Steels. Ake Josefsson. *Jernkontorets Annaler*, v. 143, no. 3, 1959, p. 121-150.

Rimming and killed carbon steels with varying carbon and Mn contents showed a shift of transition temperature depending on the degree of deformation. Compression generally causes a larger increase in transition temperature and a higher degree of embrittlement than is produced by tensile deformation or drawing through a die. 16 ref. (Q23r, 3-68; CN, *Mn*)

951-Q.* (Swedish.) Strain Embrittlement Eliminated by Annealing Below the A_1-Point. Ake Josefsson. *Jernkontorets Annaler*, v. 143, no. 3, 1959, p. 151-166.

Annealing eliminates strain embrittlement of rimming, electric and openhearth steels after tensile deformation (5-20%) or after compression (10-30%). 3 ref. (Q26s, J23, N7e, 3-68; ST)

952-Q.* Tentative Fatigue Strength Reduction Factors for Silicate-Type Inclusions in High-Strength Steels. H. Cummings, F. Stuben and W. Schulte. *ASTM Proceedings*, v. 58, 1958, p. 505-514.

Fatigue strength reduction factors for silicate inclusions in specimens of SAE 4340 and 4350 steels. The value of the notch factor depends on both the inclusion size and steel hardness. Fatigue failure is more readily caused by larger inclusions (0.003 in. diameter), and is more pronounced at high hardness levels. Below 0.00025 in. diameter, inclusions have practically no effect on fatigue strength. (Q7a; AY, 9-69, SGB-a)

953-Q.* Effect of Static Prestrain on Fatigue Properties. F. H. Vitovec. *ASTM Proceedings*, v. 58, 1959, p. 552-570.

Effect of prestrain on fatigue properties of notched and unnotched specimens of 7075-T6, 2024-T4 Al alloys, 16-25-6 Fe-Cr-Ni-Mo alloy and S-816 Co-Ni-Cr alloy. Stresses used for prestrains corresponded to those which produced rupture at 100-200 hr. Factors influencing fatigue failure include residual stresses, metallurgical reactions, cracks, strain hardening and relaxation of residual stress. (Q7, Q3, 3-68; Al-b, Fe-b, Co-b, *Cr, Ni, Mo*)

954-Q.* A Fatigue Failure Hypothesis Based Upon Stabilized Unidirectional Slip. D. G. Younger, Jr. *ASTM Proceedings*, v. 58, 1958, p. 576-594.

The total slip process taking place during the cyclic stressing of metals is considered to be that of a to-and-fro deformation superimposed upon a unidirectional deformation. A distinction is made between two phases of failure mechanism—unidirectional slip process which ceases early in the fatigue life, and alternating slip which continues throughout the fatigue life. (Q24a, Q7b)

955-Q.* Effect of Strain Rate and Temperature on the Strength of Magnesium Alloys. R. Fenn, Jr., and J. Gusack. *ASTM Proceedings*, v. 58, 1958, p. 685-696.

Investigation of the effect of strain rate (0.005, 0.050, 0.50 and 5.0 per min.) on the strength of several rolled, extruded and cast Mg alloys at temperatures up to 900° F. reveals significant increases in strength with increasing testing speed. The study provides information for use in design of structures subjected to rapid loading. (Q27, 3-68, 2-61; Mg-b)

956-Q.* Stress-Rupture Properties of Malleable Iron at Elevated Temperatures. L. C. Marshall and F. Sommer. *ASTM Proceedings*, v. 58, 1958, p. 733-752.

Performance of ferritic and pearlitic malleable iron at temperatures ranging

from 800 to 1200° F. Results are high for ferritic malleable irons at 800, 1000 and 1200° F., with a distinctly anomalous behavior on the part of low-carbon ferritic material which exhibits unexpectedly high strength at 800° F. (Q3q, 2-62; CI-s)

957-Q.* The Creep Properties of Three Low-Shrinkage, Copper-Base Casting Alloys. W. Simmons and J. Kura. *ASTM Proceedings*, v. 58, 1958, p. 791-804.

Creep tests, creep-rupture tests and tension tests conducted on cast specimens of 80-10-10, 85-5-5-5 and Navy "M" alloys, in the 350-550° F. range. Exposure to creep at higher temperatures produced moderate increase in yield strength, while tensile strength and ductility showed significant effects of prior exposure. (Q3, Q3q; Cu-b)

958-Q.* Isochronous Stress-Strain Curves for Some Magnesium Alloys, Showing the Effects of Varying Exposure Times on Their Creep Resistance. R. B. Clapper. *ASTM Proceedings*, v. 58, 1958, p. 812-825.

Short-time creep resistance studied as a function of time. Total extension of the material is investigated in terms of soaking time. Neither heating rate nor rate of straining has a significant effect on the 400, 500 and 600° F. short-time creep resistance of HK31A-H24 sheet alloy. (Q3, 2-61, 3-67; Mg-b, 4-53)

959-Q.* Young's Modulus of Magnesium Alloys as a Function of Temperature and Metallurgical Variables. Raymond W. Fenn, Jr. *ASTM Proceedings*, v. 58, 1958, p. 826-837.

A static tension method used to determine values of the relaxed Young's modulus. Significant variations are correlated with differences in composition, grain size, prior cold work and heat treatment. (Q21a, 2-60, 2-61, 2-64, 2-59; Mg-b)

960-Q.* A High Damping Magnesium Alloy for Missile Applications. G. Weissmann and W. Babington. *ASTM Proceedings*, v. 58, 1958, p. 869-892.

Mg alloys tested for damping capacity as a function of strain. An alloy containing 0.6% Zr showed best results. (Q8, T24e, 3-68; Mg-b, *Zr*)

961-Q.* A Study of the Variability in the Mechanical Properties of Alloy-A Phosphor Bronze Strip. M. Torrey, G. R. Gohn and M. B. Wilk. *ASTM Proceedings*, v. 58, 1958, p. 893-911.

Variability along the length, across the width and among milling lots of the strip. Results show variability in dimensions and mechanical properties that may be expected among specimens from a single strip. (Q-general; 4-53, Cu-s)

962-Q.* Microstructural Observations Pertinent to the Tempering and Temper Brittleness of Steel. W. Clancy and M. Norton. *ASTM Proceedings*, v. 58, 1958, p. 912-929.

Ferrite grain growth in SAE 3140 steel occurs below the lower critical temperature. "Upper nose isothermal temper embrittlement" is thought of as a change in impact properties accompanying the normal changes in microstructure which occur during the fourth stage of tempering. Etching with picric acid reagents delineates clearly the ferrite grain boundaries. (Q26s, Q6, N3, M20q; ST)

963-Q.* Effect of Size on the Yielding of Mild Steel Beams. Cedric W. Richards. *ASTM Proceedings*, v. 58, 1958, p. 955-970.

Results show a linear relationship between size and yield strength in accordance with statistical theory. (Q23b, 3-73; CN)

964-Q.* High Strength Steel Castings, Mechanical Properties and Processing Techniques. K. D. Holmes, J. Zotos, and P. J. Ahearn. *Modern Castings*, v. 36, July 1959, p. 65-70.

Mechanical properties obtainable through various heat treating and testing procedures. The superiority of arc furnace practice is indicated by data from coupon fins wherein a strength level of 225,000 psi. is obtained with 35% reduction in area and 15 ft-lb. impact at -40° F. 11 ref. (Q-general, J-general; ST, 5, 1-60)

965-Q.* (Dutch.) High Speed Toolsteels. Herbert Briefs. *Metalen*, v. 14, May 1959, p. 150-156.

Mechanical properties of high speed steels, steels used for stamping punches and dies, and of hot work toolsteel after various heat treatments and testing temperatures. 16 ref. (Q-general, J-general, W24n, W24p, 2-64, 2-61; TS-M)

966-Q.* (Italian.) Fatigue Resistance of Inafond C4S Alloy Under Rotation Bending Load. L. Mori. *Alluminio Nuova Metallurgia*, v. 28, no. 4, 1959, p. 169-175.

Fatigue resistance tests on naturally and artificially aging Al-Cu-Si alloys. Influence of sample preparation and chill temperature on mechanical properties. Micrographic examination. (Q7, Q26; Al-b, *Cu, Si*)

967-Q.* (Ukrainian.) Wear Resistance of a Metal Machined at Various Temperatures. F. P. Belyankin. *Dopovidi Akademii Nauk Ukrainskoi R.S.R.*, no. 5, 1959, p. 485-488.

Soft steel was machined into a spherical sample at starting temperatures of -195° C. and +20° C. or at a temperature maintained by a.c. or d.c. heating. Wear resistance of samples machined at differing starting temperatures varies. A.c. heating affects the wear resistance differently from d.c. heating. (Q9n, G17, 2-61; CN)

968-Q.* Fatigue Testing—a New Way to Get Quality. R. F. Griswold. *SAE Journal*, v. 67, June 1959, p. 58-61.

Fatigue testing combined with statistical analysis determines operations and quality of torsion bar strength. (Q7)

969-Q.* (French.) Effect of Stress Concentrations on Metal Fatigue. G. V. Oujik and M. J. Galperine. *Revue de Metallurgie*, v. 56, May 1959, p. 482-486.

Effect of local increases in stresses, gradient of maximum normal stress and degree of heterogeneity of stress conditions on the fatigue of 40x chromium steel and 45 medium-carbon steel. Local increase in stresses has a decisive influence on the fatigue strength. (Q7a, 3-66; CN-p, AY)

970-Q.* Thermal Stresses in Design, Pt. 11. Stresses Under Plastic Flow and Creep. S. S. Manson. *Machine Design*, v. 31, July 9, 1959, p. 124-129.

Methods of computing stress distribution for applications where the yield point of the material is exceeded. Formulations and solution by deformation theory. 14 ref. (Q25p, Q24, 17-51)

971-Q.* (French.) Effects of Copper in Gray Cast Iron. A. De Sy, W. Simoens and J. Vidts. *Fonderie Belge*, v. 29, Apr. 1959, p. 95-104.

Effect of Cu alloy additions on graphitization, ferrite reaction and mechanical properties. Brinell hardness and tensile strength of test bars with Cu additions to 2.96% and of thin and thick-section castings containing Cu additions to 2%. Comparison with identical castings containing 2% Ni instead of Cu. 10 ref. (Q-general, N8s, N8j, CI-n, *Ni, Cu*, AD-p37)

972-Q.* (French.) Fatigue Strength of Welded Aluminum-Magnesium Alloys. R. Develay. *Revue de Metallurgie*, v. 56, June 1959, p. 31-38.

Fatigue tests with sheets of various alloys, butt welded or welded in overlapped position by the TIG method. The fatigue strength of butt welded assemblies is higher than that of overlapped welds. Strength can be increased in both cases by correctly applied pretension. (Q7a; Al-b, *Mg*, 7-51)

973-Q.* (Ukrainian.) Residual Stresses in Quenching of Cast Iron. V. P. Lagutin and V. K. Titov. *Dopovidi Akademii Nauk Ukrain' skoi R.S.R.*, no. 3, 1959, p. 290-292.

Relationship between value of the longitudinal residual stresses, due to quenching of cast iron, the quenching medium and the graphite dispersion, showed the complex nature of stress distribution on the cross section of the specimen. The predominance of structural stresses accounts for the presence of tensile stress on the surface of the specimen. 10 ref. (Q25h, J26n; CI-n)

974-Q.* Hydrogen in Heavy Forgings. J. E. Steiner. *Metal Progress*, v. 76, July 1959, p. 72-75.

Hydrogen causes flakes in heavy forgings and adversely affects ductility; consequently, much effort has gone toward hydrogen reduction. Lengthy heat treatments are not reliable, but some hydrogen reduction is possible through careful melting. Vacuum casting techniques eliminate hydrogen. (Q23p; ST, *H*, 4-51, 9-70)

975-Q.* Mechanical Properties of A356 Aluminum Casting Alloy. G. N. Reinemann and L. E. March. *Metal Progress*, v. 76, July 1959, p. 80-86.

Since tensile strength and elongation depend so much on freezing rate, a full stress analysis should be given of complex castings to permit the proper placing of risers and chills. (Q27a, E25; Al-b)

976-Q.* Measuring Decarburization by Microhardness. H. Czyzewski and H. H. Honegger. *Metal Progress*, v. 76, July 1959, p. 93.

Microhardness survey of a 4130 steel sample. By using a Knoop diamond with

a 200-g. load, and 50 X objective, the depth of decarburization was determined at 0.0045 in. Decarburization of 0.002 in. was reported by the metallographic method. (Q29q, J4a; ST)

977-Q.* Normalization Procedures for NRL Drop-Weight Test. P. P. Puzak and A. J. Babeck. *Welding Journal*, v. 38, May 1959, p. 209s-218s.

Data for 90 steels and procedures for determination of surface strain in test specimens by means of weld crack opening. Procedures can be used to establish test conditions necessary to achieve a normalization of variables involving odd size steels. 8 ref. (Q6, Q26q, Q24; CN, 7-51)

978-Q.* (Czech.) Rimming L-D Steel From Iron With a Higher Phosphorus Content. Frantisek Krumnikl and Rudolf Strobl. *Hutnicke Listy*, v. 15, June 1959, p. 493-499.

Comparison of the properties of L-D steel with those of rimming openhearth and basic bessemer steels. 7 ref. (Q-general, D10a; ST-d, ST-e, ST-g)

979-Q.* The Tensile Properties of High-Purity Niobium at Low Temperatures. B. F. Dyson, R. B. Jones and W. J. McG. Tegart. *Institute of Metals, Journal*, v. 87, June 1959, p. 340-342.

High-purity Cb was tested over the range -196 to 240° C. Yield points were observed at all temperatures, the magnitude of the yield drop increasing with decreasing temperature. The temperature-dependence of the yield stress was similar to that of other body-centered cubic metals, and the material was ductile at -196° C. (Q27a, Q23b, 2-63; Cb-a)

980-Q.* Effect of Annealing Treatment on the Structure and Tensile and Creep Properties of a Commercial Titanium Alloy (4%Aluminium-4%Manganese). H. W. Mead. *Institute of Metals, Journal*. v. 87, June 1959, p. 343-346.

Changes in annealing treatment had little effect on the tensile properties of annealed as-rolled rod, but the creep strength was greatest in specimens furnace-cooled to 540° C. after annealing at either 700° C. (when tested at 300° C.) or 800° C. (when tested at 400° C.) The optimum treatment for as-rolled rod was to anneal at 800° C., furnace cool at a rate not exceeding 100° C. per hr. to 550° C., and then air cool. (Q27a, Q3m, 2-64; Ti-b, *Al, Mn*)

981-Q.* The Correlation of the Stress-Rupture Properties of the Nimonic Alloys. Hans Conrad. *Institute of Metals, Journal*, v. 87, June 1959, p. 347-349.

Correlation is achieved by an equation based on theoretical and experimental considerations. The ability of this equation to predict stresses for rupture times up to 34,000 hr. from test data of less than 3000 hr. duration is good, being comparable to that of the Manson-Haferd parameter and better than that of other parameters in common use. 21 ref. (Q3q; Ni-b)

982-Q.* Mechanical Properties of Investment Cast 410. W. Fred Carn. *Precision Metal Molding*, v. 17, July 1959, p. 34-36.

Effect of varying tempering temperatures on mechanical properties of 410 stainless with time at tempering temperature held constant. (Q-general, J29; 5-62, SS)

983-Q.* Properties of Extruded Alloys. Pt. 11. *Precision Metal Molding*, v. 17, July 1959, p. 59.

Fabrication and corrosion characteristics of various Mg alloys. (Q-general, R-general; Mg-b, 4-58)

984-Q.* (Czech.) Improvement of the Properties of Heat Resistant Nickel-Chromium Alloys. M. Vystyd. *Hutnicke Listy*, v. 15, June 1959, p. 536-537.

Effect of Mn, W, Co, B and Zr on creep strength, tensile strength and elongation. (Q3m, Q27a, Q23p, 2-60; Ni-b, *Cr, Mn, W, B, Zr, Co*)

985-Q.* (German.) Fracture Phenomena of Tubular Samples Exposed to Internal Pressure at Low Temperatures Ranging Down to -70° C. Alfred Krisch. *Archiv fur das Eisenhuttenwesen*, v. 30, June 1959, p. 337-344.

Samples were subjected to tensile load and simultaneous hydraulic pressure from within. Formation of longitudinal or transverse cracks is influenced by the testing temperature. (Q26, 2-63, 3-74; ST, 9-72)

986-Q.* (German.) Penetration of Hydrogen Into Steel and Fracture Phenomena. Friedrich Karl Naumann and Wolfhard Carius. *Archiv fur das Eisenhuttenwesen*, v. 30, June 1959, p. 361-370.

Hydrogen diffusion from a saturated solution of H_2S in water into carbon steel. Embrittlement by molecular

hydrogen present at the grain boundaries. 25 ref. (Q26, N1; CN, *H*)

987-Q.* (Report.) Properties of Cast Iron at Elevated Temperatures. J. R. Kattus and Bryan McPherson. Mar. 1959, 90 p. ASTM-ASME Joint Committee on Effect of Temperature on the Properties of Metals. ASTM STP no. 248. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa.

Properties evaluated at 800 and 1000° F. by means of tensile, creep-rupture, thermal-shock and growth tests. Alloys are promising for long-time load-carrying applications and for applications involving thermal shock at temperatures up to 800° F., but not at 1000° F. Mo improves creep-rupture properties; Ni increases resistance to thermal shock; Cr adds to structural stability. 46 ref. (Q-general, 2-62, 2-60; CI-n, *Mo, Ni, Cr*)

988-Q. (Translation—Brutcher No. 4526.) Effect of Columbium on Temper Brittleness of Manganese Steel. I. V. Volobvev and V. V. Gavranek. *Metallovedenie i Obrabotka Metallov*, v. 5, Feb. 1959, p. 28-33.

Investigation of up to 0.82%Cb and 1.84-2.07%Mn in one set of samples and up to 1.30%Cb with 1.77-1.79%Mn in another group of samples. Cb in medium-Mn alloy steel sharply reduces its susceptibility to temper brittleness. Mn steels with 0.4-0.5%C are susceptible to temper brittleness. 10 ref. (Q26s, 2-60; AY, *Cb, Mn*)

989-Q. (Translation—Brutcher No. 4527.) Impact Resistance of 30KhGS Steel. S. S. Ermakov. *Metallovedenie i Obrabotka Metallov*, v. 5, Feb. 1959, p. 34-36.

Cyclic impact loading of a Cr-Mn-Si low-alloy steel revealed features undisclosed by single impact bending. The impact fatigue curve in relation to tempering temperature has two maxima at 200 and 400° C. 4 ref. (Q6n, Q7a; AY)

990-Q. (Translation—Brutcher No. 4435.) Transition of Elastic Deformation Into Permanent Deformation During Structural Transformation. D. M. Nakhimov. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 2-6.

Permanent deformation in metals and alloys is of two types. In the first, there is the migration of a large group of atoms, while in the second there is the migration of individual atoms. High temperature, degree of structural metastability and prolonged load-induced strain are causes of the second type of deformation. 11 ref. (Q21, N1e, Q24m; AY)

991-Q. (Translation—Brutcher No. 4436.) Changes in Mechanical and Technological Properties of Ternary Titanium Alloys. L. P. Luzhnikov and V. M. Novikova. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 6-13.

Study of mechanical, technological and welding properties of fine ternary alloys Ti-Al-Mo, Ti-Al-Cr, Ti-Al-Fe and Ti-Al-Mn showed it to be advantageous to fuse the Ti-Al alloy with a beta stabilizer to the limit approaching their solubility in alpha Ti. 5 ref. (Q-general, M26q; Ti-b, *Al, Fe, Mn, Cr*)

992-Q. (Translation—Brutcher No. 4539.) Rupture Strength of Tubular Steel Specimens Tested Under Internal Hydrogen Pressure at High Temperatures. N. N. Kolgatin, L. A. Glikman, V. P. Teodorovich and V. I. Deryabina. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 19-24.

Rupture strength depends upon wall thickness of the tubes. Rupture is caused by the gradual breaking up of grain boundaries and the weakening of bonds between the crystallites. (Q3q, 3-73, 3-74, 2-62; CN, 4-60)

993-Q. (Translation—Brutcher No. 4540.) Effect of Residual Aluminum on the Impact Strength of Steel at Low Temperature. E. I. Rabinovich, M. K. Skul'skii and K. K. Biktagirov. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 25-28.

Steel with traces of Al, heat treated at 880-1000° C., water quenched, tempered at 660-680° C., normalized and annealed, shows the most severe cold brittleness at -40, -20 and 0° C.; impact strength is about 1 kg. per sq. cm.; while the critical temperature of cold brittleness is decreased as the amount of residual aluminum is decreased. 4 ref. (Q26s, Q6n, 2-63, 2-60; CN, *Al*)

994-Q. (Translation—Brutcher No. 4541.) Steels for Fastening Parts Used in Steam Power Plants Operating at 140° and 570° C. A. V. Ratner and A. S. Panicheva. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Mar. 1959, p. 28-32.

20 Kh1M1F1 or EI909 Cr-Mo-V (0.2-0.25%C, 1%Cr, 1%Mo and 1%V) low-alloy steels, after being heat treated, have high strength and relaxation properties at 565-570° C., making them suitable for

high-pressure high-temperature installations. 4 ref. (Q27, Q3q, 2-62, 2-64; AY)

995-Q. (Translation--Brutcher No. 4543.) Effect of Rare Metals on Mechanical Properties of Iron-Aluminum Alloys. E. M. Savitskii, V. F. Terekhova and I. V. Burov. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Mar. 1959, p. 38-43.

Boron and vanadium increase hardness; Ta and Zr raise impact strength and plasticity in hot rolling. The presence of oxygen is the principal contaminant in Fe-Al alloys, causing brittleness. 15 ref. (Q27a, Q6n, Q29n, 2-60; Fe-b, *Al,* Ad-n32)

996-Q. (Translation--Brutcher No. 4544.) Heat Treatment and Mechanical Properties of Magnesium Alloy Products. A. A. Naryshkin. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Mar. 1959, p. 44-46.

Heat treatment seldom results in any change in mechanical properties. It is possible to manufacture products from strip, tubes and various profiles subjected to aging at 170° ± 50° C. Heating to 170° ± 10°, not exceeding 15 min., neither changes the microstructure nor reduces the tensile strength, and needs no artificial aging. (Q27a, J27d, 2-64; Mg-b)

997-Q. (Translation--Brutcher No. 4547.) Effect of Alloying Elements on the Grain Boundaries of Aluminum Alloys at High Temperatures. L. D. Kharitonova. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Mar. 1959, p. 51-55.

Zn and Mn expand the boundary in solid solutions; Zn causes a reduction of grain-boundary strength; Mn increases it at elevated temperature. 8 ref. (Q23p, M27f, 2-60; Al-b, *Cu, Mn, Zn,* 14-67)

998-Q. (Translation--Brutcher no. 4548.) Properties of Bearing Materials. E. E. Verner and N. S. Zinovich. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Mar. 1959, p. 56.

Sn alloys of Type B-83 show no decrease of plastic deformation at elevated temperatures. (Q24; Sn-b, SGA-c)

999-Q. (Translation--Brutcher no. 4564.) Determination of Characteristic Deformation From Creep-Relaxation Curves. I. A. Odingang and G. I. Lenin. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Apr. 1959, p. 2-8.

Creep-relaxation curves constructed from mathematical equations, for iron at 280° C. and E. I. 257 steel at 600° C. 4 ref. (Q3m, Q3a; Fe-a, CN)

1000-Q. (Translation--Brutcher No. 4568.) Effect of Alloy Content on Friction Properties of Titanium. I. S. Kaptyug and V. I. Syshchikov. *Metallovedenie i Termicheskaya Obrabotka Metallov.* v. 5, Apr. 1959, p. 22-27.

Ti and Ti alloys possess low resistance to wear caused by sliding friction. With alloy additions a comparatively small reduction of the friction coefficient is apparent. (Q9p, 2-60; Ti-a, Ti-b)

1001-Q. (Translation--Brutcher no. 4569.) Relation Between Steel Structure and Yield Point Elongation. G. T. Nazarenko. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Apr. 1959, p. 28-33.

By varying the heat treatment and hence the structure it is possible to change the yield point elongation in all carbon steels. Tempering temperature corresponding to the appearance of the yield point elongation is at 300-500° C. After tempering at 680-700° C. the length of yield point elongation is maximum for all steels irrespective of their carbon content. 8 ref. (Q24c, Q23b, J29, 2-64, 2-61, 3-71; CN)

1002-Q. (Translation--Brutcher no. 4575.) Brittleness of High-Strength Nodular Cast Iron. A. A. Zhukov. *Metallovedenie i Termicheskaya Obrabotka Metallov,* v. 5, Apr. 1959, p. 53-58.

Mg-inoculated high-strength cast iron is marked by comparatively high brittleness at the grain boundary. The greatest harm to metal is caused by Si and P. Refining can be attained by reducing Si content but the carbon content must be increased. 5 ref. (Q26s, 2-60; CI-r, *Mg, Si, P,* AD-p36)

1003-Q.* A Method for Determining Abrasion Resistance of Thick Anodic Coatings on Aluminum. Bruce E. Deal. *Plating,* v. 46, July 1959, p. 823-827.

Abrasion resistance determined with jet abrasive apparatus in terms of time required for a stream of abrasive particles under controlled conditions to break through the coating. 14 ref. (Q9; Al, 8-73)

1004-Q.* (French.) Tension-Compression Fatigue Tests With Low-Alloy Steel Subjected to Nickel Plating Followed by Chromium Plating. Tigeot. *Centre d'Information du*

Chrome Dur—Bulletin de Documentation, v. 104, June 1959, p. 30.

Fatigue strength is decreased by Cr plating but can be improved by heat treatment. It is not affected by the previous Ni plating. (Q7a, L17, 2-64; AY, *Ni, Cr*)

1005-Q.* (French.) Wear Resistance of Electrodeposited Chromium and Chromium-Molybdenum Alloys as Affected by Surface Condition. P. A. Jacquet, J. Galbrun and A. Popoff. *Centre d'Information du Chrome Dur—Bulletin de Documentation,* v. 104, June 1959, p. 29-30.

Plate that is electrolytically polished shows better wear resistance in comparison with mechanically polished surfaces. Wear resistance is also increased by the presence of Mo. (Q9n, L13p, L10b; Cr-b, *Mo,* 8-62)

1006-Q.* (German.) A Theory of Metal Creep. Paul Taeubert. *Abhandlungen der Deutschen Adademie der Wissenschaften Zu Berlin,* v. 7, 1958, p. 1-59.

Creep is explained as an effect of strain hardening and recovery. A system of equations is formulated on the basis of this conception. (Q3, N7e, N4)

1007-Q. (French.) Determination of Elasticity and Damping Properties and of the Rigidity of Complex Structures. Pierre Sorin and Armand Giet. *Comptes Rendus,* v. 248, June 22, 1959, p. 3533-3535.

(Q21, Q8)

1008-Q.* A New Look at Ductility. Michael V. Zaustin. *Machine Design,* v. 31, July 23, 1959, p. 134-141.

Elongation and reduction are no criteria of ductility since they vary with the dimensions and shape of a test specimen and thus are not fundamental properties of metals. A new method is proposed based on shear resistance and cohesion of the material and is, therefore, independent of the shape and size of the specimen. (Q23p, 1-54)

1009-Q.* Thermal Stresses in Design. Pt. 12. S. S. Manson. *Machine Design,* v. 31, July 23, 1959, p. 144-150.

Techniques of applying a method of successive approximations to thermal-stress problems in which the starting point involves two unknowns or the temperature has a two-dimensional distribution. 14 ref. (Q25p, 17-51)

1010-Q.* Adhesion of Evaporated Metal Films. F. Schossberger and K. D. Franson. *Vacuum,* v. 9, Mar. 1959, p. 28-35.

Abrasion-resistivity test developed to study the adhesion of vacuum-deposited Al films on glass surfaces. Differences in the plating and annealing conditions of evaporated Al films detected. Poorest adhesion found on platings made on unclean surfaces and platings made at a slow rate of evaporation of the metal. Optimum substrate temperature for good adhesion was determined to be 175° C. 8 ref. (Q10c, K11a, 1-53; Al-b, 14-62)

1011-Q.* Joint Design for Automatic Welding Eliminates Cracking and Porosity. A. J. Rosenberg and E. W. Jamison. *Welding Design & Fabrication,* v. 32, July 1959, p. 32-34, 52, 53.

Radial, fusion line, transformation, centerbead cracking and porosity minimized in the consumable electrode welding of a low-alloy forged steel to a cast Co-base high-temperature alloy. (Q26q, K1; AY, Co-b, 17-51, SGA-l)

1012-Q.* (Chinese.) Mechanism of Internal Friction Peak of Interstitital Atoms in the Face-Centered Cubic Crystal. Tsien Chi-Tsiang. *Acta Metallurgia Sinica,* v. 4, Mar. 1959, p. 69-74.

Relationship between carbon contest and height of the internal friction peak of carbon diffusion in pure Ni and in Mn steel containing 18.5% Mn. The internal friction peak induced by the interstitial atomic diffusion in the pure metal of a face-center cubic crystal is due to the rotation of the atomic pair of two neighboring atoms in the crystal lattice under the action of stress. 13 ref. (Q22, M25, N1, 3-66; Ni, AY, *Mn*)

1013-Q.* (French.) Additions Influencing the Elastic Limit of Refractory Alloys at Room Temperature. H. Nohl, B. Lux and W. Siegfried. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, June 1959, p. 19-29.

Effects of Cb, Al, Ti, B, Cu, Ce and Mn additions and of artificial aging on elastic limit and first phase of plastic deformation of Cr-Ni-Co alloys. 11 ref. (Q21, 2-60, 2-65; Ni-b, *Cr, Co,* SGA-h)

1014-Q.* (French.) Addition of Bismuth to Gray Cast Iron. J. C. Margerie and M. Drouzy. *Memoires Scientifiques de la Revue de Metallurgie,* v. 56, June 1959, p. 47-73.

Effects of Bi on the hardness and hardness depth, elasticity, tensile strength, ductility and structure. 17 ref. (Q29n, Q21, Q27a, E25q, 2-60; CI-n, *Bi*)

1015-Q.* (Japanese.) Studies on the Standard Indentation Hardness Tester. Pt. 2. Kentaro Yamamoto, Hirosi Yano and Nobuaki Yajima. *Central Inspection Institute of Weights and Measures, Report, Tokyo,* v. 8, no. 1 (17), 1959, p. 4-16.

Analysis of the load-indentation curves of the Rockwell C hardness test. Amount of piling-up and sinking-in during process of penetration; depth of indentation from surface of test piece. 5 ref. (Q29b, Q24)

1016-Q.* (Japanese.) Temperature Characteristics of Springs for Scales. Yukivoshi Shozi, Teruji Takahashi and Shozi Shibata. *Central Inspection Institute of Weights and Measures, Report, Tokyo,* v. 8, no. 1 (17), 1959, p. 42-49.

Temperature coefficient of modulus of rigidity is affected during manufacturing. Measurements, by means of an optical lever, of springs for scales made of high-carbon steel and Co-Elinvar. 4 ref. (Q21e, T6c, 2-61; CN, Fe-b, *Co*)

1017-Q.* (Swedish.) Fracture Mechanism in Metals With Special Regard to Brittle Fracture. C. Schaub. *Jernkontorets Annaler,* v. 143, no. 4, 1959, p. 185-206.

The flow criterion of von Mises; influence of strain rate on yield stress; correlation between transition temperature level according to Charpy V and temperature below which brittle fracture may appear in practice. 13 ref. (Q26, Q26s, Q23r)

1018-Q.* (Swedish.) Principles of Testing and Evaluation of Testing Results in the Study of the Brittle-Fracture Tendency of Steel. T. M. Noren. *Jernkontorets Annaler,* v. 143, no. 4, 1959, p. 207-230.

Testing methods from four points of view—range of application, type of test bar and method of applying the load, criterion used for estimating the testing results, and correlation between testing results and service behavior of a welded structure. Fracture appearance, energy absorption, deformation and nominal fracture stress of notched bars are considered as testing criteria for brittle fracture tendency. 57 ref. (Q26s, 1-54)

1019-Q.* Fracture Strengths Relative to Onset and Arrest of Crack Propagation. G. Irvin, J. Kies and H. Smith. *ASTM Proceedings,* v. 58, 1958, p. 640-660.

A generalized plane-stress viewpoint applied to fracture strength investigations in thin plates containing a crack. A method is developed for the measurement of fracture strength which makes occurrence of fractures predictable under conditions of thickness and yield stress. (Q26q)

1020-Q.* Torsion Tests on Galvanized Wire. Ove Falck Holm. *Draht (English Edition),* no. 41, June 1959, p. 69-70.

Tensile strength and bending strength will show a normal decline after completion of the galvanizing process while the torsion figures will fall steeply. It is suggested that torsion tests on galvanized wire be carried out after pickling and removal of the Zn coating since the quality can only be determined with the wire in this condition. (Q1, Q27a; 4-61, 8-65)

1021-Q.* Investigation of High-Temperature Properties of Nickel-Base Alloys Using Balanced-Experiment Designs. T. L. Robertshaw. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 16-27.

Stress-rupture properties of three alloy systems consisting of Ni, Cr, Co and Fe in atomic ratios of 60:20:10:10 and with concurrent additions of Al, Ti and Ta; Al, Ti and W; and Al, Ti and Mo, respectively. Basic designs used were fractional-replicate, full factorial and composite. Cast specimens outperformed forged specimens of same alloy composition and heat treatment. (Q3p, A9p, 2-60, 2-62; Ni-b, *Al, Ti, Ta, W, Mo,* SGA-h)

1022-Q.* Evaluation of a Cast Nickel-Base Alloy for Use as a Bucket Material at 1650° F. R. A. Signorelli, J. R. Johnston and J. W. Weeton. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 28-37.

Wheel of 52 investment-cast Guy alloy buckets installed in J33-9 turbojet engine operated without failure at 1650° F. for 102 hr., at which point fatigue failure of compressor ended the test. Predicted life of this engine, based on stress-rupture data obtained from test bars, is 400 hr. 8 ref. (Q-general, Q3q, T7h, T24b, 2-62; Ni-b, *Cr, Mo, Al, Cb, Fe, B, Mn, Si,* SGA-h)

1023-Q.* W545—a New Higher Temperature Turbine Disk Alloy. J. T. Brown and J. Bulina. Paper from "High Temperature

Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 38-55.

Commercial development of Fe-base precipitation-hardening alloy containing boron additions is virtually complete. Tensile and stress-rupture properties of notched and plain bar test specimens and wrought products from commercial ingots; effects of boron on notch sensitivity; theory of boron effect; heat treatment. (Q-general, Q3q, Q27, J27, T24b, 2-60; Fe-b, *B*, SGA-h)

1024-Q.* ML-1700 Cast Turbine Bucket Alloy. R. J. Morris. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 81-94.

Room and high-temperature mechanical properties of new Co base alloy with special reference to effects of boron additions up to 0.6%; 51 out of 96 buckets satisfactorily completed 115-hr. engine test at 1700° F. Creep strength at this temperature was not entirely satisfactory. (Q-general, Q3, P12n, T24b, 2-60, 2-62; Co-b, *W, C, B, Cr*, SGA-h)

1025-Q.* Chromium-Base Alloys for High Temperature Applications. R. W. Fountain and M. Korchynsky. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 207-228.

Effects of composition and temperature on mechanical and physical properties; possibilities of developing Cr alloys suitable for high-temperature engineering applications. 52 ref. (Q-general, P-general, 2-60, 2-62; Cr-b, 17-57, SGA-h)

1026-Q.* Molybdenum, Its Alloys and Its Protection. J. J. Harwood and M. Semchyshen. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 243-272.

Solubility of some common alloying elements in Mo; physical and mechanical properties of a number of Mo alloys; unusual ductility of Mo-Re alloys; oxidation and protective coatings. 10 ref. (Q-general, L-general, R1h, 2-60, 2-61; Mo, SGA-h)

1027-Q.* Properties of Molybdenum-Alloys Turbine Buckets. R. G. Frank. Paper from "High Temperature Materials". John Wiley & Sons, New York 16, 1959, p. 273-291.

Mechanical properties of upset-forged 0.5% Ti alloy buckets produced for General Electric's J47 "hot rod" test vehicle compared with those of rolled bar stock of same composition and having optimum balance of strength and resistance to recrystallization. 4 ref. (Q-general, T7h; Mo-b, *Ti*, SGA-h)

1028-Q.* Evaluation of Vacuum-Melted Vacuum-Investment-Cast Nickel-Base Alloys. P. W. Beamer and J. J. Eisenhauer. Paper from "High Temperature Materials" John Wiley & Sons, New York 16, 1959, p. 364-377.

Melting and casting equipment and procedures; tensile and stress-rupture testing of Waspaloy, Udimet 500 and Inco 713. Stress-rupture properties obtained by vacuum investment casting are equal to, or better than, those obtained by conventional techniques, while ductility is improved. (Q3q, Q27, E15, 1-73; Ni-b, SGA-h)

1029-Q.* The Effect of Vacuum Melting on the High-Temperature Properties of Nickel-Base Superalloys. F. M. Richmond. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 407-426.

Effect of high temperature on tensile and stress-rupture properties of Waspaloy, M 252, Nimonic 90, J1570, Udimet 500 and GMR-235. 10 ref. (Q3q, Q27a, E10, 1-73, 2-60; Ni-b, SGA-h)

1030-Q.* The Effect of Environment on High-Temperature Creep Properties of Metals and Alloys. Donald A. Douglas. Paper from "High Temperature Materials". John Wiley & Sons, New York 16, 1959, p. 429-447.

Effects of oxidizing, neutral, inert, reducing and nitriding atmospheres on a variety of materials. 23 ref. (Q3, 2-62, 2-66; SGA-h)

1031-Q.* Comparison of the Creep Rupture Properties of Nickel in Air and in Vacuum. P. Shahinian and M. R. Achter. Paper from "High Temperature Materials". John Wiley & Sons, New York 16, 1959, p. 448-465.

At low stresses, Ni is strengthened in air while at high stresses it is stronger in a vacuum. There is a reversal of relative creep strengths during the course of testing. A theory is suggested to explain mechanism responsibile for differences. 13 ref. (Q3, Q3q, 1-73; Ni, SGA-h)

1032-Q.* Effect of Environments of Sodium Hydroxide, Air and Argon on the Stress-Rupture Properties of Nickel at 1500° F.

H. T. McHenry and H. B. Probst. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 466-485.

At 1500° F., Ni tubes have longer stress-rupture lives in air than in argon. Sodium hydroxide reduces stress-rupture lives of tubes tested in air. Response to environment of relatively simple shapes such as bars and tubes is probably different. 13 ref. (Q3q, 2-62, 2-66; Ni, SGA-h)

1033-Q.* The Effect of Testing Atmospheres on the Creep-Rupture Properties of Molybdenum-Base Alloys at 1800° F. D. D. Lawthers and M. J. Manjoine. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 486-497.

Rupture strength and rupture time of Mo-base alloys when tested in vacuum are greater than when tested in dry-tank helium containing impurity gases. Rupture ductility may also be improved. Rupture strength or time can be increased by stepped loading in impure helium atmosphere. (Q3, Q3q, 2-66, 1-73; Mo-b, SGA-h)

1034-Q.* (English.) Effect of Shot-Peening on the Fatigue Strength of Metals. Pt. 3. Effect on Steel With Notch. Sakae Takeuchi and Tsuneo Homma. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Apr. 1959, p. 94-101.

Influence of shot-peening on fatigue strength of U-notched and V-notched specimens of Si-Mn spring steel heat treated to a tensile strength of 140 kg. per sq. mm. 6 ref. (Q7a, G23n, 3-73; ST, SGA-b)

1035-Q.* (French.) Fatigue Failure. *Revue de la Soudure Lastijdschrift*, v. 15, no. 2, 1959, p. 90-99.

How improved design avoids fatigue failure observed in welded structures in tankers. (Q7, K1a, T22g; ST, 7-51, 17-51)

1036-Q.* Malleable Iron Resists High Temperature. Hans J. Heine. *Foundry*, v. 87, Aug. 1959, p. 94, 96.

Tests show that ferritic and pearlitic malleable irons possess exceptional physical and mechanical characteristics at elevated temperatures. (Q-general, P-general, 2-62; CI-s)

1037-Q.* X2219-T6 High Temperature Aluminum Alloy. Paul L. Hendricks. *Light Metal Age*, v. 17, June 1959, p. 11-12, 30.

Tensile properties at room temperature and at 300-500° F. after 100 hr. exposure. Microstructure, resistance to stress-corrosion, stress-rupture properties and fatigue strength of extrusions. Effect of specimen orientation. (Q27a, 2-62, Q3q, Q7a, 3-72, R1b; Al-b, *Cu, Mn, V, Zr*, SGA-h)

1038-Q.* X-Ray Diffraction for Residual Stress Measurements of Restrained Weldments. E. H. Kinelski and J. Alfred Berger. *Norelco Reporter*, v. 6, May-June 1959, p. 65-68.

Stresses in Monel alloy plate weldments prepared by the metal-arc, gas-shielded tungsten-arc and gas-shielded consumable-electrode welding processes. The residual-stress patterns in the weldments are compared for two conditions of preheat and interbead temperatures (room temperature and 300° F.). The X-ray diffraction method measures the strain existing in the specimen by measuring the change in the interatomic distance between planes of atoms. 7 ref. (Q25h, K1, M22g; Ni-b, 7-51)

1039-Q.* High-Temperature Properties of Ceramics and Cermets. E. Glenny and T. A. Taylor. *Powder Metallurgy*, no. 1-2, 1958, p. 189-226.

Resistance of oxides, oxide-metal cermets, carbide-metal cermets, molybdenum disilicide and silicon nitride to creep, fatigue, oxidation, thermal shock and impact. 25 ref. (Q-general, R1h, 2-62; Cr, Mo, Ni, 6-70, SGA-h)

1040-Q. Hot Hardness Tests on Thorium and Some Thorium-Rich Alloys. R. C. Burnett and J. R. Murray. *United Kingdom Atomic Energy Authority*, AERE M/M 217, Jan. 1959, 20 p.

Investigations of three samples of Th and on several Th-Al, Th-U and Th-Zr alloys in the as-cast, solution treated and aged conditions. Results suggest that Th-Al alloys can be hardened by precipitation of Th_2Al, that U additions up to 3 at.% do not improve the hot hardness of Th significantly and that Zr additions within the alpha Th solid solution range lead to solution hardening. 10 ref. (Q29p, 2-60, 2-64; Th-b, *Al, U, Zr*)

1041-Q. Metallurgical Examination of a Failed Electro-Magnetic Liquid Metal Pump Channel. G. H. Broomfield. *United Kingdom Atomic Energy Authority*, AERE M/M228, Mar. 1959, 8 p.

A pump channel, which failed by cracking after approximately 950 hr. service in an isothermal loop containing

Pb-Bi eutectic, examined by metallography, radiography and analysis for causes of failure. Data indicate that the Cr steel tube failed in fatigue, probably accelerated by liquid metal corrosion. (Q7, R6m, W13d; AY, *Pb, Bi*)

1042-Q. Tensile Creep Properties of Aluminum Containing 0.2 at.% Magnesium in the Temperature Range 200-350° C. R. Doldon. *United Kingdom Atomic Energy Authority*, IGR-TN/C-993, Mar. 23, 1959. 18 p.

The addition of Mg in amounts less than the limit of solid solubility results in an increase in creep strength; the first addition of Mg has a larger proportional effect than subsequent additions at each temperature; the increase in creep strength brought about by alloying is greater the lower the temperature. 5 ref. (Q3m, 2-60, 2-61; Al-b, *Mg*, AD-q40)

1043-Q. Effects of Hydrogen Embrittlement on Metals: 1952 to Present. Patricia E. Bell. Los Alamos Scientific Laboratory. *U. S. Atomic Energy Commission*, LAMS-2283, June 3, 1959, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Some 160 literature references, mainly concerned with the action of hydrogen on steel and Ti. (Q26s; ST, Ti, *H*)

1044-Q. Crack Propagation Tests of Some High-Strength Sheet Steels. J. E. Srawley and C. D. Beachem. Naval Research Laboratory. *U. S. Office of Technical Services*, PB 151352, Jan. 1959, 28 p. $.75.

Results for eight high-strength steels using 1/2-in. wide center-cracked tensile specimens. Relation of fracture stress and appearance to testing temperature. Influence of thickness and heat treatment on ductile-to-brittle transition temperature. (Q26q, Q23r, 2-64, 2-61; ST, 4-53, SGB-a)

1045-Q.* Physical Metallurgy of Titanium Alloys. R. I. Jaffee. Paper from "Progress in Metal Physics". v. 7. Pergamon Press Inc., New York, 1958, p. 65-163.

Effects of composition and temperature on mechanical properties, electrical conductivity, hardness and structure of Ti alloys in relation to some 26 alloying elements. 169 ref. (Q-general, P15g, M26, 2-60, 2-61; Ti-b)

1046-Q.* The Stored Energy of Cold Work. A. L. Titchener and M. B. Bever. Paper from "Progress in Metal Physics". v. 7. Pergamon Press Inc., New York, 1958, p. 247-338.

Stored energy resulting from cold deformation is determined by both the extent and temperature of deformation and by material composition. 180 ref. (Q24, 2-61, 2-60)

1047-Q.* Temperature Dependence of the Hardness of Secondary Phases Common in Turbine Bucket Alloys. J. H. Westbrook. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York, 1959, p. 95-115.

Indentation hardness measurements were made on samples of representative carbide and intermetallic compound structures prepared by cold crucible arc melting followed by homogenization and equilibration anneals. Except for Ni_3Al, all compounds studied were significantly harder at room temperature, while all were harder at 800° C. than typical high-temperature alloys. 68 ref. (Q29q, Q29c, 2-61; 14-68, SGA-h)

1048-Q.* Recent Developments in Sintered Titanium Carbide Compositions. J. Wambold and J. C. Redmond. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York, 1959, p. 125-139.

Procedures and equipment used for elevated-temperature testing in tension at Kennametal Laboratory. Properties of high-temperature, high-strength compositions supplied commercially under trade name Kentanium. Fabrication techniques for cemented carbide compositions. (Q-general, 2-62; Ti, 6-69, SGA-h, SGB-a)

1049-Q.* Relations of High Temperature Properties of a Nickel-Base Precipitation-Hardening Alloy to Contamination by Crucibles. R. F. Decker, J. P. Rowe and J. W. Freeman. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York, 1959, p. 388-406.

Trace amounts of B and Zr introduced into a heat resistant TiAl-hardened Ni-base alloy through reaction with crucible refractories during melting improve hot working characteristics and creep-rupture properties to a marked extent. Data for zirconia, alumina and magnesia crucibles. 9 ref. (Q3q, Q23q, E10b, W18h, 2-60, 2-62; Ni-b, *Zr, B*, SGA-h)

1050-Q.* (English.) Structure and Low-Temperature Annealing Effect in Cold-Rolled Alpha Brass. Pt. 1. Structure and

Change in Hardness. Osamu Izumi. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Apr. 1959, p. 120-130.

Hardness change in cold rolled 70-30 brass with different grain sizes and reductions when annealed at 150-450° C. (Q29n, J23p, 2-59, 2-64, 3-68; Cu-n)

1051-Q.* (French.) Sound Waves Produced in Plastic Deformation and the Brittle Fracture of Mild Steel. J. B. Lean and J. Plateau. *Memoires Scientifique de la Revue de Metallurgie*, v. 56, June 1959, p. 91-99.

Measurement of sound waves produced in plastic deformation when Piobert lines are produced. Brittle fracture is preceded by the formation of Piobert lines. 7 ref. (Q24c, Q26s; CN)

1052-Q.* (German.) Properties of Uranium and Its Processing. G. Schneider. *Metall*, v. 13, July 1959, p. 625-630.

Importance of process annealing in cold deformation. 28 ref. (Q-general, F-general, G17, 3-68, J23p, 2-61; U)

1053-Q.* (German.) Elastic Limit of Deep Drawing Steel Sheet After Further Rolling and Aging. Werner Lueg and Paul Funke. *Stahl und Eisen*, v. 79, no. 14, July 9, 1959, p. 969-976.

Determination of the elastic limit of low-carbon steel aged after rolling, following subsequent rolling or without previous deformation. The aging effect decreases in proportion to the number of re-rolling passes. 25 ref. (Q21e, N7a, F23, 3-68; CN-g, 4-53)

1054-Q.* (Russian.) Residual Stresses in I-Beams and Channels. I. V. Gunin, D. I. Piryazev and F. P. Volchek. *Stal'*, June 1959, p. 544-546.

Longitudinal residual stresses in flanges of standard and lightweight I-beams and channels greatly affect their bending strain. These stresses are about the same in lightweight as in standard weight shapes. The longitudinal residual stresses in the web of the substandard weight I-beams is somewhat higher than in the standard beam. (Q25h; ST, 4-57)

1055-Q. (French.) Welded Girders Exposed to Bending Stress. P. Guiaux. *Revue de la Soudure Lastijdschrift*, v. 15, no. 2, 1959, p. 61-81.

Distribution of stress; stress concentrations causing failure along a welded joint. (Q5m, 3-66; ST, 7-51)

1056-Q. (German.) Tensile Strength and Alternate Bend Strength of Light Metal Cast Alloys. W. Buchen. *Giesserei*, v. 46, June 1959, p. 361-364.

Procedure and computation of strength values. Results prove the suitability of cast alloys for considerable mechanical loading. (Q27a, Q5g; Al-b, Mg-b, 5)

1057-Q. (Italian.) Progressive Testing. L. Locati. *Metallurgia Italiana*, v. 51, May 1959, p. 179-184.

Extension of progressive method from fatigue test to other mechanical tests. 6 ref. (Q10, Q7)

1058-Q.* Strong Tough Cermets. Thomas S. Shevlin. *News in Engineering*, v. 31, no. 2, Apr. 1959, p. 17-19, 54.

Tensile strength in excess of 40,000 psi. at 2000° F. and impact energy absorption of up to 70 ft-lb. is found in lamellar cermets formed by welding Ni sheet and previously fired nonporous Ti carbide-Ni cermet strips under pressure. (Q27a, 2-62, Q6n; Ni, 6-70)

1059-Q. Improvement of the High-Temperature Strength Properties of Reactor Materials After Fabrication. R. W. Swindeman and D. A. Douglas. *Journal of Nuclear Materials*, v. 1, Apr. 1959, p. 49-57.

Improvement of Ni-Cr and Ni-Mo alloys by heat treatment, carburizing and choice of material with reference to their service environment. 7 ref. (Q3m, J28, T11, 2-62; Ni-b, *Cr*, *Mo*)

1060-Q. Effects of Heating Neutron-Irradiated Beryllium. J. B. Rich, G. B. Redding and R. S. Barnes. *Journal of Nuclear Materials*, v. 1, Apr. 1959, p. 96-105.

Effects of He, formed by exposure to irradiation. Influence on volume, hardness and bend strength of samples annealed at various temperatures and times. 8 ref. (Q29n, Q5q, P10a, 2-67, 2-64; Be, *He*)

1061-Q.* Transition Temperatures of Chromium and Chromium-Base Alloys. E. P. Abrahamson and N. J. Grant. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 229-242.

Feasibility of producing a ductile Cr by means of a simple deoxidation and denitrogenation addition to electrolytic Cr. Scavengers studied were C, B, Be, Ca, Ce, Cb, Al, Si, Ti and Zr. Results confirm that nitrogen is most significant

impurity in connection with brittle-to-ductile transition. 5 ref. (Q5g, Q23r, C5m, 3-69; Cr, AD-p, *C, B, Be, Ca, Ce, Cb, Al, Si, N, Ti, Zr*)

1062-Q.* Modes of Fracture and Slip in Cemented Carbides. N. M. Parikh. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York 16, 1959, p. 169-181.

Modes of fracture are primarily determined by microstructure, which is in turn influenced by relative surface energies of different interfaces. 4 ref. (Q24a, Q24c, Q26; W, Ti, 6-69)

1063-Q.* (French.) Hardness of Martensite in Cast Iron as Affected by Carbon Content. Gabrielle Aubrion. *Fonderie*, no. 161, June 1959, p. 266-271.

Cast iron is held for varying periods at 900° C. and then quenched. Hardness is influenced by the holding time and reaches a maximum after 20 min. 6 ref. (Q29n, J26n, N8p, 2-60; CI, *C*)

1064-Q.* (French.) Effect of Wall Thickness on Thermal Stress in Superheater Tubes of Ferritic and Austenitic Steel. N. Salier. *Revue Universelle des Mines*, v. 15, July 1959, p. 633-649.

Stress computations for various materials under service conditions. 11 ref. (Q25p, 3-73, 2-60; SS-d, SS-e, 4-60)

1065-Q.* The Effect of Temperature Interruption on Anelastic Creep. *ASTM Bulletin*, no. 239, July 1959, p. 61-62.

Alloy steel is heated while under heavy stress to produce a frozen anelastic creep which partially counteracts the plastic creep occurring in service. (Q3, Q22, Q23, 3-66, 2-61; AY)

1066-Q.* (Russian.) Effect of Preliminary Deformation on the Pasticity of Aluminum. V. D. Kuznetsov and A. I. Laskutov. *Doklady Akademii Nauk SSSR*, v. 126, Jan. 1959, p. 70-73.

If structural defects caused by 6-25% elongation tests at 300° C. are of the reversible type, then the mechanical properties of Al are restored, after annealing at 400° C., to their original values. If the deformation is of a permanent character, mechanical properties are not restored to their original state. 12 ref. (Q23p, 2-64, 3-68; Al)

1067-Q.* Mechanical Properties of Irradiated Niobium. M. J. Makin and F. J. Minter. *Acta Metallurgica*, v. 7, June 1959, p. 361-366.

Only a moderate increase in yield strength occurred immediately on irradiation but on annealing in the range 125-175° C. there was a further large increase with the formation of a yield drop at start of deformation. Activiation energy was measured and it is concluded that the process is due to vacancy migration, the yield drop being due to the condensation on dislocations of vacancies produced during irradiation. 15 ref. (Q-general, M26s, 2-64, 2-67; Cb)

1068-Q.* (Czech.) Normalized Manganese Steel Tubes for the Oil Industry. Roman Sejnoha and Ludek Prochazka. *Hutnicke Listy*, v. 14, July 1959, p. 569-573.

Mechanical properties of tubes and strip of the same material after normalizing. Effects of austenitization temperature on grain size; curve representing impact strength for various testing temperatures. 10 ref. (Q-general, M27c, 2-64, T28; AY, Mn, 4-60, 4-53)

1069-Q.* (German.) Relations Between Heat Treatment, Residual Stress and Fatigue Strength in Flame and Induction Hardening. K. Flankenmayer. *Harterei-Technik und Warmebehandlung (Supplement to Industrieblatt)*, v. 5, June 1959, p. 273-276.

Highest fatigue strength results from heat treatment producing greatest residual stresses on the surface of parts. Stress is determined by heat flow during hardening. Stress as a function of case depth. 11 ref. (Q25h, Q7a, J2g, J2h; ST)

1070-Q.* (Hungarian.) Production of St 52 Steel With High Yield Point. Lajos Schottner. *Kohaszati Lapok*, v. 14, June 1959, p. 233-239.

Prevention of embrittlement; methods of increasing the ratio of tensile strength to yield point. (Q26, Q27; CN)

1071-Q.* (Hungarian.) Quality and Surface Defects of Bz5 and Bz8 Sheets and Strips. Zoltan Hegedus and Mihaly Stefan. *Kohaszati Lapok*, v. 14, June 1959, p. 262-267.

Micro and macroscopic investigation shows cracking, flakes and laminations to be due to failures in casting and heat treatment. 5 ref. (Q26q, E-general; 9-71, Cu-s, 4-53)

1072-Q. Atom Movements and Dislocation Structures for Plastic Slip in Single Crystals of Beta-Uranium. M. L. Kronberg. *Journal*

of Nuclear Materials, v. 1, Apr. 1959, p. 85-95.

Theoretical interpretation of slip and plastic flow. 5 ref. (Q24; U, 14-61)

1073-Q.* Creep Processes in Polycrystalline Aluminium. W. A. Rachinger. *Acta Metallurgica*, v. 7, June 1959, p. 374-375.

Plastic deformation of a polycrystalline aggregate is due to one or both of two processes—grain deformation and grain sliding. In Al slowly extended at 300° C. the surface of the specimen deforms by grain elongation while the interior deforms by grain sliding. Thus it is not possible to assume surface observations typical of the interior. (Q3, Q24; Al)

1074-Q. The Deformation of Alpha Uranium at 450 and 500° C. B. R. Butcher. *United Kingdom Atomic Energy Authority*, AERE-R 2898, 1959, 15 p.

Deformation tests on alpha uranium at 450° C. show that the deformation element characteristics are very similar to those at room temperature. Similar tests at 500° C. have revealed that twinning is much decreased, and that there is some evidence for pencil glide in a <100> direction. 9 ref. (Q24, 2-62; U)

1075-Q.* (English) Effects of Compression on the Plastic Deformation Mechanism of Metals Under High Strain Rate and at Various Temperatures. Y. Matsuura. *Waseda University, Castings Research Laboratory, Report*, no. 9, Nov. 1958, p. 49-54.

Graphs show compression stress versus strain rate under various testing conditions. Stress-wave propagation and resistance to plastic deformation. (Q24, Q28k; Al)

1076-Q.* (English.) Study of Zinc-Aluminum Alloys by Measuring Young's Modulus. I. Iitaka and T. Morooka. *Waseda University, Castings Research Laboratory, Report*, no. 9, Nov. 1958, p. 55-56.

Alloys in the alpha phase show the lowest value of the modulus. Tempering and the addition of Mg produce marked changes in Young's modulus. (Q21a, 2-64, 2-60; Zn-b, *Al*)

1077-Q.* (English.) Wear Properties of 70:30 Brass and Beta-Brass. F. Hayama. *Waseda University, Castings Research Laboratory, Report*, no. 9, Nov. 1958, p. 59-63.

Sliding wear of cast and rolled brass on hardened steel shafts is affected by sliding speed, Pb and Zn content and beta structure. (Q9, 2-60; Cu-n, *Pb, Zn*)

1078-Q.* (Czech.) Hardness Changes in Surface Hardened Rail Treads as a Function of Depth and Microstructure. Slavimir Horejs. *Hutnicke Listy*, v. 14, July 1959, p. 649-656.

Tread of rails is surface hardened by short quenching immediately following rolling and then exposed to the annealing action of the heat still present. A relative hardness minimum and hardness maximum with increasing depth is explained by the presence of an austenitic zone under the martensitic surface and transformation of the austenite into bainite. (Q29, J26n, J23, 3-71, T23g; CN)

1079-Q.* (French.) Comparison Between Results of Plasticity and Elastic Limit Tests With Reference to Iron Aged After Deformation. Regina Pankowski-Fern and Georges A. Homes. *Comptes Rendus*, v. 248, June 1, 1959, p. 3167-3169.

Plasticity tests after artificially aging of deformed specimens and tensile tests after natural aging over various periods. Different effects of aging on plasticity and tensile properties. (Q23p, N7a, J27d, Q27, 3-68; Fe-m)

1080-Q.* (French.) Techniques for Testing Brittle Fracture. *Soudage et Techniques Connexes*, v. 13, May-June 1959, p. 183-196.

Brittle fracture properties of several grades of mild steel sheet examined by Charpy impact, notched slow bend, Robertson, Pellini drop-weight, bulge explosion, crack-starter and Tipper tensile tests. 10 ref. (Q26s, 1-54, Q27; CN, 4-53)

1081-Q.* (French.) Fatigue Fracture. *Soudage et Techniques Connexes*, v. 13, May-June 1959, p. 215-230.

Origin and occurrence of fatigue fracture in relation to different grades of steel and various types of welds. Failures occurred in bulkhead stringers of tankers, engine crankshaft and in the main deck of a warship. (Q26, Q7; ST)

1082-Q. (Dutch.) Strength Behavior of Dynamically Loaded Welded Beams and Plate Constructions of Various Designs. A. A. van Douwen. *Lastechniek*, v. 25, July 1959, p. 152-157.

(Q5; 7-51)

1083-Q. (Russian.) Effect of Frequency of Loading on Strength Testing. Yu. S. Danilov and N. V. Kadobnova. *Zavodskaya Laboratoriya*, v. 25, June 1959, p. 727-731.

Strength of metals subjected to cyclic loading is determined not only by size of load and time of its effectiveness but also by number of cycles per min. 4 ref. (Q7e)

1084-Q.* Intercrystalline Fracture in Creep of Chromium and Some Chromium Alloys. G. R. Wilms. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 411-413.

Coarse slip in a grain may produce jogs along the boundary, the size of the jogs depending on number of dislocations which effectively run through the boundary to initiate accommodating slip in the adjacent grain. The remaining dislocations will remain piled-up and there will be a stress field around them at the boundary; if boundary sliding occurs concomitantly, the surfaces at the jogs may be separated to form intercrystalline voids. 9 ref. (Q26, Q3, M26s, 3-68; Cr)

1085-Q.* Recovery of Decarburized Mild Steel. H. L. Couch and J. D. Lubahn. *Metallurgical Society of AIME, Transactions*, v. 215, June 1959, p. 433-436.

Strain hardening arising from 1/2% strain can be partly recovered by subsequent heating, even though recrystallization or grain growth does not occur. This recovery varies from 5% in 1 hr. at room temperature to 70% at 800° C. Except for the initial portion (Bauschinger effect), the stress-strain curve following recovery can be superimposed on the original curve by shifting it to the left. 8 ref. (Q22n, Q24, N7e; CN)

1086-Q. Properties of Certain Cold Rolled Austenitic Stainless Sheet Steels. R. J. Mangone, D. B. Roach and A. M. Hall. *Defense Metals Information Center*, Report no. DMIC 113, PB 151069, May 15, 1959, 52 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.)

Data on AISI Type 30, MicroMach, AISI Type 201, USS Tenelon and USS 17-5 MnV. These alloys have yield strengths in excess of 150,000 psi. with ductilities of about 10%. In the extra-hard condition, the alloys have yield strengths of the order of 200,000 psi. or more and ductilities ranging from 1 to 5%. The cold rolled austenitic stainless steels retain good strength at temperatures up to 1000 to 1200° F. (Q-general, Q27, 2-62; SS-e, 4-53)

1087-Q. Ductile-Brittle Transition in the Refractory Metals. F. R. Schwartzberg, H. R. Ogden and R. I. Jaffee. *Defense Metals Information Center*, Report no. DMIC 114, PB 151070, June 25, 1959, 72 p. (Available from U.S. Office of Technical Services, Washington 25, D. C.)

Ductile-brittle transition behavior occurs in Cb, Mo, W and Cr. Data for V suggest that brittleness at low temperatures is attributable to low strain rate hydrogen embrittlement. No brittle transition has yet been found in Ta. The transition from ductile to brittle behavior is associated with a rapid rise in yield strength occurring with reductions in temperature. Brittle behavior is observed to occur when the yield strength equals the fracture strength. 58 ref. (Q23r, Q26s; Cb, Mo, W, Cr, V)

1088-Q. Fracture Appearance of Impact Specimens Taken From Fractured Ship Plates. John A. Bennett. *Ship Structure Committee*, SSC-113, June 29, 1959, 9 p.

A correlation of service failure data on the basis of fracture appearance transitions. Brittle fracture area is determined at failure temperature. (Q26r, T22j; ST)

1089-Q. Dynamic Properties of 6061-T6 Aluminum Weldments. D. W. Grobecker. Paper from "Minutes of the Seventh Annual Atomic Energy Commission Welding Conference". U.S. Atomic Energy Commission, TID-7562, Jan. 1959, p. 209-225.

Analysis of typical Al weld defects, their cause and prevention; determination of impact properties and static strength of base metal and weld deposit; relative merits of 4043 (4.5% Si in Al), 5154 (3.5% Mg prime alloying constituent) and 5356 (5.0% Mg prime alloying constituent) filler materials. (Q27, Q6; Al-b, *Si, Al, Mg*, 7-51, 9)

1090-Q.* (French.) Two stages of Transient Embrittlement Observed With Aluminum-Zinc Alloys of High Zinc Content After Heating and Cooling. Pierre Gobin and Jean Montuelle. *Comptes Rendus*, v. 249, July 1959, p. 271-273.

Effects of heating temperature and cooling speed on transient embrittlement occurring in subsequent natural aging. (Q26s, N7a, 2-60, 2-64; Al-b, *Zn*)

1091-Q.* Effect of Surface Condition on the Initiation of Plastic Flow in Magnesium Oxide. R. J. Stokes, T. L. Johnston and

C. H. Li. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 437-444.

Dislocation half-loops, artificially introduced by sprinkling with carborundum, were subjected to stress using three-point loading. The different stages of loop expansion and multiplication were then correlated with the macroscopic stress-deflection curve. Slip was not detected on unsprinkled crystals below two-thirds of the "yield stress". 8 ref. (Q24, M26b, 3-66; Mg, NM-a34)

1092-Q.* Studies of Slugs From Explosives With Lined Cavities. Pt. 2. R. C. Deshpande and Sampooran Singh. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 497-499.

Metallographic studies of steel slugs recovered after firing shaped charges in deep containers of water. Microstructural studies of the slug completely support the general pattern of the direction of metal flow observed in cast iron and Cu slugs. In the deformed region, the maximum number of twin directions found in the etch plane of a single favorably oriented ferrite grain was four. (Q24, Q26; ST, CI, Cu)

1093-Q.* Twin Accommodation in Au Cd B' Alloys. Howard K. Birnbaum. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 508-509.

Accommodation at the tip of a twin lamella in the Au-Cd beta-prime alloys is achieved by elastic distortion of the twin and matrix. The conditions necessary for this type of twin accommodation are a small twinning shear and a high value of the yield stress. 4 ref. (Q24b; Au-b, *Cd*)

1094-Q.* Fatigue in Single Crystals of Copper. M. L. Ebner and W. A. Backofen. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 510-520.

Hardening as measured by bending moment for approximately constant plastic strain increases with accumulated strain in a way similar to the hardening under unidirectional straining. Fatigue cracks form on active slip planes and can be observed metallographically after saturation occurs. Intersecting slip on primary and secondary planes precedes the visible cracks and is always apparent with the beginning of saturation. Cracking is influenced to an important extent by the geometry of slip-band formation on the stressed surface. 20 ref. (Q7, Q26q, N7e, 3-68; Cu, 14-61)

1095-Q.* Effect of Prestrain on the Creep-Rupture Properties of High-Purity Aluminum and on Al-2% Mg Alloy. N. J. Grant, A. R. Cahudhuri, I. R. Silver and D. C. Ganow. *Metallurgical Society of AIME, Transactions,* v. 215, June 1959, p. 540-544.

Creep tests conducted at 500° F. and 1800 psi. for the pure Al and at 600° F. and 3400 psi. for the alloy. Prestraining has an effect on rupture life and creep rate which was less than a factor of 2 compared to the annealed condition, and therefore within the normal limits of test reproducibility. (Q3q, 3-68; Al-a, Al-b, *Mg*)

1096-Q. (Russian.) Distribution of Fatigue Cracks in Ship Steel. G. N. Vsevolodov. *Zavodskaya Laboratoriya,* v. 25, June 1959, p. 734-735.

From the constructed diagram of variable cyclic bend tests with various stress concentrations it is shown that the rate of crack distribution is diminished as the ultimate tensile strength and size of sample are reduced. (Q26q, 3-66, 3-73; CN, AY)

1097-Q. (Book.) Materials for Rockets and Missiles. Robert G. Frank and William F. Zimmerman. 124 p. 1959. Macmillan Co., 60 Fifth Ave., New York 11. $4.50.

Tensile strength, yield strength, tensile elongation, stress-rupture strength, endurance limit for cermets and wrought, sheet and cast alloys of Fe, Ni, Co, Al and Mo-base alloys. Erosive diffusion; effects of high-temperature brazing on thin material; brazed airfoil; brazed honeycomb structure; chipless production methods; fabrication by draw-roll forming and comparison of lightweight, high-temperature alloys. 51 ref. (Q-general, T2p, T24e, 2-62; Fe-b, Ni-b, Co-b, Al-b, Mg-b, Ti-b, Mo-b, 17-57, 7-59, SGA-h)

1098-Q. (Translation—BWRA.) Choice of Metal and Electrodes for Welded Structures to Work at Low Temperatures. I. N. Gerasimenko. *Avtomaticheskaya Svarka,* v. 66, Jan. 1959, p. 59-63.

Influence of welding on the low-temperature impact strength of 1Kh18N9T stainless steel, 12N3 alloy steel and St3 carbon steel. 4 ref. (Q6n, 2-63, W29h; CN, AY, SS, 7-51)

1099-Q.* Progress in the Development and Application of Steel Plates. W. Barr.

Iron and Steel Institute, Journal, v. 192, June 1959, p. 109-117.

Notched ductile steels, testing methods, revision of steel specifications and design codes for pressure vessels. Application of plates and typical high-temperature tensile properties. 10 ref. (Q23s, Q26s, Q27, 2-62, 2-63, T26q; AY, 4-53)

1100-Q.* An Experimental Investigation on the Mode of Slip in Face-Centered Cubic Metals. Tadami Taoka, Ko Yasukochi, Ryukichi Honda and Isao Oyama. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 1-6.

Changes in saturation magnetization of ordered Ni_3Mn and Pt_3Co alloys caused by plastic deformation. Explanation in terms of slip taking place in steps of one atomic distance on many successive planes. 10 ref. (Q24a, P16r, 3-68; Ni-b, *Mn*, Pt-b, *Co*)

1101-Q.* Effects of Raw Materials Purity and Melting Method on the Properties of Nickel-Chromium Alloys. Renpei Yoda. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 27-31.

Microstructure and mechanical properties of Ni-Cr alloys and Nimonic-80 alloys prepared by rapid or slow melting in a Tammann furnace. (Q3m, Q29n, M27b, 2-64, 3-69; Ni-b, *Cr*)

1102-Q.* Study on Austenitic Heat-Resisting Steels. Yoshikichi Konishi, Takeshi Akutagawa, Toshio Fujita, Ryuichi Nakagawa and Yasuo Otoguro. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 73.

Hardness, microstructure and creep-rupture properties of steels with 16 to 20% Ni, 16% Cr up to 25% Co and slight amounts of Mo, W, B, Ti and Al following various solution treatments and aging procedures. (Q3m, Q29n, M27d, 2-62, 2-64, 2-65; SS-e, SGA-h)

1103-Q.* Study on Several Properties of Cobalt-Base Alloys at High Temperatures. Tetsutaro Mitsuhashi, Renpei Yoda and Toru Watanabe. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 73.

Hardness and microstructure of Co-Ni-Cr-W alloys after forging, solution treatment and aging. Effect of Ni and C on high-temperature characteristics. (Q29p, M27d, 2-60, 2-62, 2-64, 2-65; Co-b, *Ni, Cr, W, C*)

1104-Q.* Study on Molybdenum Disilicide Cermet. Tetsutaro Mitsuhashi and Kiyoshi Tamura. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 74.

Density, hardness, modulus of rupture and resistance to corrosion, oxidation and thermal shock of cermets prepared by hot pressing or vacuum sintering. (Q-general, R1h, R6g, H14h, H15n; 6-70, Mo)

1105-Q.* Effect of Aluminum, Tin and Molybdenum on Hot-Hardness of Zirconium. Yuzo Hosoi and Norio Nagata. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 75.

Hot hardness of binary Zr alloys containing Al, Sn or Mo. (Q29p; Zr-b, *Al, Sn, Mo*)

1106-Q.* Abrasion Resistance of Copper Base Spring Materials. Yoshikichi Konishi and Ichiro Morimoto. *National Research Institute for Metals, Transactions*, v. 1, no. 1, 1959, p. 76.

Resistance of phosphor bronze, nickel silver, brass, beryllium bronze, aluminum bronze and Cu-Ni-Mn alloy to abrasion by phosphor bronze or brass rotating rings. (Q9n; Cu-b, Cu-n, Cu-s, *Be, Al, P, Zn, Sn*)

1107-Q.* High Strength Welds in Aluminum. *Precision Metal Molding*, v. 17, Aug. 1959, p. 52-53.

Welding characteristics of Tens-50 Al alloy filler rods. Resulting tensile tests conducted with Tens-50 welded sample rods compare favorably with 4043 and 6061 alloy welds fabricated on identical parent metal. (Q27, W29h; 7-51, Al-b)

1108-Q.* (German.) Relationship Between Bar Shape, Temperature of Embrittlement and Steel Quality. Herbert Kussmann. *Stahl und Eisen*, v. 79, July 1959, p. 1065-1075.

Kuntze and Kahn methods for tension tests on notiched test bars. Embrittlement temperature was recorded in impact bending tests using test bars. Notch sensitivity as a function of chemical composition of material and grain size; embrittlement temperature as a function of the notch radius at unit impact value. (Q23s, Q26s, Q6, 2-59, 2-60; ST)

1109-Q.* (German.) Elastic Constants of Germanium. Jan Koppelmann and Gottfried Landwehr. *Zeitschrift fur Angewandte Physik*, v. 11, May 1959, p. 164-167.

Elastic constants of Ge single crystal determined by ultrasonic velocity measurements. (Q21; Ge, 14-61)

1110-Q.* (Japanese.) Stresses and Cracking in Cast Aluminum Alloys. Torao Kobayashi. *Light Metals*, v. 9, Mar. 1959, p. 29-37.

Relationship between casting stresses and composition of several types of binary Al and Cu alloys; effect of casting conditions in production of stresses; stress-relief heat treatment. (Q25h, E-general, J1; Al-b, 5)

1111-Q.* (Slovakian.) Belgian Research on the Embrittlement of Welded Structural Steels. O. L. Bihet. *Zvaracsky Sbornik*, v. 8, no. 1, 1959, p. 37-49.

Large experimental weldments of rimming, semikilled and killed steel were produced and impact tested at low and room temperatures. 16 ref. (Q26s, 2-63; ST, 7-51, SGB-s)

1112-Q. Tensile Deformation and Tensile Strength of Aluminum Single Crystal Coated With Oxide Film. Tadasuke Mukai. *Hiroshima University, Journal of Science*, Series A, v. 22, Sept. 1958, p. 99-113. (Q27a; Al, 14-61)

1113-Q. Slip Patterns on the Stretched Single Crystal Aluminum Plates. Takao Kino and Takeo Fujiwara. *Hiroshima University, Journal of Science*, Series A, v. 22, Sept. 1958, p. 111-126.

Slip patterns developed by stretching on Al single crystal plates which have definite crystallographic orientations (001), (110), (111). (Q24a; Al, 14-61)

1114-Q. (German.) Brittleness—No. 1 Problem in Steel Construction. L. Seltenhammer. *Schweisstechnik*, v. 13, Apr. 1959, p. 37-46.

Conditions of embrittlement and occurrences of failure. 19 ref. (Q26s; ST)

1115-Q. (German.) Materials Testing Machines. Gerhard Jacoby. *VDI-Zeitschrift*, v. 101, July 1959, p. 917-924.

Tensile and hardness testing equipment. (Q29n, Q27a, 1-53)

1116-Q. The All-Beta Titanium Alloy. (Ti-13V-11Cr-3Al). R. A. Wood and H. R. Ogden. *Defense Metals Information Center*, Report no. 110, PB 151066, Apr. 17, 1959, 196 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

In the annealed condition (all-beta structure), it is a medium-strength (120,000-psi. yield strength) very formable alloy. It can be hardened by an aging treatment to have yield strength in excess of 180,000 psi. Combinations of cold or warm working followed by aging produce higher strengths than are obtained by aging alone. Detailed data on heat treatment, mechanical properties, welding and forming. 34 ref. (Q-general, G-general, J-general; Ti-b, *V, Cr, Al*)

1117-Q.* The Mechanism of Thermal Fatigue. H. S. Avery. *Metal Progress*, v. 76, Aug. 1959, p. 67-70.

Metal parts exposed to fluctuating temperatures for long periods eventually deteriorate. Experimental work and theoretical analysis indicate the cause to be plastic flow induced by expansion and contraction during heating and cooling. The effect can be minimized by proper design, selection of alloys that combine high hot strength with low thermal expansion coefficients, and by favorable operating conditions. (Q7j)

1118-Q.* Copper-Titanium Alloys Have High Strength. M. J. Saarivirta and Howard S. Cannon. *Metal Progress*, v. 76, Aug. 1959, p. 81-84.

Strength exceeding 200,000 psi. can be reached with a new Cu alloy containing 4.3% Ti. After solution treating, the alloy can be cold worked more than 90%. Subsequent aging develops the properties. (Q27a, 2-60, 2-64; Cu-b, Ti)

1119-Q.* Bigger, Better and Sounder Forgings. Ernest E. Thum. *Metal Progress*, v. 76, Aug. 1959, p. 103-108.

In an effort to improve the efficiency of large electrical generators, sizes and stresses have been increased to just about the capacity of the "standard" alloy steel forgings. The behavior of large notched disks, tested to destruction by spinning, simulates actual performance. New criteria have been found for toughness and ability to prevent cracks from starting and propagating. (Q26s; AY, 4-51)

1120-Q. Improvement of the High-Temperature Strength Properties of Reactor Materials After Fabrication. R. W. Swindeman and D. A. Douglas. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission*, ORNL-2687, June 15, 1959, 26 p.

Creep and tensile data for Inconel, Hastelloy B and INOR-8. Depending on material and service conditions, improvements in strength can be brought about by annealing or aging, carburization and environmental control during service. (Q3, Q27, 2-64, 2-65; Ni-b, SGA-h)

1121-Q. Observations on the Effect of Surface and Structure on the Tensile Strength of Iron Whiskers. Helmut Weik. *Wright Air Development Center,* Technical Note, 58-369, May 1959, 21 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.)

Fe whiskers were prepared under different conditions by reduction from iron chloride. The shape and mechanical properties of the whiskers depend very much on the growth conditions. Different tensile behavior of the surface layers of the whiskers compared to that of the whisker core leads to the conclusion that the whiskers are not perfect crystals with a center screw dislocation as the only lattice imperfection. It may well be that the whiskers consist of layers or shells. 39 ref. (Q27a, 3-73; Fe, 14-61)

1122-Q.* (Czech.) Magnetic Methods for Checking Steel Parts After Heat Treatment. B. H. Zitka. *Strojirenstvi,* v. 9, Jan. 1959, p. 41-42.

Quality control of heat treated parts based on determination of their mechanical properties from their magnetic behavior. Determination of hardness of heat treated bolts was checked by the magnetic method. Factors influencing the determination include magnetic remanence, permeability and hysteresis losses. (Q10, Q29, P16, 2-64; ST)

1123-Q.* (Czech.) Strain Determination With Strain Gages in Liquids Under Pressure. J. Havlik. *Strojirenstvi,* v. 9, Jan. 1959, p. 62-70.

Strain determination in pressure vessels exposed to hydrostatic pressure. Effects in strain gages for which correcting factors have to be considered include effects on temperature, presence of moisture and pressure. Examples of measurements with strain gages carried out in pressure vessels with various fluids. (Q25, T26q, X28j)

1124-Q.* The Effect of Phosphorus on the Mechanical Properties of Flake Graphite Cast Iron. G. N. J. Gilbert. *British Cast Iron Research Assoc., Journal,* v. 7, June 1959, p. 692-724.

Phosphorus up to approximately 0.8% increases tensile strength, and this is associated with a decrease in eutectic cell size; 1% phosphorus increases the Brinell hardness by approximately 40 points. The generally accepted relationship between tensile strength, hardness, modulus of elasticity and chemical composition requires modification to account for the effect of phosphorus. 11 ref. (Q-general, 2-60; CI, *P,* AD-q40)

1125-Q. The Properties of Magnesium-Thorium Alloys. R. J. Jackson. *Defense Metals Information Center,* DMIC Memo. 20, May 29, 1959, 28 p.

Analysis of tensile properties and creep strength of HK31A, HM21A, HM31A, HZ32A, ZH62A, HM11XA and HZ21 alloys. 13 ref. (Q27a, Q3m; Mg-b, *Th*)

1126-Q.* Radiation Damage in Ferrous Metals. D. E. Thomas. *Journal of Metals,* v. 11, Aug. 1959, p. 523-527.

Irradiation increases strength and decreases ductility. In general, the yield stress is increased proportionately more than the ultimate stress, accompanied by a reduced strain-hardening capacity and decreased uniform elongation. 14 ref. (Q-general, 2-67; Fe)

1127-Q.* High Silicon Aluminum Casting Alloy. Oldrich Tichy and Rolf Kissling. *Modern Metals,* v. 15, July 1959, p. 42-46.

Mechanical properties at room temperature of die, chill and sand-cast Al-Si alloy in as-cast and heat treated conditions. Effect of Si content on tensile strength and coefficient of thermal expansion. Response to aging; dimensional stability. (Q27a, Q29n, P11g, 2-60, 2-64; Al-b, *Si,* 5)

1128-Q. Tensile Properties of Titanium Alloys at Low Temperatures. F. C. Holden, F. R. Schwartzberg and H. R. Ogden. Defense Metals Information Center. *U. S. Office of Technical Services,* PB 151062, Jan. 1959, 47 p. $1.25.

Factors affecting low-temperature properties are alloy composition, interstitial content and microstructure. Sensitivity to notches generally increases as the temperature is lowered. Reasonable ductilities at -320° F. usually can be obtained, provided the interstitial content is kept low. Ductility at low temperatures is higher when the microstructure is equiaxed, rather than transformed.

1129-Q. Development of a Heat Treatable Titanium Sheet. C. R. Lillie and D. W. Levinson. Armour Research Foundation. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151279, Aug. 1958, 92 p. $2.25.

Ti-3Al-7Mo-0.25Be alloy with room-temperature yield strength of 160,000 psi.

for 0.2% offset. High-temperature stability. Value of Be for strengthening alpha-beta alloys. (Q27a, Q3m; Ti-b, *Al, Mo, Mn, Be,* 4-53)

1130-Q. Development of Wrought Beryllium Alloys of Improved Properties. Pt. 1. J. G. Klein, L. M. Perleman and W. W. Beaver. Brush Beryllium Co. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151711, Feb. 1959, 154 p. $3.

Rolled and extruded metal of commercial purity was evaluated with regard to its mechanical properties from room temperature to 1200° F. Structurally modified Be was compared with the commercial Be with regard to fabrication by extrusion and rolling, crystallographic and metallographic structures and mechanical properties. Preferred crystallographic orientation improves tensile properties in the direction of work. Recrystallization and grain growth must be avoided in cross rolling from extruded bars. (Q-general, M26, Q27a, F23, F24; Be)

1131-Q. An Investigation of the Mechanical Properties of Cermets as Related to the Microstructure. J. Binder and R. Steinitz. Firth Sterling, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151722, Jan. 1959, 95 p. $2.25.

Report of basic research in correlating changes in the microstructure of cermets with changes in physical properties with a view toward the possibility of eliminating cermet brittleness by changing microstructure. Using 60% TiC, 40% Ni as the test material, test groups were formulated, comprising changes in original particle size, processing procedure and controlled binder addition. Average grain size plays a distinct role in physical properties. (Q-general, M27, P-general, 2-59; Ti, Ni, 14-68, 6-70)

1132-Q. Development of Active Eutectoid-Base Titanium Alloys. R. F. Bunshah, D. Osterberg, E. Ence and H. Margolin. New York University College of Engineering, Research Division. *Wright Air Development Center,* Quarterly Progress Report no. 4, May 1959, 13 p.

Some 76 complex compositions based on alloys with 5% Cu, with 6% Cu, 6% Ni, 2% Cu, 2% Ni and 2% Cu, 4% Ni with various combinations of alpha strengtheners Al, Zr and Sn were produced. Short-time room and elevated-temperature tensile tests were carried out, in addition to stability evaluations for exposure at 1000° F. under no load. (Q27, 2-62; Ti-b, *Cu, Ni, Al, Zr, Sn,* AD-q, 40)

1133-Q. Energy of Crack Formation and Crack Propagation Under Impact. W. B. Triplett and C. Wells. Carnegie Institute of Technology Metals Research Laboratory. *Wright Air Development Center,* Progress Report no. 4, July 15, 1959, 22 p.

Crack formation and regular impact transition curves; 4340 steels, HY80 steel containing Ni, Cr, Mo, and T-1 steel containing Ni, Cr, Mo together with Cu, V, and B. 9 ref. (Q26q, Q6; CN-g, *Ni, Cr, Mo, Cu,* V, B)

1134-Q.* Mechanical Properties of Metals. A. M. Freudenthal. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 1-30.

Concepts of metal structure; structural mechanisms of deformation; mathematical idealization of mechanical response to applied forces. Significance of mechanical testing and interpretation of results. (Q-general, M25, M26)

1135-Q.* Hardness and Its Measurement for the Metallurgist. V. E. Lysaght. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 35-90.

Significance of hardness testing. Brinell, Rockwell, diamond Pyramid, portable and microhardness testing equipment. Problems in hardness testing. (Q29)

1136-Q.* Plastic Behavior of Metals Under Simple and Combined Stresses. Evan A. Davis. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 91-110.

Mathematical treatment of elastic and plastic behavior. General expressions for distribution of strain in a plastic body and the shape of stress-strain diagram. 10 ref. (Q21, Q23, Q24, Q25n)

1137-Q.* Creep Resistance and High-Temperature Properties of Metals. G. V. Smith. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 111-125.

Fracture of metals at elevated temperatures; evaluation and extrapolation of creep and creep-rupture data; relaxation phenomena; effect of notches, environment and fatigue. Relation between hot hardness and rupture properties. (Q3, Q26, Q7a, 2-62, 3-73; ST, SS, Al-b)

1138-Q.* Fatigue Strength of Metals. Thomas J. Dolan. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 127-162.

Mechanism of progressive fracture; statistical nature of fatigue; influence of production processing; stress raisers; temperature and frequency; effect of mean stress and fluctuations in amplitude of alternating stress on accumulation of damage. Corrosion and fretting fatigue. 27 ref. (Q7a, R1e, R1f, 3-66; ST, Al-b, Ti-b, Cu-b)

1139-Q.* Statistical Analysis of Fatigue Data. Foster B. Stulen and H. N. Cummings. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 163-202.

Consideration of service loads and stresses; fatigue testing procedures; statistical techniques for analyzing fatigue data. 17 ref. (Q7, S12)

1140-Q.* Modern Fatigue Testing Machines and Their Applications. Alexander J. Yorgiadis. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 203-233.

Crank and oscillator-type mechanical fatigue machines, their characteristics and applications; load control problems. 13 ref. (Q7, 1-53)

1141-Q.* Metals Under High Speed Loading. John S. Rinehart. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 235-261.

Propagation of transient stress disturbances in metals. Loading generated by explosive charges. Fracturing and plastic deformation under impulsive loading. Critical impact velocity; delay time. 11 ref. (Q24j, Q26r, Q6q)

1142-Q.* Radiation Effects on Metals. J. C. Wilson. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 263-275.

Mechanism of radiation damage in metals; effects of neutron irradiation on tensile properties and ductile-to-brittle transition temperatures. 10 ref. (Q7a, Q23r, 2-67; ST, SS)

1143-Q.* (English.) Study of the Nature of Fatigue Damage of Plain Carbon Steel by Reheating Method. Takeo Yokobori. *Tohoku University, Technology Reports*, v. 28, no. 2, 1959, p. 91-101.

Fatigue damage from overstressing in notched and unnotched specimens of plain carbon steel as measured when tested at original endurance limit. Influence of understressing, or of vacuum stress relief following overstressing, on damage. 4 ref. (Q7b, 2-64, 3-66; CN-p)

1144-Q.* (English.) Secular Change After Cold Working and Anneal-Hardening of Alpha Brass. Osamu Izumi and Tadatsugu Yoshiki. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, June 1959, p. 201-209.

Hardness and bending deflection of 70-30 brass after cold rolling and after low-temperature annealing. Variation with holding time at room temperature or at 40° C. 8 ref. (Q21, Q29n, 3-68, 2-65; Cu-n)

1145-Q.* (Japanese.) Experimental Study on the Abrasion of Martensitic Steel Weld Metal. Sukemitsu Itoh and Mitsuhiro Kawaguchi. *Japan Journal of Mechanical Laboratory*, v. 13, May 1959, p. 30-35.

Weld metal tested for abrasion factors over both a rubber and a Cu surface. The abrasive consisted of crushed quartz, both wet and dry, applied to a contact area with a load of 2.7 kg. per sq. cm. traveling at the rate of 30 or 60 m. per min. (Q9; 7-51, SS-c)

1146-Q. Steel—by Slipstick or by Slapstick. Robert E. Harvie. *Society of Automotive Engineers*, Preprint 73T, 1959, 8 p.

Inter-relationships between tensile properties, fatigue resistance, hardness, wear resistance, microstructure and formability; their importance in functional design and performance. (Q-general, T21; ST, 17-51)

1147-Q. Castings Tackle the Muscle Jobs. *Steel*, v. 145, Aug. 24, 1959, p. 84-86.

With tensile strengths as high as 300,000 psi., steel castings are moving

into competition for critical structural parts of aircraft and missiles. (Q27a, T24; ST, 5)

1148-Q.* Can Nickel-Free Stainless Compete at High Temperatures? R. R. Brady and D. T. Boughner. *Iron Age*, v. 184, Aug. 13, 1959, p. 90-92.

Tests indicate that Tenelon, (a high-Mn, high-nitrogen austenitic stainless steel which is very low in Ni) maintains its rupture strength at 900, 1050, 1200 and 1350° F. better than the rupture strength of commercial 18% Cr, 8% Ni stainless steels (AISI Types 304, 316, 321 and 347). (Q3q, 2-60, 2-62; SS-e)

1149-Q.* (Czech.) Production Technology of High-Alloy Austenitic Alloys. Z. Eminger and J. Krumpos. *Slevarenstvi*, v. 7, May 1959, p. 184-187.

Properties of Nimonic alloys and Udimet-500 compared with a new Ni-Cr-W-Mo-Ti-Al-B alloy designed for service temperatures up to 700° C. 4 ref. (Q-general, A-general; Ni-b, *Cr, W, Mo, Ti, Al, B*)

1150-Q.* (Czech.) Fatigue Strength of Gears. F. Benes. *Strojirenstvi*, v. 9, Feb. 1959, p. 119-125.

Experimental results. Various kinds of loads were applied and the failure conditions analyzed in relation to tooth shape, radius of the tooth base, material properties and qualities. (Q7a, T7a; ST)

1151-Q.* (Czech.) Brazed Hard Alloy Tool Tips. J. Houdek. *Strojirenstvi*, v. 9, Mar. 1959, p. 212-219.

Design factors in brazed tip tools; causes of stress in tips; experimental methods for normal and excessive stress measurements. (Q25p, K8, T6n; TS)

1152-Q.* Fatigue Failures in Ore Bridges. Harry C. Prince. *Iron and Steel Engineer*, v. 36, July 1959, p. 80-88.

Stresses and strains in bridge members suffering greatest number of failures. Importance of stress-raisers such as notches and rivet holes in fatigue failure. (Q7b, 3-66, 3-73; ST)

1153-Q.* Hypereutectic Aluminum-Silicon Alloys. Richard M. Smith. *Society of Automobile Engineers*, Preprint no. 65A, June 1958, 9 p.

Mechanical and physical properties, foundry characteristics and applications of Al-20 Si-2 Cu-Mg-0.5 Mn alloy. Effect of phosphorus addition on properties and primary Si particle size of permanent mold and sand castings. (Q-general, P-general, 2-60; Al-b, *Si, Cu, Mg, Mn, P*, 5-60, 5-63)

1154-Q.* Latest Developments in Impact Extruded Aluminum Alloys. R. A. Quadt. *Society of Automotive Engineers*, Preprint no. 65D, June 1958, 13 p.

Longer, larger and more complex impact extrusions in strong heat treatable alloys. Sintered Al powder impacts. Applications of high-strength extrusions. (Q-general, G5; Al-b, 4-58)

1155-Q.* Are Spot and Seam Welds Practical in Tension? Peel Tests Say Yes. *Welding Design & Fabrication*, v. 32, Aug. 1959, p. 30-31, 50-51.

Strength of spot and seam welds in stainless steel, Ti alloys and Al alloy as influenced by design configuration. (Q27a, Q2g, K9r, 17-51; SS, Al-b, Ti-b)

1156-Q.* (French.) Absorption of Ultrasonic Waves in Solids. M. Redwood. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 172-180.

Possible causes of error in determination of absorption in low damping capacity solids at frequencies between 10 and 300 magacycles per sec. Role of dislocations in experimentally observed variation of internal friction in metals as influenced by such factors as frequency and temperature. 49 ref. (Q8h, Q22, M26b)

1157-Q.* (French.) Measurement of Damping Capacity in the Study of Fatigue in Ferromagnetic Materials. K. M. Entwistle. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 224-230.

Height and position of a peak of magnetic origin in the damping capacity-vibrational strain curve was measured for Ni and several steels. Results show, in accordance with predictions based on domain theory, that alternating strain at peak damping is of the order of the average internal strain in the material. 8 ref. (Q8, Q22j, P16c; ST, Ni)

1158-Q.* (German.) Developments in the Field of Wear Resisting Materials Used in the Construction of Crushing Machines. T. E. Norman and G. E. Ott. *Giesserei*, v. 46, July 30, 1959, p. 441-447.

Production processes and properties of wear resisting cast alloys with an Fe base and their composition with special reference to an alloy containing 12% Mn and 2% Mo, heat treating of Cr-Mo steels

containing 15% Cr and 3% Mo and 3% Ni, 2% Cr and 1% Mo. Wear resistance, suitability and application of each type of material. (Q9, J-general, W15n; SS, *Mo, Ni,* SGA-m)

1159-Q.* Techniques for Creep Testing at High Temperatures. D. J. Armstrong, D. Murray and L. M. T. Hopkin. *Journal of the Less-Common Metals,* v. 1, Apr. 1959, p. 125-131.

Apparatus for testing of cermets. (Q3; 6-70)

1160-Q.* Theory of Thermal Stresses. D. M. Gilbey. *Journal of the Less-Common Metals,* v. 1, Apr. 1959, p. 139-144.

Method of calculation of thermal stresses which allows all the so-called constants to vary with temperature and which can also cope with stress-strain curves which bend over when plastic strain occurs. (Q25n, Q25p)

1161-Q.* Atmospheric Contamination of Chromium and Its Effect on Mechanical Properties. G. R. Wilms and T. W. Rea. *Journal of the Less-Common Metals,* v. 1, Apr. 1959, p. 152-156.

Cr heated in air at 950° C. for 200 hr. is contaminated to a considerable extent by nitrogen. This has a marked effect on the mechanical properties, especially the ductile → brittle transition temperature, the magnitude of the effect depending on the rate of cooling from 950° C. 4 ref. (Q23r, 2-62, 2-66; Cr, *N*)

1162-Q.* Development of Heat Resistant Titanium Alloys. Ulrich Zwicker. *Journal of the Less-Common Metals,* v. 1, June 1959, p. 165-184.

Electron-microscope photographs of the alloy $TiAl_6$ show the formation of the $alpha_2$-phase at 500° C. Aging tests were performed in order to examine the embrittlement of alloys containing more than 7% Al. Addition of 3-4% V prevents the embrittlement of an alloy with 9% Al after aging at 550° C. up to 1000 hr. 20 ref. (Q-general, Q26s, 2-65; Ti-b, SGA-h)

1163-Q.* Properties of Titanium-Aluminum-Niobium Alloys. J. Suiter. *Journal of the Less-Common Metals,* v. 1, June 1959, p. 232-236.

The addition of Cb to a binary Ti-Al alloy results in increased strength at temperatures up to 500° C. If the alloy contains 10 at. % Cb then the strength at low temperatures can be raised by heat treatment. Still higher strengths can be obtained by the use of poorer grades of sponge Ti without much sacrifice in ductility. 4 ref. (Q-general, 2-60, 2-64; Ti-b, *Al, Cb*)

1164-Q. Investigation of Fe-Mn-Cr-N-C System for Heat Resistance and Oxidation Resistance Between 1200 and 2000° F. Pt. 2. J. P. Tarwater and E. J. Dulis. Crucible Steel Co. of America. (Wright Air Development Center). *U.S. Office of Technical Services,* PB 151558, Oct. 1958, 115 p. $2.50.

Heat treated austenitic Cr-Mn-C-N steels containing strengthening elements have room and high-temperature properties and creep-rupture strengths that compare favorably with such superalloys as A286 and Inco 901. Various combinations of V, Cb, W and Mo were used as strengthening elements. Proper selection of composition and heat treatment results in adequate ductility in tension and creep-rupture, but a decrease in impact properties v s unavoidable. (Q3m, R1h, 2-64, 2-62, 2-60; SS-e, *Mn, C, N,* SGA-h)

1165-Q.* (French.) Gravity Cast Light Metal. Fernand Dabel. *Revue de l'Aluminum,* no. 266, June 1959, p. 721-728.

Mechanical properties of A-Z5G alloy castings. (Q27a, Q29n; EG-a39, *Al-b,* 5)

1166-Q.* (German.) Causes of Tool Wear. G. Ostermann. *Industrie Anzeiger,* v. 81, Aug. 4, 1959, p. 13-21.

Tool wear in relation to mechanical rubbing, bonding of hard metal and material machined, effect of diffusion, plastic deformation, structural changes and electrochemical processes during cutting. 13 ref. (Q9, T6n)

1167-Q.* Evaluation of Properties Obtained From an Air-Induction and Vacuum-Arc Melted High-Temperature Alloy. J. Bulina and J. T. Brown. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 571-577.

Quadruplicate tensile tests at room temperature and 1200° F., and quadruplicate stress-rupture tests at 1200° F., 80,000 psi., and 1300° F., 65,000 psi., on two heats of laboratory-melted W-545 alloy, one air-induction melted and the other vacuum-arc melted, and two heats of pilot-plant produced alloy. (Q27, Q3q, C5h, C5j, 1-73; Fe-b, SGA-h)

1168-Q.* The Embrittlement of Glass-Coated Silver Wire on Heat Treatment. Chikara Hirayama. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 622-624.

Fiber-glass-covered wire became embrittled when heated at temperatures at which the glass was fused. The degree of embrittlement was dependent on the temperature and on the time of exposure. When heated for 44 hr. at 740° C. the cracks in the wire were very small and comparatively few. At higher temperatures the cracks were more numerous and much larger. The embrittlement is indirectly caused by the migration of some component, typical of the glass, to the grain boundaries of the Ag. (Q26s, 2-64; Ag, 4-61, NM-f42)

1169-Q.* The Effect of Oxygen on the Tensile Properties of Titanium. C. Feng, C. Elbaum and W. C. Winegard. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 632-635.

Tensile experiments, using a soft-tensile machine, were performed on Ti and Ti-oxygen alloys. Results indicate that the previously reported increase of the yield strength with increase in oxygen concentration may be explained in terms of both an increase in the proportional limit and a very marked increase in the rate of work hardening. Results are interpreted in terms of simple dislocation-solute interaction theory. 9 ref. (Q27, 2-60; Ti, *O*)

1170-Q.* Effects of Melting and Casting Procedures on the Elevated Temperature Properties of Nickel and Cobalt-Base Alloys. M. J. Stutzman and J. W. Cunningham. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 637-647.

Stellite 31 and He 1049 alloys and Udimet 500 were each melted and cast in air and melted in vacuum and cast under argon. Tensile tests were run at room temperature, 1200, 1500 and 1700° F. Stress-rupture tests were run at 1250, 1500, 1600, 1700 and 1800° F. Oxidation resistance was determined as weight and following intermittent exposures to air at room temperature and 2000° F. 7 ref. (Q27, Q3q, 2-62, C5j, 1-73; Co-b, Ni-b)

1171-Q.* The Aging of Hydrogen-Charged Rimmed Steel. H. C. Rogers. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 666-672.

The yield point of rimmed steel sheet was eliminated by electrolytic charging with hydrogen. The activation energy for its return on aging was measured and found to be identical to that measured for the return of the yield point on aging after plastic deformation of the same steel, uncharged. It was also compared with the measured activation energy for the return of ductility to these steels embrittled by hydrogen charging. 22 ref. (Q24c, Q23p, N7, 2-65; ST-d, 4-53, *H*)

1172-Q.* Temperature Dependence of the Critical Stress for Slip in Magnesium Alloy Monocrystals. W. F. Sheely, E. D. Levine and R. R. Nash. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 693-695.

Variation with temperature of critical stress for basal slip of binary solid-solution single crystals of In and of Th in Mg. 8 ref. (Q24a, 2-61, 3-66; Mg-b, *In,* TH, 14-61)

1173-Q.* Hydrogen in Cold Worked Iron-Carbon Alloys and the Mechanism of Hydrogen Embrittlement. M. L. Hill and E. W. Johnson. *Metallurgical Society of AIME, Transactions,* v. 215, Aug. 1959, p. 717-725.

Cold working of Fe-C alloys was found to increase greatly the hydrogen solubility and to decrease the diffusivity at temperatures up to 400° C. These effects are increasing functions of both the carbon content and the degree of deformation. The hydrogen behavior is consistent with the idea that cold working creates "traps", which are concluded to be microcracks in which the hydrogen is chemisorbed. 33 ref. (Q26s, N1, 3-68, 2-60; Fe-b, *C*)

1174-Q.* Molybdenum—Vanguard Material for Space Vehicles. Alan V. Levy and Saul E. Bramer. *SAE Journal,* v. 67, Aug. 1959, p. 41-46.

High-temperature mechanical properties. Recommended methods for preventing some of Mo shortcomings at room temperature, such as cracking and oxidizing. (Q-general, P-general, 2-62, T24c; Mo, 17-57)

1175-Q.* Effect of Alpha Beta Thermal Cycling on Uranium and Its Alloys. B. R. Hayward. *Nucleonics,* v. 17, Aug. 1959, p. 74-79.

Materials of higher than 90% uranium submitted to thermal cycling through the alpha-beta transition temperature at 600° C. show dimensional instability. (Q7j, P10d; U)

1176-Q.* (Czech.) Austenitic Heat Resisting Poldi AkRN Steel. J. Vodsedalek. *Strojirenstvi,* v. 9, June 1959, p. 439-444.

Chemical composition and properties of heat resisting austenitic steel containing 30-40% Ni with W or Mo as addition agents. Mechanical properties, creep

and fatigue data, conductivity, relaxation, hardness and changes due to overheating. (Q-general; SS-e, SGA-h, *W, Mo,* Ad-q40)

1177-Q.* (Czech.) Microhardness Tests. J. Shon. *Strojirenstvi,* v. 9, June 1959, p. 453-460.

Comparison with the Vickers, Knoop and Brinell methods. (Q29q)

1178-Q. Preliminary Observations on Methods of Measuring Mechanical Properties of Solids at High Temperatures. Barry L. Mordike and Leo M. Fitzgerald. *Journal of the Less-Common Metals,* v. 1, Apr. 1959, p. 132-138.

Use of a carbon tube resistance furnace; induction and electron bombardment techniques. (Q-general, 2-62, X24j, 1-54)

1179-Q. (English.) Internal Friction of Lead. Pt. 2. Yosio Hiki. *Physical Society of Japan, Journal,* v. 14, May 1959, p. 590-596.

Internal friction of Pb single crystals measured as a function of the strain amplitude, frequency and temperature. 17 ref. (Q22, 3-68, 2-61; Pb, 14-61)

1180-Q.* Static Brittle-Fracture Initiation Yield at Net Stress 40% of Yield. C. Mylonas, D. C. Drucker and J. D. Brunton. *Australian Welding,* v. 2, May 1959, p. 21-26.

Static fractures are evidence of a lack of ductility at the point of crack initiation and occur at low average net stress. Static tests show that, under adverse notch conditions, sufficient ductility is present to allow yielding before fracturing. Stress-strain diagrams of brittle fracture tests of plates are given. The lowest average stress at fracture is 36% of the virgin field. (Q26q, Q26s, 3-66)

1181-Q.* (French.) Influence of Impurities on the Properties of Brasses. P. J. Le Thomas and D. Arnaud. *Fonderie,* July 1959, p. 323-325.

Influence of Pb, Sn, Fe, Sb, Mg, As, Ni, Al, Si, Mn and P on mechanical properties, machinability and corrosion resistance. 23 ref. (Q-general, G17k, R-general, 3-69; Cu-n, *Pb, Sn, Fe, Sb, Mg, As, Ni, Al, Si, Mn, P*)

1182-Q.* (Italian.) Corrosion and Heat Resistant Special Steels. *l'Acciaio Inossidabile,* v. 26, no. 2, 1959, p. 53-57.

Composition, mechanical properties and heat treatment procedures for UNI 4047 steel. (Q-general, J-general; SS, SGA-h, SGA-g)

1183-Q.* (Italian.) Effects of Chemical Composition on the Mechanical Properties of Steels. G. Meyer and L. H. Toft. *Nickel,* no. 79, Apr. 1959, p. 1-11.

In steels having similar microstructures after hardening heat treatment, variations in composition appear to have little effect on mechanical and tensile properties, except for a "carbon effect" on ultimate tensile strength. Ni, Mo and V improve impact properties, while Cr and Mn have the opposite effect. 5 ref. (Q-general, J-general, 2-60; ST, *Mo, V, Ni, Cr, Mn*)

1184-Q.* The Effect of Temper-Embrittlement on the Fatigue Properties and Damage Due to Fatigue Overstressing of a 3140 Steel. E. B. Mikus and C. A. Siebert. *American Society for Testing Materials,* Preprint no. 67, 1959, 10 p.

Fatigue life characteristics of 3140 steel with tough and temper-embrittled structures. Effect of short periods of appreciable overstress on subsequent life at a lower stress. 16 ref. (Q7b, 2-64, 3-66; AY)

1185-Q.* The Effect of Stress Cycling on the Static Mechanical Properties of SAE 4340 Steel. J. Marin, P. Borachia and U. A. Rimrott. *American Society for Testing Materials,* Preprint no. 68, 1959, 12 p.

Influence of precycling at different stress levels up to various percentages of fatigue life on static tensile properties of heat treated SAE 4340 steel. 10 ref. (Q27a, Q29n, Q7b, 3-66, 3-70; AY)

1186-Q.* Method for Determining the Fatigue Limit of Metals by Means of Stepwise Load Increase Test. N. Enomoto. *American Society for Testing Materials,* Preprint no. 71, 1959, 10 p.

Method for predicting the Wohler fatigue limit by progressive load increase fatigue tests using only one loading rate. 10 ref. (Q7a, 3-66; ST)

1187-Q.* Effect of Internal Heating on the Fatigue Life of Titanium. J. P. Romauldi and E. D'Appolonia. *American Society for Testing Materials,* Preprint no. 72, 1959, 8 p.

Relationship between deflection and temperature during fatigue tests conducted at different stress levels and at speeds ranging from 1000 to 10,000 rpm. under isothermal and non-isothermal conditions. 5 ref. (Q7b, 2-61, 3-66, 3-67; Ti)

1188-Q.* Tension, Compression and Fatigue Properties of Several Steels for Aircraft Bearing Applications. G. Sachs, R.

Sell and W. F. Brown, Jr. *American Society for Testing Materials,* Preprint no. 73, 1959, 23 p.

Static tensile and compressive properties and rotating beam fatigue strength at room and elevated temperature for several heats of SAE 52100 and three vacuum-melted toolsteels. Influence of heat treated hardness level. 28 ref. (Q27a, Q28g, Q7a, 2-62, 2-64, 2-60; AY, TS, SGA-c)

1189-Q.* Relationships Between Composition and Properties of Austenitic Chromium-Manganese-Carbon-Nitrogen Stainless Steels. A. Kasak, C. M. Hsiao and E. J. Dulis. *American Society for Testing Materials,* Preprint no. 74, 1959, 16 p.

Room temperature tensile properties and creep properties at 1200 to 1500° F. of austenitic steels in solution annealed condition containing 0.09 to 0.82% C, 10.3 to 15.7% Mn, 12.2 to 28.0% Cr and 0.1 to 0.8% N. Composition and design of stable austenitic steels and estimation of their properties. (Q27a, Q3m, 2-60, 2-62, 2-64; SS-e, *Mn, N,* 17-51)

1190-Q.* Property Relationships of Some Cast and Forged Chromium-Manganese-Nickel-Nitrogen Steels Containing 18% Chromium. K. Haefner, A. F. Lahr, W. L. Meinhart and J. J. Kanter. *American Society for Testing Materials,* Preprint no. 75, 1959, 12 p.

Phase relationships, nitrogen solid solubility, forgeability, castability, mechanical properties, embrittlement at 800 to 1800° F. and corrosion resistance of steel containing 0 to 18% Mn, 0 to 8% Ni, 0 to 0.5% N, 0.08% C and 18% Cr. 10 ref. (Q-general, N7, R-general, Q26s, 2-62, 2-60, N15e; SS-e, *Mn, N, O*)

1191-Q.* Effect of Composition and Processing Variables on Some Mechanical Properties of Large Nickel-Molybdenum-Vanadium Rotor Forgings. K. H. Kramer and J. E. Steiner. *American Society for Testing Materials,* Preprint no. 76, 1959, 6 p.

Multiple regression analysis to estimate coefficients in equations relating impact and tensile properties of large alloy steel forgings to composition and processing variables. (Q27a, Q23r, Q6n, 2-60, 2-64; AY, *Ni, Mo, V,* 4-51)

1192-Q.* Creep-Rupture Behavior of Notched and Unnotched Specimens of Types 304, 316, and 321 Austenitic Stainless Steels. F. Garofalo. *American Society for Testing Materials,* Preprint no. 77, 1959, 16 p.

Creep-rupture tests at 1100 and 1500° F. Factors promoting notch; embrittlement at elevated temperatures; rupture initiation and propagation. 12 ref. (Q3q, Q3p, Q23s, 2-62; SS-e)

1193-Q.* Effect of Environment on Creep and Creep-Rupture Behavior of Several Steels at Temperatures of 1000 to 1200° F. F. Garofalo. *American Society for Testing Materials,* Preprint no. 78, 1959, 10 p.

Creep-rupture tests of carbon, low-alloy and stainless steels in air in a purified atmosphere of helium plus 2% hydrogen and in vacuum. 22 ref. (Q3m, Q3n, 2-62, 2-66, 1-73; CN-g, AY, SS)

1194-Q.* A Cooperative Study of the Hardness Testing of Cemented Carbides. Betty M. Caugherty, H. T. Oatman and O. W. Reen. *American Society for Testing Materials,* Preprint no. 79, 1959, 15 p.

Tests by members of Cemented Carbide Producers Assoc. Statistical analysis of variability; influence of testing method and microstructure on hardness. (Q29, 6-68)

1195-Q.* Overstrain Tests on Thick-Walled Cylinders. S. M. Jorgensen. *American Society of Mechanical Engineers,* Paper no. 59-PET-1, 1959, 14 p.

Pressure-expansion tests on thick-walled, closed-end cylinders of carbon and low-alloy steels. Theoretical method for computing expansion and bursting strength based on both tension and torsion data. Simplified formula for ultimate pressures. (Q10b, Q27a, Q1a; CN, AY)

1196-Q.* Radiation Damage in Ferrous Materials. R. E. Smallman. *Iron & Steel,* v. 32, June 1959, p. 321-322.

Annealing of radiation damage; structural alterations produced by irradiation. 6 ref. (Conclusion.) (Q-general, M26p, 2-67; ST, Fe)

1197-Q.* The Cold Extrusion of Strong Alloys. R. A. Quadt. *Modern Metals,* v. 15, Aug. 1959, p. 26, 30, 32.

Tensile properties of Al alloy, Zr alloy, Ti, Ta, Mo and Cb cold extrusions. (Q27a; Al-b, Zr-b, Ti, Ta, Mo, Cb, 4-58)

1198-Q.* Survey Method Evaluates Residual Stresses in Gears. E. T. Bergquist and S. M. Lenhoff. *Product Engineering (Design Issue),* v. 30, Sept. 14, 1959, p. 84-86.

Strain-gage check prior to the standard beam-dissection technique employed as a short-cut method for estimating residual stresses retained at surface of gear teeth after heat treatment. Tabulated basic stress values are given for 4820, 4815, and 8620 steels. (Q25h, T7a, X28j; ST)

1199-Q.* Tentative Model for the Mechanical Wear Process. Robert Davies. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, 1959, p. 1-15.

Energy is received by the rubbing materials in quanta of equal size. The energy quanta are added to the rubbing materials at domains randomly spaced over their surface. The quanta are added at moments randomly spaced in time and the quantized energy diffuses into the material at a known rate. (Q9, 17-56)

1200-Q.* Energy Losses of Balls Rolling on Plates. Richard C. Drutowski. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, 1959, p. 16-35.

Data on instrument ball bearings, used to support parts, where the bearing torque is critical. Variables affecting friction torque are ball and race material, surface finish, contact stress, ball separator design and degree of fit of the parts. (Q9p, T7d)

1201-Q.* The Seizure of Metal Pairs During Boundary Lubrication. C. L. Goodzeit. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, 1959, p. 67-83.

In simple seizure problems, the resistance of metals during boundary lubrication is determined by the strength of the junction where bare metal meets bare metal. The strength is a function of the alloying characteristics of the metal pair. The ability of the pair to form intermetallic compounds also influences the performance. (Q9q; 18-73)

1202-Q.* Recent Experimental Studies of Solid Friction. F. P. Bowden. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, 1959, p. 84-109.

The friction and deformation of solids at high speeds in the vicinity of 30-40 mph. Physics of sliding processes at high speeds; friction of graphite and high temperatures and the behavior of graphite on metals. Lubrication by the gas phase was proved in some cases to be effective. (Q9p, 3-68, 2-62; NM-k36)

1203-Q.* Friction, Durability and Wettability Properties of Monomolecular Films on Solids. W. A. Zisman. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, 1959, p. 110-148.

Solid surfaces, greatly changed by the absorption of a monomolecular film, are frequently encountered in friction and wear phenomena. The wettability of an absorbed monolayer is defined by the nature and packing of the atoms at the outermost terminal of each polar molecule. The friction-reducing ability is a property of the whole molecule. (Q9p, P13h; 14-62)

1204-Q.* Study of the Stick-Slip Process. E. Rabinowicz. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, 1959, p. 149-164.

Stick-slip processes are caused when the friction force is not constant but is dependent on some other variable such as distance, time or velocity, and each produces oscillation. Analysis of the mechanism and methods of remedying stick-slip phenomena. (Q9p)

1205-Q.* Cohesion Between Two Oriented Single Crystals of Copper. Allan T. Gwathmey and Lawrence D. Dyer. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, 1959, p. 165-182.

The regular order of single crystal furnishes a reference background for the detection of movement of surface atoms and structural surface changes. 14 ref. (Q9, M26c; Cu, 14-61)

1206-Q.* (German.) Plastic Coated Steel Sheet. H. Heiner. *Schweizer Technische Zeitschrift*, v. 56, May 21, 1959, p. 438-440.

New product consists of polyvinyl coated steel sheets. Abrasion, wear and corrosion resistance and elongation stability are excellent. (Q-general, R-general; ST, 8, NM-d)

1207-Q.* Correlation Between Internal Friction and Temper Brittleness in Steel. Abdul-Fattah, K. Kaddou and P. C. Rosenthal. *American Society for Metals, Transactions*, v. 52, Preprint no. 151, 1959, 12 p.

Internal friction measurements were made with a torsional pendulum at a frequency of 1.5 cycles per sec. from room temperature to 500° F. for both embrittled and nonembrittled steels. A new theory on the basic mechanism of temper brittleness is proposed, based on a dislocation model, and it is suggested that the embrittlement results from

anchoring of dislocations by a Cottrell atmosphere, which thereby restricts slip within the grains upon impact loading. 18 ref. (Q22, Q26s, M26b; ST)

1208-Q.* Directional Grain Structures for High-Temperature Strength. F. L. VerSnyder and R. W. Guard. *American Society for Metals, Transactions,* v. 52, Preprint no. 168, 1959, 9 p.

Results of tests on an alloy whose rupture ductility is very low in the equiaxed condition show that a grain structure, where the boundaries are mainly parallel to the direction of stress, gives both higher ductility (20-40% compared to 0.3-1.5%) and longer rupture life (equivalent to 15% higher rupture strength) than for an equiaxed structure. The effect is related to the orientation of the grain boundaries and not to the preferred crystalline orientation. (Q3q, M26c, Q26)

1209-Q.* High-Strength Zirconium Alloys. R. K. Wagner and H. E. Kline. *American Society for Metals, Transactions,* v. 52, Preprint no. 169, 1959, 15 p.

Properties of Zr alloyed with Al, Sn and Mo. Data on thermal conductivity, corrosion, tensile and creep tests. The alloys demonstrate short-time elevated-temperature strength characteristics at 1050 and 1200° F. equal to or greater than those of Type 304 stainless steel. Their corrosion resistance in sodium at 1000° F. compares favorably with that for unalloyed Zr. 5 ref. (Q-general, P-general, R-general, 2-62, 2-60; Zr-b, *Al, Sn, Mo*)

1210-Q.* The Effect of Austenitizing, Tempering and Microstructure on the Properties of a Cr-M-V Steel. F. E. Werner, T. W. Eichelberger and E. K. Hann. *American Society for Metals, Transactions,* v. 52, Preprint no. 172, 1959, 20 p.

A 1% Cr, 1.2% Mo, 0.25% V steel, designed for high-temperature use, is susceptible to notch brittleness during creep unless it is properly heat treated. The maximum mechanical properties were obtained in a tempered bainitic structure. Notch sensitivity was associated with either high austenitizing temperatures or low tempering temperatures. Impact properties were relatively insensitive to austenitizing temperature. 15 ref. (Q3q, Q23s, 2-62, 2-64, Q6, M27; ST)

1211-Q.* The Influence of Pre-Existing Sharp Cracks on Brittle Fracture of a Nickel-Molybdenum-Vanadium Forging Steel. E. T. Wessel. *American Society for Metals, Transactions,* v. 52, Preprint no. 173, 1959, 21 p.

The fracture strength of samples containing sharp cracks was found to be highly temperature dependent and exhibited an abrupt transition from above, to well below, the normally measured yield strength over a narrow temperature range. This transition is associated with a change in the mode of fracture initiation from shear to cleavage. The applied stresses and temperatures at which brittle fracture will occur in the presence of a pre-existing crack are dependent upon section size and crack length. 24 ref. (Q26s, 2-61, 3-66, 3-73, 9-72, AY, *Ni, Mo, V*)

1212-Q.* Second Low-Temperature Peak in the Internal Friction of Aluminum. Edward Lax and Daniel H. Filson. *Physical Review,* v. 114, June 1, 1959, p. 1273.

Pure Al and Ag, when exposed to high frequencies of alternate shear, showed two low-temperature peaks, which is explained by kinks resulting from dislocations in a f.c.c. lattice. (Q22, 2-63, M26b; Al-a, Ag-a)

1213-Q.* Microstructure Affects Steel Fatigue Strength. *Space Aeronautics,* v. 32, July 1959, p. 85-90.

Fatigue data for critical parts of high-strength steel such as missile castings show that retained austenite in the matrix has a major effect on fatigue strength. A correlation was found between failure strength and hardness. (Q7a, T24e, N8n, M27; SS)

1214-Q. (Russian.) Effect of Vanadium, Tungsten, Chromium and Molybdenum on Internal Friction and Aging of Technical Iron. M. G. Lozinskii and A. E. Fedorovskii. *Izvestiya Akademii Nauk SSSR-Otdelenie Tekhnicheskikh Nauk,* Jan-Feb. 1959, p. 64-70.

Logarithmic damping decrement as a function of temperature and composition. Effect of aging at 115° C. on the value of the internal friction maximum of Fe containing V, W or Cr. 9 ref. (Q22g, N7a, 2-60, 2-61; Fe, *V, W, Cr, Mo*)

1215-Q. (German.) Mechanical Testing Equipment. H. Mintrop. *Werkstattstechnik,* v. 49, Aug. 1959, p. 440-449.

Equipment shown at the 1959 Hannover Industry Fair. 10 ref. (Q-general, 1-153)

1216-Q.* (Pamphlet.) High-Strength 5% Chromium Steels for Airborne Vehicles. Unimach no. 1 and Unimach no. 2. 29 p. 1959.

Universal-Cyclops Steel Corp., Station St., Bridgeville, Pa.

Room-temperature mechanical properties; effect of exposure at 1000° F.; stress-rupture properties; hot hardness; tensile properties at elevated temperatures; heat treatments; physical properties; fabrication; welding; surface treatments. (Q-general, 2-62, 2-64, P-general; TS)

1217-Q. (Book.) Friction and Wear. Robert Davies. 191 p. 1959. Elsevier Publishing Co., Amsterdam, Holland.

Papers and discussions of the first annual General Motors Research Laboratories' Symposium held at the Technical Center near Detroit, June 10-11, 1957. Papers abstracted separately. (Q9n, Q9p)

1218-Q. (Book.) Mechanical Properties of Metals (Their Determination, Interpretation and Significance). L. W. Hu and Joseph Marin, Editors. 296 p. 1958. Pennsylvania State University, University Park, Pa.

Proceedings of a short course held at Pennsylvania State University, July 7-11, 1958. Papers abstracted separately. (Q-general)

1219-Q.* (Translation—AIP.) The Relation Between Critical Sheer Stress, Temperature and Rate of Deformation in Zinc Monocrystals. V. R. Regel and V. G. Govorkov. *Soviet Physics Crystallography*, v. 3, Jan. 1957, p. 59-64.

Formation of cracks with a bent scale on stretched monocrystals. (Q24, 2-61, 3-66; Zn, 14-61)

1220-Q.* Effect of Stress on the Creep of Aluminum in the Dislocation Climb Range. A. E. Bayce, W. D. Ludemann, L. A. Shepard and J. E. Dorn. *American Society for Metals, Transactions*, Preprint no. 137, v. 52, 1959, 17 p.

Investigations revealed that a simple functional relationship between creep rate and stress does not exist; the effect of stress on the creep rate depended on the substructure as well as the stress. In general, the creep of Al under conditions of changes in stress can be resolved qualitatively in terms of dislocation climb models for creep. 12 ref. (Q3, 3-66, M26b; Al)

1221-Q.* Anomalous Effect of Hydrogen on the Mechanical Properties of Ti-8Mn Alloy. Albert H. Fleitman. *American Society for Metals, Transactions*, Preprint no. 144, v. 52, 1959, 11 p.

The presence of up to 300 ppm. hydrogen does not appear to affect adversely the notched or unnotched tensile or tensile stress-rupture properties of Ti-8 Mn sheet at room temperature. None of the mechanical tests, including the prestrain and age tests, caused brittle failures to occur after 150, 225 or 300 ppm. hydrogen was diffused into the test specimens cut from the rolled sheet. 14 ref. (Q26s, Q3q; Ti-b, *Mn, H*, 4-53)

1222-Q.* Effect of Cold Work on Temper Brittleness. A. S. Keh and W. C. Porr. *American Society for Metals, Transactions*, Preprint no. 152, v. 52, 1959, 13 p.

Effect of cold work on temper brittleness in a commercial and a laboratory heat of 5140 steel. Notch toughness was used as a measure of embrittlement with tensile tests being made on the laboratory heat at room temperature, -235 and -320° F. Cold work, up to 35%, before or after the embrittling treatment, greatly reduced the susceptibility to embrittlement for both steels. 9 ref. (Q26s, Q27, 2-63; ST)

1223-Q.* Experimental Survey of the Deformation of the Hard-Ductile Two-Phase Alloy System WC-Co. C. Nishimatsu and J. Gurland. *American Society for Metals, Transactions*, Preprint no. 155, v. 52, 1959, 16 p.

Deformation at room temperature of two-phase alloys of tungsten carbide and Co studied by mechanical and metallographic methods. The deformation characteristics under tension, bending and impact are related to the order of appearance and extent of plastic flow of the matrix and fracture of the carbide particles. 12 ref. (Q24; W, 6-69, Co)

1224-Q.* The Tensile and Yield Strength of Cr-Mn-N Steels at Low Temperatures. J. C. Shyne, F. W. Schaller and V. F. Zackay. *American Society for Metals, Transactions*, Preprint no. 162, v. 52, 1959, 5 p.

The strength of austenitic Cr-Mn-N steels studied as a function of test temperature and nitrogen content. Higher strength results from increased nitrogen contents and lower test temperatures. The formation of strain-induced martensite also contributes to the tensile strength under some conditions. (Q27a, 2-60, 2-61; SS-e, *Mn, N*)

1225-Q.* Growth of Grain-Boundary Voids Under Stress. D. Hull and D. E.

Rimmer. *Philosophical Magazine*, v. 4, June 1959, p. 673-687.

Effect of combined hydrostatic pressure and of uniaxial tension on the rupture time of polycrystalline Cu wire in 400-500° C. range. Proposes rupture mechanism is based on growth of void nuclei on a grain boundary by the addition of vacancies from the boundary. (Q3m, Q3q, 3-74; Cu)

1226-Q.* The Yield Point of a Super-Lattice. N. Brown. *Philosophical Magazine*, v. 4, June 1959, p. 693-704.

Theoretical calculation of the dependence of yield point on the degree of long-range order in b-c-c. super lattice. Width of an anti-phase domain boundary. Yield points of polycrystalline and single cyrstal specimens of beta-brass containing 48.6 and 49.9 at .% Zn for temperature range of -200 to +500° C. Comparison with theoretical values. 15 ref. (Q24c, Q27a, 2-61; Cu-n)

1227-Q.* Importance of Considering Welding Stresses Reviewed. R. E. Holt. *Welding Engineer*, v. 44, Sept. 1959, p. 48-49.

Stress distribution patterns resulting from welding of a Tee-joint to a wide flange beam. (Q25h, K9n; ST, 7-51)

1228-Q.* Some Metallurgical Aspects of Friction and Wear. L. F. Coffin, Jr. Paper from "Friction and Wear". Elsevier Publishing Co., Amsterdam, Holland, p. 36-66.

Interaction of materials in sliding contact. Friction effects and surface damage under repetitive sliding; qualitative measurements of the interfacial shear strength, and effects of gaseous atmosphere on the sliding process; influence of sliding velocity and of liquid environment. 13 ref. (Q9p)

1229-Q.* (French.) Abrasion Resistant Cast Irons for Mechanical Applications. *Journal d'Informations Techniques des Industries de la Fonderie*, no. 106, June 1959, p. 9-11.

Sliding and rolling friction as causes of wear. Structures and alloying elements providing abrasion resistance. (Q9n; CI-n, CI-q, SGA-m)

1230-Q. (Russian.) Method of Time-Hardness Testing by Concentric Impressions, Applied to the Composition Analysis of Alloys. V. P. Shishokin and N. A. Vikhoreva. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 165-167.

A cone of hard material is impressed into the surface of Bi, Pb and Cd alloys at a constant load, and the diameter of impression is measured after various periods of time. From the results, conclusions are drawn on the composition. 9 ref. (Q29, S11g; Bi-b, Pb-b, Cd-b)

1231-Q. (German.) Surface Stresses Measured With the Aid of Polarized Light. G. Oehler. *Industrie Anzeiger*, v. 81, Aug. 25, 1959, p. 53-54.

Surfaces are coated with a photoelastic layer. The interference patterns set up in the surface coat reproduce a stress pattern. (Q25, P17b)

1232-Q.* (German.) Harmful and Useful Residual Stresses. H. Buhler and A. Petter. *Industrie Anzeiger*, v. 81, Aug. 25, 1959, p. 55-57.

Residual stress phenomena in structural members should be judged on the basis of design function of the member and stressing of the member in actual service. The best form of stress distribution is given for rolled sections and stanchions. (Q25h; 17-51, SGB-s)

1233-Q. (Russian.) Influence of Annealing Time on Mechanical Properties of Steel. I. Z. Gordon and A. P. Gulyaev. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya*, no. 1, 1959, p. 220-224.

Hardness, tensile strength, yield strength, elongation and reduction of area as a function of annealing time, followed by quenching from 840-850° C. (Q29n, Q27a, Q23, 2-64; ST)

1234-Q. Test Blocks for Indentation Hardness Testing. J. G. Wood. *Engineer*, v. 2-8, Aug. 28, 1959, p. 147-149.

Methods adopted at the National Physical Laboratory for the production of standard hardness test blocks, in the range 200 to 950 HV, for the Vickers and Rockwell identation tests. (Q29, 1-60)

1235-Q.* Tensile Properties of Copper-Bearing Low Carbon Steel. G. W. Bush and R. W. Lindsay. *American Society for Metals, Transactions*, Preprint no. 140, v. 52, 1959, 10 p.

Effects of small quantities of Cu on the tensile properties of a low-carbon deep drawing steel are evaluated from true stress-true strain relationships in the plastic range. Results indicate that when Cu content exceeds a limit which lies between 0.1 and 0.2%, there is an increase in strength properties, a decrease in

elongation and in the work hardening modulus, and an alteration in the crystallographic orientation in cold rolled and annealed sheets. 22 ref. (Q27a, 2-60; CN-g, *Cu*)

1236-Q.* Supersaturation as a Factor in the Hydrogen Embrittlement of Titanium Alloys. D. N. Williams, F. R. Schwartzberg and R. I. Jaffee. *American Society for Metals, Transactions,* Preprint no. 176, v. 52, 1959, 9 p.

Effect of temperature on embrittlement in hydrogen-containing 2% Mo, 2% Fe, 2% Cr alloy studied to determine the reason for absence of embrittlement at temperatures above the embrittlement range. The upper recovery temperature can be satisfactorily explained on the basis of the hydrogen solubilities in alpha and beta Ti. The proposed explanation for the recovery phenomenon requires that a measurable amount of hydrogen supersaturation be present before embrittlement will occur. 7 ref. (Q26s, 2-61; Ti-b, *Mo, Fe, Cr, H*)

1237-Q.* Magnesium and Related Low Alloys. J. Bernard, R. Caillat and R. Darras. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 69-87.

Corrosion and mechanical behavior of various alloys considered as potential materials for uranium canning. 17 ref. (Q-general, R-general; Mg-b)

1238-Q.* The Effect of Small Columbium Additions to Semikilled, Medium Carbon Steels. C. A. Beiser. *American Society for Metals, Transactions,* Preprint no. 138, v. 52, 1959, 24 p.

Small amounts of Cb result in a significant reduction in ferritic grain size. The mechanical properties of the normalized steels reflect this grain refinement. The yield strength is increased, the tensile strength is relatively constant and high, the ductility is improved slightly and the impact transition temperature is lowered materially. In the hot rolled condition, a grain boundary network of carbide is present that results in a larger increase in yield strength, increased tensile strength and a reduction in ductility and impact properties. 6 ref. (Q27a, Q6n, M27c, 2-60; CN-p, *Cb*)

1239-Q.* Properties of Refractory Alloys Containing Rhenium. Chester T. Sims and Robert I. Jaffee. *American Society for Metals, Transactions,* Preprint no. 164, v. 52, 1959, 14 p.

Fabrication and properties of the refractory alloys of Mo, W and Ta with Re. Mo-Re and W-Re show a considerable tensile strength advantage over the base metal at elevated temperatures. In the recrystallized condition, the alloys are significantly more ductile. Re additions to Ta do not promote fabricability although the extent of the alpha solid solution field is broad. 8 ref. (Q27a, N5; EG-d, Mo, W, Ta, Re)

1240-Q. Survey of Literature on the Effect of Testing Temperature on the Properties of Wrought Copper Base Alloys. H. R. Pritchard. Frankford Arsenal. *U. S. Office of Technical Services,* PB 151306, Feb. 1958, 92 p. $2.25.

At low temperatures, the tensile and yield strengths, elongation, modulus of elasticity, hardness and fatigue strength increase while electrical resistivity decreases. At elevated temperatures, the tensile and yield strengths, modulus of elasticity and hardness decrease, while the thermal conductivity and electrical resistivity increase. (Q-general, P15, 2-61, P11h; Cu-b)

1241-Q. Testing for Notch Sensitivity in Welded Joints. C. E. Hartbower. Watertown Arsenal. *U. S. Office of Technical Services,* PB 151630, n. d., 24 p. $.75.

Study shows that it is possible to evaluate notch toughness in a welded joint as well as in the unwelded base metal. The V-notch Charpy impact test provides an excellent means for evaluating the relative toughness of weld, heat affected zone and base metal, providing that certain procedures are followed and that a significant criterion of performance and definition of temperature are selected. (Q23, Q6; 7-51)

1242-Q.* (English.) An Experimental Investigation on the Mode of Slip in Face-Centered Cubic Metals. T. Taoka, K. Yasukochi, R. Honda and I. Oyama. *Physical Society of Japan, Journal,* v. 14, July 1959, p. 888-893.

Homogeneous slip is defined as that occurring on a number of neighboring atomic planes. Changes of spontaneous magnetization are criteria for slip, being homogeneous or inhomogeneous. For ordered Ni_3Mn alloys, magnetization decreases with elongation; for ordered Pt_3Co, magnetization increases with compression. From consideration of the

Curie points, both cases are homogeneous. (Q24a, P16; Ni-b, Mn, Pt-b, *Co*)

1243-Q. (Russian.) The Relative Damping of Torsional Alternate Stress in 50A and U7A Steels After Heat Treatment. M. A. Krishtal and S. A. Golovin. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya,* no. 2, 1959, p. 173-175.

Samples are quench hardened and then annealed at various temperatures. Effects of stresses present after heat treatment and annealing temperature on damping properties. (Q8g, 2-64; 3-66, CN-r)

1244-Q. (Russian.) Investigation on the Alloy Ni_3Mn by Measuring Internal Friction. Yu. S. Avraamov and S. O. Mezhennaya. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya,* no. 2, 1959, p. 189-193.

Changes of internal friction caused by various heat treatments, carburizing and cold deformation. 5 ref. (Q22, 2-64, 2-60, 3-68, 2-61; Ni-b, *Mn*)

1245-Q.* The Effect of Initial Increments of Hot Working on the Mechanical Properties of Certain Ferrous Materials. H. J. Wagner and J. W. Spretnak. *American Society for Metals, Transactions,* Preprint no. 170, v. 52, 1959, 17 p.

Forging of Fe and AISI 4340 steel to an initial-to-final height ratio as great as 2.1 had no significant effect on the tensile strength. On the other hand, ductility, as measured by reduction of area in the tensile test, is influenced by the degree of forging. The maximum ductility of specimens in the axial direction is reached at a height ratio of 1.4. Forging reductions ranging up to a height ratio of 2.1 improved the ductility (as measured in the radial direction) of AISI 4340, but not of Fe. 9 ref. (Q27a, Q23p, F22; ST)

1246-Q.* Bigger, Better and Sounder Forgings. Pt. 2. Ernest E. Thum. *Metal Progress,* v. 76, Sept. 1959, p. 121-126.

Service performance simulated by bored and notched 2-ft. disk spun to destruction. Tough steel should have transition temperature of 100° F. or lower as judged by Charpy tests having 50% or more fibrous fracture. Vacuum casting of refined basic electric steel has improved the soundness of forging ingots. (Q26s; AY, 4-51)

1247-Q.* Low-Temperature Transverse Impact Test. John Zotos. Digest of "Effect of Phosphorus and Sulphur Content on Ductility and Toughness of Cast Low-Alloy Steels". *Metal Progress,* v. 76, Sept. 1959, p. 176-, 178, 180.

Ductility and impact resistance of the steel improved by reduced sulphur. Impact test for comparing some basic properties in heats of high-strength steels is demonstrated. (Q23p, Q6, 2-60; AY-n, *S, P,* SGB-a)

1248-Q.* Some Investigations Into the Fundamental Characteristics of and Some Simulative Tests for Aluminum Sheets for Deep-Drawing. C. R. Vassel. *Sheet Metal Industries,* v. 36, Aug-Sept. 1959, p. 543-546, 556.

Deep-drawing properties of Al sheet are correlated with tensile strength data and simulative (flat-and round-bottom cup) tests. 21 ref. (Q27, G4, 17-52; Al, 4-53)

1249-Q.* Problems of Design Associated With the Use of Cold-Rolled Sections for Structural Purposes. E. Griffin. *Sheet Metal Industries,* v. 36, Aug-Sept. 1959, p. 577-594, 612.

Strength factors in relation to design specifications of cold rolled mild and high tensile steels. (Q-general; 17-51, 4-59, SGB-a, CN)

1250-Q.* (German.) Examples of the Behavior of Lead Under Service Conditions. W. Hofmann and H. V. Malotki. *Metall,* v. 13, Aug. 1959, p. 747-749.

Flow and creep tests with Pb under compression. Internal pressure testing of cable sheaths. Bulging degree at failure as a function of bulging velocity. Cracking of Pb claddings on a steel plate after thermal cycling. 5 ref. (Q3r, Q10b, Q7e, 3-74; Pb, 8-66, ST)

1251-Q.* (German.) Precipitation and Hot Strength. H. Klemm. *Metall,* v. 13, Aug. 1959, p. 752-759.

Hot strength is explained by the effect of precipitates preventing crystal slip. Since the influence of grain boundaries becomes more important at high temperatures, steel with coarse grain is preferred. Decarburization zones along wide angle boundaries are thought to cause failure. 7 ref. (Q27a, N7, M27f; SS, SGA-h)

1252-Q. (Russian.) Hydrogen Brittleness of Low Carbon Steel Caused by Exposure to Dilute Nitric Acid. S. A. Balezin and I. V. Nikol'skii. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya,* no. 2, 1959, p. 224-226.

Wires are loaded with hydrogen by immersion in nitric acid of various concentrations. Some of the wires were subsequently heat treated 3 hr. at 150-170° C. Effects of acid concentration and heat treatment on torsion properties. 5 ref. (Q26s, Q1a, 2-64; CN-g, 4-61)

1253-Q.* (Russian.) Cold Brittleness of Commercial Iron. A. I. Paisov, L. N. Podvoiskii and Yu. A. Skakov. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 245-249.

Structure, fracture and coercivity of commercial Fe are investigated both for the state of tendency to cold brittleness (i.e., after annealing at 780° C. following hot rolling) and for the state after annealing at 920° C. and slow cooling. 8 ref. (Q26s, P16a, 2-64; Fe)

1254-Q. Embrittlement in Steels. G. T. Brown. *Iron & Steel*, v. 32, July-Aug. 1959, p. 385-387.

Includes temper embrittlement, 500° F. embrittlement, sigma and "475" embrittlement and embrittling effects of certain hardening processes. Removal of brittleness by reheating is suggested. The presence of a chromium iron phase in embrittled sample is presumed. 30 ref. (Q26s; ST)

1255-Q. (Russian.) Determination of Stresses Present in the Deformation of Metals by Pressure. I. Ya. Tarnovskii, A. A. Pozdeev, V. P. Kotel'nikov and S. G. Puchkov. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 131-135. (Q24, Q25)

1256-Q. (Russian.) Plastic Deformation of Metals. I. Ya. Tarnovskii and A. A. Pozdeev. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 136-139.

7 ref. (Q24)

1257-Q. (Russian.) Approximate Determination of Conditions for the State of Plasticity. E. F. Sharapin. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 140-144.

7 ref. (Q23p)

1258-Q. (Russian.) Stress Concentration Caused by Defects. I. M. Pavlov and A. V. Krupin. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 150-157.

5 ref. (Q25k, 9)

1259-Q. (Russian.) Method for the Testing of Properties and Phase Compositions of Alloys. E. M. Strug and E. V. Panchenko. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 252-255.

Method based on measurements of the thermo-e.m.f. (Q-general, P15g, M24, 1-54)

1260-Q.* Electrode Weld Metal for Fabrication of Dynamically Loaded Shipboard Missile Launching Systems. J. S. Kobler. *American Society of Naval Engineers, Inc., Journal*, v. 71, Aug. 1959, p. 543-551.

Brittle failure of arc welded joints over a wide range of service temperatures is evaluated in terms of notch sensitivity for a multiple-alloy high-strength weldment. Suitable electrode material for this application is considered. Possibility of a notch-sensitive zone occurring at the weld-base metal interface in relation to stress-relief. (Q23s, Q26s, K1a, 3-66, K9r; SS-c, 7-51)

1261-Q.* A Survey of Data on the Fatigue Properties of D.T.D. 363 and L.65 (D.T.D. 364) Aluminum Alloys. J. Y. Mann. *Australian Defense Scientific Service, Aeronautical Research Laboratories*, note 248, Nov. 1958, p. 1-20.

Rotating cantilever and direct stress fatigue data for Al alloys are summarized for both unnotched and notched conditions. Insufficient data are available to indicate which of the two alloy groups has better fatigue properties. (Q7c; Al-b)

1262-Q.* The Plastic Flow and Fracture of a 'Brittle' Material (Grey Cast Iron) With Particular Reference to the Effect of Fluid Pressure. B. Crossland and W. H. Dearden. *Institution of Mechanical Engineers, Proceedings*, v. 172, no. 26, 1958, p. 805-820.

Static torsion, tension and compression tests were performed upon specimens of gray cast iron at pressures to 35 tons per sq. in. A pressure vessel of special design was used for torsion tests. Tests in torsion on rubber-coated specimens indicate that the shear-stress-strain diagram is raised as pressure is increased. (Q1e, Q27a, Q27g, 3-74; CI-n)

1263-Q.* The High Temperature Properties of Four Wrought Steels Used in the Chemical Industry. B. J. Connolly and G. Boyd. *Institution of Mechanical Engineers, Proceedings*, v. 172, no. 31, 1958, p. 889-900.

Short-time, high-temperature tensile, stress-rupture and creep properties are given for low-carbon and medium-carbon 1% Cr-Mo steels and 18-10-Mo-Ti Cr-Ni austenitic stainless steel. Development

of sigma phase in austenitic steel by prolonged heating. (Q27a, Q3q, 2-62, N6p; CN, *Cr, Mo, Ti, Ni,* SS-e)

1264-Q.* A Study of Some Mechanical, Physical and Corrosion Properties of Iodide Hafnium. J. G. Goodwin and F. R. Lorenz. *Nuclear Science and Engineering,* v. 6, July 1959, p. 49-56.

Five iodide hafnium ingots were fabricated into strip. Tensile, impact, hardness, corrosion test, weight gain, electrical resistivity and chemical analysis values were obtained. The mechanical, physical and corrosion property measurements for the unirradiated and irradiated samples showed no physically significant differences attributable to chemical analysis. (Q-general, P15g, R6k; Hf, *I,* 5-59, 4-53)

1265-Q. Fatigue Studies of Inconel. Raymond G. Carlson. Battelle Memorial Institute. *U. S. Atomic Energy Commission,* BMI-1355, June 26, 1959, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.). $.75.

Fatigue strength of Inconel as a function of temperature and frequency; data obtained for range 1300-1500° F. and 10^3-10^5 cycles. Stress-strain and fatigue lifetime relationships. (Q7, 2-61, 3-66; Ni-b)

1266-Q.* Designing Joints for High Temperature Creep Conditions. *U. S. Dept. of Commerce, National Bureau of Standards, Technical News,* STR-2306, Sept. 1959, 6 p.

Methods for calculation of the creep-rupture strength of joints under static conditions and subject to tension loadings. Effects of various loads and temperatures in relation to design of joints. (Q3, 2-62, 3-68; 7, 17-51)

1267-Q.* (German.) Damping Properties of Steel After Hardening and Annealing. Erich Scheil, Ernst Wachtel and Gobind Gurbaxani. *Archiv fur das Eisenhuttenwesen,* v. 30, Aug. 1959, p. 497-501.

Effects of hardening temperature, annealing temperature and time and testing temperature on the damping and magnetic saturation of carbon steel, mild steel and of a 9.44% Ni iron alloy. (Q8, 2-64, 2-61, P16; CN, Fe-b, *Ni*)

1268-Q.* (German.) Kuprodur, a Material Used Successfully in the Construction of Trolley Lines. K. Dies. *Draht,* v. 10, Aug. 1959, p. 364-368.

Tensile strength, elastic limit, elongation and hardness of the material are listed for the ductile state before cold working and for the states after cold working and artificial aging. Relationships between temperature and time of aging. Effect of aging temperature and time on electrical conductivity and hardness. Strength at low and hardness at high temperatures. Corrosion resistance. (Q27a, Q21e, Q23p, Q29n, 3-68, J27d, P15g, 2-62, 2-63, R6; Cu-b, *Ni, Si*)

1269-Q.* (German.) Fundamental Standardization of Structural Sections. Zygmunt Wusatowski. *Freiberger Forschungshefte,* v. B36, May 1959, p. 5-47.

Rolled sections were checked for dimension deviations. Only a slight deviation from the theoretical values was found. Method gives a theoretical solution based on the composition of the steel melt. (Q24, P10d; 4-57, ST)

1270-Q.* (German.) Properties of Several High-Strength Malleable Magnesium Alloys. W. Rosenkranz. *Metall,* v. 13, Sept. 1959, p. 824-830.

Effect of various heat treatments on structure, tensile strength, elastic limit, elongation, impact strength and creep strength of extrusions. (Q27a, Q21e, Q23p, Q6n, Q3m, 2-64, 3-71; Mg-b, 4-58)

1271-Q.* (German.) Properties of Ti-6Al-4V and Ti-14Al-4V Alloys at Elevated Temperatures. U. Zwicker. *Metall,* v. 13, Sept. 1959, p. 830-837.

Effect of temperatures from 350 to 500° C. on tensile strength, elastic limit, elongation, reduction of area, hardness, impact strength and creep strength. 18 ref. (Q27a, Q21e, Q23p, Q29n, Q6n, Q3m, 2-62; Ti-b, *Al, V*)

1272-Q. Effect of Irradiation on Creep. M. L. Rudee. *American Society of Naval Engineers, Inc., Journal,* v. 71, Aug. 1959, p. 453-456.

Review. (Q3, 2-67)

1273-Q. Investigations of Residual Grinding Stresses. L. M. Kubsh. *Machinery (London),* v. 95, Sept. 16, 1959, p. 531-534.

Residual surface stresses can be reduced after the main stock removal by correctly dressing the wheel face and finishing with smaller unit feeds. (Q25h, G18)

1274-Q.* Low-Temperature Tensile Properties of Copper and Four Bronzes. R. M. McClintock, D. A. Van Gundy and R. H. Kropschot. *ASTM Bulletin,* no. 240, Sept. 1959, p. 47-50.

Effects of temperatures between 20 and 300° K. on tensile strength, yield strength and modulus of elasticity of high-conductivity Cu, beryllium bronze, beryllium cobalt bronze, silicon bronze and grade C phosphor bronze. (Q27a, Q21, 2-63; Cu, Cu-s, *Be, Si, Co*)

1275-Q.* A New Steel for Aircraft and Missile Honeycombs. Allen C. Gilbraith. *ASTM Bulletin*, no. 240, Sept. 1959, p. 51.

Hardness and strength, corrosion and heat resistance of PH 15-7 Mo stainless available in either condition A (annealed) or condition C (cold rolled). Tensile strength is 210,000 to 300,000 psi.; yield strength 200,000 to 260,000 psi. (Q27, Q29n, R-general, 2-62; SS, Mo, 7-59, 17-57)

1276-Q.* Structure and Properties of Zirconium Alloys. O. S. Ivanov and V. K. Grigorovich. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 34-51.

Phase diagrams, mechanical properties at 20 and 500° C., creep and corrosion of binary alloys with Fe, Cr, T, Be, Al, Sn, Ti and Cb. (Q-general, Q3, R4, M24c; Zr-b, *Cb, Cu, Fe, Mo, Sn, Ta, Al, Ti*)

1277-Q.* Mechanical Properties of Zirconium Binary and Ternary Alloys With Tantalum and Niobium at Room and Elevated Temperatures. V. S. Emelyanov, Y. G. Godin and A. I. Evstyukhin. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 69-74.

Hardness and tensile strength of cast and heat treated alloys. 8 ref. (Q29n, Q27b, 2-61, 2-62; Zr-b, *Cb, Ta*)

1278-Q.* Use of Magnesium, Aluminum and Their Alloys as Structural Materials. J. Bernard, B. Boudouresques, L. Alfille and R. Klersy. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 157-207.

Mechanical properties and microstructure at high temperatures and after corrosion of Mg and Al alloys and cermets. Influence of irradiation and formability; weldability. 21 ref. (Q-general, R-general, T11, 2-62, 2-67, 2-60; Mg-b, Al-b, *Zn, Zr, Mn, Ce, Th, Cu, Ni, Fe, Ti*, 17-57, SGB-s)

1279-Q.* Mechanical and Physical Properties of Magnesium and Niobium Canning Materials. T. J. Heal. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 208-219.

Thermal cycling experiments with simulated lengths of fast reactor fuel element assemblies demonstrate the restraining action of Cb cans and ductility under complex stress systems. 10 ref. (Q-general, P-general, T11g, 2-62, 3-66; Mg, Cb, *Zr, Be, Al*)

1280-Q.* Mechanical Properties of Alloys of Magnesium and of Zirconium. G. C. E. Olds, J. H. M. Draper, G. A. Geach. J. E. Harris, O. P. Hartree, T. Raine, R. R. Roberts and T. B. Smith. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 249-260.

Ductility, creep strength and microstructure of Mg-Mn alloys and Mg-Ce-Mn alloys at 350-500° C. Properties and corrosion resistance of Zr-Cu-Mo alloys and Mg-Zn-Zr-Mn alloys. 5 ref. (Q-general, M27, 2-62; Mg-b, Zr-b, *Cu, Be, Ni, Mo, Ce, Mn, Zn*)

1281-Q.* Thermal Stress Determination Methods Applicable to Reactor Materials. J. Bernard, A. Gautier and A. Peres. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 266-287.

Methods by which thermal stress fields, their time variations and their validity are determined. 21 ref. (Q25p, T11, 1-54, 3-67)

1282-Q.* Effect of Thermal Cycling on Dimensional and Structural Stability of Various Metals and Alloys. A. A. Bochvar, A. A. Gulkova, L. I. Kolobneva, G. I. Sergeev and G. I. Tomson. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 288-299.

Thermal cycling causes Al, Cu, Ni, Zn, U, Armco iron, Cu-Zn alloys, Fe and Ni-base alloys and Al-Zn alloys to undergo residual dimensional changes if the cycle varibles have correct values. 16 ref. (Q7j, P10d, 2-62; Al-b, Fe-b, Ni-b, Cu-b, U, *Zn*)

1283-Q.* High Boron Steels. J. Hochmann and A. Desestret. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 396-402.

Mechanical properties of steels containing 0.12-4.5% boron. Methods of manufacturing 4% boron steel. 12 ref. (Q-general, 2-60; AY, SS, *B*)

1284-Q.* Mechanical Properties, Embrittlement and Metallurgical Stability of Irradiated Metals and Alloys. M. J. Makin, A. T. Churchman, D. R. Harries and R. E. Smallman. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 446-456.

Mechanism of irradiation hardening in steels, welded thick plates of pressure vessel steels, Ti, Zr, Cu and Mg alloys at 20 to -195° C. 19 ref. (Q-general, Q26s, 2-63, 2-67; ST, Ti-b, Zr-b, Cu-b, Mg-b, Ni-b)

1285-Q.* Effect of Neutron Irradiation on the Mechanical Properties of Structural Materials. N. F. Pravdyuk, S. T. Konobeevsky, A. D. Amayev and Y. I. Pokrovsky. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 457-465.

Influence of temperature on tensile properties of irradiated materials at 80-600° C.; effect of the intensity of the total neutron flux on the static and impact properties of materials; influence of neutron irradiation on internal friction in metals. 11 ref. (Q-general, 2-62, 2-67; ST, Ni, Ta, SGB-s)

1286-Q.* Radiation Effects in Structural Materials at Elevated Temperatures. J. C. Wilson. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 488-499.

Effect on mechanical properties; combined effects of irradiation, stress and high temperatures. 36 ref. (Q-general, T11, 2-67, 3-66, 2-62; SGB-s)

1287-Q.* Effects of Radiation on Mechanical Properties of Solids. M. J. Makin. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 500-530.

Effect on creep, hardness, tensile properties (yield strength, etc.), ductile-brittle transition temperature, elastic constants, internal friction and annealing behavior of a number of metals. 71 ref. (Q-general, 2-67)

1288-Q.* Strength and Creep of Uranium Alloys. B. Boudouresques and M. Englander. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 621-631.

Creep data and tensile properties of U-Zr, U-Al and U-Ti alloys. 7 ref. (Q3, Q27a; U-b, *Al, Ti, Zr*)

1289-Q. (German.) Small-Load Hardness Tester. K. Potyka. *Industrieblatt*, v. 59, Aug. 1959, p. 385-387.

Description and use of the instrument. (Q29, 1-53)

1290-Q.* Cubic-Hexagonal Transformation in Single Crystals of Cobalt and Cobalt-Nickel Alloys. P. Gaunt and J. W. Christian. *Acta Metallurgica*, v. 7, Aug. 1959, p. 529-533.

Kinetic and crystallographic observations on the natural and stress-induced transformations. The shape deformation has been measured for the stress-induced transformation in alloys; the habit plane is not determined by a maximum resolved shear stress condition. 13 ref. (Q24m; 14-61, Co-b, *Ni*)

1291-Q.* The Dissipation of Energy During Plastic Deformation. J. F. Nicholas. *Acta Metallurgica*, v. 7, Aug. 1959, p. 544-548.

Various mechanisms are considered for the dissipation of heat of the mechanical energy of deformation in a cold worked metal. Since dislocations seem to account for at most 10% of this dissipation, the creation and annihilation of point defects is considered. 7 ref. (Q24, P12a)

1292-Q.* Low-Cycle Fatigue of Two Nickel-Base Alloys by Thermal-Stress Cycling. F. J. Mehringer and R. P. Felgar.

American Society of Mechanical Engineers, Paper no. 59—A-58, 1959, 10 p.

Cast DCM and cast Udimet 500, two Ni-base alloys, were tested in a thermal-stress-cycling device of the Coffin type. The strains induced by the thermal stresses were analyzed in several ways in an attempt to relate the plastic strains to cyclic life. The plastic strains were too small to permit calculating them with sufficient accuracy to correlate with cyclic life. The stress range did correlate reasonably well with the number of cycles to failure. 11 ref. (Q7j; Ni-b)

1293-Q.* Tensile and Short-Time Creep Properties of N-155 Alloy Sheet. Eugene C. Bernett. *American Society of Mechanical Engineers,* Paper no. 59—A-27, 1959, 18 p.

At rapid strain rates, the high-temperature tensile strengths of Haynes N-155 alloy were up to 300% higher than those obtained at conventional testing speeds. At high temperatures and high stress levels, however, creep rates were shown to be extremely rapid, and in most cases, the creep strength became a critical factor. Application of rapid-strain-rate tensile data and high-stress creep data in short-life designs. 4 ref. (Q27a, Q3, 3-66, 3-68; Co-b)

1294-Q.* Stresses in Wrought-Steel Wheel Rims and Their Relation to Wheel Life. M. S. Riegel. *American Society of Mechanical Engineers,* Paper no. 59-A-241, 1959, 5 p. $.80.

Basic types of wheel failures. Type A-40 and F-36 diesel wheels are stressed to extremely high levels as a result of heating. Stresses produced at certain locations on the wheel plate apparently exceeded the static yield point of the steel and there are strong indications that heat stresses may be a major factor in wheel failures. (Q25, T23, ST)

1295-Q.* Fatigue Tests on Butt Welded Joints in Aluminium Alloys HE.30 and NP.5/6. R. P. Newman. *British Welding Journal,* v. 6, July 1959, p. 324-332.

Fatigue properties of butt welded joints made by improved techniques in types of high-strength heat treatable Al alloys. Tests were confined to HE.30 and NP.5/6 alloys containing transverse butt welds made by manual argon-arc and self-adjusting processes with some tests also on metal-arc welded specimen. (Q7, K9s; Al-b)

1296-Q.* Some Aspects of Inhomogeneous Deformation in Polycrystalline Metals. Ajit K. Mallik and Rajendra Kumar. *Indian Institute of Metals, Transactions,* v. 12, June 1959, p. 119-126.

Local elongation in coarse-grained specimens of Al and decarburized mild steel. Effect of grain boundaries and tri-crystal junctions on deformation. 6 ref. (Q24f, 2-59; CN-g, Al)

1297-Q.* Theory and Experiment of Press Forging Axisymmetric Parts of Aluminum and Lead. S. Kobayashi. *Journal of Engineering for Industry (ASME Transactions, Series B),* v. 81 Aug. 1959, 228-238.

Theory for simple geometry with axial symmetry of relations of forging pressure, flash height, and die friction. Good agreement is shown to experimental data for pure Pb and Al. (Q23q, F22j, 3-68, 3-74; Al-a, Pb-a)

1298-Q.* Evaluation of Adhesion of Thick Electrodeposits. Hyman Chessin and John G. Poor. *Plating,* v. 46, Sept. 1959, p. 1037-1038.

Pushing out the end of lined holes in specimens allows classification of adhesion of Cr and other electrodeposits on cast iron, steel or Al alloys. 5 ref. (Q10c; CI, ST, Al-b, *Cr,* 8-62)

1299-Q. Grain Size Effects on Fatigue and Their Relationship to Notch Geometry, Stress Gradient and Size of Specimens. F. H. Vitovec. University of Minnesota. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151598, Dec. 1958, 39 p. $1.

Effect of grain size, size of specimen and stress gradient on the direct stress fatigue strength of a 2.5 Al-Mg alloy at room temperature. Specimens with 3 different grain sizes and 7 notch sizes were used. The fatigue strength of unnotched specimens increases linearly with the parameter one divided by the square root of average grain size. For specimens with the same theoretical stress concentration factor and the same grain size, fatigue strength increases linearly with decreasing ratio of notch root radius versus grain size. (Q7a, 3-73, 2-59, 3-66; 1-60)

1300-Q.* The Strength of Arc Welded Joints. *Welding Design & Fabrication,* v. 32, Sept. 1959, p. 62-65.

Principles involved in calculated nominal stresses in welded butt, tee and lap joints. (Q27a, Q25k, 7-51, 17-51)

1301-Q.* Effect of Specimen Geometry on Charpy Low-Blow Transition Temperature.

George M. Orner. *Welding Journal,* v. 38, Aug. 1959, p. 315-s-323-s.

Effect of striking the crack-initiating low blows at room temperature instead of at the temperatures selected for crack propagation. Results indicate that this modification of the testing technique has no measurable effect on the temperature at which the low-blow transition occurs. (Q6, Q26, 3-73)

1302-Q.* (German.) Determination of the Toughness of High Hardness Steels by the Bending Test. K. Bungardt, O. Mulders and W. Schmit. *Stahl und Eisen,* v. 79, Sept. 1959, p. 1258-1263.

With the one point loading method, the maximum bending strength and bending elongation limit was reached at a drawing temperature of 200 to 300° C. The elastic and plastic bending strength and elongation were established for the one and two-point loading method. Plastic deflection and bending yield point indicate toughness of the steel. (Q5j; CN)

1303-Q.* (Russian.) High-Strength Weldable Steels. *Metallovedenie i Termicheskaya Obrabotka Metallov,* no. 8, 1959, p. 56-60.

Effect of alloying elements on the strength properties of the ferritic phase and rate of spontaneous cooling from approximately 700° C. Relationship between transformation temperature and tensile strength. (Q27a, 2-61, N8; AY-n, SGB-a)

1304-Q.* (Russian.) Improving the Wear Resistance of Rolls Used in Continuous Light Gage Rolling. A. E. Krivosheev, L. S. Rudnitskii, Ya. N. Taran and I. E. Lev. *Stal',* July 1959, p. 629-636.

Highest hardness is reached with 3.8-4.3% Ni. Increasing Cr content up to 1.0% improves the hardness so long as the concentration of Ni does not exceed 3.8-4.3%. The highest wear resistance is found in those having a double layer (chilled and mottled) with a 78-85 hardness scale. (Q9n, W23k, Q29h)

1305-Q.* (Russian.) Properties of Aluminum Oxidized Al2A Steel. I. P. Zhetvin, P. A. Prokopovich, V. P. Tunkov, I. B. Tseitlin, E. E. Glazunov and G. L. Eisenberg. *Stal',* July 1959, p. 643-648.

Due to its reduced carbon, Mn and phosphorus amounts, and almost no Mn, Al2A steel has a better roll bite, less cracks during the cooling of ingots and less fissures and laminae during rolling. 7 ref. (Q-general, F23; CN-g, 9-72)

1306-Q. A System for Automatic Processing of Fatigue Data. A. J. Belfour and W. S. Hyler. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151596, Jan. 1959, 195 p. $3.

System provides a means of entering on IBM punch cards descriptive and quantitative information necessary to completely describe a fatigue test and its results. Such useful data as basic material and fabrication, mechanical properties of the material, specimen design and methods of preparation and type of test and associated testing procedure can be coded. The system is useful for coding information from basic fatigue studies of materials as well as component and structural fatigue studies. (Q7, A9p)

1307-Q. Effects of Low Neutron Exposures at Low Temperatures on Hardness and Tensile Properties of Natural Uranium. A. L. Bement. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW-60326, June 2, 1959, 59 P. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

Irradiation and testing techniques. Increases in hardness and yield strength and a decrease in unit elongation were observed. Annealing at 400° C. resulted in virtually complete recovery of original properties. 24 ref. (Q27a, Q29n, 2-67; U)

1308-Q.* (French.) Cracking and Failure of Steel in the Presence of Hydrogen. Paul Bastien. *Archiwum Hutnictwa,* v. 4, no. 2, 1959, p. 93-121.

Effect of hydrogen absorbed during electrolysis or the attack by an acid, on the reduction of area, damping properties and tensile strength at various testing temperatures and deformation rates. Influence of the rate of hydrogen absorption and storing time on area reduction. Laminated structures were found to be more sensitive to embrittlement than granulated structures. 41 ref. (Q26s, Q23p, Q8g, Q27a, 2-61, 3-67, 3-71; ST, *H*)

1309-Q.* Improvement of the Fatigue Strength of Large Cylindrical Shafts With Radial Holes. M. P. Troitskaya. *Metallovedenie i Termicheskaya Obrabotka Metallov,* no. 8, 1959, p. 12-14.

Fatigue testing of crankshaft pins after hardening by surface rolling or surface hardening by high-frequency induction. Effect of hardening process on strength. (Q7a, T7, G23s, J2g, 2-64; CN-p)

1310-Q.* Fatigue Strength of Carbon Steel as Affected by a Melt of the Eutectic Alloy Pb-Sn. M. I. Chaevskii. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 14-20.

Fatigue testing in Pb-Sn melts at temperatures between 200 and 400° C., and for comparison in air. In the melt, the average fatigue strength was 40% higher. 14 ref. (Q7a, 2-66; CN, 14-60)

1311-Q.* Failure of Babbitt Under Compression. S. E. Gurevich. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 24-27.

Cylindrical samples of babbitt metal are deformed by compression. The deformation and failure mechanism is tested microscopically. (Q28g, 2-60; SGA-c)

1312-Q.* Relationship Between the Hardness of Metals and Alloys and Resistance to Seizure. A. D. Kuritsyna. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 27-31.

The tendency to seizure of binary Cu alloys containing Si, Sn, Al, Ni and Zn is tested by compressing thin specimens between dies. Hardness and pressure necessary for seizure as functions of the composition. 9 ref. (Q9q, Q29n, 2-60; Cu-b, *Si, Sn, Al, Ni*, Zn)

1313-Q.* Effect of the Temperature of Second Quenching After Cementation on the Fatigue of Steels and Repeated Impact. S. S. Ermakov and V. I. Kochnev. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 49-50.

After cementation, the samples were quenched in oil, heated up to 720-860° C., and again oil quenched. Effect of the temperature of this second treatment on structure and impact fatigue. (Q7a, Q6n, 2-61, 2-64; ST)

1314-Q.* Embrittlement of Steel 20 and Steel 20KH After Electrolytic Loading With Hydrogen. K. V. Popov and V. A. Yagunova. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 51-52.

Samples were exposed to a current in diluted H_2SO_4 and then mechanically tested. Influence of the quantity of hydrogen absorbed on the reduction of area. (Q26s, N15, 1-68, Q23p; ST, *H*)

1315-Q.* Effect of Cold Deformation on the Hot Strength of KHN80T Alloy. D. Ya. Kagan and V. I. Kolchinskii. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 52-54.

Cr-Ni-Ti alloys for service between 550-600° C. were subjected to tensile deformations of 4-15%. Effect of deformation on tensile strength, elongation and creep strength at 550 to 750° C. (Q3m, Q27a, 2-62, 3-68; SGA-h, Cr-b, *Ni, Ti*)

1316-Q.* Effects of Neutron Irradiation on Mechanical Properties of Ferritic Steels and Iron. L. P. Trudeau. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 475-480.

Effect of composition and microstructure as controlled by heat treatment on the magnitude of the radiation-induced change in properties. Impact energy transition curves and tensile test results reported for subsize specimens; the correlation between results for subsize samples and those for full-size samples given for the unirradiated materials. (Q-general, 2-60, 2-67; Fe-b, CN, AY, SS-d)

1317-Q.* Effect of Gases Produced in Reactor Materials by Irradiation. R. S. Barnes and G. W. Greenwood. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 481-485.

Gas produced during irradiation causes fragmentation of brittle materials. Ductile materials increase volume at elevated temperatures with internal formation of gas. Precipitation of helium bubbles within both Be and Cu suggest that vacancy diffusion is the controlling mechanism. 11 ref. (Q26r, 2-67; Be, Cu)

1318-Q.* Fuel Element Behavior Under Irradiation. V. W. Eldred, G. B. Greenough and P. Leech. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 510-520.

Magnox, Al and uranium are studied for surface wrinkles, creep and turning during irradiation. 5 ref. (Q3, M28, T11g, 2-67; U, Al, Mg-b)

1319-Q.* Assessment and Testing of Fuel Elements. H. K. Hardy and H. Lawton. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5.

Properties of Reactor Materials". United Nations, Geneva, 1958, p. 521-531.

Sources of strain, irradiation effects, wrinkling, creep, swelling, thermal creep, thermal cycling of uranium and can. 22 ref. (Q7j, P10d, Q3, Q25p, T11g, 2-67, 3-68; U)

1320-Q.* (Rumanian.) Effect of Heat Treatment of Superheated Steel After Secondary Austenitization, on the Tendency to Temper Brittleness. Butu Rotenstein and Nicolae Dragan. *Studii si Cercetari de Metalurgie,* v. 4, no. 2, 1959, p. 127-138.

After a first quenching from 1200° C. the samples are heated and quenched a second time and then annealed at 850-1000° C. Effect of annealing temperature on fracture and embrittlement. 6 ref. (Q26s, 2-64; CN-p)

1321-Q. (Book.) Elevated-Temperature Properties of Chromium Steels (12-27%). American Society for Testing Materials STP no. 228, 1958, 113 p. $4.25.

Curves and data on various mechanical properties for 23 steels ranging from 12-27% Cr. (Q-general, 2-62; SS)

1322-Q. (Translation—Brutcher no. 4690.) Mechanical Properties of Cold Worked Austenitic 18-8 Cr-Ni Steels at Low Temperatures. N. N. Lyulicheva and N. V. Pisareva. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya,* no. 2, 1959, p. 217-220.

Yield and tensile strength of 1Kh18N9 steel at various degrees of cold deformation are recorded for the testing temperatures +20 and -183° C. Relationship between crystal structure and strength. 8 ref. (Q23b, Q27a, M26, 3-68, 2-63; SS)

1323-Q. (Translation—Brutcher no. 4712.) Effect of Sulphurizing on the Wear Resistance of Parts From Antifriction Malleable Cast Iron. Ya. G. Lifshits. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya,* no. 2, 1959, p. 221-223.

Influence of service temperature and sulphurizing on wear resistance of machine parts. (Q9, T7d, J28, 2-61; CI-s, SGA-c)

1324-Q.* Spontaneously Induced Brittle Fractures in Welded-Steel Disks. A. Vinckier. *Welding Journal,* v. 38, Sept. 1959, p. 354s-359s.

A simple test is used to demonstrate how fractures take place. Factors governing the initiation and propagation of fracture. 12 ref. (Q26s, 1-54; 7-51, ST)

1325-Q.* Micromechanism of Brittle Fracture in a Low-Carbon Steel. G. T. Hahn, W. S. Owen, B. L. Averbach and M. Cohen. *Welding Journal,* v. 38, Sept. 1959, p. 367s-376s.

Tensile data, elastic limit measurements, standard Charpy data and observations of slip, twinning and microcracking in relation to brittle fracture in coarse and fine-grained steels. 32 ref. (Q26, Q27, Q24; CN-g)

1326-Q.* Analysis of Fatigue. Louis S. Clock. *Machine Design,* v. 31, Oct. 15, 1959, p. 167-169.

How to construct and use modified Goodman diagrams for maximum stress determinations with fluctuating and steady loads. (Q7a, 3-66, 3-74)

1327-Q.* Cast and Wrought Alloy Steels—Elevated Temperature Properties. R. K. Buhr and W. A. Morgan. *Modern Castings,* v. 36, Oct. 1959, p. 61-67.

Low-alloy high-strength steels investigated by means of static mechanical properties, fatigue strength and hardness for both cast and wrought forms. Secondary hardness caused by precipitation of fine alloy carbides. (Q27a, Q6n, Q7a, Q29n; AY-b, 1-60, 2-60, 2-61, 2-64)

1328-Q.* Magnesium Casting Alloy EK31XA. K. E. Nelson. *Modern Castings,* v. 36, Oct. 1959, p. 71-83.

Mg alloy containing 3.2% didymium and 0.6% Zr discussed in terms of castability, weldability, heat treatment for optimum properties, tensile strength, creep strength and corrosion characteristics. (Q27a, Q3m, R11j; Mg-b, 2-63, 5-60)

1329-Q.* (French.) Effect of a Low Arsenic Content on Mechanical Properties of Deep Drawing Steel Sheet. A. Kohn and J. Stremsdoefer. *Revue de Metallurgie,* v. 51, July 1959, p. 101-112.

Mechanical and structural testing of steel containing up to 0.080% As. Effect of As on the heterogeneous distribution of components and deep-drawing properties. 8 ref. (Q27a, Q21e, Q23p, M27; ST, 4-53, As)

1330-Q.* The Structure of Steel. E. Gregory and E. N. Simons. *Edgar Allen News,* v. 38, Aug. 1959, p. 177-179.

Physical and mechanical properties of both heat resisting and austenitic stainless steels. Corrosion, work hardening and forging characteristics. (Q27a, Q29n, Q6n; SS-e)

1331-Q.* Low Temperature Properties of Ferrous Materials. *Society for Automotive Engineers,* Preprint no. TR-169, 1959, 9 p.

Notch toughness behavior with respect to welding, design, fabrication, composition, microstructure of steels. 47 ref. (Q6, Q26, Q23s, 2-63, 2-59, 2-60; AY, SS)

1332-Q. Effect of Hardness, Surface Finish and Grain Size on Rolling Contact Fatigue Life of M50 Bearing Steel. R. A. Baughman. *American Society of Mechanical Engineers,* Paper no. 59-LUB-11, 1959, 11 p. $.80.

Bearing fatigue of M50 increases by increasing hardness, decreasing surface and increasing grain size. The optimum life identified occurs at hardness of Rockwell C-64, 1.5 surface finish and a grain size of ASTM 2. (Q7b, 2-59, Q29n; CN, SGA-c)

1333-Q.* Creep of Cold-Drawn Nickel. William D. Jenkins and Carl R. Johnson. *Journal of Research of the National Bureau of Standards,* v. 63C, July-Sept. 1959, p. 1-18.

Creep of cold drawn Ni specimens in tension under constant loads at 300 to 1200° F. Effect of stress and temperature on strain-time relations, on second-stage creep rate and fracture time. Influence of temperature and creep rate on ductility and fracturing characteristics and resulting structures. 23 ref. (Q3, Q23p, 2-62, 3-66, 3-67, 3-68, Q24; Ni-a)

1334-Q.* Temper-Embrittlement. T. P. Singh. *Metal Treatment and Drop Forging,* v. 26, July-Aug. 1959, p. 275-283.

Temper embrittlement of low-alloy and plain carbon steels; displacement of ductile-to-brittle transition temperatures. Metallographic evidence; nature of fracture; kinetics of embrittlement. 37 ref. (Q23r, Q26s, N8a, J29; ST)

1335-Q.* (Japanese.) "Melt Quality" and Fracture Characteristics of 85-5-5-5 Red Brass. Shigeo Oya and Umeo Honma. *Japan Foundrymen's Society, Journal,* v. 31, Aug. 1959, p. 699-707.

Microstructure, macrostructure and fracture in relation to various melting conditions. (Q26, M28, E10; Cu-n)

1336-Q.* (Japanese.) Structure and Tensile Strength of Vacuum Melted Silicon Cast Iron. Masao Kikuchi. *Japan Foundrymen's Society, Journal,* v. 31, Aug. 1959, p. 713-718.

Tensile strength is influenced by the graphitization after vacuum melting. (Q27a, N8; CI, *Si*)

1337-Q.* Pick-Up of Copper and Duralumin on Bonded Tungsten Carbide. J. Golden and G. W. Rowe. *British Journal of Applied Physics,* v. 10, Aug. 1959, p. 367-371.

Transfer of metal in sliding wear as determined by radioactive tracers; significance of pick-up in analysis of wear. (Q9n, 1-59; Cu, Al-b, W, 6-69)

1338-Q.* Selection of Precipitation-Hardening Stainless Steels. M. E. Holmberg. *Machine Design,* v. 31, Oct. 29, 1959, p. 139-140.

Short-time high-temperature tensile properties and corrosion rates of 17-4 PH stainless. (Q27a, 2-61, R-general; SS)

1339-Q.* The Stress-Dependent Damping Capacity of Ferromagnetic Metals. G. Sumner and K. M. Entwistle. *Iron and Steel Institute, Journal,* v. 192, July 1959, p. 238-245.

Stress-dependent damping arises from the irreversible movement of magnetic domain boundaries. A simple analysis using domain theory predicts a relation between stress for peak damping and magnetizing field for maximum susceptibility which is found experimentally to be valid. (Q8, P16, 3-66, Fe-b)

1340-Q.* Mechanical Properties of Hardened High-Speed Tool Steels. J. Clayton Cave and E. Ineson. *Iron and Steel Institute, Journal,* v. 192, July 1959, p. 248-252.

Tests to determine ductility, fatigue limits and other "toughness" properties of hardened toolsteels under various conditions. (Q29n, Q7a, Q23p; TS)

1341-Q.* Some Recent Experiments on the Friction, Wear and Deformation of Solids. F. P. Bowden. *Society of Automotive Engineers,* Preprint no. 17R, 1959, 7 p.

Frictional behavior of metallic carbides at high temperatures and high speeds; damage to solids by liquid impact at high speeds and deformation. (Q9, Q24; 6-69)

1342-Q.* Use of Bench Wear Tests on Materials Development. G. H. Robinson, R. F. Thomson and F. J. Webbere. *Society of Automotive Engineers,* Transactions, v. 67, 1959, p. 569-579.

Studies on a tappet machine show that wear resistance of Fe alloys is affected by formation of surface films. 10 ref. (Q9; Fe-b)

1343-Q. Physical and Mechanical Properties of Nine Commercial Precipitation-Hardenable Stainless Steels. D. A. Roberts, D. B. Roach and A. M. Hall. Defense Metals Information Center. (Battelle Memorial Institute.). *U. S. Office of Technical Services,* PB 151068, May 1959, 83 p. $2.25.

The three classes studied are martensitic (stainless W and 17-4 PH); semi-austenitic (17-7 PH, PH 15-7 Mo, AM 350, and AM 355); and austenitic (A-286, 17-10P, and HNM). Among their desirable characteristics are ease in hot working, machining, forming and joining. The alloys possess good properties at moderately high temperatures (up to 1400° F. for some), along with good oxidation and corrosion resistance. (Q-general, 2-62, R1h, G17, K-general; SS)

1344-Q. Properties of Certain Cold-Rolled Austenitic Stainless Sheet Steels. R. J. Mangone, D. B. Roach and A. M. Hall. Defense Metals Information Center. (Battelle Memorial Institute.) *U. S. Office of Technical Services,* PB 151069, May 1959, 62 p. $1.75.

Physical and mechanical properties of five cold rolled austenitic stainless sheet steels being used or considered for airframe construction. Included are AISI Type 301, MicroMach, AISI Type 201, USS Tenelon and USS17-5 MnV. In the full-hard condition these alloys have yield strengths exceeding 150,000 psi., with ductilities of about 10%. Yield strengths increase to 200,000 psi. in the extra-hard condition, while ductility decreases to 5% or below. (Q23b, Q23p; SS, 4-53)

1345-Q. Studies of the Effect of Dynamic Preloads on the Mechanical Properties of Steel. R. C. Smith. U. S. Naval Research Laboratory. *U. S. Office of Technical Services,* PB 151685, May 1959, 15 p. $.50.

Low-carbon steel specimens were dynamically preloaded and their mechanical properties were determined to analyze the yielding phenomenon. Upper and lower yield stresses and the inelastic microstrain which preceded gross yield on the retest were used to evaluate the extent of damage and recovery. The most interesting results occurred during the static tests of elastically shocked specimens where the materials showed no permanent deformation even when subjected to stresses greatly exceeding the static yield. (Q-general, 3-68, 3-66; CN-g)

1346-Q. (Russian.) Effect of Gas Content on Hot Brittleness of Aluminum Alloys. G. A. Korol'kov and I. I. Novikov. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo,* no. 2, 1959, p. 19-23.

Melts of various composition, both in the original state and after increasing the hydrogen content by treatment with steam, were tested for hot shortness. Reducing effect of hydrogen on linear shrinkage and ductility. 13 ref. (Q26s, N15e, P10c, Q23p; Al-b, *H*)

1347-Q. (Russian.) Deformation of Nickel in Creep. E. A. Minkina, N. V. Preobrazhenskaya and V. M. Rosenberg. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo,* no. 2, 1959, p. 48-55.

Creep tests performed at 400-800° C. Effects of time and temperature on crystal slip and displacement of the whole crystal along the grain boundary. Relationship between total elongation, elongation resulting from crystal slip and elongation caused by displacement along the grain boundaries. 16 ref. (Q3, Q24a, 2-61; Ni)

1348-Q.* Solders for Nuclear and Space Environments. Alvin B. Kaufman. *Electronics,* v. 32, Sept. 4, 1959, p. 50-51.

Applications and tensile properties of soft and Ag solders subjected to heat, cold and radiation. 9 ref. (Q27a, 2-61, 2-67; SGA-f, Sn-b, *Pb,* Ag-b, *Zn, Cu*)

1349-Q.* The Practical Realization of the HV and HR Scales of Hardness. R. S. Marriner. *Machinery (London),* v. 95, Sept. 2, 1959, p. 405-410.

Influence of indenter misalignment and imperfections and error. speed and duration of loading on hardness values determined with new dead weight Vickers machine. (Q29c, 3-67)

1350-Q.* 500,000 Psi. Steel. Ford Leaps the Tensile Barrier. *Steel,* v. 145, Sept. 21, 1959, p. 84-86.

Heavy working of a modified SAE 4340 steel from 800-1050° F., followed by quenching and tempering, results in a fine martensitic structure and extraordinarily high strength and ductility. (Q27a, N8p; AY, SGB-a)

1351-Q.* Extruding Costly Metals Cuts Scrap, Ups Physicals. *Steel*, v. 145, Sept. 21, 1959, p. 88-90.

Tensile strength, yield strength and elongation of Ti, Zr, Cb, Ta and Mo in the annealed state and following cold extrusion. (Q27a, G5; Ti, Zr, Cb, Ta, Mo, Al)

1352-Q.* Prestrain, Size and Residual Stresses in Static Brittle Fracture Initiation. C. Mylonas. *Welding Journal*, v. 38, Oct. 1959, p. 414s-424s.

Mechanism of static initiation of brittle fracture based on the concept of exhaustion of ductility in relation to static fractures of steel plate at stress levels as low as 12% of virgin yield. As a rule, the ductility of sound structural steels is sufficient to prevent appreciable influence of localized residual stresses. 37 ref. (Q25h, Q26s, Q23p, 3-68; ST, 7-51)

1353-Q. (Russian.) Effects of Thermal Stress Present Between the Phases of Cast Iron During Transition Through the Eutectoid Point. V. F. Zubarev and F. K. Tkachenko. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 113-115.

Dilatometric measurements on white cast iron of various composition and a pearlitic steel. Effect of interphase stress on graphitization and micropores. 8 ref. (Q25p, N11h, N8, 9-68; CI-p, AY)

1354-Q.* (Russian.) Correlationship Between Creep and Relaxation. I. A. Oding and G. F. Lepin. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 2-8.

Creep and relaxation as functions of load and time. 17 ref. (Q3, 3-67)

1355-Q.* (Russian.) Effect of Heat Treatment on the Heat Resistance of Boiler-Turbine Steel 12KhMF. I. N. Bogachev and Kh. D. Reshetnyak. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 8-12.

Effect on structure and creep strength. 6 ref. (Q3m, 2-64, 3-71; SS, SGA-h)

1356-Q.* (Russian.) Effect of the Sigma-Phase on the Mechanical Properties of Heat Resistant Alloys. E. E. Levin, E. M. Pivnik and P. M. Libman. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 17-19.

Behavior of the sigma-phase during deformations at elevated temperatures. After quenching from 1200° C. and aging at 800° C., samples were heated by passing a current and simultaneously subjected to deformation. (Q27a, Q23p, 2-60, 2-62, 2-65; SGA-h)

1357-Q.* (Russian.) Anomalies of the Initial Stage of Plastic Deformation. Ya. R. Rauzin. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 23-29.

Investigation of Al, Fe and steel. Effects of grain size and degree of purity. 14 ref. (Q24, 2-59, 2-60; Al, Fe, ST)

1358-Q.* (Russian.) Influence of Alloying With Chromium and Manganese on the Tendency of Low Carbon Steel to Brittle Fracture. V. G. Savitskii, K. V. Popov, V. F. Zakharov and G. M. Grigor'eva. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 49-51.

Bend and impact bend testing at temperatures from -200 to 0° C. Some of the samples were previously annealed at 860° C. while others were quenched from 880° C. and tempered at 600° C. (Q26s, Q5g, Q6, 2-64, 2-60, 2-63; CN-g, *Cr, Mn*)

1359-Q.* (Russian.) Influence of High Temperature Heating in Hydrogen on the Brittleness of Weldments. L. S. Livshits, L. P. Bakhrakh, I. D. Grebeshkova and V. P. Teodorovich. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 52-55.

Effect of changes in the Mn and Cr contents on the brittleness of welded samples held through 900 hr. at 510-550° C. in a hydrogen atmosphere. (Q26s, 2-66, 2-60, 2-62; AY, 7-51, *Mn, Cr, H*)

1360-Q.* (Russian.) Effect of a Fine-Grained Surface Layer on the Cold Shortness of Steel. P. S. Cakharov. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 55-57.

A fine-grained layer is produced on the surface of the alloy steel 1Kh25Yu5 by hot rolling. Bend tests at -40 to 90° C. show that a fine-grained surface reduces the cold shortness tendency. 4 ref. (Q26s, 3-71; AY)

1361-Q.* (Russian.) Reasons for the Development of Hydrogen Brittleness in the Pickling of Steel Sheet. P. G. Kovtun. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 58-59.

Effect of heat treatment temperature and time on the brittleness behavior after pickling in diluted H_2SO_4. Tensile tests and Erichsen cupping tests. (Q26s, 2-64, L12g, 2-66, Q27a, Q23q; ST, 4-53, *H*)

1362-Q. (Russian.) Application of Formulas Showing Relationships of Temperature and Other Parameters for the Process of Creep. N. N. Geminov. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Sept. 1959, p. 19-22.
10 ref. (Q3, 2-61)

1363-Q.* Comparisons Between the Shearing Properties of Alpha-Brass as Derived From the Cutting Process and From Static and Impact Torsion Tests. S. S. Chang and W. B. Heginbotham. *American Society of Mechanical Engineers*, Paper no. 59—A-38, 1959, 9 p.
Tests carried out on standard specimens at various loads and speeds and shear stresses, shear strains and Merchant constant derived from various methods. 11 ref. (Q2g, Q6, Q8g; Cu-n)

1364-Q.* A Test to Anticipate the Performance of Steam Piping at 5000 Psi. and 1200° F. George C. Wiedersum, Jr. *American Society of Mechanical Engineers*, Paper no. 59-A-230, 1959, 8 p.
Tests on Type 316 stainless steel piping covering ultrasonic behavior, transverse tension, ductility, liquid penetration, impact, hardness, microscopy and temperature-stress cycling properties. 9 ref. (Q-general, 2-62, 1-53; SS, 4-60)

1365-Q.* High-Stress, Low-Cycle Fatigue Properties of Notched Alloy Steel Specimens. S. Yukawa and J. G. McMullin. *ASTM Bulletin*, no. 241, Oct. 1959, p. 38-40.
Data on tension-only (zero stress ratio) fatigue loading applied at nominal stresses of 50% or more of static strength. 10,000 load applications at about 50% of static strength caused failure. (Q7, 3-66; AY)

1366-Q.* Boron-Treated Cast Steels. W. J. Jackson. *Iron and Steel Institute, Journal*, v. 192, Aug. 1959, p. 350-361.
Effect of boron additions in low-alloy and medium-carbon Mo steels on impact values, hardenability, tensile strength and ductility. Hardenability showed an increase, but no improvement in impact properties. 25 ref. (Q27a, Q6n, Q23p, 2-60; AY, CN-p, *B*)

1367-Q. High-Temperature-Strain Fatigue Testing With a Modified Direct-Stress Fatigue Machine. W. F. Anderson and C. R. Waldron. Atomics International. *U. S. Atomic Energy Commission*, NAA-SR-4051, Oct. 1, 1959, 34 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.
Strain fatigue tests conducted on Type 304 stainless steel at room temperature and 1000° F. to determine its capacity to withstand thermally induced cyclic strain. (Q7j, Q23, Q27, Q21, 2-62; SS-e)

1368-Q.* (English.) Sintered Intermetallic Compound NiAl as High-Temperature Materials. Pt. 2. Yunoshin Imai and Masuji Kumazawa. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 312-316.
Oxidation resistance, axial rupture by compression, transverse rupture by bending and absorption energy by Charpy tests. (Q-general, R1h; Ni, Al, 6-71, 14-68, SGA-h)

Influence on the stress-rupture, tensile and hardness properties of Inconel X-550, Inco 739, Nimonic 90 and Inco 700. (Q3q, Q27a, Q29b, 2-64; Ni-b, SGA-h)

1370-Q.* Survey of Various Special Tests Used to Determine Elastic, Plastic and Rupture Properties of Metals at Elevated Temperature. F. Garofalo. *American Society of Mechanical Engineers*, Paper no. 59—A-112, 1959, 14 p.
Techniques depend on static or dynamic measurements. A comparison and analysis of test results determined by these two methods. Effect of composition, grain size and various transformations on the elastic moduli or their temperature dependence. (Q23, Q21, Q3q, 2-60, 2-62, 2-59, 1-54)

1371-Q. Bibliography on Thermal Stresses and Low Cycle Fatigue. D. R. Miller. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission*, KAPL-2048, Aug. 20, 1959, 29 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.
Some 200 references concentrating mainly on U. S. literature. (Q7j, 11-65)

1372-Q. Deformation Modes of Zirconium at 77, 300, 575 and 1075° K. E. J. Rapperport and C. S. Hartley. Nuclear Metals, Inc. *U. S. Atomic Energy Commission*, NMI-1221, Aug. 12, 1959, 33 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

The only slip system observed at any of the temperatures was of the form $(10\bar{1}0)$ $[\bar{1}2\bar{1}0]$ with a critical resolved shear stress of about 1.0 kg. per sq. mm. in tension at 77° K., 0.65 kg. per sq. mm. in compression at 300° K., 0.20 kg. per sq. mm. in tension at 575° K., and 0.02 kg. per sq. mm. in tension at 1075° K. The active twin planes were $\{10\bar{1}2\}$, $\{11\bar{2}1\}$, $\{11\bar{2}2\}$ and $\{11\bar{2}3\}$ with varying frequencies at the different test temperatures. (Q24a; Zr)

1373-Q.* Strain Hysteresis, Energy and Fatigue Fracture. Charles E. Feltner. *University of Illinois, Dept. of Theoretical and Applied Mechanics*, Report no. 146, June 1959, 53 p.

Portion of hysteresis energy is an index of fatigue failure; relationship between plastic hysteresis energy and fatigue failure. 71 ref. (Q26r, Q7, 3-68; ST)

1374-Q.* Micro-Plastic Strain Hysteresis Energy as a Criterion for Fatigue Fracture. C. E. Filtner and J. Morrow. *University of Illinois, Dept. of Theoretical and Applied Mechanics*, Report no. 576, May 1959, 42 p.

Relationship between stress amplitude and number of cycles to failure depending on material properties obtained from the static true stress-strain tension test. Determination of S-N curves for soft SAE 4340. 13 ref. (Q26r, Q7, Q24, 3-66; ST)

1375-Q.* (Japanese.) Behavior of Pure Iron Under Impact Tensile Loading. Seita Sakui and Masanobu Omori. *Tetsu To Hagane*, v. 45, Apr. 1959, p. 415-423.

Yield stress and tensile strength were larger and total elongation smaller than those under static test. By increasing the strain rate, both yield stress and tensile strength increased while total elongation decreased slightly. The rate of increase of yield stress was greater than that of tensile strength. 14 ref. (Q27b, Q27a; Fe-a, CN-g)

1376-Q.* (Japanese.) Effect of Ti and Al on Mechanical Properties of Nimonic 80 A. Pt. 6. Taro Hasegawa. *Tetsu to Hagane*, v. 45, Apr. 1959, p. 432-437.

Effects of Ti, Al and gas content on stress-rupture characteristics at 750° C. and 25 kg. per sq. m. Stress-rupture life increased with an increase of Ti + Al. Stress rupture life depends also on the amount of nitrogen and oxygen or hydrogen. The increase of gas content causes much precipitation around grain boundaries and tends to soften the material during stress-rupture testing by overaging, so that stress-rupture life decreases. (Q3q, 2-60; Ni-b, *Ti, Co, Al, Cr*)

1377-Q. (Russian.) Decomposition and Heat Resistance of the Alloy KhN80T. B. G. Livshits and N. N. Kossakovskaya. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 433-450.

Effect of the rate of cooling after holding at 1080° C. on hardness, heat resistance, precipitation of alpha' phase and on the size of alpha' particles. 10 ref. (Q27a, 2-61, Q29n, M26, N7, 3-67; Ni-b, *CR*)

Castability, mechanical properties and microstructure of ZK61 and EZ33 Mg alloys. (Q-general, E25p, M27; Mg-b)

1396-Q.* (Japanese.) Magnesium Casting Alloy. Pt. 6. Makoto Tsukuda. *Light Metals,* v. 9, July 1959, p. 61-73.

Mechanical properties; hardness; heat treatment and effect of alloy additions. (Q-general, Q29n, 2-64, 2-60; Mg-b, 5-60)

1397-Q.* (Japanese.) Effect of Heat Treatment on Mechanical Properties of M252. Pt. 3. Studies on Nickel-Base Heat-Resisting Alloys. Taro Hasegawa. *Tetsu to Hagane,* v. 45, May 1959, p. 522-527.

The optimum temperature of solution treatment to get high stress-rupture life is 1065° C. Solution treatment at temperatures higher than 1065° C. causes grain coarsening and overaging during long-time testing and decreases the resistance to creep rupture. Specimens solution treated at 1065° C. have superior creep-rupture life to the specimens solution treated and aged at 750° C. But the life in stress-rupture testing of the former becomes inferior to the latter at longer testing time. 4 ref. (Q3q, 2-64, 2-62; Ni-b, SGA-h)

1398-Q.* (Japanese.) Effect of the Normalized Structure in Medium Carbon Steel on Mechanical Properties and Ultrasonic Propagation. Mamoru Nishihara, Taira Nakano and Minoru Makioka. *Tetsu to Hagane,* v. 45, Aug. 1959, p. 709-803.

Study of the relationship between microstructure and mechanical properties (ductility and toughness) to clarify the effect of acicular pearlitic structure found in normalized medium-carbon steel on its mechanical properties. 6 ref. (Q-general, M27, Q21f, 1-74; CN-p)

1399-Q.* (Japanese.) Comparison of Mechanical Properties at Elevated Temperature of Some Commercial Ni-Base Heat Resisting Alloys. Pt. 5. Studies on Ni-Base Heat-Resisting Alloys. Taro Hasegawa. *Tetsu to Hagane,* v. 45, July 1959, p. 712-716.

Effects of Co, Mo and Cb on mechanical properties. Co was found effective to increase strength at high-temperature and long-time tests and increased ductility. M252 which contained 10% Mo was found to have a lower creep-rupture strength above 750° C. than Inco 700 which contained lower Mo, but higher Ti, Al and Co content. (Q-general, 2-60, 2-62; Ni-b, *Co, Mo, Cb, Ti, Al,* SGA-h)

1400-Q.* The Stability of Metals Under Cyclic Plastic Strain. L. F. Coffin, Jr. *American Society of Mechanical Engineers,* Paper no. 59—A-100, 1959, 12 p.

Experiments for longitudinally loaded, fully reversed strain cycling, with and without external mean stress, demonstrate sensitivity of instability. Cyclic tension test shows flow stress and fracture altered by superposition of cyclic strain, particularly for 2S Al and OFHC Cu. (Q7, Q3, 3-68; Al-b, Cu)

1401-Q.* Cycle-Dependent Stress Relaxation of A-286 Alloy. A. S. Ross and JoDean Morrow. *American Society of Mechanical Engineers,* Paper no. 59—A-116, 1959, 5 p.

Tubular A-286 alloy specimens subjected to cyclic, axial fatigue loading at different fixed mean stresses and alternating strains. Data are given for cycle-dependent relaxation of mean stress, fatigue and stress-strain. Fatigue limit is raised by compressive mean stress and lowered by tensile mean stress, mostly at low-strain amplitude because of less relaxation. (Q7, 3-66 Q3; AY)

1402-Q.* The Effects of Sulfur on the Notch Toughness of Heat-Treated Steels. J. M. Hodge, R. H. Frazier and F. W. Boulger. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 745-753.

Impact energy levels decreased continuously as the sulphur content increased while there is a straight-line relationship between impact energy and sulphur content when plotted on logarithmic co-ordinates. Cross rolling raises the level of these lines for transverse

tests and lowers the level for logitudinal tests proportionately to the amount of cross rolling. (Q6, 2-64, 3-68, 2-60; ST, S)

1403-Q.* The Cyclic Straining and Fatigue of Metals. L. F. Coffin, Jr., and J. F. Tavernelli. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 794-807.

Deformation and fracture characteristics of eight metals subjected to fully reversed cyclic strain ranging from 0.2 to 50% at room temperature. Strain-hardening characteristics of these metals can in part be predicted from monotonic stress-strain behavior but many of the effects observed are unique to cyclic strain. With respect to the deformation resistance of metals under cyclic strain, each metal exhibits its own peculiar hardening characteristics associated with the effect of the cyclic-straining process on the internal structure of that metal. 27 ref. (Q7, N7e, 3-68)

1404-Q.* Yield Phenomena in Magnesium Single Crystals Containing Nitrogen. D. Geiselman and A. G. Guy. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 814-820.

Crystals of known orientation were tested in tension in an Instron machine to determine yield strength and observe whether a yield point occurred. Slowly cooled crystals or those given a solution heat treatment did not show a yield point. Crystals that were aged following a solution treatment showed a yield point for all of the nitrogen contents studied. Nitrogen causes the yield point by the Cottrell mechanism. 21 ref. (Q24c, Q23b, 2-65; Mg, 14-61, *N*)

1405-Q.* Creep of a Dispersion-Hardened Aluminum Alloy. G. S. Ansell and J. Weertman. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 838-843.

Creep behavior of an alloy hardened with a finely dispersed phase of Al oxide. The as-extruded alloy shows an approximate steady-state creep in which the creep rate depends exponentially on the applied stress. The activation energy of creep is approximately 150,000 cal per mole. 14 ref. (Q3, 3-66, N7; Al-b)

1406-Q.* Relation Between Beta Grain Size and Ductility of High-Strength Alpha-Beta Titanium Alloy. A. J. Griest, A. P. Young and P. D. Frost. *Metallurgical Society of AIME, Transactions,* v. 215, Oct. 1959, p. 844-848.

The primary cause of beta embrittlement is the large grain size which is obtained so rapidly in many alpha-beta Ti alloys when heated into the beta field. Grain-boundary alpha and acicular intragrannular alpha in the microstructure are not necessarily detrimental to the tensile ductility if the prior beta grain size is sufficiently fine. 5 ref. (Q23p, Q26s, 2-59; Ti-b)

1407-Q.* Coatings on Molybdenum for High Temperature Sliding. G. W. Rowe. *Scientific Lubrication,* v. 11, Oct. 1959, p. 12-15.

A film of Mo disulphide gives low friction up to 800° C. (1500° F.) but must be protected from oxidation. Mo disilicide resists oxidation and can prevent seizure at temperatures up to 700° C. (1300° F.) in air, but shows a higher friction. (Q9p, 2-62; Mo, 14-02)

1408-Q. Stress Relaxation in Stainless Steel During Irradiation. J. W. Joseph, Jr. E. I. du Pont de Nemours & Co. *U. S. Atomic Energy Commission,* DP-369, June 1959, 29 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Fast neutron irradiation (9×10^{20} per sq. cm.) of Type 304 stainless steel stressed at 20,000 to 39,000 psi. decreased elastic stress and ductility and increased hardness, modulus of elasticity, tensile and yield strength at temperatures below 100° C. Steel stressed at 20,000 psi. showed a negligible increase in stress relaxation at exposures in excess of 4×10^{20} fast neutrons per sq. cm. (Q23, Q3a, Q29, Q27, 2-67; SS)

1409-Q.* New Advances in Physical Metallurgy. W. R. Hibbard. Paper from "Symposium on Materials Research Frontiers". American Society for Testing Materials, STP no. 243, June 1958, p. 32-40.

Recent investigation of dislocations and imperfections influencing structure properties, experimental data on brittle fracture, behavior controlling high-temperature properties of metals. (Q-general, M26b, Q26s, 2-62)

1410-Q.* (Czech.) Fatigue Strength of Screwed and Fusion Welded Bolts. O. Puchner and S. Tesar. *Zvaranie,* v. 8, July 1959, p. 195-199.

Comparative tests on fusion welded and screwed bolts reveal no difference

with regard to their resistance to static loading. Differences were noticed in fatigue strength investigations. Rotation bending tests proved the superiority of the welded bolts, in some instances indicating a 200% increase. (Q7a, Q7c; 7-51, 7-55)

1411-Q.* (German.) Influence of the Surface Layer on the Friction of Austenitic Materials During Cold Working Taking Place in Deep Drawing. H. Wiegand and K. H. Kloos. *Metalloberflache*, v. 13, Aug. 1959, p. 229-233.

Friction occurring during deep drawing can cause surface sliding of adjacent metallic layers. Increased phase changes take place in the deformation zone. X-ray examination of martensitic structure. (Q9p, G4b, 3-68; SS-e)

1412-Q.* (German.) Influence of Galvanizing on the Notch Impact Strength of WRST 37-2 Structural Steel. H. Wiegand and F. Nieth. *Metalloberflache*, v. 13, Aug. 1959, p. 254-259.

Influence of 10% buckling on hardness retention and notch impact strength in relation to temperature. (Q6n, L16; SS, *Zn*)

1413-Q.* (German.) Strength Welds in Cylindrical Vessels. H. Heusler. *Schweissen und Schneiden*, v. 11, Aug. 1959, p. 315-318.

Dynamic and static strength properties of welds of the vessels and types of resulting rupture. Elongation studies of the weld exterior and interior in relation to varying pressures in the vessel. 6 ref. (Q3q, K9r, T26q; 7-51)

1414-Q.* (German.) Electron Diffraction Investigation of Stress in 18-8 Stainless Steel. Sh. Yamaguchi. *Werkstoffe und Korrosion*, v. 10, Aug. 1959, p. 499-501.

By mechanical abrasion of the tested 18-8 steel, surface changes from the original austenitic state into the ferritic state were observed. Changes are due to the mechanical tension phenomena similar to the corrosion process. Increasing the thickness of the changed surface layers results in diminished material quality. (Q25m, M22h; SS)

1415-Q. Mechanics of the Sheet-Bending Process. Bernard W. Shaffer and Eric E. Ungar. *American Society of Mechanical Engineers*, Paper no. 59—A-35, 1959, 7 p.

Mathematical assumptions used in fabricating processes involving the bending of sheet. (Q5; 4-53)

1416-Q. Correlation of Bendability of Materials With Their Tensile Properties. J. Datsko and C. T. Yang. *American Society of Mechanical Engineers*, Paper no. 59—A-110, 1959, 5 p.

Procedures to predict minimum or critical bend radius of a specimen involve consideration of tensile strength and percentage reduction of area. (Q5g, Q27a)

1417-Q. (French.) Rotation of Crystalline Matrix and Deformation Bands During Elongation of Aluminum Single Crystals. W. M. Baldwin, Jr., and J. T. Brown. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Oct. 1959, p. 453-462.

16 ref. (Q24c, Q23p; Al, 14-61)

6 ref. (Q25h, F23, J23; Cu)

1434-Q.* The Creep Properties of Two Molybdenum-Bearing Austenitic Steels. H. W. Kirkby. *Alloy Metals Review,* v. 9, June 1959, p. 1-7.
High-temperature behavior of F.V. 555 and F.V. 548 Mo- bearing austenitic steels. Creep properties of the Mo austenitic steels are compared with plain 18/12/1Nb austenitic steel. (Q3, 2-60, 2-62; SS-e, *Mo*)

1435-Q.* Burst Strengths and Deformations of Welded Composite Turbine Wheels as Related to Weld Quality and Plasticity Calculations. A. G. Holms and A. J. Repko. *American Society of Mechanical Engineers,* Paper no. 59—A-28, 1959, 14 p.
Accuracy of predicting deformation and fracture of welded wheels by rotating disk deformation theory (finite difference plastic flow calculation method). 8 ref. (Q26, Q23, 3-68; 7-51)

1436-Q.* The Effect of Ball Bearing Steel Structure on Rolling Friction and Contact Plastic Deformation. Richard C. Drutowski and Ernie B. Mikus. *American Society of Mechanical Engineers,* Paper no. 59—Lub-2, 1959, 5 p.
Roller friction, contact plastic deformation and elastic limit for SAE 52100 steel austenitic content varied from 0-18.4%. Retained austenite content, rather than hardness, is a superior mechanism to select and to insure high quality instrument bearing materials. 7 ref. (Q9p, Q24, 3-71; AY, SGA-c)

1437-Q. Effect of Prior Creep on Mechanical Properties of Aircraft Structural Metals. J. V. Gluck, H. R. Voorhees and J. W. Freeman. Paper from "Proceedings of the Florida Conference on High-Speed Aerodynamics and Structures". v. 1. U. S.

Office of Technical Services, PB 151538, Washington 25, D. C., 1959, p. 54-60.

Tensile, compressive yield and tensile impact tests at room temperature and creep temperatures are used to evaluate the effects of prior creep in 2024-T86 Al alloy 17-7PH (TH 1050) stainless steel and C-110M Ti sheet alloys. (Q27, Q3, Q28; Al-b, SS, Ti-b, SGB-s, 4-53)

1438-Q. Materials Evaluation and Design Criteria. G. Sachs and K. N. Tong. Paper from "Proceedings of the Florida Conference on High-Speed Aerodynamics and Structures". v. 1. U. S. Office of Technical Services, PB 151538, Washington 25, D. C., 1959, p. 61-77.

Properties, specifications and methods of evaluating component behavior of 4340 steel and Mg-alloy. (Q-general, S22; ST, Mg-b, 17-51)

1439-Q. Mechanical Property Data Requirements for New Weapons Systems. D. A. Shinn and R. F. Clinger. Paper from "Proceedings of the Florida Conference on High-Speed Aerodynamics and Structures" v. 1. U. S. Office of Technical Services, PB 151538, Washington 25, D. C., 1959, p. 79-94.

Short-time tensile tests on Cu, Fe, Mo, Ta and Inconel specimens. Tensile properties are correlated with compression, bending and shear properties of the materials. (Q27a, T2; Cu, Fe, Ta, Mo, Ni-b)

1440-Q.* Technique of Hardness Testing and Its Use as a Test in the Production of Copper and Copper Alloys in the Form of Sheet and Strip. V. L. James. *Sheet Metal Industries*, v. 36, Oct. 1959, p. 639-646.

Review of dynamic tests, mainly by measuring the material resistance to indentation; scratch and static tests to achieve hardness and penetration data. Comparison of hardness numbers assessed by loss of specular reflection. (Q29; Cu-b, 4-53)

1441-Q.* A New Method for the Fatigue Tests on Steel Wires and Wire Ropes and the New Viewpoints Opened by the Results Obtained. Denis G. van de Moortel. *Wire and Wire Products*, v. 34, Oct. 1959, p. 1317-1325.

Device and procedure for the simultaneous application of torsion, bending, abrasion and pulsation. Tests on various grades, types and diameters of strands and ropes. (Q7, Q5j, T7g; ST, 4-61)

1442-Q.* A Substitute for Silicon Bronze—Its Fabrication and Properties. Roger E. Martin. *Wire and Wire Products*, v. 34, Oct. 1959, p. 1343-1344, 1414.

Stress-corrosion and dezincification data, effect of Si content and cold working on tensile strength of 90% Cu, 0.8-1.5% Si, balance Zn alloy. (Q27a, 2-60, 3-68, R1d, R2k; Cu-b, *Zn, Si*)

1443-Q.* (German.) The Limit Stress of ST37 Steel. I. Koranyi. *Acta Technica (Budapest)*, v. 26, no. 1-2, 1959, p. 135-151.

Limit stresses for tension and bending, modulus of elasticity and buckling effects. Tension limit stress is based on statistical data. Tensional limit stress of 1850 to 1950 kg. per sq. cm can be obtained. The mean value of the modulus of elasticity is 2113 tons per sq. cm. 4 ref. (Q3q, Q21a; ST)

1444-Q.* (German.) Modern Developments in Steel Ropes. D. van de Moortel. *Draht*, v. 10, Sept. 1959, p. 484-488.

Fatigue and wear tests of steel ropes. Bend tests and loading experiments were used to simulate practical and actually existing loading conditions during rope life. (Q7, Q9, T7g; ST)

1445-Q.* (German.) Rolled Steel Wires. *Draht*, v. 10, Sept. 1959, p. 497-499.

Chemical composition, surface quality, bending, loading and fatigue testing procedures. (Q7, Q5, 3-68; ST, 4-61)

1446-Q.* (German.) Properties and Heat Treatment of Al 17Mo 4Ti Alloy. W. Knorr. *Technische Mitteilungen Krupp*, v. 17, Sept. 1959, p. 111-123.

Influence of composition and heat treatment on the mechanical properties. Strength values at high temperatures; stability of the alloy and conditions of surface brittleness after prolonged stresses at 500° C.; hardness curves at various quenching and age-hardening temperatures. 13 ref. (Q-general, 2-60, 2-64, 2-62; Ti-b)

1447-Q.* (German.) Investigation of 6Mo 3Al Ti Alloy. W. Knorr. *Technische Mitteilungen Krupp*, v. 17, Sept. 1959, p. 124-129.

The minimal elongation at 800° C. is caused by the mechanically unstable beta phase. Mechanical properties of alloys after quenching and aging; oxidation behavior between 600 and 900° C. 6 ref. (Q-general, 2-64; Ti-b, *Mo, Al*)

1448-Q.* (Japanese.) Relationship Between Dent Size and Density Caused by Shot-Peening and Fatigue Strength. Michira Uchiyama and Kazunori Kamishohara. *Tetsu to Hagane,* v. 45, Feb. 1959, p. 105-110.

Reversed bending fatigue testing of shot peened flat steel showed that a decrease in fatigue strength is caused by increases in dent size resulting from an excess impact force and an excess of number of dents per unit area beyond a critical value. (Q7a, G23n; ST)

1449-Q.* (Japanese.) Effect of Heat-Treatment on Mechanical Properties of Nimonic 80A. Pt. 2. Studies on Nickel Base Heat-Resisting Alloys. Taro Hasegawa. *Tetsu to Hagane,* v. 45, Feb. 1959, p. 123-127.

Nimonic 80A, water-quenched after solution treatment, has greater hardness and higher short-time tensile strength up to 800° C. than the air-quenched specimens. Stress rupture life at 750° C. and Charpy impact value were lower in water-cooled specimens. (Q3n, Q27a, 2-64; Ni-b, SGA-h)

1450-Q. (French.) Properties of Copper Alloyed Steels. *Journal d'Information Techniques des Industries de la Fonderie,* no. 109, Oct. 1959, p. 12-13.

(Q21e; AY, *Cu*)

1451-Q. (Russian.) Influence of Residual Stresses and Strain on Mechanical Properties of Welds. L. I. Gladshtein. *Svarochnoe Proizvodstvo,* Oct. 1959, p. 27-29.

(Q-general, Q25h, 3-68; 7-51)

1452-Q. (Swedish.) Semi-Austenitic Steel for Airplanes. *Teknisk Tidskrift,* v. 89, Sept. 25, 1959, p. 917.

Composition, tensile strength, elastic limit and creep properties of AM350 and AM355 steels. (Q27a, Q21e, T24, Q3; SS, 17-57)

1453-Q. (Swedish.) Austenitic High-Temperature Steel With High Carbon Content. *Teknisk Tidskrift,* v. 89, Sept. 25, 1959, p. 918.

Tensile strength, yield point, elongation, area reduction and hardness of high-carbon austenitic steel at 20-590° C. (Q27a, Q23, A29n, 2-61; SS-e)

1454-Q. (Swedish.) Rhenium on a Commercial Scale. *Teknisk Tidskrift,* v. 89, Oct. 9, 1959, p. 972.

Tensile strength, elongation and hardness of commercial strip, rods and wire. (Q27a, Q23p, Q29n; Re, 4-53, 4-55, 4-61)

1455-Q. (Swedish.) Corrosion Resistant Nickel Alloy for Use at High Temperatures. *Teknisk Tidskrift,* v. 89, Oct. 16, 1959, p. 1030.

Tensile properties of Hastalloy B, Hastalloy N and Inconel at 200-870° C. (Q27a, 2-62; Ni-b, *Fe,* Cr, Cr-b, SGA-g)

1456-Q. (French.) Effect of Hard Chromium Plating Fatigue Strength. V. Linhart and J. Sulc. *Chrome Dur,* 1958, p. 72-78.

26 ref. (Q7a; L17, *Cr*)

1457-Q.* The Mechanical Properties of Heat-Treated Nickel-Tin-Bronze Sand Castings and Effect of Impurities, Especially Lead. J. E. Bowers and B. S. Munro. *British Foundryman,* v. 52, Oct. 1959, p. 425-435.

Age hardening in relation to tensile properties of sand cast bronzes containing 2-10% Ni and Sn with 2% Zn. Effects of impurities and solution treatment on tensile properties. (Q27a, J27a, J27d, 3-69; Cu-s, *Ni, Sn, Pb,* 5-60)

1458-Q.* (Japanese.) Bending and Impact Tests on Various White Cast Irons. Pt. 6. Study on Alloy White Cast-Iron. Ichiro Fukumoto. *Japan Institute of Metals, Journal,* v. 23, May 1959, p. 252-262.

Some hairline cracks were found in the eutectic cementite or along the boundaries on the tension side of the bending test pieces, when the tensile strain became about 0.1 to 0.5%. When the cracks reached the primary crystals, they developed as transcrystalline (about 70%), or as intercrystalline cracks (about 30%). The fracture stress in bending tests varied markedly. (Q6, Q5; CI-p, 9-72)

1459-Q.* (Japanese.) Observations on Plastic Deformation and Cracks in White Cast-Iron. Pt. 5. Study on Alloy White Cast Iron. Ichiro Fukumoto. *Japan Institute of Metals, Journal,* v. 23, May 1959, p. 255-259.

When subjected to tensile stress, cleavage cracks appeared mainly in the eutectic cementite and passed through the primary crystals or along the boundaries. When subjected to compression stress, the specimens with low hardness values were broken along the glide plane 45° to the compressed axes. (Q24; CI-p, 9-72)

1460-Q.* (Japanese.) Mechanical Properties of 17-7 PH Stainless Steel Containing 1% Al. To-oru Furukawa and Tomo-o Sato. *Japan Institute of Metals, Journal,* v. 23, May 1959, p. 281-284.

Mechanical properties in relation to heat treatments such as solution treatment, intermediate quenching and aging

for various temperatures and times. Steel showed better mechanical properties by aging after solution treatment and intermediate quenching. (Q-general, 2-64, 2-65; ST, *Al*)

1461-Q.* (Japanese.) Relationship Between Heat Treatment and Room-Temperature Internal Friction of Some Carbon Steels. Genjiro Mima and Michio Mizuta. *Japan Institute of Metals, Journal*, v. 23, Aug. 1959, p. 469-473.

Internal friction of martensitic specimens exists in proportion to carbon content and is caused by stress-induced diffusion of carbon into Fe lattices. Internal friction of annealed specimens is proportional to vibration amplitude, while tempering produces a two-stage change in friction. 27 ref. (Q22, 2-64, N1, 2-60; CN)

1462-Q.* (Japanese.) Effect of Alpha + Beta Phase of 2.5% Al Magnesium Alloy on the Microhardness. Toshio Yoshino. *Journal of Mechanical Laboratory (Japan)*, v. 13, Sept. 1959, p. 229-233.

Two maximums observed with Vickers microhardness test on the alpha phase. First maximum at low load is dependent on load and is explained by hindrance from surrounding structure. Second maximum is that usually found. 4 ref. (Q29q, 3-71, 3-68; Mg-b, *Al*)

1463-Q. (Dutch.) Increased Usefulness of Sinter Alloys by the Mallory Process. C. Vollers. *Metalen*, v. 14, Oct. 15, 1959, p. 308-309.

Tensile strength, yield point, hardness, impact strength and fatigue strength of Steelmet 100, 101, 302 and 600. (Q27a, Q23b, Q29n, Q6n, Q7a; ST, 6-72)

1464-Q. (French.) Effect of Temperature on the Structure of an 18-8 Austenitic Steel Exposed to Alternate Torsional Stress. J. de Fouquet. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Sept. 1959, p. 357-370.

4 ref. (Q7h, Q24a, 2-61; SS)

1465-Q. (French.) Hardening of Magnesium Alloys Containing Zirconium by Heating in a Hydrogen Atmosphere. J. Herenguel and J. Boghen. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Sept. 1959, p. 371-378.

Effect on tensile strength, elongation, elastic limit and grain size. 15 ref. (Q27a, Q23p, Q21e, M27c, 2-61, 2-66; Mg-b, *Zr, H*)

1466-Q. (French.) Formation of Twin Crystals in Steel as Influenced by Stress, Temperature and Rate of Loading. Albert Kochendorfer. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Sept. 1959, p. 388-392.

4 ref. (Q28, 2-63, 1-52)

1500-Q. (Russian.) Deformation Measurements at Low Temperatures. T. A. Volikanova and S. I. Sergeev. *Zavodskaya Laboratoriya*, v. 25, no. 10, 1959, p. 1252-1254.
Behavior of transmitting elements at low temperatures. (Q24, 1-53, 2-63)

1501-Q.* Effect of Torsion on the Tensile Stress-Strain Curve of Aluminum. D. B. Holt. *Acta Metallurgica*, v. 7, July 1959, p. 446-468.
Work hardening of Al single crystals resulting from alternate tensile and torsional deformation. Increase in tensile flow stress due to twisting and its relation with prior extension, crystal orientation and amount of twist. Modes of torsional deformation in different orientation regions and corresponding dislocation mechanisms. Explanation of slip line distribution and changes in flow stress and hardening rate due to twisting in terms of dislocation theory. 45 ref. (Q23a, Q24, Q27a, Q1a, M26b; Al, 14-61)

1502-Q.* The Flow Stress of Iron and Its Dependence on Impurities. G. Schoeck and A. Seeger. *Acta Metallurgica*, v. 7, July 1959, p. 469-477.
Redistribution of solute interstitial onto lower energy lattice sites which takes place in the stress field of a dislocation. Locking of dislocations by this Snoek-effect. Calculation of locking energy and stress to free dislocations for a screw dislocation in alpha Fe. Magnitude of frictional force on a moving dislocation caused by Snoek-effect. Consideration of flow stress of alpha Fe in terms of this mechanism. 17 ref. (Q27a, Q24c, 3-69; Fe)

1503-Q.* Studies on the Susceptibility of Cathodically Protected Steel to Hydrogen Embrittlement. W. H. Bruckner and K. M. Myles. *Corrosion*, v. 15, Aug. 1959, p. 591t-595t.

Steels tested were API grades A, B and M (N-80). The presence of a reducible FeO portion of the mill scale delayed hydrogen absorption. Embrittlement of Grades A and B occurred due to notch formation when adherence of FeO to base metal was destroyed during cathodic protection. Under conditions of low pH with and without sulphide ion, cathodic protection induced hydrogen absorption, and with sulphide ions present embrittlement of steels A and B was severe. (Q26s, 2-66; ST, *H*)

1504-Q.* Elastic Constants of Alpha-Brasses: Variation With Solute Concentration From 4.2-300° K. J. A. Rayne. *Physical Review*, v. 115, July 1, 1959, p. 63-66.

Ultrasonic determination at low temperature of elastic constants and Debye temperature. Comparison with calorimetric data; effects of lattice heat capacity of alloys. (Q21f, 3-71; Cu-n)

1505-Q.* The Influence of Solute Atoms on the Damping Due to Dislocations in Iron Alloys. P. M. Robinson and R. Rawlings. *Philosophical Magazine*, v. 4, Aug. 1959, p. 938-947.

Effect of Si and oxygen in solid solution on the damping of Fe vibrating at 1.03 cycles per sec. Damping is independent of vibrational amplitude up to a critical amplitude. From the temperature variation of the critical amplitude a binding energy of 0.004 ev. between a Si atom and a dislocation is obtained. Above the critical amplitude, the damping varies with amplitude of vibration. 11 ref. (Q8, M26b, 2-60; Fe-b, 14-67, *Si, O*)

1506-Q.* Ductile Fracture in Metals. K. E. Puttick. *Philosophical Magazine*, v. 4, Aug. 1959, p. 964-969.

Cup-and-cone fracture in single-phase ductile metals appears to originate at holes formed by drawing away of material from nonmetallic inclusions. In Cu, the holes expand under the triaxial stresses in the neck and coalesce in a macroscopic fissure; in alpha Fe fine cracks are formed by the stress concentrated at the holes. In coarse-grained material shear cracks are formed on the surface of the neck. 9 ref. (Q26, 3-66; Fe, 9-72)

1507-Q.* Fatigue Studies of Plated Hot Work Tool Steels. G. William Lawless, Vernon F. Lardenoit and Bennie Cohen. *Plating*, v. 46, Nov. 1959, p. 1264-1267.

Endurance limit is drastically lowered by plated, sprayed or dipped metallic coatings in both the as-coated condition and after exposure to elevated temperatures. Both shot-peening and nitriding the steel prior to coating restore the endurance limit of the steel in the as-coated condition. (Q7; TS-k, 8-62, 8-65, 8-67)

1508-Q.* Fretting in the Light of Aircraft Experience. P. B. Walker. *Royal Aeronautical Society, Journal*, v. 63, May 1959, p. 293-298.

Fretting and its relation to fatigue. Various defects and preventive measures. (Q7, Q9q, T24)

1509-Q.* (English.) The Temperature of Rubbing Surfaces. J. F. Archard. *Wear*, v. 2, Oct. 1959, p. 438-455.

Formulation of the flash temperature theory. Graphical methods for deducing temperatures; application of the theory to new experimental results on the breakdown and wear of steels. 14 ref. (Q9n, Q9p; 2-62, ST)

1510-Q.* Effects of Radiation. Ernest E. Thum. Paper from "Metals for Nuclear Reactors". American Society for Metals, Metals Park, Novelty, Ohio, 1959, p. 32-46.

Atomic displacements and thermal spikes due to neutron bombardment. Transformation and aging effects. Influence of fission and fission products on dimensional stability and mechanical properties. Requirements of materials for cladding fuel elements. Changes in tensile properties, ductile-to-brittle transition and impact strength of metals resulting from neutron radiation. (Q-general, P10d, 2-67; SS, ST, Al, Ni, Cu, U)

1511-Q. Investigation of the Compressive, Bearing and Shear Creep-Rupture Properties of Aircraft Structural Metals and Joints at Elevated Temperature. Pt. 5. L. A. Yerkovich. Cornell Aeronautical Laboratory, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151561, Dec. 1958, 97 p. $2.

PH15-7-Mo stainless steel and 6Al 4V Ti tested from 700 to 900° F. to establish creep and rupture performance. With only slight variations creep-rupture correlation agreed with short-time strength correlations when the short-time characteristics were determined under a controlled strain rate of 0.5% per min. Both

alloys showed creep-rupture stress sensitivity in bearing and shear as well as tension. (Q28, Q3q, 2-62, 3-68; SS, Ti-b, *Al, V, Mo,* SGB-s)

1512-Q. Theory of Brittle Fracture in Steel and Its Application to Radiation Embrittlement. A. H. Cottrell. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 3-17.

Theory of yield in Fe and conditions for the nucleation of slip from cracks. Formulation of a new theory of crack nucleation in which the crack nucleus is formed at the junction of two intersecting slip planes by the coalescence of dislocations in those planes. Equations express change of ductile-to-brittle transition temperature with grain size, lattice hardness, strain rate and yield stress for notched and unnotched steel specimens. Essential features and conditions of service failures of large structural steel assemblies. Nature of radiation embrittlement and its effect on transition temperature. 48 ref. (Q23, Q24, Q26, 3-66, 3-68, 2-59, 2-67; ST)

1513-Q.* The Transition Temperature in Notched Specimens. N. J. Petch. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 18-20.

Mechanism of crack formation and propagation; equations giving criteria for brittle fracture; relationship of grain size, strength of dislocations and triaxial tension in the notch with the temperature of ductile-to-brittle transition. Comparison with experimental values for steel. (Q23r, Q23s, Q26, 2-59, 2-60, 2-61; ST)

1514-Q.* The Mechanical Properties of Steels Irradiated With Neutrons. D. Hull. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 21-22.

Effect of irradiation on notched impact values of nitrided and unnitrided specimens of low-carbon steel between -80 and 180° C. Tensile properties of fine and coarse-grained low-carbon steel at room and liquid-nitrogen temperatures after various irradiation treatments. (Q27a, Q6n, Q23r, 2-67, 2-59; CN-g)

1515-Q.* The Effect of Irradiation in a Nuclear Reactor on the Mechanical Properties of Steel. S. F. Pugh. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 23-30.

Displacement of atoms by fast neutron bombardment and changes in mechanical properties due to the interaction of point defects with dislocations and due to disordering of ordered phases or mixing of phases at the grain boundaries. Damage due to thermal neutron capture. Effect of irradiation on tensile properties and on ductile-to-brittle transition temperatures on radiation damage. 23 ref. (Q27a, Q23r, Q26n, Q5h, 2-67, 2-59, 2-61; ST)

1516-Q.* The Effect of Neutron Irradiation on the Mechanical Properties of Steels. D. R. Harries and C. Judge. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 31-34.

Influence of irradiation temperature and dose on ductile-to-brittle transition temperature for weld and parent metal specimens of Ducol W.30, Conlo 1 and Croloy steel. (Q23r, Q5h, 2-67, 2-61; AY)

1517-Q. Possible Effects of Irradiation on the Hydrogen Embrittlement of Steel. T. J. Heal. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 35-37.

Possible influence of irradiation on rate or extent of hydrogen solution and on mechanism of embrittlement of steel after entry. 10 ref. (Q26s, N15, 2-67, 3-69; ST, *H*)

1518-Q.* A Survey of Hydrogen Embrittlement of Steels. B. E. Meredith and D. White. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 38-40.

Influence of hydrogen content, ultimate tensile strength, temperature and stress on the degree of embrittlement; theories of hydrogen embrittlement. 9 ref. (Q26s, N15, 2-61, 3-66, 3-67; ST, *H*)

1519-Q.* Ductile-Brittle Transition in Non-Ferrous B.C.C. Metals. R. E. Smallman. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 41-43.

Ductile-to-brittle transition temperatures of Mo, W, Cr, Ta, Cb and V. Variation with strain rate, grain size, cold work, impurities, stress-relief and neutron irradiation. 15 ref. (Q23r, Q26, 2-61, 2-59, 2-67, 3-68, 3-69; Mo, W, Cr, Ta, Cb, V)

1520-Q.* Cleavage Fracture in Hexagonal Metals. G. B. Greenough. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 44-45.

Effect of plastic deformation, fatigue or coatings on fracture stress of monocrystalline and polycrystalline Zn. Fracture of Mg, Cd and Ge. 6 ref. (Q26n, 3-68, 2-59, Zn, Mg, Cd, Ge, 14-61)

1521-Q. The Ductility Problem of Reactor Beryllium. G. C. Ellis. Paper from "Brittleness in Metals". United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, p. 46-47.

Longitudinal and transverse tensile properties of various types of Be at elevated temperatures. Probable causes of brittle behavior. Possibilities for future improvement. (Q27a, Q23p, 2-62, 3-69; Be, 4-58, 6-72)

1522-Q. (English.) Fatigue Strength of a Copper Coating Sprayed on Steel Bars. Jaakko Salokangas and P. Lehto. *Acta Polytechnica Scandinavica*, no. 7, 1959, 21 p.

Cu layer was sprayed on the surface of a steel test bar. The stress that could be sustained for 10^7 load cycles without producing a crack, visible under the binocular microscope, was regarded as the fatigue strength of sprayed Cu. Both the wire feed and the spraying distance were within certain limits, inversely proportional to the fatigue strength of sprayed Cu. 4 ref. (Q7a, L23; ST, 4-55, 8-67)

1523-Q. (Pamphlet.) Brittleness in Metals. United Kingdom Atomic Energy Authority, I. G. Report no. 145 (RD/C), 1959, 47 p.

Theory of brittle fracture in steel; factors affecting transition temperatures; effect of irradiation on mechanical properties and hydrogen embrittlement of steels. Brittle fracture of Mo, W, Cr, Ta, Cb, V, Zn, Mg and Be. Papers abstracted separately. (Q-general, Q26s, Q23r, 2-61, 2-67, 3-67, 3-68, 3-69; ST, Mo, W, Cr, Ta, Cb, V, Zn, Mg, Be)

1524-Q. (Pamphlet.) The Tensile and Impact Properties of Plate and Welds of Aluminum Alloy 5083-H113 Between +75 and -320° F. R. D. Olleman and G. C. Wolfer. 9 p. 1959. Kaiser Aluminum & Chemical Corp., Kaiser Bldg., 1924 Broadway, Oakland 12, Calif.

Tensile tests, notched and unnotched tensile-impact tests and Charpy keyhole impact tests; evaluating resistance of plates and welds of 5083 Al alloy to brittle fracture; performance of SAE 1034 steel subjected to the same tests. 9 ref. (Q27a, Q6n, Q23r, Q26s; Al-b, ST)

1525-Q. (Pamphlet.) Engineering Properties of "S" Monel Hard Nickel-Copper Cast Alloy. (Inco Casting Data.) 9 p. 1959. International Nickel Co., Inc., Oak St., Bayonne, N. J.

Age-hardenable cast material provides unusual strength, hardness and antigalling properties up to 1100° F. in addition to the general corrosion resistance of Monel. (Q-general, P-general, 2-62; Ni-b, Cu, Si, Fe, *Mn*)

1526-Q. (Pamphlet.) Basic Data. Inconel "702" Aluminum-Containing Nickel-Chromium Alloy. 3 p. Apr. 15, 1959. International Nickel Co., Inc., 67 Wall St., New York 5, N. Y.

High-Al, low-Ti alloy for improved oxidation resistance to 2400° F. Data for composition, physical and mechanical properties, tensile and rupture strength, oxidation resistance, working properties. (Q-general, 2-62, R1h, P-general; Ni-b, *Cr, Al, Ti*)

1527-Q. (Pamphlet.) Engineering Properties and Applications of Ni-Vee Bronzes. 25 p. 1958. International Nickel Co., Inc., 67 Wall St., New York 5, N. Y.

Five types of alloys with 5% Ni and 5% Sn whose as-cast properties can be elevated through simple heat treatments which control Ni-Sn-W precipitation reaction. Used for constructional and pressure castings and bearing applications. (Q-general, P-general, 2-64; Cu-s, *Ni, Sn*, SGA-c, SGB-s)

1528-Q. (Pamphlet.) 300-M Ultra High Strength Steel. 12 p. 1959. International Nickel Co., In., 67 Wall St., New York 5, N. Y.

Low-alloy steel has a higher strength at all temperatures without increase in carbon content and resists softening at a tempering temperature of 400-600° F. Its high hardenability allows light sections to be air hardened, simplifying heat treatment and minimizing distortion. (Q27a, J-general; AY, SGB-a)

1529-Q. (Pamphlet.) Ductile Iron Combines Quality With Economy for Fluid Handling Equipment. K. H. Kurgin. 16 p. 1959. International Nickel Co., Inc., 67 Wall St., New York 5, N. Y.

Methods of manufacture and heat treatment; resistance to cracking by thermal and mechanical shock; tensile

properties, creep characteristics, stress-rupture levels, oxidation and growth characteristics. (Q-general, Q3, R1h, R-general, J-general; CI-r)

1530-Q. (Translation.) Indentation of a Ball. Pt. 2. Strain Figures Developed in and on the Ball Indentation Specimen. Shigehiko Yazawa and Kiyoshi Sato, Masao Unno and Go Yaguchi. *Journal of Mechanical Laboratory of Japan*, v. 5, no. 1, 1959, p. 19-23. Behavior of Sn, Pb, Al, Ag, Cu, Ni and stainless steels at 0.800° C. 253 ref. (Q22, 2-61; Co, Ni, Cu, Mo, Pb, Al, Ag, SS)

1540-Q. (Translation—AIP.) Physico-Chemical Phenomena in the Deformation of Metals. V. I. Likhtman and E. D. Shchukin. *Soviet Physics—Uspekhi*, v. 1, Sept.-Oct. 1958, p. 91-112.
Theoretical treatment of mechanical properties of Zn and Cd crystals from the point of view of dislocation theory. 69 ref. (Q24, M26b; Cd, Zn, 14-61)

1541-Q. (Translation—AIP.) Brittle Fracture of Metals. V. L. Sarrak. *Soviet Physics—Uspekhi*, v. 2, Jan-Feb. 1959, p. 150-164.
Theoretical strength of metals, Griffith's theory, dislocation theory of fracture, temperature dependence of yield point, role of impurities, structure of steel and its tendency toward brittle fracture, intergranular fracture and the

propagation of cracks. 78 ref. (Q26s, Q26q, 2-61, 2-60; AY, ST)

1542-Q. (Translation—AIP.) Temperature Dependence of the Mechanical Strength and Life Under Load of Metalloceramic Bodies. B. Ya. Pines and A. F. Sirenko. *Soviet Physics, Solid State,* v. 1, no. 2, n.d., p. 247-254.

Specimens prepared from powders of Cu, Ni, Fe, Mo and W and from mixtures of powders Cu-Ni, Cu-Fe, Ni-Fe and Ni-W, tested to 1000° C. 6 ref. (Q27a, Q7a, 2-62; Cu, Ni, Fe, Mo, W, 6)

1543-Q. (Translation—Brutcher no. 4494.) Effect of Hydrogen on Structure and Properties of Titanium and Its Alloys. S. G. Glazunov, I. I. Kornilov and A. M. Yakimova. *Izvestiya Akad. Nauk SSSR, Otdelenie Tekhnicheskikh Nauk,* Jun. 1958. p. 30-36.

(Q-general, M28, 2-60; Ti-b, *H*)

1544-Q. (Translation—Brutcher no. 4736.) Effect of Molybdenum, Chromium and Aluminum on the Strength of Hard Alloys on a Nickel or Cobalt Base. A. I. Baranov, K. A. Bystrova, T. A. Novikova and V. F. Funke. *Izvestiya Akademii Nauk SSSR, OTN, Metallurgiya i Toplivo,* no. 2, 1959, p. 43-47.

Correlation between the amount of Mo, Cr or Al and the quantity of cementing phase on one side and the bend strength on the other side. 9 ref. (Q5g, 2-60, 2-61; SGB-q, Ni-b, Co-b, *Mo, Cr, Al*)

SECTION R

CORROSION

1-R.* Corrosion of Aluminum. Frederick W. Fink. *Nuclear Technology Briefs*, no. TI-8, Sept. 18, 1958, 8 p.

Progress to development of Al alloys with sufficient corrosion resistance for use as cladding materials in pressurized water reactors. Nature of corrosion attack and the reduction of corrosion in high-temperature water by alloying and use of inhibitors. 22 ref. (R4, T11g; Al-b)

2-R.* (German.) Stress-Corrosion. Ludwig Graf. *Draht*, v. 9, Oct. 1958, p. 383-389.

Stress-corrosion sensitivity of supersaturated alloys with precipitation tendency can be eliminated by heat treatment, provided the alloy is not corrosion sensitive in the homogeneous state of saturation. With unsupersaturated homogeneous alloys, stress-corrosion was observed only when the alloying components of the solid solution were considerably more negative than the base metal. 19 ref. (R1d)

3-R.* (German.) Mechanism of Influence of the Surrounding Medium on Metals. G. W. Karpenko. *Zeitschrift fur Physikalische Chemie*, v. 208, Apr. 1958, p. 809-817.

Inactive media; surface active media, chemically active media and media which act on metals through diffusion. Adsorption starts corrosion, which diminishes the surface strength. Through diffusion a medium penetrates far below the surface and the following adsorption promotes corrosion which weakens the tensile strength of the metal. Relationships between physical, chemical and mechanical conditions of the metal surfaces and their reaction with surrounding mediums. 6 ref. (R1)

4-R.* (Japanese.) Galvanic Corrosion of Metals. Hiroshi Asada and Shiro Kohara. *Light Metals*, no. 31, July 1958, p. 35-39.

Corrosion tests of Cu, Fe, Zn and Al in 5.8% sodium chloride containing 0.3% hydrogen peroxide were carried out with galvanic couples formed by two metals and with contacts of three metals. Zn was corroded most severely, Fe next and Cu galvanic couples, basic metal and couple was corroded preferentially as predicted from galvanic series. In case of contact of three metals only basic metal was corroded. The protection afforded by loss of anodic metal decreased with time, corresponding to decrease in corrosion current. The decrease in corrosion current resulted from thicknening of hydrate film formed on metal surface. 14 ref. (R1a; Al, Cu, Fe, Zn)

5-R.* (Japanese.) Utilization of Aluminum and Its Alloys in the Wine and Brandy Industry. Takuichi Morinaga, Shigeo Zaima and Motoo Kagami. *Light Metals*, no. 31, July 1958, p. 40-50.

Corrosion tests in white dry wine and brandy. Effect of Al on wine characteristics. 15 ref. (R7f, T29p; Al-b, 17-57)

6-R. (Polish.) Resistance of Nonstabilized 18-8 Type Steels to Intercrystalline Corrosion in Welding Zone. Josef Nemec. *Hutnik*, v. 24, no. 9, 1957, p. 356-363.

The tendency to intercrystalline corrosion is one of the indices of the welding capacity of metal. Cooling with water during welding decreases the tendency to intercrystalline corrosion in the welding zone considerably; in 0.07% C steels water cooling completely neutralizes possibility of intercrystalline corrosion. (R2h, K-general; SS)

7-R. (Polish.) Calcium Cyanamide as an Inhibitor of Steel Corrosion in Aqueous Solutions. Stefan Pawlikowski, Iwo Pollo and Jerzy Wegiel. *Zeszyty Naukowe Politechniki Slaskiej*, no. 12, 1957, p. 107-128.

Influence of calcium cyanamide on the corrosion rate and change of the irreversible electrode potential of iron (0.3% C) in distilled and tap water and in series of salt solutions in relation to underground corrosion. Addition of 4% calcium cyanamide to tap and distilled water reduced corrosion rate ten times. Greatest inhibition was observed in $CaSO_4$ solution. Inhibition of corrosion rate in water and the majority of salt solutions by calcium cyanamide additions is caused by the hydrolysis of the latter and by the rise in alkalinity of the solutions. (R10b; ST)

8-R. (Rumanian.) Cathodic Protection of Gas Pipeline With Galvanic Anodes. M. Hamerak. *Petrol si Gase*, v. 8, no. 6, 1957, p. 309-313.

Protection of a gas pipeline 5.5 m. in diameter and 1700 m. long, with anodes of 99.9% pure Zn. Resistance of the soil was mainly in the range from 10 to 20 ohm. per m., rising to 41-45 and up to 140 in the last three sections. Anode installation was carried out in special castings of plaster-of-paris and clay. (R10d; 4-60)

9-R. (Serbian.) Corrosion of Electric Units and Other Objects in Soil by the Action of Electric Current. Pance Kirkov. *Zastita Materijala*, v. 5, no. 1, 1957, p. 5-8.

Rate of corrosion of Fe, Zn, Cu, Sn, Pb, Cu + Zn (40% Zn), Pt in the soil, conducted in a laboratory unit, in which samples were inserted in a vessel containing sand that had been treated with HCl and were polarized with alternating current. Alternating current affects to a considerable extent the rate of corrosion, depending on the duration and the manner of introducing the current into the system. (R1j; Fe, Zr, Cu, Sn, Pb, Zn)

10-R. Corrosion Studies in Dynamic Aqueous Systems at Elevated Temperature and Pressure. M. Krulfeld, M. C. Bloom and R. E. Seebold. Naval Research Laboratory. *U. S. Office of Technical Services*, PB 131775, June 1958, 14 p. $.50.

Hydrogen effusion technique for measurement of corrosion rates. Comparison with rates in static systems at this temperature showed that they are similar. Method also appears highly sensitive to local corrosion. (R11)

11-R. The Oxidation Characteristics of Several Reactor Metals. J. V. Cathcart and J. H. Frye. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/704, 1958, 21 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Behavior of V, Cb, Ta, Ti, Zr and Hf. At low temperatures they all form protective oxide films, but as the temperature is increased, a stage is reached in which there is a transition from protective to nonprotective oxidation. Electron microscopic investigations of the micro-topography of films formed on Cb have shown that the formation of small, cracked blisters in the oxide can be correlated with the transition from protective to nonprotective oxidation. (R1h; V, Cb, Ta, Ti, 2r, hf)

12-R. Radiation Effects on the Oxidation Rate and on Other Chemical Properties of Graphite. G. R. Hennig, G. J. Dienes and W. Kosiba. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1778, 1958, 12 p. (Available from U. S. Office of Technical Services, Washington, 25, D. C.) $.50.

Properties of graphite are altered by irradiation with fast particles because these produce various lattice defects such as vacancies, interstitial atoms, ions, clusters of both, and possibly dislocations. 10 ref. (R1h, 2-67; NM-K36)

13-R.* (Japanese.) Stress-Corrosion Cracking Properties of Corrosion Resisting Copper Alloy "Albrac". Rihei Kawachi and Mutsumi Okawa. *Sumitomo Metals*, v. 10, Apr. 1958, p. 105-110.

Albrac alloy tubes with different grain sizes were subjected to sinking and mercurous nitrate testing to determine the effects of grain size, plastic deformation and Si, Ti or P additions on stress-corrosion properties. Relation between percentage reduction by sinking, internal stress and resistance to cracking. Ti, Si or P addition improved resistance to

stress-corrosion. Variation of internal stress with specimen length. 9 ref. (R1d, 2-59, 2-60, 3-68; Al-b, 4-60)

14-R. A Method for Determining Corrosion Rates From Linear Polarization Data. Milton Stern. *Corrosion,* v. 14, Sept. 1958, p. 60-64.

11 ref. (R11m)

15-R. Effect of Surface Active Agents on the Formation of Boiler Scale. G. H. Ireland. *Corrosion Prevention & Control,* v. 5, Oct. 1958, p. 57-60.

Mechanism suggested for formation of the common calcite and anhydrite scales frequently found on heating and cooling surfaces of industrial plant. Types of treatment compared; advantages of specially developed organic surface active agents. Related compounds, such as antifoams, oxygen scavengers and neutralizing amines, and their applications. (R2q, R10a, R10b, T26q)

16-R. A New Problem Brings a New Primer. K. V. Hodgson. *Corrosion Technology,* v. 5, Aug. 1958, p. 260-261, 271.

Quick drying, nonpoisonous, inflammable primer protects shot blasted metal of ships and does not interfere with fabricating operations. (R10b, L26n, T22g, NM-g)

17-R. (Russian.) Texture of Iron Scale. Pt. 12. Structure Changes in Scale on Change of Atmosphere. V. I. Arkhapov, M. I. Simonova and N. A. Khatanova. *Fizika Metallov i Metallovedenie,* v. 6, no. 8, 1958, p. 444-449.

7 ref. (R2q, M27, R4; Fe)

18-R.* Stress Corrosion Cracking in Copper Alloy Weldments. Raymond T. Phebus. *American Society of Naval Engineers, Inc., Journal,* v. 70, Aug. 1958, p. 543-549.

For most metal systems stress-corrosion cracking is intergranular. However, for stainless steel, it is transgranular. Best technique for prevention is a post-fabrication anneal. 8 ref. (R1d; Cu-b, SS, 7-51)

19-R.* A Study of the Compatibility of Some Creep-Resistant Steels With Liquid Bismuth in Non-Isothermal Systems. D. W. Dawe, G. W. Parry and G. W. Wilson. *Iron and Steel Institute, Journal,* v. 190, Nov. 1958, p. 271-276.

If pure Bi alone is used, increasing the Cr content of otherwise low-alloy steels confers increasing resistance to attack by the liquid metal at temperatures up to 550° C. This can be satisfactorily explained on the basis that the protection is afforded by the presence of a thin oxide film at the steel-bismuth interface which contains increasing amounts of chromic oxide. Of the series of steels tested, the one containing 12% Cr proved to be the most resistant to attack and mass transfer, no indication of this occurrence being observed during 2500 hr. continuous testing. 5 ref. (R6m; SS-d, Bi)

20-R.* (Polish.) Corrosion Properties of Manganese Brass of the MM46 Type With Low Copper Content. Pt. 1. Jerzi Romanski and Maria Bialonczuk. *Prace Instytutow Odlewnictwa,* v. 6, no. 4, 1956, p. 15-24.

Corrosion tests of alloy composed of 47-49% Cu, 2-2.5% Mn, 2-4% Pb, 0.3-1% Fe and over 46% Zn. A solution of 5% $CuCl_2$ + 5% HCL showed that it is subject to severe dezincing. Tests showed also that Al bronze (with 9.64% Al) had a tendency to selective corrosion in the same medium. The eutectoid rich in Al was corroded, while the poorer Al phase remained intact. (R2k; Cu-n, *Mn*)

21-R.* Effect of Temperature on the Rate of Corrosion of Metals. V. V. Gerasimov and I. L. Rozenfeld. *Academy of Sciences of the USSR, Bulletin,* no. 10, 1957, p. 1192-1197.

Behavior of Cu, Fe, Ni, Mg and Zn in 1.0 N NaCl, 1.0 N NaCl + 0.1 N HCl, 1.0 N NaCl + 0.1 N NaOH, and 1.0 N NaOH, and 1.0 N NaCl + 0.1 N $KMnO_4$. 4 ref. (R6; 2-61, Cu, Fe, Ni, Mg, Zn)

22-R.* (German) Corrosive Properties of Nondrying Oils and Greases, Especially of Modern Lubricants and Preservatives. A. Bukowiecki. *Schweizer Archiv,* v. 24, Aug. 1958, p. 263-270.

Important factors: capacity of an oily substance to dissolve or emulsify water; affinity to oxygen and formation of peroxides and organic acids in aging; corrosion properties of diesel fuels and additives to oils and greases. (To be continued.) (R7e; NM-h)

23-R.* (German) Corrosion of Pressure Pipes. C. Tschappat. *Werkstoffe und Korrosion*, v. 9, Oct. 1958, p. 613-623.

Chemical and physical causes of corrosion on an underground pressure line. Changes in temperature and moisture of the surrounding air do not allow a protective film to form on the pipe surface. Cr and Cu alloy steels showed no better corrosion resistance than carbon steel. (R8, R3; ST, T26r)

24-R.* (German) Corrosion of Iron Covered by Earth. T. Markovic. *Werkstoffe und Korrosion*, v. 9, Oct. 1958, p. 623-630.

Research on the influence of water present in soil on electrochemical corrosion of iron. In a slightly acid earth of 3.5 to 4.5 pH, strong rainfall (33 in. yearly) caused corrosion while in an earth of slight basic reaction corrosion decreased with increased rainfall. Cathodic protection best. 11 ref. (R8; Fe)

25-R.* (German.) Corrosion of Tin Cans. H. Cheftel. *Werkstoffe und Korrosion*, v. 9, Oct. 1958, p. 630-636.

Corrosion on the outer surface prevented proper storing. Inner corrosion determined by three factors: composition of steel, thickness of tin coat, electrical resistance of lacquer. In the presence of acids, corrosion is promoted by high amounts of Si, P and Cu. Other influences: pH and temperature. Salts of bivalent tin act as inhibitors. 34 ref. (R-general, T29p; ST, *Sn*)

26-R. Mechanism of Corrosion. Arthur G. Keller. *Louisiana State University, Engineering Experiment Station, Bulletin* no. 62, 1958, p. 33-45.

(R7k, R7d)

28-R.* (Japanese.) Rust Prevention Techniques. Yoichi Yamamoto. *Metals (Supplement)*, v. 28, Oct. 1958, p. 1-6.

The techniques of rust prevention are classified as material considerations, environment amelioration, cathodic protection. Rust prevention technique: surface cleaning, application of preservative oil, application of vaporizing inhibitor, use of sealer, grease proofing and water proofing, desiccation. (R10)

29-R.* (Japanese.) List of Rust Inhibitors. Ichiro Shinozaki. *Metals (Supplement)*, v. 28, Oct. 1958, p. 7-14.

Surface cleaners and soluble rust preventive additives; petroleum derivatives; alkaline cleaning solutions; emulsions; electrolytic cleaning solutions; rust removers, soluble rust inhibitors. Preservatives; petrolatum oil; vaporizing inhibitors; sealers; anti-rust wrapping. (R10b)

30-R.* (Japanese.) Anti-Corrosive Inhibitors. Seiichi Fujii. *Metals (Supplement)*, v. 28, Oct. 1958, p. 19-24.

System which is composed of metal and water is considered to be thermodynamically unstable. If an inhibitor is added to the system the reaction rate will be decreased and metal is protected from corrosion. Inorganic inhibitors are classified into anodic and cathodic inhibitors. Organic inhibitors can hardly be classified. (R10b)

31-R.* (Japanese.) Storage of Metallic Goods. Kiyoshi Ichikawa. *Metals (Supplement)*, v. 28, Oct. 1958, p. 39-49.

To be considered for better shed storage are clean air, low humidity, prevention of bacterial growth and avoidance of contact between different kinds of metals. Preventive materials are inhibitors, water-proof paper, foil, plastics and temporary coatings. (R10)

32-R.* (Japanese.) Rust Prevention for Thin Steel Plates. Shigeru Yonezaki. *Metals (Supplement)*, v. 28, Oct. 1958, p. 55-58.

Moisture, HCl, H_2SO_4, and SO_2 gas, mist and dust are exhausted from factories. The best protection method is isolation (i. e., metallic or other layer formation or rust preventive oil covering). (R10; ST, 4-53)

33-R.* (Japanese.) Rust Prevention for Roller Bearings. T. Hashimoto and S. Ohki. *Metals (Supplement)*, v. 28, Oct. 1958, p. 59-66.

There are three periods of rusting—during the manufacturing process, during

transportation and during the working process. Preventive methods. (R10, T7d)

34-R.* (Japanese.) Rust Prevention for Machines. Masao Terasawa. *Metals (Supplement)*, v. 28, Oct. 1958, p. 72-76.

Avoid sprinkling the floor; keep out dust; paint the surface nearest the floor; prevent corrosive gases; use protective finish on part exposed; cover to prevent dew. (R10)

Al-Cr-Mo steel pipe undergoing field test in effort to withstand high hydrogen sulphide and carbon dioxide content of Lacq gas. (R7k; RM-m35, AY, *Al, Cr, Mo*, 4-60)

40-R. Corrosion: Here and There. F. W. Emhardt. *Industrial and Engineering Chemistry*, v. 50, Nov. 1958, p. 71A-72A.

Examples of stress-corrosion cracking. (R1d)

41-R. Corrosion of Buried Metal. *National Safety News*, v. 78, Nov. 1958, p. 30-31, 131-133.

Summary of 45 years of research by National Bureau of Standards includes causes, soils and burial procedures. (R8, 4-60)

42-R. Reduce Fuel-Gas-Line Corrosion. Larry Resen. *Oil and Gas Journal*, v. 56, Nov. 3, 1958, p. 107, 109.

Use water injection to combat ammonium chloride in cat reformer off-gas. (R7h; ST, 4-60)

43-R. (Japanese.) Test for Rust Inhibitors. Minoru Kashima. *Metals (Supplement)*, v. 28, Oct. 1958, p. 25-38.

Pulse polarizer method and change of surface potential of metal. (R11m, R10b)

44-R. (Japanese.) Notes on Corrosion Prevention. Kenji Murayama. *Metals (Supplement)*, v. 28, Oct. 1958, p. 50-54.

Corrosion preventives are sometimes corrosion accelerators. (R10b)

45-R. (Japanese.) Rust Prevention for Tap Dies. *Metals (Supplement)*, v. 28, Oct. 1958, p. 67-71.

Grease-covered wax paper wrapping and vaporizing inhibitor treating seem best. (R10b, R10e; T6r)

46-R.* Lead Alloy Anode for Cathodic Protection. J. H. Morgan. *Corrosion Technology*, v. 5, Nov. 1958, p. 347-352.

Method of operation of a corrosion product impressed current anode and the formation of a conducting oxide film on a P6 alloy. Two types of impressed current anode can be used in sea water —consumable anodes from which metal is dissolved by the anodic reaction and permanent anodes which are not affected by the anodic reaction. (R10d; Pb)

47-R.* Does Higher Fuel Efficiency Increase Corrosion. Nigel Seely. *Corrosion Technology*, v. 5, Nov. 1958, p. 355-356.

As the thermal efficiency of modern high-pressure, high-temperature oil burning plant increases, a similar increase in

corrosion results, since currently available residual fuel oils contain inorganic substances, among them V, Na and S. (R7d; ST, *V, Na, S*)

48-R.* Prevention of Scale and Corrosion With Phosphates and Filming Amines. *Corrosion Technology* v. 5, Nov. 1958, p. 363-364, 368.

Phosphate conditioning is now standard practice in boilers working at pressures above 200 psi. and has also found use at much lower pressures. Phosphates most commonly used for this treatment are sodium metaphosphate, disodium phosphate and trisodium phosphate. (R10b, R4c, ST)

49-R.* (Italian.) Study of Anodic Behavior of Titanium. Pt. 2. Characteristics of Protective Films Formed on Titanium. Bruno Rivolta. *Metallurgia Italiana,* v. 50, July 1958, p. 255-262.

Oxide films formed during 2-hr. treatments in solutions of HCl, NaCl, H_3BO_3, KOH, Na_2S, NaF, $HClO_4$, H_2SO_4, NaF plus HCl and NaF plus H_2SO_4 at 25, 50 and 65° C. and over 8 v. studied by electron diffraction and metallographic microscopy. Diffraction patterns of Ti surfaces chemically treated in solutions of concentrated HCl, acqua regia, boiling HNO_3 for 1/2 hr. and in HNO_3 at ambient temperature for 100 hr. 7 ref. (R1h, L19q; Ti-b)

50-R.* (Italian.) Evaluation of the Corrosivity of Waters. Pt. 2. Behavior of the Steel-Copper Galvanic Couple in Aqueous Salt Solutions. G. Bombara. *Metallurgia Italiana,* v. 50, July 1958, p. 263-272.

Break-point method used to study galvanic corrosion in extensive series of solutions of different concentrations. Corrosion currents and couple potentials, as well as conductivity, pH and redox potential values, measured under identical conditions of aeration and agitation. For some sulphate, chloride and fluoride solutions tests were repeated in presence of potassium bichromate to determine amount of inhibiting effect. 7 ref. (R1a, R10a, R10b; Cu, ST)

51-R.* (Polish.) Sulphurization of Silver-Copper Alloys in Boiling Sulphur. Lacjan Czerski, Stanislaw Mrowec, Krystyna Wallisch and Teodor Werber. *Archiwum Hutnictwa,* v. 3, no. 3, 1958, p. 149-159.

Sulphurization of alloys with 0.0 to 100% studied by exposing samples to the action of boiling sulphur. For alloys rich in Cu, the plotted sulphurization-time graphs are parabolas, for alloys rich in Ag straight lines result. The scale is composed of the sulphides of both metals with a larger amount of Ag on the contact surface of scale and sulphur and a larger amount of Cu on the contact surface of scale and alloy. 14 ref. (R7k; Ag, Cu)

52-R.* Basic Research Into the Corrosion of Steel in Salt Water. *Corrosion Technology,* v. 5, Sept. 1958, p. 295-296.

National Bureau of Standards study of electrical potentials needed to protect steel cathodically from corrosion in salt water. Optimum protection achieved when specimens were held at -0.77 volt with reference to a saturated calomel electrode. (R10d, R4b; ST)

53-R.* Stress-Corrosion Cracking of Austenitic Stainless Steels With Applied E. M. F. J. G. Hines and T. P. Hoar. *Journal of Applied Chemistry,* v. 8, Nov. 1958, 764-776.

Behavior of Cr-Ni austenitic stainless in 42% aqueous magnesium chloride solution at 150-154°, saturated with air, was studied under conditions of cathodic or anodic treatment of the metal during the induction period prior to crack initiation and/or during crack propagation. Mild cathodic polarization delays the onset of cracking and fracture, the time to fracure increasing with increasing degree of polarization. 19 ref. (R1d; SS-e)

54-R.* (French.) Investigation of the Stress-Corrosion of Mild Steels in Natural Environments. A. Hache. *Revue de Metallurgie,* v. 55, July 1958, p. 656-678.

Eight hundred specimens representing five grades of steel were tested over a period of six years in industrial, rural and marine atmospheres and by immersion in fresh, salt and sea waters. In none of these media and on none of the steels was corrosion aggravated by application of stress even up to elastic limit of material. 25 ref. (R1d, R3, R4; CN)

55-R.* (German.) Internal Oxidation of Copper-Silicon Alloys. W. Gruhl and S. von Engelmann. *Metall,* v. 12, Nov. 1958, p. 985-989.

Increased amount of free Si causes a strong increase of oxidation speed within the range beneath 200° C. (R2s; Cu-b, *Si*)

56-R.* (German.) Co-Operative Research on Corrosion Testing Methods. Pt. 2. W. Wiederholt. *Metalloberflache*, v. 12, Nov. 1958, p. 337-347.

Salt spray tests and exposure to industrial atmosphere. (R11j, R11q)

57-R. (German.) Corrosion Protection of Ship Bodies by Anodes. A. Farchadow, W Negrejew, M. Nurijew, B. Samanow, B. Kjasimow and L. Rybakow. *Schiffbautechnik*, v. 8, Aug. 1958, p. 416-418.

In experiments with painted and unpainted steel plates in sea water, the first behaved as anodes. To protect a ship against corrosion, the use of cast iron anodes of a high Si content, fastened to the ship body, is recommended. When body and anodes are exposed to a current density of 1.5 to 5 milliamp. per sq. dm. sufficient corrosion protection is established. (R10d, T22g; ST)

58-R.* (Russian.) Passivity of Iron in Hot Alkaline Solution. A. M. Sukhotin and K. M. Kartashova. *Zhurnal Phizicheskoi Khimii*, v. 32, Sept. 1958, p. 2068-2072.

The substance of the passivating film on iron in a 10 N sodium hydroxide solution of 80° C., as in acid solutions, is magnetic iron oxide. In system studied, magnetic film may attain considerable thickness but the passivating action is connected only with a very thin layer directly adhering to the metal surface. (R10c; Fe)

59-R. Criteria for Adequate Cathodic Protection of Coated, Buried or Submerged Steel Pipe Lines and Similar Steel Structures. *Corrosion*, v. 14, Dec. 1958, p. 561t.

It is recommended that a protective electric current be applied to the structure in an amount sufficient to maintain its external surface, at every point, negative by at least 0.85 v. to a copper-saturated copper sulphate half-cell in the structure's immediate proximity. (R10d; T26r, ST)

60-R. Corrosion of Refinery Equipment During Acid Cleaning. K. R. Walston and A. Dravnieks. *Corrosion*, v. 14, Dec. 1958, p. 571t-579t.

Corrosion rate increases exponentially with temperature. Maximum allowable temperature will vary depending upon the inhibitor. Around 170° F. is a generally accepted maximum for carbon steel equipment; 125° F. is the accepted limit for cast iron. 11 ref. (R7a, T29n, 2-61; CN, CI)

61-R. (Russian.) Electrochemical Corrosion of Metals. A. I. Krasilshchikov. *Khimicheskaya Nauka i Promyshlenost*, v. 3, no. 4, 1958, p. 476-482.

(R3)

62-R. (Russian.) Passivation of Metals. Ya. M. Kolotyrkin and G. M. Florianovich. *Khimicheskaya Nauka i Promyshlenost*, v. 3, no. 4, 1958, p. 483-491.

Mechanics of passivation and nature of passivation state. (R10c)

63-R. (Russian.) Corrosion Inhibitors. I. L. Rosenfeld and V. P. Persiantseva. *Khimicheskaya Nauka i Promyshlenost*, v. 3, no. 4, 1958, p. 500-504.

(R10b)

64-R.* Failure of Type 316 Stainless Steel Autoclave Components. J. P. Hugo and L. G. Nel. *Corrosion*, v. 14, Dec. 1958, p. 553t-556t.

Failure of components situated in vapor phase was attributed to stress-corrosion cracking. The active corrodant was probably chloride while the stresses that initiated failure were predominantly residual. Components suffered some degree of cold working prior to installation, the latter probably resulting from machining or fabrication. Failure was in no way due to the use at any time of excessive operating temperatures or pressures. 12 ref. (R1d, X1a; SS)

65-R.* Corrosion Properties of Tantalum, Columbium, Molybdenum and Tungsten. Clifford A. Hampel. *Corrosion*, v. 14, Dec. 1958, p. 557t-560t.

Ta, the most resistant, is inert to all acids except HF and free SO_3 at temperatures usually encountered in industrial processes. It is attacked by strong alkalis at room temperature. Cb in general is less resistant than Ta in all media. Mo shows good resistance to nonoxidizing acids and

to alkaline solutions over a wide range of temperatures and concentrations and is attacked only slightly by hydrofluoric acid. Resistance of W to acid corrosion is equal to or better than that of Mo. (R6, R7; Ta, Cb, Mo, W)

66-R.* A Polarographic Study of the Corrosion of Iron and Some Ferrous Alloys by Sulfur Dioxide. F. J. Bowen and A. H. Gropp. *Corrosion,* v. 14, Dec. 1958, p. 578t-582t.

Tests on one pure Fe and seven low-alloy steels exposed to sulphur dioxide over 12-hr. periods. Rate of consumption of sulphur dioxide by various test samples. A corrosion mechanism is outlined involving the reduction of sulphurous acid by Fe to give the sulphide. 14 ref. (R11m, R7k; Fe)

67-R.* Chloride Stress Corrosion Cracking of Austenitic Stainless Steel-Effect of Temperature and pH. L. R. Scharfstein and W. F. Brindley. *Corrosion,* v. 14, Dec. 1958, p. 588t-592t.

Overstressed U-bends of Types 304 and 347 stainless steels were exposed to water containing chloride ions. Stress-corrosion cracking in the range of 165 to 200° F. is less severe than at 500 F. and specific conditions are required for corrosion cracking to occur at all. 10 ref. (R1d; SS-e)

68-R.* Effect of Halogen Ions on the Anodic Passivation of 13 Cr Stainless Steels. Namio Ohtani and Hideo Sugawara. *Electrochemical Society of Japan, Journal,* v. 26, no. 4-6, 1958, p. E-63-E-65.

Passiviation dependent on X^-/OH^-; the effect decreases with temperature rise of solution, difference in Cl^- and Br^- from that of F^- and I^-. (R10c; SS, EG-k)

69-R.* Less Oxygen = Less Corrosion. L. C. Case and W. C. Whiteside. *Oil and Gas Journal,* v. 56, Oct. 20, 1958, p. 74-76.

O_2 in brines affects corrosion of steel. An open water-flood system equipped with aerating tower and blower, settling basin and filters, gives good results. 7 ref. (R4h, R11p; ST)

70-R.* The Prevention of Air Heater Corrosion. L. E. Hardy. *Steam Engineer,* v. 28, Oct. 1958, p. 20, 21.

Preventing acid corrosion at low-temperature zone while firing oils high in sulphur content. Solution is to raise the metal temperature of the heater elements at the cold end. (R6g, W13a)

71-R. Corrosion of Zirconium Alloys in 900° F. Steam. J. Paul Pemsler. Nuclear Metals Inc. U. S. Atomic Energy Commission, NMI-1208, Aug. 18, 1958, 24 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Zircaloy-2 and Zircaloy-3 have poor resistance at 900° F. The presence of Sn is highly detrimental to corrosion resistance. Additions of Ni, Cr and, to a lesser extent Fe, extend the life of Zr-base alloys. Quenching from the beta phase impairs the corrosion resistance of Ni and Cr alloys and extends the life of Fe alloys and the Zircaloys. (R4d; Zr-b)

Effect of dissolved gases, temperature, pH, flow rate, inhibitors, suspended matter, bacteria, concentration of various souble metal cations and common anions on the corrosion of iron and steel by water. 24 ref. (R4; ST, 4-60)

108-R.* Cathodic Protection of Well Casing. Y. W. Titterington. Paper from "Second Annual Appalachian Underground

Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 302-312.

Causes of external corrosion of oil well casings. Method of investigation, current requirements for cathodic protection; application of cathodic protection. 4 ref. (R10d, T28p; ST)

109-R.* Electrolysis Reverse Current Switches. R. M. Keller. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 313-318.

Switches to interrupt reverse current in underground systems bonded to d-c. power system. (R10d, R8, T1d)

110-R.* (English.) Corrosion Resistance of Stainless Steel. I. Cornea and S. Zamirca. *Revue de Metallurgie (Bucharest)*, v. 3, no. 2, 1958, p. 29-39.

Influence of heat treatment upon oxidation at high temperatures. Decrease of ferrite content leads to decrease in corrosion. Increase of grain size increases corrosion. Quenching temperature of 1100° C. recommended, but for short periods only. 5 ref. (R-general, 2-60, 2-61, 2-64, 3-71; SS)

111-R.* (French.) Corrosion of Pure Aluminum in Water at Elevated Temperatures. Jean Herenguel and Pierre Lelong. *Revue de l'Aluminium*, no. 258, Oct. 1958, p. 991-998.

Three forms of attack: (1) formation of surface layer; (2) intergranular attack; (3) local impingment. 7 ref. (R4, 2-62; Al-a)

112-R.* (Japanese.) Effects of Iron and Silicon on the Blackening of Aluminum. Yoshino Yamasaki, Hachiro Onbe, Shoji Nakamura and Hiromitu Harimoto. *Metal Finishing Society of Japan, Journal*, v. 9, Nov. 1958, p. 422-426.

Low-Si Al alloy shows slightly lighter color than with low-Fe Al alloy, but in higher Si alloy the differences in the degree of blackening are little. (R4, 2-60; Al-b, *Fe, Si*)

113-R.* Effect of Inhibitors of the Corrosion of Iron on the Air-Formed Film. P. Hancock and J. E. O. Mayne. *Chemical Society, Journal*, Nov. 1958, p. 4172-4175.

Effect of sodium benzoate, acetate, borate, carbonate and hydroxide on air-formed film on pickled mild steel, pickled iron or iron reduced in hydrogen was determined electrometrically. (R6g, R10b; CN, Fe)

114-R.* Solid Metal—Liquid Metal Reactions in Bismuth and Sodium. John R. Weeks and David H. Gurinsky. Paper from "Liquid Metals and Solidification". American Society for Metals, 1958, p. 106-163.

Dissolution of a solid metal into a liquid; redeposition of the solid; effect of oxygen in the melt; alloying; dissimilar metals in contact with melt and metallic additives to liquid metal on the rate of corrosion or mass transfer of iron, steel and other metals in liquid Bi. 44 ref. (R2a, R10b, N12, 2-60; ST, Fe, Bi-a, 14-60)

115-R.* (French.) Effect of Carbon on Oxidation of Zirconium. G. Chauvin, B. Roudouresques, H. Coriou and J. Hure. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 939-952.

The better the carbide phase is distributed, the higher the oxidation resistance. 13 ref. (R1h, 2-60, 2-61, 3-67; Zr-a, *C*)

116-R.* (French.) Corrosion Resistance of Fe-Ni Aluminum Alloys to Water at High Temperature. H. Coriou, L. Grall, J. Hure and A. Roux. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 953-967.

With alloys of more than 0.5% Fe and Ni, the dispersion of intermetallic compounds should be as great as possible. On the surface, three layers are formed by the corrosion products, the two upper of which scale off easily while the lower layer is adherent. 4 ref. (R4e, 2-60, 2-62; Al-b, *Fe, Ni*)

117-R.* (French.) Corrosion Resistance of Aluminum-Iron Alloys to Water at High Temperatures. H. Coriou, L. Grall, A. Hauptmann and J. Hure. *Revue de Metallurgie*, v. 55, Oct. 1958, p. 968-975.

Corrosion resistance increased by the Fe which is able to form compounds with the corrosion-promoting Si. 8 ref. (R4e, 2-60, 2-62; Al-b, *Fe, Si*)

118-R. Corrosion Problems With Pressure Vessels. Henry Allen. *Corrosion Technology*, v. 5, Dec. 1958, p. 390, 397.

Check systems, corrosion control techniques. (R10g, T26q)

119-R. Corrosion Prevention in Automobile Bodies. T. P. Hoar. *Current Engineering Practice*, v. 1, Oct. 1958, p. 47-53.

(R-general, T21a)

120-R. Corrosion of Mild Steel in Aqueous Monoethanolamine. H. R. Froning and J. H. Jones. *Industrial and Engineering Chemistry*, v. 50, Dec. 1958, p. 1737-1738. 27 ref. (R7f; CN)

121-R. How Cathodic Protection in Breweries Saves Money in Corrosion Prevention. John A. Michelson and Gerard L. Power. *Modern Brewery Age*, v. 58, Dec. 1958, p. 42, 45-46. (R10d, T29p)

122-R. Underground Corrosion—Cause, Effect, Cure. *Water Works Engineering*, v. 111, Dec. 1958, p. 1122-1124. Experimental data for plain ferrous pipe, Cu, brass and Pb alloys in relation to cathodic protection. (R8, R10d, 4-60, ST, CI, Cu-n, Pb-b)

123-R. Corrosion. W. F. Fair, Jr. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 5-7. General problem of corrosion control. (R-general)

124-R. Electrochemical Principles. C. M. Rutter, Jr. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 99-121. Elements of electrochemistry, mechanism of corrosion, electromotive series, galvanic series, cells of common metals and alloys. Current reversal and cathodic protection. (R1a, R10d)

125-R. Coal Tar Tapes. J. B. Casey. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 166. (R10e)

126-R. Pressure Sensitive Tapes. George F. Roberts. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct. 1957, p. 167-170. (R10e)

127-R. Corrosion Control for Gas Distribution Systems. J. J. Meany, Jr. Paper from "Second Annual Appalachian Underground Corrosion Short Course, Proceedings". West Virginia University, Bulletin, Series 58, no. 4-1, Oct.1957, p. 318-324. (R10d, R10e; ST, 4-60)

128-R.* Aluminum-Bronze Alloy Mainstay in Fight Against Chloride Corrosion. Gordon Weyermuller and Earl H. Miller. *Chemical Processing*, v. 21, Dec. 1 58, p. 36-37. Ampco metal Grade 8 does not stress crack; used for process piping and seven large crystallizers. (R6; Cu-s, *Al*, 4-60)

129-R.* Protection of Magnesium Alloys. W. F. Higgins. *Chemistry & Industry*, no. 49, Dec. 6, 1958, p. 1604-1611. Corrosion rates of A8, AZ91, Z5Z, ZRE1, RZ5 and TZb Mg alloys in relation to chromating, hard anodizing, H.A.E. process, paints and surface sealing resins. (R-general, L14c, L19, L17, L26; Mg-b)

130-R.* Corrosion Protection. Stephen Y. Scott. *Iron & Steel*, v. 31, Dec. 1958, p. 589-592. Al sprayed coatings at the National Steelworks, Aviles, Spain. Parts sprayed include gasholders, gas mains and blast furnaces. Results of accelerated corrosion tests are given from the point of view of adherence, porosity and rust staining. (R-general, L23; Al, 8-67)

131-R.* The Mechanism of Cavitation. E. G. Richardson. *Wear*, v. 2, Nov. 1958, p. 97-106. Measurements of the number and size of the gaseous nuclei which exist in water and other liquids and which give rise to cavitation and consequent erosion in hydraulic machinery. The nuclei may be removed by long standing or by application of pressure. Nuclei are detected by the absorption of an acoustic signal which they produce in a "reverberation vessel" containing the liquid. 4 ref. (R2m)

132-R.* (German.) Determination of Causes of Corrosion by Electrochemical Measurements. H. Schmecken. *Werkstoffe und Korrosion*, v. 9, Nov. 1958, p. 690-693. Semilogarithmic plots of current density versus voltage disclose nature and magnitude of corrosion currents. In mild steel, corrosion sensitivity depends strongly on chemical composition, showing marked improvement in high-carbon steels. A 18% Cr, 10.5% Ni stainless steel in commercial phosphoric acid bath generates static potentials which cause pitting of contaminated surfaces. (R11m; CN, SS)

133-R.* (German.) Causes of Stress-Corrosion Cracking in Nonferrous Metals and Steels. Ludwig Graf. *Werkstoffe und Korrosion,* v. 9, Nov. 1958, p. 693-698.

Reasons for extremely localized attack on intercrystalline grain boundaries and the effect of tensile stress on stress-corrosion of steel, Cu and Cu-Zn and Cu-Au. Tensile stress increases activity of solid solution in a state of plastic deformation, but does not cause localization of the intergranular attack. Latter effect appears in homogeneous solid solutions in the absence of stress; is traced to increased reactivity of obtuse-angled grain boundaries due to solid solution formation. (R1d; Cu-b, *Au, Zn,* ST)

134-R.* (German.) Galvanic Corrosion of Cast Iron and Brass in Acids in the Absence and Presence of Inhibitors. Willibald Machu and M. G. Gouad. *Werkstoffe und Korrosion,* v. 9, Nov. 1958, p. 699-715.

Galvanic corrosion of cast iron and brass in H_2SO_4, H_3PO_4, $HCl + H_2SO_4$, $HCl + H_3PO_4$, $H_2SO_4 + H_3PO_4$, with and without inhibitors. Galvanic corrosion independent of that caused by local cells, amounts usually to about 1% of total. Inhibitors affect local cell corrosion much more, increasing proportional effect of galvanic corrosion. Mixtures of inhibitors give better protection. Inhibition occurs at both anode and cathode of corrosion cell. 11 ref. (R1a, R1b, R6g; Cu-n, CI)

135-R.* (Russian.) Electro-Capillary Measurements in Investigation of Inhibitors of Acid Corrosion. L. I. Antropov, V. P. Grigorev and A. T. Petrenko. *Zhurnal Prikladnoi Khimii,* v. 31, Oct. 1958, p. 1497-1503.

Effectiveness of inhibitors of acid corrosion is linked to the lowering of surface tension. Reliability of the inhibitor's action increases with the increase of the surface activity. (R10b, P13h)

136-R.* Investigation of the Black Solid Formed on Reaction of Uranium Metal With Hydrochloric Acid. R. C. Young. *Journal of Inorganic & Nuclear Chemistry,* v. 7, Nov. 1958, p. 418-420.

Oxidation state of U in the black solid formed by reaction of U metal with 6 *N* HCl in an atmosphere of nitrogen found to be 2.7±0.1 by direct analysis. Only a trace of chloride was found in the solid. An oxidation state of 2.67 corresponds to an oxide, U_3O_4. X-ray analysis showed no U metal present. (R6g, R1h; U)

137-R. (English.) Products of the Corrosion of Steel in Alkaline Sulphide Solutions. Eino Uusitalo. *Suomen Kemistilehti,* v. 31, no. 11, 1958, p. 367-371.

Fe and S contents were found to vary between limits that correspond to the formulas Fe_9S_8 and FeS_2. According to the X-ray patterns the corrosion products consisted of troilite (FeS) or pyrrhotite ($Fe_{0.875}S$), and pyrite (FeS_2). The formation of kansite, Fe_9S_8, is also probable in the early stages of corrosion. 15 ref. (R6j; ST)

138-R.* (Polish.) Prolonged Corrosion of Aluminum Alloys in Floating Parts. M. Orman. *Prace Instytutow Ministerstwa Hutnictwa,* v. 9, no. 4, 1957, p. 167-171.

Light alloys affected by sea water or sea atmosphere, may also develop intercrystalline corrosion as well as surface corrosion. Addition of Cr, Ti or V to the Al-Mg and Al-Mn alloys is proposed. 3 ref. (R4b, 2-60; Al-b, *Cr, Ti, V*)

139-R. Consider Nonoxidative Corrosion. Robert V. Jelinek. *Chemical Engineering,* v. 65, Dec. 29, 1958, p. 56-60.

Solubility and solution rates explain intergranular penetration and alloying of materials in corrosive attack by liquid metals. (R6m)

140-R. (German.) Records and Protection Against Corrosion by Paints. K. A. van Oeteren-Panhauser. *Werkstoffe und Korrosion,* v. 9, Nov. 1958, p. 681-686.

Standard testing procedures and records. (R11, S22; NM-g30)

141-R.* Effects of Local Boiling on Corrosion and Crud Deposition of Zircaloy Surfaces. Richard T. Esper, Walter E. Hopkins, Jr., Clarence Jacklin and James H. Phillips. *American Power Conference, Proceedings,* v. 20, Mar. 26-28, 1958, p. 697-708.

Within a pressurized-water reactor, local boiling had no detrimental effects on Zircaloy-2. 4 ref. (R4c, T11p)

142-R.* Corrosion. D. G. Anderson. *Journal of Electronics and Control,* v. 5, Nov. 1958, p. 443-456.

General survey of main causes of corrosion in industry; more important preventive methods. (R-general, R10)

143-R. (Book.) Second Annual Appalachian Underground Corrosion Short Course, Proceedings. R. E. Hanna, Jr., Ed. *West Virginia University, Bulletin,* Series 58, no. 4-1, Oct. 1957, 350 p.

Papers on practical and theoretical aspects of the causes of underground metallic corrosion. Instrumentation, corrosion surveys, cathodic protection, pipe coatings and miscellaneous methods of corrosion control. Papers abstracted separately. (R-general, R8, R10d, L-26)

144-R. (Translation.) Passivation of Silver by Argalin Process. H. W. Dettner. *Industrial Finishing*, v. 10, Dec. 1958, p. 43-44. (From *Metalloberflaeche*, v. 12, no. 7, p. 197-199.)

See item 602-R, 1958. (R10c; Ag)

145-R. (Translation-BISI, 1082.) The Morphology of Precipitates in Titanium Stabilized Steels. V. Cihal and J. Jezek. *Hutnicke Listy*, v. 11, Mar. 1956, p. 151-154.

See item 238-R, 1956. (R2, N7; SS)

146-R. (Translation—Brutcher, 3831.) Stress Corrosion of Austenitic Stainless Steels in Low-Pressure Steam and in Hot Water. S. Brennert and H. Nathorst. *Jernkontorets Annaler*, v. 140, no. 11, 1956, p. 839-853.

Stresses in sheet samples; effect of type of water; time required for stress-corrosion cracking to start; effect of oxygen; effect of salts dissolved in hot water. (R1d, R4; SS-e)

147-R.* (Russian.) Effect of Nickel on the Electrochemical and Corrosive Behavior of Steel. G. M. Florianovich, Ya. M. Kolotyrkin and N. K. Smirnova. *Doklady Akademii Nauk SSSR*, v. 120, no. 4, 1958, p. 845-848.

Degree of passivation of steel surface of a given composition is a function of its potential. Changing chemical composition may bring a substantial change in the degree of passivation at a given potential. (R10c, 2-60; ST, *Ni*)

148-R.* (Russian.) Passivation of Iron in Acid Solutions. Pt. 2. A. M. Sukhomin and K. M. Kartashova. *Zhurnal Fyzicheskoi Khimii Akademii Nauk SSSR*, v. 32, July 1958, p. 1633-1637.

Comparison of the kinetic characteristic of the cathodic reduction of magnetite and of the passivating film substance on irons. (R10c; Fe)

149-R.* (Russian.) Thickness of Oxidizing Films on Some Metals From Data of Electronographic and Optical Studies. V. V. Andreeva and H. S. Shimakov. *Zhurnal Fyzicheskoi Khimii Akademii Nauk SSSR*, v. 32, July 1958, p. 1671-1672.

Oxidizing film, which is formed as soon as Al is in contact with air, is of the order 21-22A. at 150° F. Iron has an oxide film of 15-17 A. Pt at room temperature has no oxidizing film measured electronographically but has a film thickness of 24 A. when measured optically at normal atmospheric pressure. (R1h, Al, Fe, Pt)

150-R.* (Russian.) Anticorrosion Effect of Sodium Nitrate on Iron. N. A. Shishkov. *Zhurnal Fizicheskoi Khimii*, v. 32, Oct. 1958, p. 2281-2286.

Electron diffraction studies show that sodium nitrate crystals have a tendency to orient with their axis normal to the surface. Similar orientation capacity is possessed by iron hydroxide. (R10b; Fe)

151-R.* (Russian.) Corrosion of Stainless Steels in Region of Contact With Nonmetallic Substances. I. B. Ulanovskii and Yu. M. Korovin. *Zhurnal Prikladnoi Khimii*, v. 31, no. 9, 1958, p. 1366-1370.

One of the basic causes of failure is the activation of metal surface, because of the lowered value of pH. Rubber, Plexiglass and Textolite tested; medium was sea water at 15 to 16° C. (R4b, R7p; SS)

152-R. Measuring Corrosion by the Electrical Conductance Test Method. Eric Ford. *Corrosion Technology*, v. 5, Oct. 1958, p. 330-331.

(R11a, 1-68)

153-R. Retardation of Copper Corrosion by Light. *Corrosion Technology*, v. 5, Oct. 1958, p. 331.

(R10a; Cu, 2-67)

154-R. Evaluating Rust Prevention Greases: American Experience. Eric Ford. *Corrosion Technology*, v. 5, Oct. 1958, p. 332.

Corrosion due to condensation during period of idleness demanded tests which introduced water into lubricated anti-friction bearing. (R11k, R10f, T24b; NM-h)

155-R. (Russian.) Safeguarding Cable Joints Against Corrosion by Stray Current. L. D. Rasumov. *Electrosvyaz*, no. 10, 1958, p. 71-73.

(R1j)

156-R.* Corrosion of Valve Seat Ring Results in Flexible Metal. J. E. Prior. *Corrosion*, v. 15, Jan. 1959, p. 17.

Failure occurred in a Type-316 stainless steel valve seat ring after nine months' service in a water treating system. The ring had suffered intergranular corrosion after exposure to dilute sulphuric acid, which was presumably caused by not being given the normal homogenizing heat treatment required to properly diffuse the alloying elements throughout the casting. (R6g, 2-64; SS)

157-R.* Corrosion of Steel Weldments. J. U. MacEwan and H. H. Yates. *Corrosion*, v. 15, Jan. 1959, p. 18-22.

Weldments were subjected to 12 months' alternate immersion in 3% sodium chloride solution. Weight loss was more dependent on the type of steel than the nature of the weld, but severity of corrosion in the weld region was affected by both factors. Apparauts was designed to measure short circuit current between exposed surfaces of parent metal and weld metal. 31 ref. (R11g; ST, 7-51)

158-R.* Observations on the Mechanisms and Kinetics of Aqueous Aluminum Corrosion. Pt. 1. Role of the Corrosion Product Film in the Uniform Aqeuous Corrosion of Aluminum. V. H. Troutner. *Corrosion*, v. 15, Jan. 1959, p. 25-28.

Experiments include barrier film measurements, effect of an applied potential on corroding Al, effect of various ions and combinations of ions in dilute aqueous solutions on the uniform corrosion, X-ray diffraction studies of corrosion product films, and comparisons between air oxidation and aqueous corrosion studies. 6 ref. (R4, M22g; Al-b)

159-R.* Observations on the Mechanisms and Kinetics of Aqueous Aluminum Corrosion. Pt. 2. Kinetics of Aqueous Aluminum Corrosion. R. L. Dillon. *Corrosion*, v. 15, Jan. 1959, p. 29-32.

Corrosion of Al in high temperature deionized water in the range of 100 to 363° C. Data indicate Al corrosion successively has a logarithmic, a parabolic and a linear dependence on time as the temperature increases. Certain similarities exist between air and water oxidation. The effect of alloying additions is negligible. 13 ref. (R4, 3-67, 2-61, Al-b)

160-R.* A Critical Analysis of Pitting Corrosion. N. D. Greene and M. G. Fontana. *Corrosion*, v. 15, Jan. 1959, p. 41-47.

Pitting corrosion behavior can be related to the particular cathodic reaction which occurs during attack. Pitting in systems where 0 reduction is the major cathodic reaction demonstrates marked differences from attack in systems in which metal ion reduction is the controlling cathodic reaction. Pit sites in stainless steel appear to be almost randomly distributed in relation to metal surface structure, with some preference for grain and twin boundaries. 95 ref. (R2j; SS)

161-R. An Electrochemical Study of Pitting Corrosion in Stainless Steels. Pt. 2. Polarization Measurements. N. D. Greene and M. G. Fontana. *Corrosion*, v. 15, Jan. 1959, p. 55-60.

Artificial pit technique used to study the electrochemistry of pitting corrosion of 18/8 stainless steel in ferric chloride solutions. Pitting corrosion was proved to be a highly complex, time-dependent phenomenon. A new concept of electrochemical action during pitting, based on the mixed potential theory, is proposed. 17 ref. (R2j; SS)

162-R. Recovery of Graphitically Embrittled Nickel. *Corrosion*, v. 15, Jan. 1959, p. 112.

Heat treatment at 1800° F. is discussed as a means of restoring almost full ductility to Ni tubing that had been graphitically embrittled. Corrosion tests indicate that the Ni that is heat treated can be used subsequently for other applications in which embrittling temperatures are not encountered. (R2h, 2-64; Ni, 4-60)

163-R.* Steels for the Petroleum Industry. Pt. 1. A Comparison of British and American Qualities. F. A. Kirk and J. Williams. *Corrosion Technology*, v. 5, Oct. 1958, p. 316-318.

Compares corrosion and heat resisting steels. Advancement in design was discovery of effects of Cr upon scaling and corrosion resistance. (To be continued.) (R7k, R6, T29n; ST, Cr, 15-55)

164-R.* Mechanics of Corrosion. H. E. LaBour. *Corrosion Technology*, v. 5, Oct. 1958, p. 320-322.

Identifies and classifies different types of corrosion through illustrations showing mechanical effect on corroded parts of chemical equipment. Uses pump case castings to show dissimilar metals, gas concentration, defective casting, intercrystalline and general corrosion and erosion. (R-general, T29m; Fe, Cr, 2-61, 2-66, 2-74, 9-69)

165-R.* High-Temperature Hydrogen Sulphide Corrosion in Refinery Experience. P. W. Sherwood. *Corrosion Technology*, v. 5, Oct. 1958, p. 326-329.

Factors governing rate of corrosion. Protection against H_2S attack may be provided by using Cr-Ni steels or Al coating, or by adequate desulphurization of feedstock and recycle gas. 6 ref. (R6g, T29n; ST, Cr, Ni, Al, 8-62, 17-57)

166-R.* Some Observations on the Mechanism of Inhibition. A. C. Makoides. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 7-9.

Thiocyanic and citric acids are efficient inhibitors of dissolution of Fe in dilute HNO_3 solutions. Inhibition does not generally involve poisoning of the combination reaction between adsorbed H atoms. Observations on the kinetics of dissolution of Fe in dilute HNO_3 solutions. 12 ref. (R10b; Fe)

167-R.* Oxidation of Titanium, Zirconium and Hafnium. G. R. Wallwork and A. E. Jenkins. *Electrochemical Society, Journal*, v. 106, Jan. 1959, p. 10-14.

Metallographic study shows that alterations in the rate equations relating to oxidation may be associated with the establishment of 0 diffusion gradients in surface layers of the metal. Changes in oxidation behavior are related to observed alterations in the form of these gradients. (R1h; Ti, Zr, Hf)

168-R.* Growth and Scaling in S. G. Iron. Influence of Silicon. R. J. Maitland and I. C. H. Hughes. *Iron and Steel*, v. 31, Dec. 1958, p. 573-577.

Scaling behavior of nodular graphite irons having from 1.2 to 5.7% Si at temperatures within the 650° to 1000° C. range. Both growth and scaling proceed relatively slowly and are inhibited by increasing Si contents at temperatures below the austenite transformation range. When the critical temperature is exceeded, growth and scaling become excessive and in this field Si seems to promote growth and scaling. 15 ref. (R2q, 2-60; CI-r, *Si*)

169-R.* (Russian.) Electrochemical Properties and Corrosion of Titanium in Sulphuric Acid. V. V. Audreeva and V. I. Kozarin. *Doklady Akademii Nauk SSSR*, v. 121, no. 5, 1958, p. 873.

Dependence of speed of Ti corrosion on H_2SO_4 concentration at 40° studied in 40, 75 and 80% solutions. At 75% Ti dissolves by deoxidation of H_2SO_4 to H_2S and free sulphur and at 80% with separation of SO_4 and free sulphur. The oxidation-deoxidation process proceeds very rapidly at 75% so that concentrated H_2SO_4 acts as strong oxidizer and the ions of trivalent Ti as energetic deoxidizers. 4 ref. (R6g; Ti-b)

170-R.* (Russian.) High-Temperature Alloys of Platinum With Rhodium, Praseodymium, Aluminum and Chromium. I. I. Kornilov and R. S. Polyakova. *Zhurnal Neorganicheskoi Khimii*, v. 3, no. 11, 1958, p. 2554-2561.

Oxidizing characteristic expressed in diagrams of composition-heat resistance which show functional relation between oxidation and composition in the systems Pt-Rh, Pt-Pr, Pt-Al and Pt-Ch. (R1h, 1-60; Pt-b, Al, Cr, Pr, Rh)

171-R.* (French.) Growth and Structure of Oxide Films on Iron at Elevated Temperatures. J. Moreau and M. Cagnet. *Revue de Metallurgie*, v. 55, Nov. 1958, p. 1091-1109.

Mechanical action between the oxides and Fe during growth and cooling led to deformations and fissures in the oxides. 21 ref. (R1h, 2-62; Fe)

172-R. An Electrochemical Study of Pitting Corrosion in Stainless Steels. Pt. 1. Pit Growth. N. D. Greene and M. G. Fontana. *Corrosion*, v. 15, Jan. 1959, p. 48-54.

Effects of solution composition, agitation, atmosphere, corrosion current interruption, chloride ion concentration and inhibitor additions in 18-8 stainless steel. Pit interaction during pit growth is determined and autocatalytic nature of pitting verified. 24 ref. (R2j; SS)

173-R. Underground Corrosion—a Summary of 45 Years of NBS Research. *Corrosion*, v. 15, Jan. 1959, p. 107-110.

Results of burial tests on metals, coatings and wrappings conducted by National Bureau of Standards. Data for plain ferrous pipe materials, openhearth iron and steel, hand-puddled and mechanically puddled wrought iron, Bessemer steel, plain carbon steel, pit cast and centrifugally cast iron. Corrosive resistance of Cu, Pb, brass and Zn. 9 ref. (R8; 4-60, ST, CI, Cu-b, Cu-n, Pb, Zn)

174-R. High Temperature Corrosion Product Films on Aluminum. V. H. Troutner. *Corrosion*, v. 15, Jan. 1959, p. 23-24.

Preparation of electron microscope replicas of the surface of corrosion product

adjacent to the metal. Electron micrographs illustrate the corrosion product films formed on samples of 1245 and X-8001 alloys during various stages of corrosion in high-purity water and in corrosion inhibited systems. (R4e, M21e, Al-b)

175-R.* Formation and Properties of Passive Films on Iron. Morris Cohen. *Canadian Journal of Chemistry*, v. 37, 1959, p. 286-291.

A unified mechanism for the formation of passive films on Fe in aqueous solutions together with the effects of water, O, and oxidizing and nonoxidizing ions. The gamma-Fe_2O_3 film is formed first by oxidation of water-formed magnetite, while further thickening of the film occurs by oxidation of diffusing Fe^{++} ion at the water surface of the oxide film. 15 ref. (R10c; Fe, 14-62)

176-R.* Chromium Plating in Relation to the Corrosion Resistance of Nickel-Chromium Deposits. Alan Smart. *Electroplating and Metal Finishing*, v. 12, Jan. 1959, p. 3-10.

Mechanism of failure of Cr-plated Ni coatings. Atmospheric exposure tests of specimens prepared by dull and bright Ni processes. Effect of Cr plating conditions on porosity and cracking of plate and relation to corrosion resistance. Optimum Cr plating conditions. Influence of physical condition of Ni on corrosion pattern. 6 ref. (R3n, R2j, L17c; ST, Zn-b)

177-R.* Investigation of the Variables Affecting the Corrosion of Copper. W. D. Robertson, V. F. Nole, W. H. Davenport and F. P. Talboom, Jr. *Electrochemical Society, Journal*, v. 105, Oct. 1958, p. 569-573.

In the presence of excess O the corrosion rate of Cu is a linear function for each of three anions ($SO_4^=$, Cl^-, $C_2H_3O_2^-$). The rate is not a simple function of anion concentration and the concentration dependence varies with pH. The effect of CO is negligible. 9 ref. (R1b; Cu)

178-R.* Galvanic Corrosion. Pt. 2. Effect of pH and Dissolved Oxygen Concentration on the Aluminum-Steel Couple. M. J. Pryor and D. S. Keir. *Electrochemical Society, Journal*, v. 105, Nov. 1958, p. 629-635.

High-purity Al cathodically protects steel completely in chloride solutions within the pH range 0.2 to 14.0. Galvanic currents and weight losses of the Al anodes are at a minimum from pH 4.0 to 10.0. Within this pH range the rate of galvanic corrosion is controlled by oxygen depolarization at the steel cathodes. At higher and lower pH the rate of galvanic corrosion is much greater and is independent of the O concentration in solution. 11 ref. (R1a, R10d; ST, *Al*)

179-R.* Local Cell Action During the Scaling of Metals. Christa Ilschner-Gensch. *Electrochemical Society, Journal*, v. 105, Nov. 1958, p. 635-638.

If Ni is covered by a borate melt under an O atmosphere, practically no oxidation takes place. If the Ni sample is in electrical contact with an electronic conductor, such as a noble metal gauze, which extends up to the melt-oxygen interface, Ni is attacked rapidly by local cell action. Electron transfer is accomplished by the metal gauze and ions migrate through the borate melt. 12 ref. (R2q)

180-R.* Mechanism of Passivating-Type Inhibitors. Milton Stern. *Electrochemical Society, Journal*, v. 105, Nov. 1958, p. 638-647.

Passivating-type inhibitor functions by producing local-action current which anodically polarizes a metal into the passive potential region and thereby provides means of obtaining a noble mixed potential. Factors which determine whether a system exhibits passivity include electrochemical parameters for reduction of the inhibitor on the metal surface, critical anodic current and Flade potential of the metal. Data for passivation of stainless steel and Ti. 35 ref. (R10c; Ti, SS)

181-R.* A Study of Corrosion Films on Zirconium and Its Alloys by Impedance Measurements. J. N. Wanklyn and D. R. Silvester. *Electrochemical Society, Journal*, v. 105, Nov. 1958, p. 647-654.

Oxide films formed on Zr and Zr alloys during corrosion in steam and water studied by impedance measurements made by immersion in electrolyte. A fall in the protective character of the film is accompanied by an increase of capacity, and measurements of the latter provide a useful method of comparing films. 12 ref. (R4d, R11a; Zr-b, 14-62, *O*)

182-R.* Reaction of Germanium With Aqueous Solutions. Pt. 1. Dissolution Kinetics in Water Containing Dissolved Oxygen. Walter W. Harvey and Harry C. Gatos. *Electrochemical Society, Journal*, v. 105, Nov. 1958, p. 654-660.

Dissolution studied as a function of oxygen partial pressure, temperature, crystallographic orientation and mobile-carrier density. Ge does not react with water, freed of O, up to 100° C. For a given O pressure the dissolution rate is approximately trebled for a 10° temperature rise. 19 ref. (R2g, R4, 2-61, 3-74; Ge, 14-61)

183-R.* (Russian.) Electromotive Forces and Electrode Potentials in Tin-Iron Systems, With Tin-Containing Flux Electrolytes. A. I. Vitkin. *Zhurnal Physicheskoi Khimii SSSR*, v. 32, July 1956, p. 1612-1617.

Electromotive force and electrode potentials show a galvanic cell Sn (flux) Fe, in which Sn is the anode and Fe is the cathode on which Sn from the electrolyte is deposited. (R1a; Fe, Sn)

184-R.* The Prevention of "Wastage". A. R. French. *Corrosion Prevention & Control*, v. 5, Dec. 1958, p. 45-46.

Resistance of ships' propellers cast from Cu-base alloy containing Mn and Al to excessive metal losses by cavitation corrosion. (R2m, R4b, T22h; Cu-b, *Mn, Al*)

185-R.* Cathodic Protection of Shell Plating. J. P. O'Donovan. *Corrosion Prevention & Control*, v. 5, Dec. 1958, p. 49-50.

Cathodic protection of the under-water surface of ships with Mg anodes. (R10b, T22g; ST)

186-R.* (Italian.) Behavior of Aluminum in Contact With Cement Mortars. A. Prati. *Alluminio*, v. 27, Sept. 1958, p. 381-385.

Corrosion does not occur normally, but presence of stray currents, chlorides or metal particles in mortar, and differently aerated zones on Al surface, cause local corrosion. Protective treatments. 4 ref. (R1; Al)

187-R.* (Italian.) Corrosion of Underground Piping and Its Protection. Luigi Scuri. *Calore*, v. 29, July 1958, p. 317-323.

Factors in electrolytic and galvanic corrosion; cathodic protection; use of Mg anodes. (R8, R10; 4-60)

188-R.* (Swedish.) Reactivity of Carbon Electrodes and Its Dependence on Inorganic Catalysts and Inhibitors. G. Wranglen. *Jernkontorets Annaler*, v. 14, no. 10, 1958, p. 613-637.

The binder is the most reactive component in carbon electrodes and oxidizes preferentially. Inhibitors are described which can be used to reduce the non-electrolytic oxidation of the C anodes in Al electrolysis cells. The mechanism of the inhibitors consists partly of a neutralization of the catalyzing metal oxides and partly of a mechanical shielding effect. 83 ref. (R1h, R10b, T1f; C)

189-R.* Growth and Scaling in S.G. Iron. The Influence of Silicon. R. J. Maitland and I. C. H. Hughes. *Iron and Steel*, v. 32, Jan. 1959, p. 19-24.

Comparative scaling of irons containing 1.2, 2.0, 3.1, 4.0, 4.9, 5.7% Si after 240 hr. at 600 to 900° C. At 650° C. the irons behaved consistently and scaling rate increased with decreasing Si content. At 900° C. the order of scaling was reversed and the 5.7% Si iron showed the greatest weight increase. (To be continued.) (R2q; CI-r, *Si*, 2-60)

190-R. Anodic Passivation of Iron. Earl S. Snavely, Jr., and Norman Hackerman. *Canadian Journal of Chemistry*, v. 37, 1959, p. 268-275.

Passivation in solutions of 0.1*N* sodium sulphate at a pH of 3.0. 6 ref. (R10c; Fe)

191-R. Corrosion in Cooking Utensils. H. Kessler. *Light Metals*, v. 22, Jan. 1959, p. 14-16. (From *Aluminium*, Feb. 1957.)

(R6g, T10a, 2-61, 3-74; Al-b, *Cu, Zn*)

192-R.* Reaction Between Iron and Water in the Absence of Oxygen. *Electrochemical Society, Journal*, v. 105, June 1958, p. 322-324.

Reaction at 25, 60 and 300° C. At room temperature the primary product appears to be $Fe(OH)_2$. Formation of Fe_3O_4 occurs readily in the iron-water system at both 60 and 300° C. It is possible that the Fe_3O_4 is produced via formation and subsequent decomposition of $Fe(OH)_2$. 13 ref. (R4e; Fe)

193-R.* Chemical Factors Affecting Stress Corrosion Cracking of 18-8 Stainless Steels. H. H. Uhlig and John Lincoln, Jr. *Electrochemical Society, Journal*, v. 105, June 1958, p. 325-332.

Transgranular cracking in Type 304 specimens does not depend on rate of stressing nor on small variations in degree of plastic deformation. Addition of HCl to $MgCl_2$ decreases cracking time whereas addition of NaOH increases the time. Pre-exposure of unstressed speci-

mens to $MgCl_2$ slightly decreases cracking times of the same specimens subsequently stressed. 17 ref. (R1d; SS)

194-R.* Protective Value of Tin-Nickel Alloy Deposits on Steel. F. A. Lowenheim, W. W. Sellos and F. X. Carlin. *Electrochemical Society, Journal,* v. 105, June 1958, p. 338-346.

Outdoor exposure tests of the comparative value of Sn-Ni alloy and conventional Ni-Cr deposits on steel, with and without a Cu undercoat. Sn-Ni is comparable in protective value to Ni-Cr, not quite so good in marine but superior in industrial atmospheres. Corrosive behavior of the two deposits differs considerably. 11 ref. (R3; ST, *Ni, Cr, Sn,* 8-62, SGA-g)

195-R.* Electrochemical Properties of PbO_2 and the Anodic Corrosion of Lead and Lead Alloys. Paul Ruetschi and Boris D. Cahan. *Electrochemical Society, Journal,* v. 105, July 1958, p. 369-377.

Anodic corrosion of Pb and Pb-Sb alloys in sulphuric acid under conditions of O_2 evolution evaluated by measuring the length of the potential plateau (transition time) during the electrochemical reduction of the PbO_2 layer, with a constant current, taking into account self-discharge and degree of utilization of the PbO_2. 30 ref. (R6g; Pb-b, *Sb*)

196-R.* A Contribution to the Theory of Stress Corrosion in Al-4% Cu Alloys. William H. Colner and Howard T. Francis. *Electrochemical Society, Journal,* v. 105, July 1958, p. 377-384.

Stress cracking is greatly influenced by exposed area of the specimen (small areas showed long time-to-failure). Experiments with grain boundary-grain center couples showed that neither potentials nor couple current were influenced sufficiently by stress to account for the acceleration of failure by stress. At constantly applied anodic current, however, stress directed the attack perpendicular to applied stress. 17 ref. (R1d; Al-b, *Cu*)

197-R.* Protection of Molybdenum From Oxidation at Elevated Temperatures. Dwight E. Couch, Harold Shapiro, John K. Taylor and Abner Brenner. *Electrochemical Society, Journal,* v. 105, Aug. 1958, p. 450-456.

Good protection is afforded by composite coatings of Cr and Ni. Adhesion of Cr to Mo is obtained by anodically etching the Mo in a solution of sulphuric and phosphoric acids (1:1 volume) before plating. A coating of Cr followed by one of Ni protects Mo at 980, 1100 and 1200° C. for 1200, 500 and 100 hr. respectively. 16 ref. (R1h; Mo, 8-62, *Cr, Ni,* 2-62)

198-R.* Room Temperature Tarnishing of Silver in Bromine and Iodine. Joseph L. Weininger. *Electrochemical Society, Journal,* v. 105, Oct. 1958, p. 577-581.

Tarnishing reactions resulted in an impervious halide surface layer which contains up to 20% pores, located at random. Rate constants are given for tarnishing in the absence of water vapor and when it was present to the extent of 90% relative humidity, at room temperature. 11 ref. (R2r; Ag, *Br, I*)

199-R.* Selective Oxidation of Aluminum From an Al-Fe Alloy. Richard E. Grace and Alan U. Seybolt. *Electrochemical Society, Journal,* v.105, Oct. 1958, p. 582-585.

Al in solid solution in Fe was oxidized selectively with damp H at 700-900° C. Microbalance weight gain data followed a parabolic time law after an initial time lag. The surface oxidation product was identified by electron diffraction to be the crystalline spinel, gamma Al_2O_3. 9 ref. (R1h; Al-b, *Fe*)

200-R.* (French.) Behavior of Aluminum and Its Alloys in Different Atmospheres. Pt. 1. Andre Guilhaudis. *Revue de L'Aluminium,* no. 259, Nov. 1958, p. 1111-1118.

Exposed to sprays, to sea water, to atmosphere in industrial environment up to 12 years. (R3, R4b, R1a; Al-b)

201-R.* (Hungarian.) Processes Taking Place in Cathodes of Aluminum Electrolytic Cells. M. B. Rapaport. *Kohaszati Lapok,* v. 91, July 1958, p. 322-326.

Sodium-induced decomposition considered as main cause of reduced lifetime of cathodes. (R6j, C23n; Al-b, C)

202-R. Corrosion Control by Dehumidification. *Corrosion Prevention & Control,* v. 5, Dec. 1958, p. 46-47.

Effectiveness of dehumidification in reducing corrosion on steel surfaces of empty tanks of oil tankers. (R3p, R10a, T26q; ST)

203-R. Underground Corrosion Investigation. *Corrosion Prevention & Control,* v. 5, Dec. 1958, p. 55-58.

Program of U. S. National Bureau of Standards; basic electrochemical reactions, influence of soil characteristics and alloy compositions on corrosion. (R8; ST, CI, Al-b, Cu-b)

204-R. (Russian.) Nature of the X-Phase. F. N. Tavadze and I. A. Bairamashvili. *Liteinoe Proizvodstvo*, Nov. 1958, p. 18-20.

As compared with ordinary carbon steel, cast iron at 750-850° is characterized by high heat resistance because of formation of thick oxide layers. Heat resistance also due to oxidation of interior resulting in new grain structure and new phase state - X. Investigation also revealed X'-phase which is dark blue and is often mistaken for graphite. X' differs from X-phase by much thicker structure and contains traces of graphite. 7 ref. (R1h, R2s, N3, 2-61; CI)

205-R. Corrosion Research Laboratories. Pt. 14. F. Wormwell. *Corrosion Technology*, v. 6, Jan. 1959, p. 5-9. (R-general, A9h)

206-R. Effect of Reactor Atmosphere on Zirconium and Zirconium Alloys. R. G. Wheeler. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission*, HW-55958, May 6, 1958. 13 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.20.

Zr, Zircaloy-2 and Zircaloy-3b specimens were exposed to a 50 vol. % helium 50% carbon dioxide reactor atmosphere at a weighted average temperature of 430° C. for a total of 866 days at temperature. Corrosion rates are represented by empirical equations. Either the irradiation, or some constituent in the gas, appears to reduce the rate of reaction above 450° C. primarily by delaying the inception of breakaway corrosion. (R-general; Zr-b, 2-67)

207-R. Corrosion by Solutions Containing HNO_3, Hf, and Reducing Agents. M. LaVern Holzworth. E. I. du Pont de Nemours & Co. *United States Atomic Energy Commission*, DP-284, May 1958. 24 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Corrosion of Types 304L and 309Cb stainless steel as a function of the concentrations of the components of mixtures of nitric and hydrofluoric acids containing hydroxylamine nitrate, sulphamic acid and ascorbic acid. Methods of decreasing corrosion by addition of ferric, cupric and silver cations as inhibitors, or Al as a complexing agent. (R6g, R10b; SS)

208-R.* (Czech.) Effect of Stabilization With Columbium on the Intercrystalline Corrosion of Stainless Steel. Vladimir Cihal and Rudolf Pospisil. *Hutnicke Listy*, v. 13, Dec. 1958, p. 1092-1098.

Steels homogenized, then precipitation heated and boiled in solution of 100 g. $CuSO_4 . 5H_2O$ + 100 g. H_2SO_4. Intercrystalline corrosion studied by bend tests. Main cause is solution of columbium carbide at high temperatures, and later precipitation of chromium carbides at the grain boundaries. Effect can be eliminated by stabilizing at a certain temperature between 850 and 950° C. 20 ref. (R2h, J27; SS, *Cb*)

209-R.* Some Aspects of Refinery Corrosion Due to Crude Oil. P. W. Sherwood. *Corrosion Technology*, v. 6, Jan. 1959, p. 10-12.

Relation of chloride, acid, water and sulphur contents to corrosiveness of crude oil. Methods of evaluating corrosiveness. Use of neutralizers and inhibitors. Economic importance. 6 ref. (R7a; ST)

210-R.* Pipeline Protection in the Middle East. Pt. 1. Protective Coating and Cathodic Protection Practice. L. R. Sparrow. *Corrosion Technology*, v. 6, Jan. 1959, p. 13-18.

Corrosive conditions and problems encountered in Iraq, Syria and Lebanon with surface and buried oil pipelines. Pipe coating and cathodic protection practices. Effectiveness of protection. (R8, R10d, L26a; ST, 4-60)

211-R.* (German.) Corrosion of High-Alloy Steels by Nitric Acid. Johannes Bunger. *Werkstoffe und Korrosion*, v. 9, Dec. 1958, p. 747-755.

Corrosion diagrams for Cr and Cr-Ni steels with nitric acid of varied concentration up to 67% and at temperatures up to the atmospheric boiling point. Influence of composition. 4 ref. (R6g; SS)

212-R.* (German.) Cathodic Inhibition by Organic Substances. Hellmuth Fischer. *Werkstoffe und Korrosion*, v. 9, Dec. 1958, p. 765-768.

Cathodic inhibition, such as by beta-naphthaquinoline, N-quinoline ethyl iodide is explained by chemisorption at the double joints of heteocyclic ring shaped compounds. Cathodic anodic inhibition

also is assumed. 6 ref. (R10b; Fe, NM-b)

213-R. (Translation.) Solution of Iron in Fused Mixtures of the Chlorides of Lithium and Potassium and Sodium and Potassium. V. P. Kochergin and G. I. Stolyarova. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 184-187.

Rate of solution of Fe in fused eutectic mixture of Li and K and low-melting mixture of sodium and potassium chlorides. Increase in solution rate with increasing temperature of melts. 14 ref. (R6k; Fe)

214-R. (Translation.) Solution of Iron in Fused Chlorides of Alkali and Alkaline Earth Metals. V. P. Kochergin, M. S. Garpinenko, O. N. Skornyakova and M. Sh. Minullina. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 188-192.

Rates of solution of pure Fe and eutectic mixtures of the chlorides of Mg and K, Ca and Na, Ba and K. 24 ref. (R6k, 2-61, 2-66; Fe-a)

215-R. (Translation—AIP.) Investigation of Oxidation in Air of Single-Crystal Layers of Pb-S by Method of Electron Diffraction. T. M. Zimkina. *Soviet Physics, Technical Physics*, v. 3, May 1958, p. 930-937.

7 ref. (R1h, R3, M22h; Pb, *S*, 14-61)

216-R. (Translation—Brutcher, no. 4448.) High-Temperature Oxidation of Nickel in Sulphur Dioxide. V. V. Ipat'ev and D. V. Zheltukhin. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 42-45.

Scale-forming constant depends upon temperature, reaching a maximum at 800° C. Scale, deposited on Ni in SO atmosphere consists of 2 phases NiO and NiS. 5 ref. (R2q, R6p, 2-62; Ni-a, S)

217-R. (Translation—Brutcher, no. 4449.) Corrosion Cracking of Brass in Ammonia. A. N. Konorat'ev. *Metallovedenie i Obrabotka Metallov*, Dec. 1958, p. 45-52.

Ammonia and its compounds produce a comparatively weak general corrosion but cause highly localized damage. Presence of moisture and oxygen in an ammonia atmosphere increases corrosion. 17 ref. (R6j; Cu-n, *Zn*)

218-R. (Translation—ConBur.) Kinetics of Gaseous Corrosion of Mg Alloys. J. A. Makolkin. *Journal of Applied Chemistry of the USSR*, v. 30, Oct. 1957, p. 1608-1612.

Corrosion rate in air, CO_2, SO_2 and nitrogen. Mn, Zn and Al in alloys affect the heat resistance. 7 ref. (R3; Mg-b, *Mn, Zn, Al*, 2-66, 2-60)

219-R.* Licking the Problem of Stress-Corrosion Cracking. John F. Klement, Robert E. Maersch and Patrick A. Tully. *Metal Progress*, v. 75, Feb. 1959, p. 82-86.

High-pressure steam, either pure or containing acid or salt vapors, quickly causes intergranular cracks in aluminum bronze pressure vessels. Apparently grain boundaries are slightly enriched in Al, and this is oxidized preferentially. The trouble is permanently avoided by addition of a fractional % of tin. (R1d, R4d, 2-60; Cu-s, *Al, Sn*)

220-R.* Stress-Corrosion Cracking. L. R. Scharfstein and W. F. Brindley. Digest from "Chloride Stress Corrosion Cracking of Austenitic Stainless Steel—Effect of Temperature and pH." National Meeting of National Assoc. of Corrosion Engineers, Mar. 1958. *Metal Progress*, v. 75, Feb. 1959, p. 180, 182.

Susceptibility of austenitic stainless steels to stress-corrosion cracking in dilute sodium chloride solutions between the temperatures of 165 and 200° F., and with the pH varying from 6 to 12 in Types 304 and 347 stainless steel. (R1d; SS-e)

233-R. (Japanese.) Oxide Films Formed at High Temperature on Copper Alloy Condenser Tubes. Takemichi Otsu and Shiro Sato. *Sumitomo Metals,* v. 10, July 1958, p. 167-173.

Pure Cu, 70-30 brass, Admiralty brass, Albrac, 10% cupronickel and 30% cupronickel, heated at 400 to about 700° C. in an electric furnace. (R1h, 2-61; Cu-a, Cu-n, Cu-b, *Ni*)

234-R. (Ukrainian.) Kinetics and Mechanism of High-Temperature Oxidation of Rhenium in the Recrystallized and Cold Worked States. V. A. Lavrenko. *Dopovidi Akademii Nauk Ukrainskoi RSR,* no. 11, 1958, p. 1216-1220.

Temperature relation equation of linear oxidation calculated for temperature range 400-725° C. 10 ref. (R1h, 2-62; Re)

235-R.* Design From the Viewpoint of Corrosion. W. D. Clark. *Metallurgical Reviews*, v. 3, no. 11, 1958, p. 270-325.

Economic and environmental factors affecting design and choice of corrosion resistant materials. Interpretation of corrosion tests. Environmental, geometrical and metallurgical factors to be considered in design. Protective measures. 75 ref. (R-general; 17-51, SGA-g)

236-R.* Internal Cathodic Protection. Pt. 1. C. Plumpton and C. Wilson. *Corrosion Prevention & Control*, v. 6, Jan. 1959, p. 31-36.

Techniques and mathematical principles involved in analysis of cathodic protection problems. General theorems concerning electric current density of re-entrant edges of structures. Examples illustrate determination of potential due to distribution of electrodes in presence of plane boundaries. (R10d)

237-R.* Effect of Dextrin Inhibitor on the Corrosion Potentials of Aluminum in Alkaline Solutions. J. Sundararajan and T. L. Rama Char. *Corrosion Prevention & Control*, v.6, Jan. 1959. p. 41-42.

Potentials of commercial Al alloys containing 4% Mn and 3% Fe in 0.1 and 0.3 normal NaOH solutions with up to 30 g. per l. dextrin. (R10b; Al-b, *Mn, Fe*)

238-R.* Corrosion Prevention in the Bottling Industry. L. A. Johnson. *Corrosion Prevention & Control*, v. 6, Jan. 1959, p. 45-49.

Corrosion problems; removal of mill scale and protection of steel work with primers, paint and coatings. (R10, L26, ST)

239-R* Anodic Dissolution of Magnesium Alloys in Aqueous Salt Solutions. R. Glicksman. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 83-88.

Dissolution of magnesium alloy AZ10A studied by measuring corrosion rates and electrode potentials as functions of current density, pH and electrolyte concentration; explained in terms of rate-controlling proton transfer step through surface film of magnesium oxide or hydroxide. Effects of different alloy compositions and soluble metal additives to electrolyte on anodic corrosion rate and electrode potential. 26 ref. (R1a; Mg-b, 2-60)

240-R.* Potential Studies on Passivity to Corrosion Induced by Pretreatment Processes for Metals. Pt. 1. Aluminum. K. S. Rajagopalan. *Electrochemical Society, Journal*, v. 106, Feb. 1959, p. 113-117.

Potential and polarization characteristics of Al which was subjected to various chemical oxidation processes. Treated metal shows more negative initial electrode potential. Cathodic polarization curve is also much steeper than untreated metal. 32 ref. (R10c; Al, 8-69)

241-R.* Deterioration of Anodized Aluminum Exposed to Corrosive Environments. J. M. Kape. *Electroplating and Metal Finishing*, v. 12, Feb. 1959, p. 41-46, 59.

Review of literature on testing atmospheric, aqueous and chemical corrosion. 23 ref. (R-general; Al-b, 8-73)

242-R.* Oxidation of Three Iron-Nickel Alloys and Iron at 800° C. S. W. Kennedy, L. D. Calvert and M. Cohen. *Metallurgical Society of AIME, Transactions*, v. 215, Feb. 1959, p. 64-72.

How orientation of an Fe_2O_3 layer on Fe, on a 25% Fe-Ni alloy and on a 75% Ni alloy affects oxidation phenomena. Process by which FeO layer is identified. (R1h, 3-72, 2-62; Fe-a, Fe-b, *Ni*, Ni-b, *Fe*)

243-R.* The Use of Stainless Steels in Corrosion Control. J. P. Ogilvie. *Canadian Mining and Metallurgical Bulletin*, v. 52, Feb. 1959, p. 85-89.

Intergranular corrosion, pitting corrosion, crevice corrosion, chemical corrosion. 5 ref. (R-general; SS)

244-R.* Mechanical Properties and Corrosion Resistance of Oil Well Tubing. F. A. Prange. *Corrosion*, v. 15, Feb. 1959, p. 49t-54t.

Applications of the various grades of tubing in sweet and sour wells related to corrosion damage. Sulphide stress cracking is closely related to mechanical properties. 9 ref. (R1d, R8, Q-general, T28p; 3-66)

245-R.* Influence of Service Temperature on the Resistance of Wrought Aluminum-Magnesium Alloys to Corrosion. E. H. Dix, Jr., W. A. Anderson and M. Byron Shumaker. *Corrosion*, v. 15, Feb. 1959, p. 55t-62t.

Prolonged heating of wrought Al-Mg alloys with high Mg content in the range of 150 to 350°F. causes selective precipitation of an anodic phase resulting in susceptibility to intergranular corrosion,

which can cause stress-corrosion cracking. A new alloy, 5454, is free from the temperature limitation placed on the higher Mg alloys. 7 ref. (R1d, R2d, 2-60; Al-b, *Mg*, SGA-g)

246-R.* Choride Stress-Corrosion Cracking of the Austenitic Stainless Steels. J. P. Engle, G. L. Floyd and R. B. Rosene. *Corrosion*, v. 15, Feb. 1959, p. 68t-72t.

Conditions under which hydrochloric acid can be safely used to clean austenitic steels. The active-passive characteristics of the alloys play an important role. A number of factors, acting together, must be present to produce cracking. 5 ref. (R1d, R6, L12; SS-e)

247-R.* Variable Interaction: a Statistical Solution. H. C. Bowen, C. Groot and J. L. Jaech. *Corrosion*, v. 15, Feb. 1959, p. 83t-84t.

Effects of independent variables in corrosion data seem to be multiplicative, which calls for a logarithmic transformation to convert this to an additive system. Experiment to determine whether the occasional use of low-purity water would cause excessive corrosion in the Al alloy cooling system of a nuclear power reactor. (R4a, W10f, W11f; Al-b)

248-R.* Effect of Molten Boron Oxide on Selected High-Temperature Alloys. David Roller and C. R. Andrews. *Corrosion*, v. 15, Feb. 1959, p. 85t-96t.

Exposure of high-temperature alloys to molten boron oxide at 1600 to 2000°F. in air and inert atmosphere for 150 hr. Molten B_2O_3 is very corrosive, particularly to Fe and Co-base alloys over 1800° F. Plastic properties are more rapidly affected than the elastic properties. 21 ref. (R6p, R11g, 2-62, 2-60; Co-b, Ni-b, SGA-h, *B, O*, NM-a34)

249-R.* Intergranular Corrosion of Duralumin: Correlation of Laboratory and Service Behavior. G. J. Schafer, T. Marshall and H. J. Todd. *Journal of Applied Chemistry*, v. 9, Jan. 1959, p. 38-43.

Those Al-Cu alloys which corrode intergranularly in the acid chloride test give approximately parabolic gas evolution curves. 6 ref. (R6g, R2h, 2-60; Al-b, *Cu*)

250-R.* Use of Radioactive Tracers in the Study of Passive Films on Metals. Dora M. Brasher, A. H. Kingsbury and A. D. Mercer. Paper from "Radioisotopes in Scientific Research". v. 1, Pergamon Press, New York, 1958, p. 326-342.

Radioactive tracer technique is an extremely sensitive and reliable means of measuring small amounts of Cr on the surface of Fe after immersion in chromate solution. Metal specimen acquires an adsorbed film immediately on immersion, and thereafter the oxide film grows in a "logarithmic" manner, similar to its growth in air at room temperature. 43 ref. (R10c, L14c, 1-59; Fe, Cr)

251-R.* Exfoliation of Metals at High Temperatures. Koji Inagaki. *Tohoku University, Research Reports, Series A*, v. 10, no. 5, 1958, p. 388-399.

Disintegration mechanism is represented by three actions—fatigue exfoliation, deforming exfoliation and sintering. At high temperatures, especially above the recrystallizing temperature, deforming exfoliation pays a major role in the pulverizing mechanism; exfoliation by fatigue increases with the lowering of the temperature and is scarcely observable above the recrystallizing temperature. (R2n, 2-62, 3-68)

252-R.* (English.) Effect of Stress on the Corrosion Potential of Steel. Pt. 1. Tensional Stress. Eino Uusitalo. *Suomen Kemistilehti*, v. 31, no. 12, 1958, p. 395-399.

In the elastic range stretching produces a temporary shift of the potential in the anodic direction. At the plastic limit the potential first undergoes a large shift in the anodic direction but then changes rapidly in the reverse direction. 11 ref. (R1d; ST)

253-R.* (French.) Behavior of Aluminum and of Aluminum Alloys in Various Atmospheres. Pt. 2. Andrew Guilhaudis. *Revue de l'Aluminium*, v. 35, Dec. 1958, p. 1271-1278.

Effect of anodizing in corrosion prevention; salt spray tests; corrosion in marine atmospheres. (R3, R11j; 8-73, Al-b)

254-R.* (Russian.) Anode Behavior in Cu-Zn System in 0.1 N Solution of Sodium Chloride. V. V. Scorchelletti, I. A. Stepanov and E. P. Kuksenko. *Zhurnal Prikladnoi Khimii*, v. 31, no. 12, 1958, p. 1823-1831.

Alloys with a Zn content above 25% are dezinced; mechanism of dezincification. 9 ref. (R2k, M24b; Cu-b, *Zn*)

255-R.* (Russian.) Effect of Chromium Diluted With Nitrogen on Corrosion of Metals

at High Temperature. K. L. Tseitlin and V. A. Strunkin. *Zhurnal Prikladnoi Khimii*, v. 31, no. 12, 1958, p. 1843-1848.

Regulation of the corrosion rate by changing Cr concentration in a medium of inert gas. Cr diluted with nitrogen sharply lowers the corrosion rate of Al; Fe and its alloys, Ta and to a lesser degree Cu (above 200° C.), Ni (above 600° C.), Pb (above 250°). 11 ref. (R-general, 2-62; Al, Fe-b, Cu, Pb, Ni, Ta, Cr, N, EG-m43)

256-R. Corrosion Resistance of Wrought Iron and Openhearth Steel. Irvine I. Tingley and R. R. Rogers. *Canadian Dept. of Mines, Technical Surveys, Mines Branch*, IC111, Dec. 12, 1958, 21 p.

Wrought iron and openhearth steel have essentially similar corrosion behavior in most common media. 36 ref. (R-general; Fe-m, ST)

257-R. An Electrochemical Study of Aluminum and Aluminum Alloys. E. M. Khairy and M. Kamal Hussein. *Corrosion*, v. 15, Feb. 1959, p. 63t-67t.

Static electrode potentials of the R, duralumin, M 22, DK and S 2 Al-base alloys show that these alloys have the same behavior as pure metal in buffer solutions initially free from metal ions within the pH range 1 to 8. Corrosive action of chloride ions. 5 ref. (R11m, P15; Al-a, Al-b)

258-R. Behavior of AZ 63 Alloy and Magnesium, 1 Percent Manganese Alloy Anodes in Sodium Chloride Electrolyte. J. H. Greenblatt and E. Zinck. *Corrosion*, v. 15, Feb. 1959, p. 76t.

The solution mechanism for the dissolution of Mg alloys is substantially the same as for pure Mg. 4 ref. (R10d, P15; Mg-b)

259-R. Corrosivity of Soil. N. D. Tomashov and Y. N. Mikhailovsky. *Corrosion*, v. 15, Feb. 1959, p. 77t-82t.

Methods used to determine the corrosive activity of soils. 14 ref. (R8, 1-54, 1-68)

260-R. Developments in Cooling Tower System Treatments. J. I. Bregman and T. R. Newman. *Corrosion*, v. 15, Feb. 1959, p. 97t-100t.

The addition of certain metallic cations in very small quantities to synergized polyphosphate treatments in cooling tower systems will increase corrosion protection. 4 ref. (R10b, W10f; CN, *P*, *O*)

261-R. Underground Corrosion Investigation. Pt. 2. *Corrosion Prevention & Control*, v. 6, Jan. 1959, p. 52-54.

U. S. National Bureau of Standards investigation on influence of soil and soil conditions on corrosion of iron, steel, Cu, Pb and Zn. Protection. (R8; CI, ST, Cu-b, Pb, Zn)

262-R. Application of T-Δ G Diagram to High-Temperature Oxidation of a Binary Alloy. Kazuo Fueki. *Electrochemical Society of Japan, Journal*, v. 26, no. 7-9, 1958, p. E120-E122.

Diagram for determining the layer structure of oxides formed in Ni-Cr alloys. (R1h, 2-62; Ni-b, *Cr*)

263-R. Observations on the Corrosion of Aluminum and Its Relation to Chemical Examination of the Corrosion Products. R. A. Hinze. *Journal of Applied Chemistry*, v. 9, Jan. 1959, p. 43-49.

Performance and limitations of different alloys in various environments. 16 ref. (R-general, 2-66; Al-b)

264-R. Effect of Radiation on Corrosion of Structural Materials by Molten Fluorides. G. W. Keilholtz, J. G. Morgan and W. E. Browning. *Nuclear Science and Engineering*, v. 5, Jan. 1959, p. 15-20.

Metallurgical examinations of the Inconel capsules and tubing have likewise shown no changes in corrosion that can be the result of radiation damage. 6 ref. (R6, 2-67; Ni-b)

265-R. (French.) Treatment of Boiler Water by Means of Aluminum Anode. Gilbert L. Aslan. *Revue de l'Aluminium*, v. 35, Dec. 1958, p. 1265-1267.

Anodes are placed inside the boiler and supplied with low-tension positive current; the cathode is formed by the metallic mass of the boiler. (R10d, T26q, W3h; Al)

266-R.* (French.) Protection Afforded by Metallized Zinc and Aluminum Coatings in Liquid Fuels. Zbigniew Kowalski. *Corrosion et Anticorrosion*, v. 6, Dec. 1958, p. 457-462.

Samples of steel coated with Zn or Al were immersed in five types of motor fuels for periods of 1128, 1248 and 2376 hr. Presence of water and of tetraethyl lead affect corrosion resistance of these coatings, especially in case of Zn, but protection provided is adequate for walls of tanks and other vessels containing liquid fuels. 11 ref. (R7d, ST, 8-67, *Al*, *Zn*)

267-R.* (German.) Corrosion Caused by Perspiring Hands. G. Oelsner. *Galvanotechnik*, v. 50, Feb. 15, 1958, p. 77-84.

Corrosion considered in terms of anodic dissolution. 9 ref. (R7p)

268-R. (German.) Last Developments in Rust-Proof Painting. K. Krenkler. *Werkstoffe und Korrosion*, v. 10, Jan. 1959, p. 1-14.

Effects of environment (atmospheric conditions) on structural steel corrosion. Mechanical rust removal and coating the steel with various media. 8 ref. (R3, L26; ST, SGB-s)

269-R.* (German.) Influence of Protective Colloids on the Corrosion of Brass. M. N. Desai, Y. D. Talati and A. M. Trivedi. *Werkstoffe und Korrosion*, v. 10, Jan. 1959, p. 26-29.

Effect of protective colloids (pulvis acacia, egg albumin, agar and dextrine) on the corrosion of cold rolled electrolytic brass plates (Cu and Zn) in citric acid, sulphuric acid and in hydrochloric acid. Essential decrease in corrosion took place in citric acid solutions. 16 ref. (R6g, R10b; Cu-n, 4-53)

270-R.* Correlate Corrosion Testing Methods. Robert V. Jelinek. *Chemical Engineering*, v. 66, Jan. 26, 1959, p. 104-110.

Test objectives are to study corrosion mechanism and factors that influence it; select the best material or protective coating to withstand a particular corrosive environment; determine the environment which a given material withstands; develop materials for particular uses; study effectiveness of various protective measures; control product uniformity in the manufacture of corrosion resistant materials. 42 ref. (R11)

271-R.* Nitric Acid Corrosion of Austenitic Stainless Steels. J. M. West. *Journal of Applied Chemistry*, v. 9, Jan. 1959, p. 1-10.

Variables in the testing of corrosion of Ti stabilized austenitic stainless. 6 ref. (R6q, 2-60, 2-61, SS-e, *Ti*)

272-R.* Mechanism of Stress-Corrosion Cracking in the AZ31B Magnesium Alloy. Hugh L. Logan. *Journal of Research of the National Bureau of Standards*, v. 61, Dec. 1958, p. 503-508.

Cracking is predominantly an electrochemical process and is dependent on the rate of strain in the specimen following loading in tension. Cracks develop if the protective film on the metal surface is ruptured (over narrow segments of the specimen) at a greater rate than it is repaired in the corroding medium. This would expose film-free metal that is anodic to the filmed metal. 14 ref. (R1d, R4a, R6, 3-66; Mg-b)

273-R.* Thermal Oxidation Properties of Metallic Coatings. R. L. Samuel. *Product Finishing*, v. 12, Feb. 1959, p. 73-86.

Reference to Zn, Si, Al and Cr diffusion and use of facing alloys or cladding. 12 ref. (R1h, L15, 2-61; Al, Cr, Si, Zn, 8-74)

274-R.* (French.) Cathodic Protection and Coatings for Buried and Submerged Steel and Reinforced Concrete. Bernard Heuze. *Nature*, Dec. 1958, p. 472-479.

Coordination of cathodic protection and coatings; dangers of improper use of coating materials, incompatibility with metals in certain cases; use of coatings to limit interactions between a cathodic protective device and a nonprotected installation in vicinity. Examples of protection of pipelines, floating docks, heating plants. (R10d; ST, 4-60)

275-R.* (French.) Behavior of Magnesium and Two Magnesium Alloys Heated in CO_2. M. L. Boussion, R. Darras and D. Leclercq. *Revue de Metallurgie*, v. 56, Jan. 1959, p. 61-67.

Mg specimens, pure or lightly alloyed with Zr and Zn, were exposed to CO_2 under pressure of 15 kg. per sq.cm. for 3000 hr. at 400 to 500° C. Weight increases were slight. CO_2 appears to have inhibiting effect, as was noticed also in tests of shorter duration in mixed atmospheres of CO_2, N_2O_2 and air. A carbon deposit appears at 450° C.; presence of Zn causes marked sublimation above 550°. (R1h, 2-60; Mg-b, *Zr*, *Zn*)

276-R.* Pipe-Wrapping Materials for Corrosion Protection. J. G. Parry and J. R. James. *Corrosion Technology*, v. 6, Feb. 1959, p. 35-37.

Functions of pipeline coatings. Characteristics of asphalt, coal tar and plastic tape coatings and inner and outer wraps of glass fiber, asbestos or kraft paper. (R10e, T26r; ST, 4-60)

277-R.* Polyvinyl Chloride Tapes for Pipe Protection. K. S. Chitty. *Corrosion Technology*, v. 6, Feb. 1959, p. 39-41.

Physical and insulating properties of polyvinyl chloride tapes; protection of

pipe from corrosive and abrasive conditions. (R10e; ST, 4-60)

278-R.* Pipeline Protection in the Middle East. Pt. 2. Preparing the Ground and Checking the Results. L. R. Sparrow. *Corrosion Technology*, v. 6, Feb. 1959, p. 42-48.

Problems in construction of ground beds in the desert. Effects of magnetic iron oxide scale, salt concentration of ground water and variation in soil resistivity on effectiveness of cathodic protection of pipeline. Cathodic protection of oil field equipment in marine environment. (R10d, R8, T26r; ST, 4-60)

279-R.* General and Intergranular Corrosion of Austenitic Stainless Steels in Acids. Michael A. Streicher. *Electrochemical Society, Journal*, v. 106, Mar. 1959, p. 161-180.

Effect of cations in the acids, influence of heat treatment and grain boundaries. 57 ref. (R6g, R2h, 2-64, 3-71; SS-e)

280-R.* Reaction of Aluminum and Carbon Tetrachloride. Pt. 1. J. D. Minford, M. H. Brown and R. H. Brown. *Electrochemical Society, Journal*, v. 106, Mar. 1959, p. 185-191.

Corrosion of alloys by boiling CCl_4. Reaction decreases as Mg content increases. 15 ref. (R6k, 2-60; Al-b, *Mg*)

281-R.* Reaction of Aluminum and Carbon Tetrachloride. Pt. 2. R. H. Brown, E. H. Cook, M. H. Brown and J. D. Minford. *Electrochemical Society, Journal*, v. 106, Mar. 1959, p. 192-199.

Conductivity measurements indicate that the reaction starts as soon as the Al is exposed to the boiling solution. Increase in the conductivity with time is caused by the presence of $AlCl_3$. Substances that retard the reaction form inactive complexes with the $AlCl_3$. 7 ref. (R6k, Al-b)

282-R.* (French.) Role of Corrosion Inhibitors in Water Treatment. E. L. Streatfield. *Metaux Corrosion-Industries*, v. 33, Oct. 1958, p. 420-430.

Various types of anodic, cathodic and organic inhibitors. Aliphatic amines and their salts have properties particularly useful in boiler applications. 12 ref. (R10b, R4c)

283-R. (French.) Zinc and Its Resistance to Corrosion. A. Herz. *Corrosion et Anticorrosion*, Dec. 1958, p. 444-445.

(R-general; Zn)

284-R.* Dissolution of Metals and Alloys. Pt. 1. Dissolution of Copper in Solutions Containing Persulphate Ion. G. C. Bond, B. M. Hill and R. Tennison. *Chemical Society, Journal*, Jan. 1959, p. 33-38.

Copper readily dissolves at room temperatures, but the reaction is transport controlled at all concentrations up to 0.1 M above 35°. 11 ref. (R2a, P15, 2-60, 2-61; Cu)

285-R.* (English.) Influence of Aggressive Carbonic Acid on the Corrosion of Steel in Water. E. Uusitalo and J. Heinasen. *Teknillisen Kemian Aikakauslehti*, v. 15, Dec. 31, 1958, p. 625-627.

Carbonic acid corrodes uncoated steel pipe both in soft and hard water, although less in hard water. 7 ref. (R6g, 2-60, 2-66; ST, 4-60)

286-R. (Translation.) German Standardization Practice With Accelerated Corrosion Tests. Pt. 1. B. M. Pearson. *Corrosion Prevention & Control*, v. 6, Jan. 1959, p. 50-51, 54. (From *Metalloberflache*, v. 12, no. 10, p. B145-B147.)

See item 56-R, 1959. (R11j, R11q)

287-R. (Translation—BISI no. 1036.) Rate of Scaling of Pure Iron in Oxygen at Reduced Pressures and in Carbon Dioxide. Norbert G. Schmahl. *Archiv fur das Eisenhuttenwesen*, v. 29, Mar. 1958 p. 147-152.

See item 281-R, 1958. (R2q, 3-74; Fe-a)

288-R. (Translation—Brutcher no. 4482.) Susceptibility of Stainless Steels to Intercrystalline Corrosion After Heat Treatment. A. P. Akshentseva. *Metallovedenie i Termicheskaya Obrabotka Metallov*, Jan. 1959, p. 47-52.

Hot rolled sheets of steels EI533, EI628 and EI629 were heated and held at high temperatures for various periods and treated subsequently in hot acid. EI533 and EI628 steels from 600 to 850° C. revealed precipitation of carbides at the grain boundaries which makes them susceptible to intercrystalline corrosion. 10 ref. (R2h, 2-64; SS, 4-53)

289-R. (Translation—ConBur.) Oxidation of Alloys Containing the Intermetallic Compound NiAl. E. I. Mozhukhin, L. Kh. Pivouarov and Ya. S. Umansky. *Journal of Applied Chemistry of the USSR*, v. 30, Nov. 1957, p. 1658-1663.

Dense oxide film formed in presence of excess Al atoms; with excess Ni atoms

the continuity of film is disrupted by separation of Ni_3Al phase, with acceleration of oxidation processes. CoAl is oxidized more than NiAl. 6 ref. (R1h, 2-60; Ni-b, *Al*, Co-b, *Fe*, 14-68)

290-R. (Translation—ConBur.) Mechanism of Corrosion of Metals in Molten Chlorides. N. D. Tomashov and N. I. Tugarinov. *Journal of Applied Chemistry of the USSR*. v. 30, Nov. 1957, p. 1681-1687.

Activity and prevention of high-temperature corrosion; 70% of surface corrosion concentrated around grain boundaries. 11 ref. (R6j, 2-62; Fe-a)

291-R. (Translation—ConBur.) Corrosion of Zinc, Iron Aluminum and Magnesium in Aqueous Dioxane Solutions of Certain Electrolytes. Yu. B. Kletenik. *Journal of Applied Chemistry of the USSR*, v. 30, Nov. 1957, p. 1688-1693.

In H_2SO_4 passivation takes place. Influence of CI ions and dioxane on corrosion rate of passivated metals. 10 ref. (R7b, R10c; Mg, Zn, Fe, Al)

292-R. (Translation—ConBur.) Corrosion of Steel in the Atmosphere of a Steel Mill. A. V. Shreider and A. I. Sokolikov. *Journal of Applied Chemistry of the USSR*, v. 30, Nov. 1957, p. 1770-1772.

Effect of relative humidity of SO_2 and HCl and of the type of steel on weight loss due to corrosion for 160 hr. (R3n, 2-60, 2-66; ST)

293-R. (Translation—ConBur.) Corrosion of Steel by Hydrochloric Acid in the Spheroidal State. Kh. L. Tseitlin and S. M. Babitskaia. *Journal of Applied Chemistry of the USSR*, v. 31, Jan. 1958, p. 76-80.

Maximum operating temperature is 400° for carbon steel and 500° for 1KH18N9T and EI-496 stainless steels. To reduce the breakdown of spheroidal state of HCl, metal surface temperature must be greater than 300° C. 6 ref. (R6g, 2-62; SS, CN)

294-R. (Translation—ConBur.) Effect of Alpha-Activity on the Corrosion of Platinum and Zirconium in Hydrobromic Acid. D. M. Ziv and I. A. Efros. *Soviet Journal of Atomic Energy*, v. 4, Mar. 1958, p. 388-389.

Radiation does not effect the corrosion of Pt except at ranges above room temperature. Zirconium is effected to a greater extent. Atomic bromine and hydrogen peroxide are thought to be the corrosion agents. 4 ref. (R6g, 2-67; Pt, Zr)

295-R.* Growth and Scaling in S.G. Iron. The Influence of Silicon. R. J. Maitland and I. C. H. Hughes. *Iron and Steel*, v. 32, Feb. 1959, p. 57-59.

Provided the exposure occurs below the critical temperature range, growth and scaling are inhibited by increasing Si content. Above a maximum temperature, corresponding roughly with the critical temperature range, scaling and growth become catastrophic. Increasing Si content raises the critical range and the safe maximum working temperature but also promotes both growth and scaling above this temperature. (To be continued) (R2q, 2-60; CI-r, *Si*)

296-R.* (Dutch.) Attack of Nitrogen on Various Heat Resistant Alloys. C. Vollers. *Metalen*, v. 14, Feb. 14, 1959, p. 41-42.

Exposure of Ni-Cr-Fe alloys, a Ni-Fe alloy and pure Ni at 500° C. in an atmosphere of anhydrous ammonia for a period of 1540 hr. With high Ni content, a protective film of nitrides forms. Corrosion resistance against nitrogen is also increased by Cr. (R7j, 2-62; Ni-b, Cr, Fe, SGA-h)

297-R.* (German.) Decomposition of Wustite in Layer of Scale on Iron Specimens. Wilhelm Anton Fischer and Alfred Hoffman. *Archiv fur das Eisenhuttenwesen*, v. 30, Jan. 1959, p. 15-22.

X-ray and microscopic investigation of wustite decomposition below 570° C. in the scale layers produced by oxidizing pure Fe, Armco iron and low-carbon steel. Lattice constants for wustite after oxidation at 750 to 1050° C. 38 ref. (R1h, M26; Fe, CN-g)

298-R.* (Rumanian.) Effect of Plastic Deformation on the Corrosion of Rolled Nodular Cast Iron. Irina Cornea and Stefan Zamirca. *Studii si Cercetari de Metalurgie*, v. 3, no. 4, 1958, p. 451-461.

Corrosion behavior of cast iron, rolled at approximately 900° C. and then heat treated. When the heat treatment temperature is too low for producing a structural transformation, the weight loss in HCl and NaCl increases with the degree of deformation. With higher temperature , stress relief and an extensive ferritization occur, while corrosion decreases in proportion to the amount of plastic deformation. 5 ref. (R1d, Q24; CI-r)

299-R.* High-Temperature Oxidation of Magnesium in Dry and in Moist Oxygen.

S. J. Gregg and W. B. Jepson. *Institute of Metals, Journal,* v. 87, Feb. 1959, p. 187-203.

Oxidation of Mg sheet between 350 and 600° C. in dry oxygen and in moist oxygen at four different humidities. Effect of surface preparation, moisture and temperature on rate of oxidation. Reaction mechanisms. 46 ref. (R1h, 2-62; Mg-a, 4-53)

300-R. A Review of the Corrosion Behavior of Uranium. James T. Waber. Los Alamos Scientific Laboratory. *U. S. Atomic Energy Commission, La-2035,* Dec. 29, 1958, 45 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Data for dry air and oxygen and for attack by water, water vapor and steam, as well as by moist air and helium. Role of lattice defects in the corrosion mechanism; effects of impurities and test conditions on corrosion rates. 32 ref. (R-general, 3-69, M26s; U)

301-R.* Equipment and Procedure for the Evaluation of Stress Corrosion Susceptibility of a Wrought Copper Base Alloy. G. B. Smith. *Corrosion,* v. 15, Mar. 1959, p. 101t-102t.

Wrought aluminum bronze alloys in stress condition exposed to corrosive vapors at 350° F. (R11s; Cu-b, Cu-s, *Al*)

302-R.* The Corrosion of Zirconium in Hydrochloric Acid at Atmospheric Pressure. W. E. Kuhn. *Corrosion,* v. 15, Mar. 1959, p. 103t-112t.

Corrosion resistance of commercial grade consumable electrode arc-melted Zr in aerated and in boiling aqueous solutions of hydrochloric acids for up to 2000 hr. Influence of mechanical polishing, electrolytic polishing or vacuum annealing on corrosion behavior and formation of oxide and hydride protective films. Film characteristics; corrosion mechanisms. 18 ref. (R6g, 2-64, 3-70; Zr)

303-R.* Corrosion in the Corn Wet Milling Industry. Richard Benes, Fred J. Holsinger and Russell E. Pierson. *Corrosion,* v. 15, Mar. 1959, p. 113t-116t.

Corrosion problems resulting from use of sulphurous acid, sodium hypochlorite, sulphuric acid and hydrochloric acid in corn processing. Application of Type-316 stainless steel, Cu alloys and organic finishing. (R6g, T29p, SS, Cu-b)

304-R.* Cathodic Protection of Process Equipment. *Corrosion,* v. 15, Mar. 1959, p. 123t-124t.

Ten case histories of application of cathodic protection to chemical processing equipment including 316 stainless steel in sodium hypochlorite, lead pipe in barium chloride, mild steel in sodium hydroxide; stainless steel in sulphuric acid, organic acid mixtures; Cu in zinc chloride, in ammonium chloride and in hydrochloric acid. (R10d, T29m)

305-R.* Iso-Corrosion Rate Curves for High-Temperature Hydrogen-Hydrogen Sulfide. E. B. Backensto and J. W. Sjoberg. *Corrosion,* v. 15, Mar. 1959, p. 125t-127t.

Corrosion rates of 0-5% Cr steels and for Cr-Ni austenitic stainless steels in hydrogen-hydrogen sulphide containing up to 10% hydrogen sulphide by volume at temperatures from 500-1400° F. 10 ref. (R6p, R7k, 2-62; SS-e, *Cr, Ni*)

306-R.* Evaluation of Certain Organic Nitrogen Compounds as Corrosion Inhibitors. R. J. Schwoegler and L. U. Berman. *Corrosion,* v. 15, Mar. 1959, p. 128t-130t.

Static water drop tests to evaluate ability of a number of heterocyclic nitrogen compounds in lubricating oil to inhibit corrosion of SAE 1020 steel. Relation of various functional groups and their positions in the molecule to corrosion inhibiting properties. 9 ref. (R10b, R11a; ST)

307-R.* Corrosion Inhibitor Testing Inside Products Pipe Line. Robert H. Meyer. *Corrosion,* v. 15, Mar. 1959, p. 131t-134t.

Tests with four different oil-soluble corrosion inhibitors in a 150-mile section of refined petroleum products pipe line. Data from test coupons, special segments of pipe, product filtration, scraper trap deposits, turbine-type rust tests and roughness factors. (R10b, R7d, T26r)

308-R.* Factors Influencing the Rate-of-Pickling Test on Tin-Plate Steel. R. M. Hudson and G. L. Stragand. *Corrosion,* v. 15, Mar. 1959, p. 135t-140t.

Measurements of time required to produce a uniform rate of attack as indicated by weight loss, hydrogen evolution or corrosion potential of steel specimens in *6N* hydrochloric acid at 90° C. Influence of annealing atmospheres, cleanliness of steel and time-temperature cycles. Variation in lag time with concentrations of certain elements on steel surface. 7 ref. (R6g, R11a; ST, 8-62, *Sn*)

309-R.* High Temperature Oxidation of Chromium-Nickel Steels. D. Caplan and M.

Cohen. *Corrosion*, v. 15, Mar. 1959, p. 141t-146t.

Scaling of austenitic stainless steels Type 302, 309 and 330 at 1600-2000° F. X-ray diffraction, spectrographic and metallographic examination of scales. (R1h, R2q, 2-62; SS-e)

310-R.* Comparative Corrosion Resistance of 200 and 300 Series Stainless Steels in Chemical Manufacturing Processes. A. C. Hamstead and L. S. Van Delinder. *Corrosion*, v. 15, Mar. 1959, p. 147t-157t.

Results of laboratory and field tests covering a variety of chemical manufacturing processes. Effect of sensitizing heat treatment on susceptibility to intergranular attack. 12 ref. (R6, R7, R2h, 2-60; SS)

311-R.* Control of Internal Corrosion of Petroleum Products Pipelines With Oil Soluble Inhibitors. Maurice R. Barusch, L. C. Haskell and Robert L. Piehl. *Corrosion*, v. 15, Mar. 1959, 158t-166t.

Effectiveness of water-soluble and oil-soluble inhibitors in controlling corrosion. Behavior mechanism of oil-soluble corrosion inhibitors. 8 ref. (R7d, R10b, T26r; ST)

312-R.* Growth and Scaling in S. G. Iron. R. J. Maitland and I. C. H. Hughes. *Iron & Steel*, v. 32, Mar. 1959, p. 100-103.

Critical temperatures determined by heating at various temperatures near the critical temperature range, followed by quenching in water. Relation of critical temperature to linear growth and scaling. (Concluded.) (R2q, P10d, 2-61; Fe-b *Si*)

313-R.* Why and How to Use High Alloy Castings. Ernest A. Schoefer. *Modern Castings*, v. 35, Mar. 1959, p. 34-35.

Corrosion and mechanical characteristics, applications. (R-general, Q-general; SS, 5, 17-57)

314-R.* (French.) Problems of Contact Corrosion of Aluminum in Buildings. S. Acimovic, F. Podbreznik and S. Vuckovic. *Alluminio*, v. 27, Dec. 1958, p. 533-540.

Unanodized, anodized, anodized and colored Al sheet of 99.5% purity in contact with steel, galvanized iron, concrete, mortar, plaster, beech and fir woods, polyvinyl chloride and tar paper in 100% humidity chamber and in steam. With exception of polyvinyl chloride and tar paper, all materials studied caused corrosion. (R1a, T26n; Al, 17-57)

315-R.* (Italian.) Mixed Joints of Aluminum and Other Metallic Materials. *Alluminio*, v. 27, Dec. 1958, p. 567-574.

Galvanic couples; metals that can be used in direct contact with Al and Al alloys in saline atmosphere without danger of corrosion; methods of preventing or diminishing contact corrosion; insulating materials; design of insulated joints. 7 ref. (R1a; Al-b)

316-R.* Copper-Nickel-Chromium and Corrosion Protection. A. H. Du Rose and W. J. Pierce. *Metal Finishing*, v. 57, Mar. 1959, p. 44-50, 54.

Quality of electroplating, value of undercoating, validity of tests. 11 ref. (R3, R11j; ST, *Cr, Cu, Ni*, 8-62)

317-R.* (Rumanian.) Effect of Heat Treatment on the Intercrystalline Corrosion of Stainless Steel 20-9 With Titanium. Irina Cornea and Stefan Zamirca. *Studii si Cercetari de Metalurgie*, v. 3, no. 3, 1958, p. 287-294.

Thin sheets quenched after being held at 1050, 1100 and 1150° C. for 10 to 40 min., subjected to annealing at 650° C. with holding times from 30 min. to 8 hr., and then boiled for 72 hr. in $H_2O + CuSO_4 + H_2SO_4$. Susceptibility to intercrystalline corrosion decreases in proportion to the ferrite present. 12 ref. (R2h, 2-64; SS-e)

318-R.* (French.) Effect of Photosynthesis Upon the Corrosion of Steel in Sea Water. A. Hache, L. Barriety and J. Debyser. *Corrosion et Anticorrosion*, v. 7, Feb. 1959, p. 56-61.

Oxygen content in sea water is the decisive factor with regard to steel corrosion. Tests with sea water and with sodium chloride solution indicate that the corrosion of specimens tested is proportional to the concentration of oxygen in sea water or in the solution. 6 ref. (R4b, R1h; ST)

319-R.* (French.) Stress Corrosion Cracking of Austenitic Stainless Steel in Aqueous Magnesium Chloride Solution. T. P. Hoar and J. G. Hines. *Metaux Corrosion Industries*, v. 34, Jan. 1959, p. 36-47.

Experiments on alloy steel wires under tension showed that corrosion cracking may be avoided by cathodic protection. 23 ref. (R1d, R10d; SS-e)

320-R.* (German.) Scale Formation on Hot Rolled Sheets. August Lueth. *Archiv fur das Eisenhuttenwesen*, v. 30, Feb. 1959, p. 71-78.

Scale on sheets in rolled conditions. Sheet scale behavior as affected by annealing in controlled atmosphere. (R2q, F23, 2-64; ST, 4-53)

321-R.* Corrosion Testing and Corrosion Problems in Process of Tall Oil. Harold C. Templeton. *American Oil Chemists' Society, Journal,* v. 36, Mar. 1959, p. 127-129.

Hastelloy C, Inconel and 316 alloy with Mo have good resistance. (R7, R11; SS, *Mo,* Ni-b)

322-R.* Corrosion of Metals Connected to Graphite Components. T. K. Ross. *British Chemical Engineering,* v. 3, July 1958, p. 368-370.

Corrosion resistance of stainless steel, Ni and Ti is excellent while that of mild steel, Pb and Cu is not. (R1a; CN, SS, Cu, Ni, Pb, Ti, C, NM-k36)

323-R.* Wrought Iron Learns New Tricks. R. B. Norden, Editor. *Chemical Engineering,* v. 66, Mar. 9, 1959, p. 172-176.

A. M. Beyer 4-D material shows improved resistance to atmospheric and chemical corrosion. (R-general; Fe-m)

324-R.* High-Nickel Alloys in the Petroleum Industry. Pt. 1. G. L. Swales. *Corrosion Technology,* v. 6, Mar. 1959, p. 81-84.

Corrosion properties of Ni alloys; applications of Ni and Ni alloys. 4 ref. (R-general, T29n; Ni-b, 17-57)

325-R.* Cyclohexylamine for Corrosion Prevention in Steam-Raising Equipment. W. K. Ashcroft and P. N. Heron. *Corrosion Technology,* v. 6, Mar. 1959, p. 85-88.

Neutralization of carbonic acid in boiler water. 9 ref. (R4c, R10b)

326-R.* Resistance of Cobalt to Certain Solutions. R. S. Young. *Corrosion Technology,* v. 6, Mar. 1959, p. 89.

Results of immersion tests with sodium hydroxide, hydrofluoric acid, phosphoric acid and hydrazine. (R-general; Co)

327-R.* Some Fundamental Features of Mechano-Chemical Attack on Metals. T. P. Hoar. *North Atlantic Treaty Organization, Advisory Group for Aeronautical Research and Development, Structures and Materials Panel, 6th Meeting,* Report no. 158, Nov. 1957, 11 p.

Behavior of oxide films under conditions leading to their chemical failure, and under fretting, fatigue and static stress conditions. 5 ref. (R1d)

328-R.* Corrosion Exists in Many Forms. John C. Kuli and John L. McPherson. *Petroleum Engineer,* v. 31, Mar. 1959, p. C6-C11.

Atmosphere, fluid and soil corrosion; hydrogen blistering. (R2n, R3, R8)

329-R.* Calcareous Coatings: Corrosion Engineer's Offshore Ally. Donald M. Taylor. *Pipe Line Industry,* v. 10, Mar. 1959, p. 36-39.

In salt water the protective current builds up a calcareous coating where current density is high. In some ways this "electrocoating" is superior to conventional coatings. 5 ref. (R4b, T26r; ST)

330-R.* (German.) High-Temperature Corrosion of Oil Refining Equipment by Sulfur Compounds. W. G. Richards. *Werkstoffe und Korrosion,* v. 10, Feb. 1959, p. 74-77.

Corrosion of alloy steel (8% Cr content) in hydrogen sulphide at 780° F. amounts to 0.13 in. per year. Increase in Cr to 30% decreases speed of corrosion to 0.01 in. per year. (R7k, T29n, 2-60, 2-62; AY, *Cr*)

331-R.* (German.) Pitting Corrosion of Austenitic High-Alloy Cr-Ni Steels and Ferritic Chromium Steels in Aqueous Halide Solutions. Guenther Pier and Wilhelm Schwenk. *Werkstoffe und Korrosion,* v. 10, Feb. 1959, p. 78-81.

Alloy steels (18 Cr, 10 Ni; 18 Cr, 10 Ni, 2 Mo; 18 Cr, 10 Ni, Ti stabilized; 18 Cr, 10 Ni, 2 Mo, Ti stabilized) investigated in $FeCl_3$, NaCl, H_2SO_4 and KNO_3 by the K_3 $[Fe(CN)_6]$ test. Pitting appears as active-passive reaction. (R2j; SS, *Cr, Ni, Mo, Ti*)

332-R.* (German.) Effect of Organic and Inorganic Bases Upon Corrosion of Aluminum and Aluminum Alloys. A. Bukowiecki. *Werkstoffe und Korrosion,* v. 10, Feb. 1959, p. 91-105.

Comparison of organic and inorganic bases upon Anticorodal AC B, Avional AV-23, Perunal PU V, and Peraluman, indicates a decrease in attack in the range of sodium hydroxide, methylamine, ethylamine, n-butylamine, ammonia, thietanolamine, sodium carbonate, calcium hydroxide and hydrazine. 33 ref. (R6j; Al-b)

333-R. Corrosion in Amine-Type Gas Processing Units. R. A. Graff. *Petroleum Engineer,* v. 31, Mar. 1959, p. C12-C14.

Recommendations for protection of gas refinery equipment. (R7, T29)

334-R. What Trans-Canada Is Doing to Protect Its System Against Corrosion. Lance

F. Heverly. *Petroleum Engineer*, v. 31, Mar. 1959, p. D22-D27.

Pipeline covering 2290 miles is subjected to every type of galvanic corrosion process. Protection is by coating and zinc anodes. (R10d, T26r)

335-R.* Initial Oxidation Rate of Nickel and Effect of the Curie Temperature. H. Uhlig, J. Pickett and J. Macnairn. *Acta Metallurgica*, v. 7, Feb. 1959, p. 111-117.

Nickel foil oxidized for 24-hr. periods at 307 to 442° C. producing NiO films up to 3400 Å maximum. Discontinuity of oxide thickness at Curie temperature explained by an observed work function of Ni. 26 ref. (R1h, 2-62; Ni)

336-R. Mechanism of Stress-Corrosion Cracking. Hugh L. Longan. *U. S. National Bureau of Standards*, STR 2300, n.d., 5 p.

Experiments indicated that stress-corrosion cracking of AZ31B Mg alloy is primarily an electrochemical process and is dependent on strain rate. (R1d; Mg-b)

337-R. Rocket Exhaust Corrosion Simulator. F. B. Cramer. Rocketdyne, North American Aviation, Inc. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151273, Aug. 1957, 138 p. $2.75.

Application of the equipment showed that exposure was uniform from specimen to specimen and that differences could be demonstrated between different surfaces. (R11, X1)

338-R. Oxidation of Experimental Alloys. Pt. 1. J. C. Richmond and H. R. Thornton. National Bureau of Standards. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151264, June 1958, 54 p. $1.50.

Oxidation resistance of Nichrome V and Cb-modified and Al-modified Nichrome V, Inconel, Inconel X and Inconel 702, Hastelloy W and Hastelloy R235, Type 136 stainless steel, and an Fe-Cr-Al alloy. (R1h; SGA-h, Ni-b, SS, Fe-b, *Cr*, *Al*)

339-R.* (Italian.) Electrochemical Study of Inhibitors. Pt. 1. Neutral Solutions of NaCl. Dina Gherard. *Metallurgia Italiana*, v. 51, Jan. 1959, p. 13-20.

Theory of electrochemical action of inhibitors; interpretation of polarization curves. Corrosion potentials, polarization data and weight losses obtained from tests on steel (0.09%C, 0.02% S, 0.102% P, 0.28% Mn) with series of organic and inorganic inhibitors. $K_2Cr_2O_7$ and KNO_2 were most effective of inorganic inhibitors; of others, only Teramin showed any clear inhibitor action, chiefly due to anodic polarization. (R10b, R11m, ST)

340-R.* (Russian.) Corrosion by Condensed Water. I. L. Rosenfeld and K. A. Zhigalova. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 172-174.

Corrosion of low-carbon steel caused by condensed water is influenced by the shape of condensed water (droplets or continuous film) and is promoted by periodical drying and the presence of SO_2 or salts such as NaCl. (R4, R6; CN-g)

341-R.* (Russian.) Long-Time Tests on the Corrosion by Liquid Media Under Elevated Temperatures and Pressures. A. V. Ryabchenkov and V. P. Sidorov. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 204-205.

Testing of three austenitic and one ferritic-martensitic steel. 4 ref. (R11s, 2-62, 3-74; SS)

342-R. Hydrogen Permeation of Zircaloy-2 Corrosion Films. R. F. Boyle and T. J. Kisiel. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 31-48. U. S. Office of Technical Services, Washington 25, D. C.

Determination of the effect of H_2 pressure during normal 750° F. steam corrosion to simulate in-pile failures. Zircaloy-2 with a corrosion film will hydride completely in a pure hydrogen atmosphere and in a hydrogen-steam mixture if the hydrogen-to-steam pressure ratio is greater than 10^4-to-1 when the temperature is 343° C. 12 ref. (R4d; Zr-b)

343-R. Relationship of Cooling Rate to the Corrosion Resistance of Zircaloy-2. L. S. Rubenstein, J. G. Goodwin and F. L. Shubert. Paper from "Bettis Technical Review, no. 10, Reactor Metallurgy". WAPD-BT-10, Oct. 1958, p. 23-30. U. S. Office of Technical Services, Washington 25, D. C.

To maintain high corrosion resistance in Zircaloy-2 and to obtain a weight gain of 28-10 mg. per sq. dm. after a 14-day, 750° F., 1500-psi. steam test, any heat treatment in the beta or the alpha-plus-beta regions should be consummated with a rapid cooling rate through the alpha-plus-beta phase region greater than 90° F. per min. 6 ref. (R4d, 2-64; Zr-b)

344-R.* (French.) Protection Against Stress Corrosion. A. Royez and J. Pomey. *Revue de Metallurgie*, v. 56, Feb. 1959, p. 122-128.

Protection afforded alloy steel tubes by electrodeposition of Zn, Cr, Co, Pb and Cd. (R1e, L17; AY, 4-60, *Zn, Cr, Co, Pb, Cd*)

345-R.* (German.) Corrosion and Protection of Iron and Steel. Heinrich Steinrath and Helmut Ternes. *Stahl und Eisen*, v. 79, Mar. 5, 1959, p. 307-313.

Behavior of recently developed stainless steel with 14% Ni, 12% Cr, 6.5% Cu and 6.5% Mo; atmospheric corrosion at ambient and at elevated temperature; corrosive effects of gases, of sea and fresh water. Passivation of cast iron and steel with HNO_3 in different concentrations. 391 ref. (R-general, R10c; SS, *Ni, Cr, Cu, Mo*)

346-R.* (Italian.) Corrosion Resistance of Stainless Steels. Pt. 2. Stress Corrosion. Giampiero Colombo. *Acciaio Inossidabile*, v. 25, Nov-Dec. 1958, p. 173-185.

Nature of stresses and resulting fractures; examples of stress-corrosion, methods of prevention. 8 ref. (R1d, R10; SS)

347-R. Investigations on "Active Iron". Pt. 1. Isolation. G. V. L. N. Murty. *Metallurgia*, v. 59, Mar. 1959, p. 141-142.

Iron deposited electrolytically under certain conditions appears to have an unusually high chemical reactivity. 10 ref. (R4; Fe)

348-R. How to Design Impressed Current Systems. Pt. 1. James C. Bell. *Pipe Line Industry*, v. 10, Mar. 1959, p. 40-47.

To be continued. (R10d, T26r, 17-51)

349-R.* Influence of Hydrogen Peroxide on the Corrosion of Brass by Acids. M. N. Desai and A. M. Trivedi. *Indian Journal of Applied Chemistry*, v. 21, no. 4, 1958, p. 138-141.

Hydrogen peroxide was found not to favor dezincification of brass, but it leads to dissolution of both Cu and Zn. 10 ref. (R7b; Cu-n)

350-R.* (Japanese.) Resistivity of Beryllium Carbide for Hydrolysis and Oxidation. Yasumichi Oishi, Yoshiteru Hamano and Yachiho Seki. *Osaka Industrial Research Institute, Bulletin*, v. 8, July 1957, p. 159-165.

Oxidation rate in air is less than that of graphite, but poor above 140° C. Hydrolysis in humid air is rapid. 5 ref. (R3; Be, C, NM-a35)

351-R.* Cathodic Protection Applications Using Platinum Anodes. H. S. Preiser. *Platinum Metals Review*, v. 3, Apr. 1959, p. 38-43.

Corrosion properties of Pt, Ta and Ti; application of Pt-clad Ti and Ta as anodes. 15 ref. (R10d; Ti, Ta, *Pt*, 8-66, 17-57)

352-R.* Lead-Platinum Bi-Electrodes. L. L. Shreir. *Platinum Metals Review*, v. 3, Apr. 1959, p. 44-46.

Pb electrodes with small inserts of Pt used for cathodic protection. (R10d; Pb, Pt, 17-57)

353-R.* (German.) Importance of Inhibitors and Passivators in Corrosion Protection. Willibald Machu. *Archiv fur das Eisenhuttenwesen*, v. 30, Mar. 1959, p. 145-152.

Mechanism of the protection of metallic surfaces by inhibitors and passivators. For inhibitors, a pin-cushion shaped structure formed by built up molecules on the surface is assumed. 44 ref. (R10b, R10c)

354-R.* (German.) Problems in Rust Prevention. Hans Hebberling. *Bauingenieur*, v. 34, Jan. 1959, p. 23-24.

Mechanical and chemical derusting, passivating and base painting with red lead. The protective coating hinders the rust-producing local currents. (R10, L26; ST)

355-R.* A High-Temperature X-Ray Investigation on Niobium Pentoxide and Some Problems Concerning the Oxidation of Niobium. H. J. Goldschmidt. *Institute of Metals, Journal*, v. 87, Mar. 1959, p. 235-239.

Phase transformations of columbium (niobium) pentoxide. The total oxidation of initially pure Cb metal is followed in sequence, the isothermal stages extending from solid solution of oxygen in Cb to Cb_2O_5. Preferred orientation can be produced in thin films of alpha Cb_2O_5, as distinct from the random loose oxide. The alpha or beta form of Cb_2O_5 can be stabilized by additions of certain oxides of other metals. 14 ref. (R1h, N7c, M21f; Cb)

356-R. Corrosion Tests on Metallized Coatings. *Welding Journal*, v. 38, Mar. 1959, p. 215-221.

Atmospheric and sea water immersion tests of An and Al coatings on steel. Thickness, 0.003-0.018 in., of both gives protection. (R3, R4b, R11; ST, *Al, Zn*, 8-67)

357-R. Corrosion of Stainless Steel Welds Formed With Carbon Dioxide Shielding. B. E. Hopkinson and D. W. McDowell. *Welding Journal*, v. 38, Apr. 1959, p. 188s-193s.

Compares the effect on weld chemistry and corrosion resistance of weldments made under CO_2 shielding with similar welds made under argon plus 1% oxygen. 10 ref. (R3, K1d, SS)

358-R.* (German.) Wire Rope Corrosion and Prevention. Anton Zastera. *Stahl und Eisen*, v. 79, Mar. 19, 1959, p. 369-370.

Water containing oxygen causes cathodic effect in the outer layer and anodic in the lower having less contact with the oxygen. The electric current produced in these cells accelerates corrosion in addition to chemical factors. Effectiveness of corrosion preventive lubricants. (R1a; 4-61, ST)

359-R. Corrosion Inhibition and Chelating Agents. Norman Hackerman. *Electrochemical Society, India Section, Bulletin*, v. 8, Jan. 1959, p. 9-15.

Mechanism of inhibition by chelating agents. 13 ref. (R10b)

360-R. Using High-Sulphur Fuel Oils. T. J. Wilkinson and D. G. Clarke. *Foundry Trade Journal*, v. 106, Apr. 2, 1959, p. 387-388.

Corrosion and corrosion prevention in generating stations. (R7d, R10, W11)

361-R. Corrosion Problems With Pressure Vessels. Henry Allen. *Petroleum*, v. 22, Apr. 1959, p. 140-143.

Corrosive agents, preventive maintenance, neutralizers and inhibitors. 6 ref. (R-general, T26q)

362-R.* Growth and Scaling Characteristics of Cast Irons in Air and Steam. G. N. J. Gilbert. *British Cast Iron Research Assoc., Journal*, v. 7, Feb. 1959, p. 478-566.

Growth and scaling tests on 35 cast irons in air at 483 to 932° F. for periods up to 64 weeks and in steam at 440 to 800° F. up to 49 weeks. Includes flake-graphite, nodular-graphite and black-heart malleable irons. Tensile and hardness of growth test specimens. Results of short-time high-temperature tensile and impact tests. 6 ref. (R2q, R1h, Q-general, 2-62; CI)

363-R.* Corrosion Problems Associated With Uranium Refining. F. H. Meyer, Jr., F. J. Podlipec and T. R. Kato. *Corrosion*, v, 15, Apr. 1959, p. 168t-170t.

Processing conditions and materials of construction. Corrosion rate of various irons, stainless steel, Ni alloys and Ta exposed to nitric acid, hydrochloric acid and hydrogen sulphide atmospheres. (R6, T29m, C19, SS, CI, Ni-b, Ta, U)

364-R.* Corrosion Rate Measurement by Hydrogen Effusion in Dynamic Aqueous Systems at Elevated Temperature and Pressure. M. Krulfeld, M. C. Bloom and R. E. Seebold. *Corrosion*, v. 15, Apr. 1959, p. 179t-182t.

Apparatus and procedures; corrosion rate in thermal convection loop of SAE 1010 steel by distilled water at 316° C., 2000 psi. and with flow velocity of 1 ft. per sec. Reproducibility of hydrogen effusion rates and comparison with static systems. Corrosion in loop with high flow velocity. 7 ref. (R11a, R4e, 2-62; CN)

365-R.* Minimum Corrosion for Butane Isomerization Units. J. F. Mason, Jr., and C. M. Schillmoller. *Corrosion*, v. 15, Apr. 1959, p. 185t-188t.

Operating conditions of vapor phase and liquid phase process units. Corrosion rate of Ni, Monel, Hastelloy A and Hastelloy B alloys and Ni-Resist cast iron in air-saturated and air-free hydrochloric acid solutions. Influence of acid concentration and temperature. (R6g, R7d, T29n, 2-61; Ni-b, CI)

366-R.* Corrosion of Refinery Equipment by Aqueous Hydrogen Sulfide. Roy V. Comeaux. *Corrosion*, v. 15, Apr. 1959, p. 189t-193t.

Experience with corrosion inhibitors in units employing mild steel condenser tubes. Electrochemistry of corrosion reaction. 6 ref. (R10b, R6p, R7k, T29n; CN)

367-R.* Some Experiments on Internal Oxidation of Nickel Chromium Alloys. H. R. Copson and F. S. Lang. *Corrosion*, v. 15, Apr. 1959, p. 194t-198t.

Oxidation of alloys containing up to 20% Cr and varying amounts of Fe and other elements by exposure to air and dry or wet carbon monoxide at 1750 to 1900°F. Effect of alloy content on penetration of oxides and weight gain. 12 ref. (R2s, 2-60; Ni, *Cr, Fe, Cb, Ti, Mo, Cu, Si*)

368-R.* Identification of Corrosion Products on Copper and Copper Alloys. *Corrosion*, v. 15, Apr. 1959, p. 199t-201t.

Microchemical methods for oxides, chlorides, sulphates, sulphides, carbonates, silica, Ca, Mg, Na, ammonia and

metal constituents. Spectrographic procedure. 5 ref. (R11, S11k; Cu-b)

369-R.* Evaluation of Steam Resistant Coatings for Carbon Steel Hospital Ware. E. G. Bobalek, W. R. R. Park, E. G. Bell and W. R. Dawson. *Corrosion*, v. 15, Apr. 1959, p. 202t-206t.

Performance of 120 commercial coatings exposed for 500 hr. to 20-psi. steam. Protection afforded by steam resistant resinous coatings, Ni plate, porcelain or Al on mild steel sterilizers intermittently exposed to live steam. 7 ref. (R4d, L26n, L26p, 2-62; CN)

370-R.* The Effect of Sigma Phase Vs. Chromium Carbides on the Intergranular Corrosion of Type 316 and 316L Stainless Steel. Pt. 1. Donald Warren. *Corrosion*, v. 15, Apr. 1959, p. 213t-220t.

Service environment and laboratory test solutions causing intergranular corrosion of austenitic stainless steel and relation to presence of chromium carbides and sigma phase. 80 ref. (R2h, R6g, R7, N8r; SS-e)

371-R. Effect of Alloying Additions and Temperature on the Corrosion of Aluminum-Nickel-Iron Alloys in High Temperature Water. G. J. Biefer. *Atomic Energy of Canada Ltd.*, CR-MET-796, July 1958, 26 p.

Small additions of Ti, Zr and Be improve corrosion resistance. The effect of increased Ni and minor additions is additive. The alloy possessing the best corrosion resistance has 2% Ni, 0.5% Fe, 0.2% Si, 0.2% Ti, 0.05% Zr, 0.05% Be. Significance of these data in terms of reactor technology and the mechanism of corrosion. 12 ref. (R4, 2-62, 2-60; Al-b, *Ni, Fe, Ti, Zr, Be, Si*)

372-R.* (French.) Corrosion of Buried Metal Pipe. *l'Industrie Francaise*, v. 8, Mar. 1959, p. 257-261.

Chemical, biochemical and electrochemical corrosion of metal pipes conveying water, vapor, gas, oil and other fluids. Cathodic protection and other preventive measures. (R-general, R10d, T26r)

373-R.* (German.) Corrosion Resistance With Special Reference to Corrosion Fatigue of Nitrided Titanium Steel. M. Tomory. *Periodica Polytechnica-Engineering Series*, v. 2, no. 4, 1958, p. 275-289.

Corrosion coupled with alternating stress causes sharp cracks. Corrosion fatigue strength is increased by internal compressive stresses as in nitrided Ti steel. Corrosion resisting phase of nitrided Ti steel or Cr-Al-Mo steel. 13 ref. (R1e, R10, 2-64, 3-66; AY, *Ti, Cr, Al, Mo*, CN)

374-R. Metallurgy—Important Factor in Corrosion Science. Anton I. Petrovich. *Industrial & Engineering Chemistry*, v. 51, Feb. 1959, p. 73A-74A.

Hydrogen embrittlement and types of stress-corrosion cracking as manifestations of interaction between hydrogen diffusing in the metal, and dislocations. 5 ref. (R1d, Q26s, M26b; H)

375-R.* This Test for Oxidation Resistance. Rod Simenz. *Product Engineering (Design Issue)*, v. 30, Apr. 27, 1959, p. 48-50.

Metallographic examination for subsurface defects, intergranular oxidation and alloy depletion. 6 ref. (R1h, 1-54, R2h, M21c; SGA-h)

376-R.* (German.) Possibilities and Limitations in the Corrosion Protection of Brass. G. Marwedel. *Farbe und Lach*, v. 65, Feb. 1959, p. 64-71.

The porosity of organic protective coatings requires a certain layer thickness. Full protection is afforded by baked-on lacquer. (R10, L26n; Cu-n)

377-R.* (Italian.) Corrosion Behavior of Aluminum by Rain Water Containing Copper and Zinc Salts. G. Luft. *Aluminio*, v. 28, Mar. 1959, p. 115-120.

Over a period of 5 years Cu or Zn sheet was exposed over Al sheet to catch the rain water before it dropped onto the Al. The resultant Cu salts caused strong corrosion while no remarkable corrosion by Zn salts was observed. (R6; Al)

378-R.* (Czech.) Prevention of Intercrystalline Corrosion in Stainless Steel Weldments. Josef Nemec. *Zvaranie*, v. 8, Mar. 1959, p. 74-78.

Heat treatment after welding. Service conditions to which the weldments will be exposed. Methods of testing corrosion resistance. Stabilized filler metals obtained in various automatic welding processes. 15 ref. (R2h; SS-e, 7-51)

379-R.* (German.) Adsorption of Hydrogen in the Dissolution of Iron. L. Cavallaro, G. P. Bolognesi and L. Felloni. *Werkstoffe und Korrosion*, v. 10, Feb. 1959, p. 81-86.

Results from Armco iron sheet samples dissolved in hydrochloric acid indicate a

correlation between the quantity of hydrogen adsorbed from the iron and the dissolution speed. 10 ref. (R6g; Fe)

380-R.* (German.) Effect of Photosynthesis on the Corrosion of Steel in Sea Water. A. Hache, L. Barriety and J. Debyser. *Werkstoffe und Korrosion,* v. 10, Mar. 1959, p. 145-148.

Openhearth steel exposed to sea water and to a 3% NaCl solution with varying oxygen content. Oxygen enrichment (for example, by photosynthesis) increases the pH-value and promotes corrosion. 6 ref. (R4b; ST-e)

381-R. Visual Observation on the Water Stream in an Elevated Temperature High Velocity Loop. R. E. Seebold. *Corrosion,* v. 15, Apr. 1959, p. 183t-184t.

Visual examination of effects of oxygen and oxide coatings on corrosion of low-carbon steel loop by high-velocity water at 316° C. (R4e, X1c, 2-62; CN)

382-R. (German.) Corrosion Testing of Paints With Aerosoles. H. Anders. *Werkstoffe und Korrosion,* v. 10, Mar. 1959, p. 151-152.

Apparatus for short-time testing the corrosion behavior of metals and the corrosion protection by surface treatments and paint. (R11a, 1-53, 8-70)

383-R. Oxidation of Nickel-Cobalt Alloys in the Range of Curie Temperatures. W. W. Smeltzer. *Acta Metallurgica,* v. 7, Mar. 1959, p. 191-198.

Alloy of largest Co content oxidized most rapidly. Proposed that variations are caused by electronic properties of the metal substratum, which influence the rate-determining reaction step of metal ion diffusion through the surface oxide layer. 16 ref. (R1h, 2-62, 2-60; Ni-b, *Co*)

384-R. Are Cathodic Protection Techniques for You? *Chemical Engineering,* v. 66, Jan. 12, 1959, p. 154-158.

Underground sea water pipe protection with Mg anodes. (R4b, R8, R10d, T26r)

385-R.* (German.) Corrosive Behavior of Non-Drying Oils and Greases, With Special Reference to Modern Lubricants and Metal Preserving Agents. Pt. 3. Corrosive Behavior of Non-Drying Oils and Greases Containing Water and Salt. A. Bukowiecki. *Schweizer Archiv,* v. 25, Feb. 1959, p. 62-74.

Corrosive mechanism, literature review, experiments using various oils and greases with additions on Fe, Cu, Pb and Zn. (To be continued.) (R7e; Fe, Cu, Pb, Zn)

386-R.* (Italian.) Corrosion Resistance of Stainless Steels. Pt. 7. Pitting Corrosion. Giampiero Colombo. *Acciaio Inossidabile,* v. 26, Jan-Feb. 1959, p. 5-12.

Mechanism, electrochemical reactions, formation of galvanic couples, passivation, development of attack. (To be continued.) (R2j; SS)

387-R.* Impressions of Russian Corrosion Research. J. B. Cotton and E. C. Potter. *Corrosion Technology,* v. 6, Apr. 1959, p. 117-118.

Report on corrosion conference in Moscow, May 1958. Application of electrochemical kinetic theory to practical corrosion prevention. (R-general, A9)

388-R.* High-Nickel Alloys in the Petroleum Industry. Pt. 2. G. L. Swales. *Corrosion Technology,* v. 6, Apr. 1959, p. 119-124.

Selection of materials for high-temperature applications in refinery and associated petrochemical processes. 11 ref. (R-general, T29n, 2-62; Ni-b)

389-R. The Reactions of Zirconium and Zirconium Based Alloys With Nitric and Nitric-Hydrofluoric Acids. F. S. Martin and B. O. Field. *United Kingdom Atomic Energy Authority,* AERE C/R 2692, Dec. 1958, 14 p.

Explosive reactions observed are not of the detonation type but involve a rapid oxidative reaction between adsorbed or precipitated nitrates and finely divided metal, or metal in a low oxidation state, on the alloy surfaces. Dissolution rates are reported for 5% U, Zircaloy-2 and for Zircaloy-2 in nitric acid-fluoride mixtures and in sulphuric acid catalyzed by ferric ion (R6g; Zr)

390-R. Oxidation of Uranium in Air at High Temperatures. R. K. Hillard. Hanford Atomic Products Corp. *U. S. Atomic Energy Commission,* HW-58022, Dec. 10 1958, 31 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Oxidation rates at furnace temperatures up to 1440° C. The over-all oxidation rate, based on the time required to completely oxidize the specimen, was correlated as a function of furnace temperature and area/weight ratio. From these correlations the over-all rate for any specimen size can be estimated at any temperature near the melting point of U. (R1h, 2-62; U)

391-R.* (French.) Steels and Alloys Resistant to Sulphuric and Hydrochloric Environment. L. Colombier. *Metallurgie et la Construction Mecanique,* v. 91, Mar. 1959, p. 155-162.

Steels and alloys composed of Ni, Mo, Fe, Cr, Si and Cu tested in sulphuric and hydrochloric acid for 1000 hr. at 10-1000° C. (R6g; AY, *Ni, Mo, Fe, Si, Cu*)

392-R.* (German.) Corrosion Protection Inside Hollow Structures. A. Seils and W. Kranitzky. *Stahlbau,* v. 28, Feb. 1959, p. 46-53.

Atmospheric conditions inside hollow structures were registered. Air-tight structures need no inside protective coating while ventilated structures need only a light coating. Zinc dust paint does not impair the welding. 13 ref. (R3; ST)

393-R.* (German.) Potentail-Time Measurements on Oxide-Covered Aluminum Surfaces. St. Bloeck. *Metall,* v. 13, Mar. 1959, p. 196-198.

Test results indicate the possibility of quick detection of oxide layers on the surface of Al and of their resistance to corrosion. Potential measurements are not adequate for the differentiation of particular oxide layers. 6 ref. (R1h, 1-54; Al)

394-R.* Indentation of Metals by Cavitation. W. H. Wheeler. *American Society of Mechanical Engineers,* Paper no. 59-Hyd-15, 1959, 9 p.

Indentations, rupture and corrosion damage of high-purity Fe and Al caused by cavitation in water or toluene. Metallographic techniques; rupture and corrosive oxidation mechanisms. 11 ref. (R2m; Al-a, Fe-a)

395-R.* Evaluation of Corrosion in Diesel Cylinders. J. M. A. Van der Horst and W. Schultze. *American Society of Mechanical Engineers,* Paper no. 59-OGP-2, 1959, 8 p.

Corrosion of Cr plated cylinders in 40-hr. test runs. Corrosion patterns with straight-run emulsified and special-duty lubricants. 22 ref. (R7d, R11a, R10b; Cr, 8-62)

396-R.* (French.) Application of Zinc Anodes in Cathodic Protection. R. Soucke. *Corrosion et Anticorrosion,* v. 7, Mar. 1959, p. 79-82.

Protection of exposed or buried steel structures, tanks and vessels. Zn must be at least 99.996% pure and usually contains trace amounts of Al or Mg. (R10d; Zn-a, *Mg, Al*)

397-R.* (French.) Corrosion and Passivation. U. F. Franck. *Corrosion et Anticorrosion,* v. 7, Mar. 1959, p. 83-97.

The passive state results from very thin films which are formed on the metal surface. The reaction of passivated metals toward corrosion is primarily determined by chemical and electric properties of the film and not by the properties of metal itself. 62 ref. (R10c)

398-R.* (French.) Faraday's Law and Anodic Dissolution of Metals. Michel Froment. *Corrosion et Anticorrosion,* v. 7, Mar. 1959, p. 98-109.

Anodic dissolution of metals by baths containing magnesium perchlorate, ethyl alcohol, perchloric acid, acetic andryhide and sodium chloride aqueous solutions. 14 ref. (R7)

399-R.* (Italian.) High-Temperature Corrosion of Metals by Vanadium Oxide. Pt. 5. Mechanical Properties and Behavior of Fe-Al-Ti Alloys. A. Burdese and S. Gallo. *Metallurgia Italiana,* v. 51, Feb. 1959, p. 65-71.

Effect of increasing Al content on oxidation resistance of Fe in presence of V_2O_5 vapors. Properties compared with those of commercial superalloys, particularly the refractory "Thermenol". Addition of small quantities of Ti and C to Fe-Al alloys simplifies their manufacture and decreases costs, improves forgeability and mechanical properties and produces a finer grain than Mo additions. Ti is partially segregated as a carbide. 24 ref. (R6p, Q27a, Q3, 2-62; Fe-b, *Ti, Mo*)

400-R.* Oxidation Studies on the Iron-Chromium-Aluminum Heater Alloys. Earl A. Gulbransen and Kenneth F. Andrew. *Electrochemical Society, Journal,* v. 106, Apr. 1959, p. 294-302.

Studies on weight gain of alloys and crystal structure and composition of oxide films. Tested adhesion of oxide film to metal by introducing strains into the metal oxide system during oxidation. Showed constant oxidation rate between 900-1050° C., rate increase above 1050° C. 23 ref. (R1h; Fe-b, *Cr, Al*)

401-R.* (French.) Protection of Metals by Corrosion-Resistant Paints. George Nedey. *Nature,* no. 3287, Mar. 1959, p. 112-116.

Protection of metals exposed either to atmospheric conditions (oxygen, water vapor and corrosive industrial gases) or to acid solutions, alkaline or saline. Efficiency of the protection depends on the adhesion of paint to the metal surface and

its impermeability to liquids and gases. (R3; NM-g30)

402-R.* (Polish.) Oxidation at High Temperatures. Stanislaw Mrowiec, Dominik Wajszel and Teodor Werber. *Wiadomosci Chemiczne,* v. 12, Nov. 1958, p. 709-736.
Oxidation in relation to jet engine, gas turbines, chemical apparatus, electric furnaces and nuclear reactor applications. 55 ref. (R1h, 2-62)

403-R. X-Ray Examination of Corrosion Products. R. Scheidegger. *Brown Boveri Review,* v. 45, Nov-Dec. 1958, p. 561-566.
18 ref. (R11a, M21f)

404-R. (French.) Corrosion Research at Cebedeau. Edm. Leclerc. *Metaux Corrosion-Industries,* v. 34, Feb. 1959, p. 81-83.
Research methods at the Centre Belgique d'Eau. 9 ref. (R4)

405-R. Iron-Aluminum Alloy Systems. Comparative Study of Oxidation Resistance in the Fe-Al System. Richard E. Heimerdinger. Ford Motor Co., Scientific Laboratory. *Wright Air Development Center,* Technical Report no. 57-298, Pt. 2, Nov. 1958, 18 p.
Effect of Al (o-16%) on oxidation resistance of Fe-Al alloys at temperatures to 2200° F. and for periods up to 500 hr. The addition of Cr was beneficial only at the 7.50% Cr level. An alloy containing 7.50% Al and 7.50% Cr is recommended for its good oxidation resistance, corrosion resistance and ductility. (R1h, 2-62, 2-60; Fe-b, *Al, Cr*)

406-R.* (Japanese.) Corrosion of Insoluble Lead Anodes in Zinc Sulphate Solution. Yuuichi Imai. *Metal Finishing Society of Japan Journal,* v. 10, Jan. 1959, p. 21-26.
Anodic potential and weight loss of 99.99% Pb, Pb-Ag, Pb-Tl, Pb-Ca, Pb-As and Pb-Sb anodes. Weight loss increases with increasing anodic potential. (R6p, W3r; Pb-b, *Ag, Tl, Ca, As, Sb*)

407-R. Oxidation in Metals. Walter W. Smeltzer and Lyndon H. Everett. *Industrial & Engineering Chemistry,* v. 51, Mar. 1959, p. 406-411.
Review. 196 ref. (R1h)

408-R. Inhibition of the Corrosive Attack of Paint Remover Solvents on Steel. A. Stanley Dalton Materials Laboratory. *Wright Air Development Center,* Technical Note 58-129, Mar. 1959, 14 p.
Corrosivity of typical methylene chloride-base paint remover solvent. Effect of inhibitors. 10 ref. (R10b, R7h; ST)

409-R.* (English.) Corrosion of Iron and Steel in Moving Acid Aqueous Solutions. Saburo Shimodaira and Yoshinobu Sawada. *Electrochemical Society of Japan, Journal,* v. 26, no. 10-12, 1958, p. E-177-E-179.
Rate of corrosion is controlled by diffusion of hydrogen ions above pH 3 and is determined by dissolved oxygen below pH 3. (R6a; Fe, ST)

410-R.* (English.) Rate of Oxygen Consumption by Aluminum in Aqueous Salt Solution. Hiroshi Chiba and Takaski Tanaka. *Electrochemical Society of Japan, Journal,* v. 26, no. 10-12, 1958, p. E-180-E-182.
Rate of consumption in neutral salt solutions measured by polarographic method. Presence of chloride strongly influenced oxygen consumption. (R1h, 1-66; Al)

411-R.* (English.) Cathodic Polarization and Cathodic Corrosion of Titanium in Dilute Sulphuric Acid. Rikuro Otsuka. *Electrochemical Society of Japan, Journal,* v. 26, no. 10-12, 1958, p. E-191-E-194.
Electrochemical and corrosion behavior of Ti; effect of Ti hydride on the surface. 4 ref. (R6g, P15; Ti)

412-R.* Electrochemical Aspects of Stress Corrosion. D. K. Priest. *Electrochemical Society, Journal,* v. 106, Apr. 1959, p. 358-360.
Data and theory which support electrochemical theory of stress-corrosion. 11 ref. (R1d)

413-R.* Ignition of Titanium. *Light Metal Age,* v. 17, Apr. 1959, p. 6-7.
Rapid oxidation occurs when oxygen content and pressure are high and fresh metal surface is exposed. (R1h, 3-74; Ti, Zr)

414-R.* (English.) o-Hydroxyazo Compounds in Basic Baths as Inhibitor for Metallic Aluminum. Yasumasa Hayakawa and Ikuo Ida. *Electrochemical Society of Japan Journal,* v. 26, no. 10-12, 1958, p. E-197-E-199.
Inhibition takes place only in alkaline baths and is caused by the formation of aluminum chelate. 7 ref. (R10b; Al)

415-R. Automotive Corrosion Resistance: Past and Present. Leonard C. Rowe. *Corrosion,* v. 15, Apr. 1959, p. 167t.

Factors responsible for improved corrosion resistance of modern automobiles. (R10, T21a)

416-R. (English.) Flade Potential of Passive Nickel. Go Okamoto, Tetsuo Takaishi and Norio Sato. *Electrochemical Society of Japan, Journal,* v. 26, no. 10-12, 1958, p. E-188-E-190.
11 ref. (R10c; Ni)

417-R. New Alloy N Joins Hastelloy Family. F. S. Badger. *Chemical Engineering,* v. 66, May 4, 1959, p. 162, 164, 166.
Nickel alloy designed as a container for fused chlorides containing uranium. (R6, T11; Ni-b, 17-57)

418-R.* New Alloy Licks Top Corrosion Troubles. *Chemical Week,* Apr. 18, 1959, p. 76, 78, 81.
Addition of 1% Pd to commercially pure Ti produces alloy resistant to reducing environments. (R-general; Ti-b, *Pd*)

419-R.* Oxygen and Carbon Dioxide Corrosion. Paul Brindisi. *Combustion,* Apr. 1959, p. 47-52.
Corrosion by water in steam power plants. (R4c, W11g; O)

420-R.* Internal Cathodic Protection. Pt. 2. Application of Cathodic Protection to the Inner Walls of a Rectangular Box. C. Plumpton and C. Wilson. *Corrosion Prevention & Control,* v. 6, Mar. 1959, p. 49-54.
Theoretical mathematical analysis of current flow of the anodes. (R10d)

421-R.* Studies on the Dry Corrosion of Nimonic 80A by Peat Ash. J. A. Waddams and J. C. Wright. *Metallurgia,* v. 59, Apr. 1959, p. 161-164.
Corrosion of Nimonic 80A in peat ash and synthetic mixtures of sulphates, chlorides, phosphates and silicates at 800° C. in air. X-ray diffraction and metallographic examination of corroded area. (R1h, R2q, R6k; Ni-b, *Cr, Ti, Al, Fe, Co*)

422-R.* Rating Heat Transfer Surfaces for Corrosion. N. D. Groves and C. M. Eisenbrown. *Metal Progress,* v. 75, May 1959, p. 78-81.
A new test can accurately determine weight loss of a metal immersed in a corrosive solution. Specimen and corrodent can be maintained at different temperatures simulating heat transfer conditions. A typical problem in heat exchanger design is solved with curves developed from this test. (R11a, R6g; SS)

423-R.* (English.) Cathodic Protection of Mild Steel and Some Copper Alloys in Agitated Artificially Prepared Sea Water. Hayata Shigeno and Toyoji Kobayashi. *Electrochemical Society of Japan, Journal,* v. 26, no. 10-12, 1958, p. E-175-E-176.
Corrosion and protection of mild steel brass, gun metal and manganese bronze. (R4b, R10d; CN, Cu-n, Cu-s, *Mn, Sn*)

424-R.* (English.) Corrosion of Aluminum Irradiated in Atomic Reactor. Masayuki Kawasaki, Sueo Nomura and Noboru Ito. *Electrochemical Society of Japan, Journal,* v. 26, no. 10-12, 1958, p. E-195-E-196.
Radiation has little effect on aqueous corrosion. (R4, 2-67; Al)

425-R.* (English.) High-Temperature Corrosion of Cast Iron in Sulfur Vapor. Keizo Nishida. *Electrochemical Society of Japan, Journal,* v. 26, no. 10-12, 1958, p. E-205-E-208.
Thickness and structure of the sulphide scale; effect of Al in the cast iron. 9 ref. (R6q, 2-62, 2-60; CI, *Al*)

426-R.* Corrosion of Metals in Synthetic Atmospheres Containing Sulphur Dioxide. B. Sanyal and D. V. Bhadwar. *Journal of Scientific & Industrial Research,* v. 18A, Feb. 1959, p. 69-74.
Each metal requires a minimum humidity for the initiation of corrosion. 9 ref. (R3, R7k; Al, Cu, Ni, ST, Zn)

427-R. Titanium-Palladium Alloys Has Broad Corrosion Resistance. *Chemical Processing,* v. 22, May 1959, p. 158-159.
Addition of 0.1% or less of noble metal to Ti makes it resistant to reducing solutions such as HCl without lessening ability to withstand oxidizing agents. (R6g, R7b, 2-60; Ti-b, *Pd, EG-c*)

428-R. (Translation—ConBur) Kinetics of the Process of Formation of Oxide Films on Tungsten and Molybdenum. V. A. Arslambekov and K. M. Gorbunova. *Academy of Sciences of the USSR, Physical Chemistry Section, Proceedings,* v. 119, Mar-Apr. 1958, p. 151-153.
(R1h; Mo, W)

429-R.* (Translation—ConBur) Atmospheric Corrosion of Irradiated Metals. A. V. Bialobzheskii. *Academy of Sciences of the USSR, Proceedings, Physical Chemistry Section,* v. 119, Mar-Apr. 1958, p. 183-186.

Intensification of the process of atmospheric corrosion results from the fact that the radiation products formed intensify the corrosion current of the microcells by acting as energetic cathodic depolarizers. (R3, 2-67)

430-R.* (French.) Dry Oxidation of Steels and Refractory Alloys at Elevated Temperatures (to 1200° C.) S. Ferre. *Revue de Metallurgie*, v. 56, Apr. 1959, p. 386-394.

Isothermal oxidation tests on 18-8 type steels, Nimonic-type alloys, cobalt-base alloys and other materials such as a TiC-base cermet. Influence of duration of test and composition of alloy on weight increase; intergranular corrosion; classification of materials in order of susceptibility to oxidation. 9 ref. (R1h, 2-62, 6-70; Ni-b, Co-b, SS)

431-R.* (German.) Prevention of Damage in Aluminum Semifinished Products Caused by Condensed Moisture in Transportation and Storage. H. M. Cohen. *Aluminium*, v. 35, Apr. 1959, p. 197-202.

Smooth and polished metal sheet surfaces are more susceptible to corrosion than rough surfaces. Prevention is possible by coating the surfaces with oil and protective grease. 5 ref. (R10e, R10f; Al, 4-53)

432-R.* (Russian.) Effect of Some Inhibitors on Season Cracking in Stainless Steel and Brass. S. A. Balezin, V. V. Romanov and N. I. Podovaev. *Doklady Akademii Nauk*, v. 123, no. 5, 1958, p. 902-905.

Organic inhibitors may completely prevent inner-crystalline structure of an austenite stainless steel in a chlorine atmosphere at elevated temperature. Protection is provided against corrosion and from cracking under stress. This indicates that mechanical factors have a smaller effect during cracking of metals than corrosive factors. (R1d, R10b; SS-e, Cu-n)

433-R. Oxidation and Contamination Reactions of Niobium and Niobium Alloys. William D. Kloop, Daniel J. Maykuth, Chester T. Sims and Robert I. Jaffee. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-1317, Feb. 3, 1959, 62 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.25.

Cb reacts linearly with air at 600 to 1200° C. and with oxygen at 400 to 1400° C. At 1400° C. a very rapid reaction with oxygen is observed. Contamination hardening during oxidation is attributed to diffusion of oxygen into the metal from the predominantly Cb_2O_5 scale. The most effective binary additions for improving oxidation resistance are Cr, Mo, Ti and V. 24 ref. (R1h, 2-60; Cb, *O, Cr, Mo, Ti, V*)

434-R.* (Russian.) Origin and Development of Pitting Corrosion in Iron. T. N. Shavanova, N. I. Fedulova and A. I. Krasil'shchekov. *Zhurnal Fizicheskoi Khimii*, v. 33, Jan. 1959, p. 206-212.

Pitting corrosion is derived from fluctuations of potential due to the thermal motion of the molecules and from the presence of certain conditions facilitating the appearance in the electrode of protracted local potential differences. 16 ref. (R2j)

435-R.* (Russian.) Mechanism of Metallic Corrosion in Cracks and Crevices. Pt. 5. Corrosion of Copper and Copper Alloys. I. K. Marshakov and I. L. Rosenfel'd. *Zhurnal Fizicheskoi Khimii*, v. 33, Jan. 1959, p. 219-223.

In copper and bronze intensified disintegration of the metal lies not in the crevice itself but on the external surface. Severe corrosion in a crack or crevice in Cu and bronze is due to the presence of concentration cells. 9 ref. (R1b, R2k; Cu, Cu-n, Cu-s)

436-R.* (Russian.) Protective Effect of Volatile Corrosion Inhibitors and Anitcorrosive Greases in Tropical Humidity and Temperature. E. I. P. Skorskii and E. M. Il'ina. *Zhurnal Prikladnoi Khimii*, v. 32, Jan. 1959, p. 138-141.

Presence of carbamides or a mixture of carbamide with Na_3N considerably increases the protective ability of grease. A 624-hr. test at a relative humidity of 98% and 63°, a grease containing 2% of barium soap of montanin and 10% of lanolin, produced a corrosion resistant grease. (R10b; NM-b)

437-R.* (Russian.) Protective Action of Corrosion Inhibitor Mixtures in Neutral Atmospheres. A. S. Afans'ev and F. V. Zhuk. *Zhurnal Prikladnoi Khimii*, v. 32, Jan. 1959, p. 141-149.

Effects on atmospheric and underwater corrosion of steel of sodium nitrite, silicon-nitride; triethylamine, sodium triphosphate, emulsions used as corrosion inhibitors. 4 ref. (R10b; ST, NM-b)

438-R. (French.) Corrosion Protection in the Refrigeration Industry. (Continued.) P. Orlowski. *Revue Pratique de Froid*, v. 12,

Feb. 1959, p. 41-43.

(R2r)

448-R.* Palladium Makes Titanium More Resistant to Corrosion. *Modern Metals*. v. 15, May 1959, p. 82.
Improvement in the performance of Ti as a corrosion resistant metal is achieved by small additions of most of the other noble metals—Pt, Re, Ru, Ir, Os, Rh. Mechanical properties are identical with those of unalloyed Ti. (R6g, Q-general, 2-60; Ti-b, *Pd*, SGA-g, *Pt, Re, Ru, Ir, Os, Rh*)

449-R. Evaluation and Control of Sweat Damage. Raymond K. Cohen and Michael Nelson. *Stanford Research Institute*, Technical Report no. 1, May 1, 1958, 123 p.
Evaluation of sweat (condensation) damage to canned goods. Statistical analysis shows that damage claims are increasing and that the increase is related to reduction of weight of the Sn coatings. 91 ref. (R7p, R3p, W12c; ST, *Sn*, 8)

450-R. Reprocessing of Power Reactor Fuels. Third Quarterly Progress Report. Apr. 1 to July 1, 1958. E. I. du Pont de Nemours & Co., Savannah River Laboratory. *U. S. Atomic Energy Commission*, DP-319, Dec. 1958, 15 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.
Zr-clad fuel elements of U-Mo alloy can be dissolved in boiling hydrofluoric-nitric acid mixtures practicably and without excessive corrosion in a dissolver made of wrought 309 Cb stainless steel. (R6g, T11g, A11d; U-b, *Mo*, Zr, 8-66)

451-R. Reprocessing of Power Reactor Fuels. Fourth Quarterly Progress Report. July 1 to Oct. 1, 1958. E. S. Occhipinti. E. I. du Pont de Nemours & Co. Savannah River Laboratory. *U. S. Atomic Energy Commission,* DP-338, Feb. 1959, 12 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.

Studies of reprocessing fuel elements clad with Zr revealed that increased concentrations of nitric acid increases the dissolution rate of Zr in hydrofluoric nitric acid mixtures with concentrations of hydrofluoric acid less than approximately 1.0 molar. (R6g, T11g, Alld; Zr, 8-66)

452-R. Corrosion Resistance and Mechanical Properties of Aluminum Powder Products. J. E. Draley and W. E. Ruther. Argonne National Laboratory. *U. S. Atomic Energy Commission,* ANL-5927, Mar. 1959, 10 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.

Experimental extrusions were prepared from mixtures of atomized Al alloy and several powdered additives, including SiO_2, $AlPO_4$ and Al_2O_3. Some extrusions failed during corrosion testing in water at 290 and 350° C., others corroded in approximately the same manner as wrought X8001 alloy. The ultimate tensile strengths of these extrusions at 316° C. were approximately $2\frac{1}{2}$ times greater than that of wrought X8001 alloy. (R-general, Q-general; Al-b, *Si, O,* 6-72, 4-51)

453-R.* (French.) Conditions of Fixation of Radioactive Sulphur on the Surface of Polycrystalline Iron and Its Relationship to Crystal Orientation. Bernard Le Boucher, Cesar Libanati and Paul Lacombe. *Comptes Rendus,* v. 248, May 4, 1959, p. 2578-2580.

Aqueous or gaseous fixation of S^{35} on surface of Fe at room temperature is influenced by presence of oxygen at the metal surface or in corrosive medium. When the presence of oxygen is minimal, the amount of S^{35} deposited is function of crystal orientation. (R7k, 1-59, 3-72; Fe, S)

454-R.* (German.) Pipe Systems for Conveying Sulphuric Acid. Gert Westhoff. *Industrie-Anzeiger,* v. 81, May 15, 1959, p. 593-595.

Corrosion and passivation behavior of carbon steel, V2A-E, V4A-E and V16A-E steels, Si alloyed cast iron and Pb in the presence of H_2SO_4 of various concentrations. Effects of temperature and flow velocity of acid. (R6g, R10c, 2-61; Cn, AY, CI, *Si,* Pb, 4-60)

Method by which the corrosion of Fe, Al, Zn, Cu in various aggressive media can be tested and the effect of inhibitors studied. Effect of phosphatizing on the corrosion behavior. (R6, 2-62, R10b, L14b; Fe, Al, Zn, Cu)

456-R. (German.) Cathodic Protection by Applied Current and Sacrificial Anodes. H. Kaesche. *Werkstoffe und Korrosion,* v. 10, Apr. 1959, p. 227-239.

Regulation of the current density resulting from sacrificial anodes by adequate screening and surrounding the anode with substances of satisfactory conductivity. Determination of the correct density of applied current. Cathodic protection by electroplating. 33 ref. (R10d)

457-R.* (German.) Corrosion Theory for Titanium. W. R. Fischer. *Werkstoffe und Korrosion,* v. 10, Apr. 1959, p. 243-249.

Effect of potential changes on the corrosion behavior of Ti in various aggressive media. 35 ref. (R1a; Ti)

458-R.* (Japanese.) Materials for Turbo-Jet Engines. Sachio Nishiyama. *Metals,* v. 29, Feb. 1959, p. 120-123.

Resistance to stress corrosion of turbine blades was improved by the development of a 12% Cr steel. Low alloy heat resistive steel H-40 "17-22A" S or "17-22A" V has superior characteristics at high temperature and is protected from oxidation and erosion if it is adequately Ni plated. (R1d, R1h, T24b; SS)

459-R.* (Russian.) Electrochemical Corrosion of Titanium. Pt. 2. Effect of Halide Ions and Electrochemical Behavior of Titanium in Sulphuric Acid. N. D. Tomashov and P. M. Al'tovskii. *Zhurnal Fizicheskoi Khimii,* v. 33, no. 3, 1959, p. 610-616.

Corrosion behavior of Ti is determined by the presence of a protective oxide film on its surface. The halide ions Cl' and Br' in H_2SO_4 acid in air or hydrogen atmosphere have a double effect on the corrosion of Ti in that they activate corrosion in dilute acid solution and retard it in a concentrated acid solution. 13 ref. (R6g; Ti)

460-R. Investigation of Cracks in an 18/13/1 Stainless Steel Autoclave. F. Turner

and H. K. Richardson. *United Kingdom Atomic Energy Authority,* IGR-TN/C-1015, Sept. 5, 1958, 10 p.

A stainless steel autoclave used in the corrosion testing of metals in high-temperature water failed by stress corrosion in the vicinity of a weld. Welding had been done by metallic arc using flux coated electrodes and a slag deposit was found at the weld root in the failed area. The corroding medium was the chloride content of the entrapped slag at the weld root. (R1d, X1a; 7-51, SS)

461-R.* (German.) Corrosion Protection for Tankers Carrying Light Oil. R. H. Maas and R. D. Merrick. *Werkstoffe und Korrosion,* v. 10, May 1959, p. 305-311.

Laboratory and field experiments with water soluble inhibitors, oil soluble inhibitors, on samples of various types of alloy steels and on the cathodic protection of tanks. (R10b, R10d, T26q; AY)

462-R.* (German.) Critical Considerations on the Huey-Test. Herbert Zitter. *Werkstoffe und Korrosion,* v. 10, May 1959, p. 311-321.

Corrosion behavior of steel in boiling 65% nitric acid is not always an adequate criterion for its behavior in other substances. (R6n; SS)

463-R.* (German.) Corrosion Protection by Zinc, Cadmium and Tin Platings on Steel. H. W. Dettner. *Werkstoffe und Korrosion,* v. 10, May 1959, p. 321-326.

Behavior of samples with different plating in the salt-spray test and in industrial and tropical atmospheres. 10 ref. (R3; ST, *Zn, Sn, Cd,* 8-62)

464-R.* (Russian.) Corrosion Resistance of Titanium and Titanium Alloys. D. Mendeleeva. *Khimicheskaya Nauka i Promyshlenost,* v. 3, no. 6, 1959, p. 803-807.

Resistance of Ti to corrosion in media of chlorine, chlorides and weak HCl is greater than that of 18-8 stainless steel. The formation on the surface ot Ti of a thin oxide film, due to its density and uniformity, protects the metal from further interaction with outer media. It is attacked by a number of mineral and organic acids. 23 ref. (R6g, R7b; Ti)

465-R.* (Russian.) Effect of Anhydrous Sulphur Dioxide on Wear of Cast Iron. K. S. Ramaiya and V. S. Zavel'skii. *Khimiya i Tekhnologiya Topliva i Masel,* no. 1, 1959, p. 31-34.

Anhydrous SO_2 gas, at temperatures developed by friction of moving pistons in cylinders of internal combustion engines, cause corrosion of ferrous parts and decrease their resistance to wear. (R7k, Q9n; CI)

466-R.* (Russian.) Intensity of Atmospheric Corrosion of Low Carbon Steel at Below Zero Temperatures. I. P. Kharlmanov and G. N. Mekhovshchikova. *Zhurnal Prikladnoi Khimii,* v. 32, no. 2, 1959, p. 443-444.

Study of low carbon steel, stored in the open air for about one year, with a winter temperature of -35° C. showed that corrosion proceeds slowly at this temperature. Corrosion rate during winter is about three times slower than during spring and summer months. 7 ref. (R3; CN-g)

467-R. Study of Corrosion on Various Metals in the Calcining of Aqueous Radioactive Wastes Containing Zirconium Fluoride and Aluminum Nitrate as Bulk Salts. E. J. Tuthill and R. F. Domish. Brookhaven National Laboratory. *U. S. Atomic Energy Commission,* BNL 510 (T-123) May 1959, 45 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Corrosion rates for Illium G, Inconel X, Haynes 25 and Nionel. (R6g; Ni-b, Co-b, *Cr, W*)

468-R.* (French.) Oxidation of Austenitic Steel at High Temperatures. Jacques Benard, Jean Hertz, Yves Jeannin and Jean Moreau. *Comptes Rendus,* v. 248, Apr. 6, 1959, p. 2095-2097.

Oxidation occurs in three stages. In the initial period oxidation is slow and parabolic and the scale is mostly composed of chromium-rich oxides, $FeCr_2O_3$ and Cr_2O_3; in the second period (rapid oxidation) a strong proportion of the iron oxide, especially of Fe_2O_3 alpha appears close to chromite. In the third period the velocity of oxidation suddenly drops and the reaction comes to an end. (R1h, 2-62; SS-e)

469-R.* (French.) Steels and Alloys With High Resistance to Sulphuric and Hydrochoric Acids. Pt. 2. L. Colombier. *Metallurgie et la Construction Mecanique,* v. 91, Apr. 1959, p. 249-259.

Corrosion resistance, technological characteristics and structure of Hastelloys; applications, particularly in chemical industry. (R6g, T29; Ni-b, SGA-g)

470-R.* (Japanese.) Oxide Films of Copper Alloys at High Temperature. Pt. 2. Takemi-

chi Otsu and Shiro Satoh. *Sumitomo Metals*, v. 10, Oct. 1958, p. 241-245.

Electron diffraction study. Films formed at 500 or 600° C. consist of amorphous aluminum oxide and CuO while films formed at 700° C. are composed of gamma aluminum oxide. (R1h, 2-62; Cu-b)

471-R.* (German.) Pitting Corrosion on Passive Electrodes of Unalloyed Steel in Sulphuric Acid Containing Chlorine-Ions. Hans-Jurgen Engell and Nikolas D. Stolica. *Archiv fur das Eisenhuttenwesen*, v. 30, Apr. 1959, p. 239-248.

Steel electrodes are passivated in 1n H_2SO_4 of 25° C. by a potential of +1750 mV. A lower potential is applied to the electrodes in 1n H_2SO_4 and in the presence of Cl-ions. The increase of dissolution current at a constant electrode potential is due to local attacks on the electrode surface by Cl-ions. (R2j, R10c; ST)

472-R.* (German.) Formation of Internal Oxidation Zones in Silver-Indium Alloys. Isolde Dietrich and Lisl Koch. *Zeitschrift fur Metallkunde*, v. 50, Jan. 1959, p. 31-35.

Internal oxidation of Ag-In alloys. The subscales were produced by annealing in air. Etched or polished samples were studied metallographically. The effect of In concentration, annealing time and annealing concentration on the subscale growth. 9 ref. (R2s; Ag-b, In)

473-R. Mechanism of the Iron-Hydrogen Sulfide Reaction at Elevated Temperatures. Fritz Hugli, Charles M. Hudgins, Jr., and Paul Delahay. *American Petroleum Institute, Proceedings*, v. 38, no. 3, 1958, p. 23-30.

Reaction investigated in the 427 to 760° C. range. The law of attack is linear; the rate depends on the partial pressure of hydrogen which acts as a diluent; hydrogen can be replaced by helium at the same partial pressure, the rate remaining unchanged (not near equilibrium). 34 ref. (R7k, 2-62; Fe, *S*)

474-R. Study on Oxidation Resistance of Zirconium. Jin-ichi Takamura and Yasuo Sasaki. *Kyoto University, Engineering Research Institute, Technical Reports*, v. 9, Mar. 1959, 16 p.

23 ref. (R1l; Zr)

475-R. Stress-Corrosion Fracture. Notes from Papers Presented at a Technical Conference on Physical Metallurgy of Stress-Corrosion Fracture, Sponsored by A.I.M.E., Pittsburgh, Apr. 1959. *Metal Progress*, v. 75, June 1959, p. 143-144, 149A, 150, 152, 154, 156.

Concise digests of 14 papers. (R1d)

476-R. Atmospheric Corrosion Resistance and Metal Coatings. John H. Nicholls. *Product Finishing*, v. 12, May 1959, p. 65-67.

Process of depositing Sn on a layer of Cd already present on the steel base. (R3, R10, L17; Sn, Cd, ST)

477-R.* (German.) New Physical and Chemical Properties of High-Purity Metals. G. Chaudron. *Galvanotechnik*, v. 50, Apr. 15, 1959, p. 203-205.

Al and Fe investigated after refining by electrolysis and heating in pure hydrogen, or produced by zone melting. Different behavior of refined and of high-purity metals (after zone melting or heating in hydrogen) in the presence of corrosive agents. (R7b, C23p, C28k; Fe-a, Al-a)

478-R.* (German.) Effect of Degree of Purity on Properties of Aluminum. P. Brenner. *Galvanotechnik*, v. 50, Apr. 15, 1959, p. 205-209.

Al shows an increase in corrosion resistance in proportion to an increase in its purity. The influence of Si additions is very small compared with that of Cu. Zn up to 0.4% does not affect the corrosion resistance of Al. Stress-cossosion of Al-Zn-Mg alloys may be diminished by heat treatment, retarded cooling, and additions of Cr and V. (R2h, R1d, 2-60; Al-a, Al-b, *Zn, Cu, Cr, V, Si*)

479-R.* (German.) Corrosion Under Alpha-Particle Irradiation. K. Lintner. *Galvanotechnik*, v. 50, Apr. 15, 1959, p. 211.

Effect of radiation on corrosion resistance to steam at 50° C. in Al and Al alloys. (R4d, 2-67; Al, SS)

480-R.* (German.) Effect of Cations on Stress-Corrosion of Aluminum Alloys. H. Spindler. *Galvanotechnik*, v. 50, Apr. 15, 1959, p. 211-213.

Stress-corrosion resistance of $AlMg_7$ and Al-Cu-Mg alloys tested in various aqueous solutions of metal chlorides. The composition of distilled water used proved very important in that even slight changes in the content of metal ions showed strong effects. Chlorides of alkali metals, alkaline earth metals and earth metals do not cause stress-corrosion unlike chlorides of Cu, Hg, Fe, Co, Ni, Sn, Pb and Cd. (R1d, Al-b, *Mg, Cu*)

481-R. (Ukrainian.) Corrosion Resistance of Borides of Columbium, Tantalum and Tungsten. K. D. Modylevskaya and G. V. Samsonova. *Ukrainskii Khimicheskii Zhurnal, Akademii Nauk Ukrainskoi SSR,* v. 25, Jan. 1959, p. 55-61.

Borides of Cb, Ta and W have a high resistance to acid and caustic soda corrosion at room temperature. 6 ref. (R-general; Cb, Ta, W, 14-68)

482-R. (Ukrainian.) Effect of Urotropin on Corrosion of Steel. A. S. Afanas'ev, A. P. Brynza and L. I. Gerashutina. *Ukrainskii Khimicheskii Zhurnal, Akademii Nauk Ukrainskoi SSR,* v. 25, Jan. 1959, p. 73-80.

Urotropin (hexa-methylene-tetramine) in weak concentrations is an anodic inhibitor of acid corrosion, while in strong concentrations it stimulates corrosion. Corrosion losses in 0.2N H_2SO_4 of an oxidized and scale-covered steel were considerably decreased by the use of urotropin as an acid inhibitor. 8 ref. (R10b; ST)

483-R.* (French.) Chemical Attack and Oxidation of Oriented Surfaces of Germanium Single Crystals. L. Gouskov and N. Nifontoff. *Comptes Rendus,* v. 248, Mar. 9, 1959, p. 1499-1502.

Microstructure of the faces corresponding to the (001), (110) and (111) planes of Ge single crystals following corrosion by a solution of H_2O_2. (R1h, M27; Ge, 14-61)

484-R.* (Japanese.) Study of Corrosion Fatigue. S. Okamoto and H. Kitagawa. *Japan Society of Mechanical Engineers, Journal,* v. 62, Feb. 1959, p. 204-213.

SS41 steel corroded by water or salt spray and then examined by bending, tension and load tests. (R1e; AY)

485-R.* (Russian.) Mechanism of Metal Corrosion in Narrow Cracks and Crevices. Pt. 4. Magnesium and Magnesium Alloys. I. L. Rosenfeld and I. K. Marshakov. *Zhurnal Fizicheskoi Khimii,* v. 33, no. 2, 1959, p. 411-415.

Metals are subjected to more severe corrosion in cracks than in a conventional electrolyte, the corrosion assuming a more clearly expressed local character. 4 ref. (R1b; Mg-b)

486-R.* (Pamphlet.) Three-Year Interim Report of Corrosion Tests on Metallized Coatings. 7 p. Dec. 1958. American Welding Society, 33 W. 39th St., New York 18, N. Y.

Corrosion protection afforded by metallized Zn and Al coatings applied to low-carbon steel. Data on atmospheric and salt spray testing. (R11j, R3; Zn, Al, 8-67)

487-R.* (Translation—AIP.) Electron-Diffraction Study of the Oxidation of Aluminum Alloys. Iu. D. Chistiakov and M. V. Mal'tsev. *Soviet Physics, Crystallography,* v. 2, no. 5, 1958, p. 620-625.

Effect of additions of Be, Li, Ca, Sr, Ba and Mg on oxidation of Al alloys. 10 ref. (R1h, 2-60; Al-b, *Be, Li, Ca, Sr, Ba, Mg*)

488-R. (Translation—BISI no. 1148.) Stress Corrosion Tests on Mild Steel. A. Hache. *Revue de Metallurgie,* v. 55, July 1958, p. 656-675.

See item 54-R, 1959. (R1d, R3, R4; CN)

489-R.* The Corrosion-Resistance of Welded Nickel-Molybdenum Alloys. G. N. Flint. *Institute of Metals, Journal,* v. 87, May 1959, p. 303-310.

Welded Ni-Mo-Fe alloys of normal commercial purity suffer intergranular corrosion in the zones adjacent to the weld metal when in contact with many industrial media. This susceptibility arises from the presence of carbides precipitated at grain boundaries during cooling after welding. Additions of V and Cb prove beneficial. 9 ref. (R2h; Ni-b, *Mo, Fe,* 7-51)

490-R.* Corrosion Characteristics of Types 304 and 304L Weldments. M. W. Marshall. *Welding Journal,* v. 38, June 1959, p. 247s-250s.

Small amounts of carbides which precipitate in heat affected zones alongside welded joints can adversely affect their performance. This is true with carbon as low as 0.04%, and especially where service conditions are of unknown severity. 7 ref. (R-general, 2-60; SS, 7-51, *C*)

491-R.* Weld Corrosion in Type 316 and 316L Stainless Steels and Related Problems. M. E. Carruthers. *Welding Journal,* v. 38, June 1959, p. 259s-267s.

Weld corrosion deficiencies are overcome by post annealing or stabilizing heat treatment. Preferential attack at delta-ferrite boundaries was associated with all the weld failures studied. Heat affected zones in Type 316 sheets and plates failed by intergranular corrosion in several cases. (R6g, R2h, 2-64; SS, 7-51)

492-R.* Duplex-Type Nickel Plate Protects Zinc Die Castings. *Iron Age,* v. 183, June 11, 1959, p. 132-133.

Plating process adjusted to specific operating conditions to maintain required brightness and adhesion. With semi-bright Ni, corrosive materials do not penetrate or corrode. (R3, L17; Zn-b, *Ni*, 5-61)

493-R.* (French.) Study of Stress-Corrosion of 18-8 Type Austenitic Steels. Joseph Hochmann. *Comptes Rendus*, v. 248, May 25, 1959, p. 2999-3000.

Study of influence of surface condition on corrosion resistance. Pickled and polished specimens broke after periods of time ranging from 2 to 24 hr. No cracking was noted in sand-blasted specimen after 150 hr. (R1d; SS)

494-R. (Russian.) Emission of Electrons and Hydrogen Peroxide Formation in the Corrosion of Metals. I. L. Roich. *Zhurnal Fizicheskoĭ Khimii*, v. 33, no, 2, 1959, p. 288-293.

The relationship of electron emission and H_2O_2 formation in the oxidation of Al. 22 ref. (R1h, 2-67; Al)

495-R.* The Corrosion Resistance of Aluminium and Aluminium Alloys. F. C. Porter. *Corrosion Prevention and Control*, v. 6, May 1959, p. 36-44.

Atmospheric resistance, chemical resistance, effective physical factors, contact with other materials, mechanical and design factors, methods of protection, and Al as a coating metal. 17 ref. (R-general; Al)

496-R.* The Passivation of Iron and Steel in Chromate Solutions. A. H. Kingsbury. *Australian Institute of Metals, Journal*, v. 4, May 1959, p. 12-18.

It is suggested that both chromate ion adsorption and oxide film formation take part in the passivation process. A layer of chromate ions is first adsorbed onto the surface. This adsorbed layer obstructs the electrode processes involved in corrosion and acts as a reservoir of oxidants in intimate contact with the surface and as a shield against ions which could interfere with the orderly growth of an oxide film beneath it. Oxidation by chromate ions (and oxygen in aerated solution) then proceeds under the adsorbed layer. 27 ref. (R10c; ST, Fe)

497-R.* Latest Developments in Materials to Resist Chemical Corrosion. Spencer W. Shepard. *American Society of Mechanical Engineers*, Paper no. 59-MD-7, 1959, 13 p.

Availability, fabricability, mechanical properties and corrosion resistance of stainless steels, cast irons, Al, Ni, Cb, V, Mo, Ti, Mg, Zr, U and Cu alloys. Plastics, cermets and organic, ceramic and metallic coatings. 100 ref. (R6, R7, L-general, Q-general; SGA-g)

498-R.* (German.) Scaling of Pure Iron-Silicon Alloys in Oxygen. Norbert G. Schmahl, Hans Baumann and Hermann Schenck. *Archiv fur das Eisenhuttenwesen*, v. 30, May 1959, p. 267-273.

Scaling of Fe-Si alloys was tested on specimens with Si content varying from 0.03-3.63% by melting in crucibles of pure silica under an argon atmosphere. A considerable decrease in the logarithms of scaling constants appeared above 1% Si. 30 ref. (R2q; Fe-b, *Si*)

499-R.* (German.) Adherence of Scale on Steel. Friedrich-Karl Peters and Hans Juergen Engell. *Archiv fur das Eisenhuttenwesen*, v. 30, May 1959, p. 275-282.

Effect of scale thickness, chemical composition of steel and oxidizing temperature on the adhesive strength. Increase in the thickness of scale layer is accompanied by a decrease in the adhesive strength. 21 ref. (R2q, 2-60; ST)

500-R.* (German.) Effect of Corrosion Produced by Aqueous Solutions of Hydrogen Sulphide on the Stress-Corrosion Cracking of Steel. Friedrich Karl Naumann and Wolfhard Carius. *Archiv fur das Eisenhuttenwesen*, v. 30, May 1959, p. 283-292.

Atomic hydrogen separates during cathodic reaction. This separation is not caused by ions discharge but results directly from the reduction of dissolved hydrogen sulphide molecules. 19 ref. (R1d, Q26, R11m; ST)

501-R.* (German.) Intergranular Corrosion of Austenitic Chromium-Nickel Steel After Long-Time Stress Between 450 and 800° C. Hans Joachim Wiester and Guenther Pier. *Archiv fur das Eisenhuttenwesen*, v. 30, May 1959, p. 293-297.

Resistance to intergranular corrosion of 11 high-alloy austenitic Cr-Ni steels with 18% Cr and 9% Ni, with or without Ti or Cb; 18% Cr, 10% Ni and 2% Mo, with or without Ti or Cb; 16% Cr, 13% Ni with Mo, V and Cb; 16% Cr, 16% Ni and 2% Mo with Cb, was tested after quenching from various temperatures between 950 and 1300° C. and after heat treatment. (R2h, 2-64, 2-60; SS-e, *Cr, Ni, Mo, V, Ti, Cb*)

502-R.* (German.) Precipitation in Austenitic Chromium-Nickel Steels and Its Effect on Intergranular Corrosion. Hans Joachim Wiester, Hans-Jurgen Schueller and Paul Schwaab. *Archiv fur das Eisenhuttenwesen,* v. 30, May 1959, p. 299-309.

Electron microscopic and electron diffraction investigation of precipitation and the tendency to intergranular corrosion of two austenitic Cr-Ni steels. Intergranular corrosion susceptibility is always connected with the appearance of chromium carbides $M_{23}C_6$ on grain boundaries. 29 ref. (R2h, N8r; SS-e)

503-R.* (German.) The Tantalum-Oxygen System. Erich Gebhardt and Hans-Dieter Seghezzi. *Zeitschrift fur Metallkunde,* v. 50, May 1959, p. 248-257.

Ta was oxidized by pure oxygen at 700-1420° C. under pressure. Three simultaneous reactions occur—formation of an outer oxide layer of Ta_2O_5, growth of an oxide subscale of laminated structure in cubic Ta and dissolution of oxygen in Ta. 33 ref. (R1h; Ta)

504-R. Internal Cathodic Protection. Pt. 3. The Application of Cathodic Protection to the Inner Walls of a Long Pipeline of Circular Cross-Section. C. Plumpton and C. Wilson. *Corrosion Prevention & Control,* v. 6, May 1959, p. 53-58.

(R10d, T26r; ST)

505-R.* (Italian.) Solubilization of Arsenic, Lead and Antimony Contents of Tin. Giulio Milazzo. *Chimica e l'Industria,* v. 41, Feb. 1959, p. 128-131.

Possibility of contamination of toxic elements present in Sn of process food containers investigated in Sn-As, Sn-Sb and Sn-Pb alloys, using H_2SO_4, NaOH, tartaric, citric and oxalic acids in solution. As and Sb did not pass into solution while Pb did in small quantities. 8 ref. (R7n; Sn, Pb, Sb, As)

506-R.* Oxidation Kinetics in the Case of Ageing Oxide Films. J. L. Meijerling and M. L. Verheijke. *Acta Metallurgica,* v. 7, May 1959, p. 331-338.

The cubic relationship for the oxidation of CuO in the 800-1000° C. range is confirmed together with the abnormally low temperature coefficient of the rate constant. Experiments show that aging effects in the CuO layer must be responsible for this behavior. Calculations of the oxidation kinetics are given for the case when the permeability (or its reciprocal) of the oxide formed changes exponentially with age. 20 ref. (R1h, N7a; Cu)

507-R.* (German.) Pitting Corrosion of Austenitic Chromium-Nickel Steels. H. Graefen. *Metalloberflache,* v. 13, June 1959, p. 161-166.

Boiling experiments, measurement of potential-time and amperage-voltage curves. Development of pitting corrosion and its relationship to stress and intergranular corrosion. 10 ref. (R2j, R2h, R1d; SS-e)

508-R.* (German.) Corrosion of Boilers. K. Kovacs. *Metalloberflache,* v. 13, June 1959, p. 167-168.

Steam corrosion lowers the resistance of steel surfaces to further development of corrosion. Protective layer of magnetite is formed only up to 570° C. and is then replaced by wustite which has a reduced protective capacity. 5 ref. (R4d, T26q; ST)

509-R. Thorex Plant Corrosion Studies: Pt. 1. Corrosion of Types 304L and 309SCb Stainless Steel During Production and Development Periods. J. L. English. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission,* ORNL-2673, May 12, 1959, 73 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.25.

Both types of steel exhibited comparable corrosion resistance in all environments. The area of most severe corrosion attack was the vapor phase of the feed adjustment tank operated at 155° C. maximum. (R6g; SS)

510-R.* The Effect of Sigma Phase vs. Chromium Carbides on the Intergranular Corrosion of Type 316 and 316L Stainless Steel. Pt. II. Donald Warren. *Corrosion,* v. 15, May 1959, p. 17-28.

Tests of steels in 14 different acids including nitric, nitric-hydrofloric and weaker acids. 10 ref. (R2h, R6g; SS)

511-R.* Summary of Questionnaire—Replies on Corrosion in HF Alkylation Units. *Corrosion,* v. 15, May 1959, p. 33-36.

Study of corrosion of various component parts in terms of uniform corrosion, pitting, grooving, weld decaying, hydrogen attack and stress-corrosion cracking. 14 ref. (R1d, R2j, T29n)

512-R.* Corrosion Prevention in Tankers and Storage Tanks by Fogging or Flotation With an Inhibitor Solution. J. C. D. Oosterhout, M. E. Stanley and W. S. Quimby. *Corrosion,* v. 15, May 1959, p. 37-40.

Proper amount of inhibitor for flotation, proper fogging procedure, time and dispersant. 8 ref. (R10b)

513-R.* Study of Chemical Factors Affecting Corrosion of Carbon Steel AISI 1020 by Liquid-Phase Fuming Nitric Acid. John B. Rittenhouse and David M. Mason. *Corrosion,* v. 15, May 1959, p. 41-46.

Corrosion rates obtained by measuring change in electrical resistance of the tube with time. Rates decreased with increasing nitrogen dioxide concentration and with increased water content. Passivity was produced by the formation of an oxide layer. 25 ref. (R6g; CN)

514-R.* Laboratory Methods for Determining Corrosion Rates Under Heat Flux Conditions. A. O. Fisher and F. L. Whitney, Jr. *Corrosion,* v. 15, May 1959, p. 53-57.

Comparison of three techniques prove advantage of a modified disk-heat flux technique. Skin temperature of metals is major controlling factor in corrosion, not the amount of heat flowing through the metal. (R6, R11)

515-R.* Influence of Temperature on Corrosion Fatigue. I. Cornet and Simcha Golan. *Corrosion,* v. 15, May 1959, p. 58-64.

Test equipment, results from two types of steel between 80 and 180° F. in 2.5% NaCl solution. Better corrosion fatigue properties exist at 180° F. than at room temperature. 32 ref. (R1e, 2-61; ST)

516-R.* Erosion of Materials by Cavitation Attack. D. Peckner. *Corrosion,* v. 15, May 1959, p. 65-70.

Relationship between cavitation attack and erosion, with causes and possible mechanism of cavitation attack. Various test methods and relative erosion resistance of several alloys. 36 ref. (R1c, R2m)

517-R.* Acetylenic Alcohol-Inhibited Pickling Bath as a Pretreatment Prior to Linding Steel Pipe. K. N. Edwards, L. J. Nowacki and E. R. Meuller. *Corrosion,* v. 15, May 1959, p. 71-74.

Bath provides substrate which increases corrosion inhibitation of epoxy-phenolic system. Effects of various metal surface pretreatments and effect of Zn. 14 ref. (R10b, L12g; ST, 4-60)

518-R.* (German.) Choice of Materials for Corrosion Resistant Welded Constructions: Stainless Steels of Low Carbon Content or Stabilized Steels. Gunnar Lilljekvist. *Chemische Rundschau,* Beilage 3, v. 12, June 1, 1959, p. 313-316.

Corrosion behavior of various Ti and Cb- stabilized and unstabilized 18-8 Cr-Ni-steels, with low carbon content, in 6% HNO_3. Corrosive attack, together with the formation of carbides during welding, are influenced by carbon content. Stabilized steels have slightly higher mechanical properties. (R-general, K-general, 2-60; SS, *C, Cb, Ti,* 7-51)

519-R.* (German.) Chromic Acid Passivation of Zinc With the Chromic Acid Ester of Tertiary Butyl Alcohol. L. Cerveny. *Czechoslovak Academy of Science, Collection of Czechoslovak Chemical Communications,* v. 24, May 1959, p. 1400-1407.

Samples of galvanized steel sheet exposed to vapors of the passivation agent under reduced air pressure. Corrosion resistance depends on the time the samples are exposed to the agent. 24 ref. (R10c; ST, 8-62, *Zn*)

520-R.* (German.) Corrosion by Washing Compounds, With Special Reference to "Syndets". H. Stupel and F. Koch. *Seifen, Ole, Fette, Wachse,* v. 85, May 27, 1959, p. 311-315.

Corrosive effects of soaps and washing compounds on stainless steel, copper, brass, bronze, Sn, Zn, Al and other alloys. (R7p; SS, Cu, Cu-s, Cu-n, Sn, Zn, Al-b)

521-R.* (German.) Effect of Inhibitors on the Corrosion of Iron. H. Grubitsch and T. Sneck. *Teknilisen Kemian Aikakauslihti (Helsinki),* v. 16, Apr. 15, 1959, p. 203-216.

In a cell with a diaphragm between anode and cathode, a steady current of nitrogen is supplied to the anolyte while an air current bubbles through the catholyte. Urotropine acts in neutral electrolytes as an anodic inhibitor and, in acids, as a cathodic inhibitor. 16 ref. (R10b; Fe)

522-R.* (German.) Nuclei Formation in Supersaturated Salt Solutions During the Anodic Passivation of Cadmium, Zinc and Lead. W. Lorenz. *Zeitschrift fur Physikalische Chemie,* v. 20, Apr. 1959, p. 95-102.

Experiments with electrodes in dilute H_2SO_4 and HCl. Relationships between the concentration of metal salt in solution and anodic passivation. (R10c; Cd, Zn, Pb)

523-R.* (Hungarian.) Scale Resistant Alloys. R. Radtke. *Kohaszati Lapok,* v. 14, May 1959, p. 127-131.

Ferritic-base cast alloys in relation to scale formation. The influence of various alloying elements is defined. Si is claimed to have a good effect on scale prevention. Protective layers of spinell-structure are recommended. (R2q; CN, 2-60)

524-R.* (French.) Biological Factors Influencing Sea Water Corrosion. Bernard Callame. *Corrosion et Anticorrosion,* v. 7, May 1959, p. 173-177.

Oxygen enrichment and elevation of the pH-number by the photosynthesis of green plants. Reduction of oxygen content and of the pH-number by animal metabolism. Formation of H_2S and CO_2 and hydrogen consumption by anaerobes. (R4b)

525-R.* (French.) Sea Water Resistant Steels. M. Thivin. *Corrosion et Anticorrosion,* v. 7, May 1959, p. 195-202.

Corrosion resistance of a low-alloy steel and martensitic, austenitic-ferritic and austenitic stainless steels increases with the Cr and Mo content. Austenic-ferritic steels showed best results. Behavior of steel in the presence of bronze. (R4b, 2-60; AY, SS, *Mo, Cr,* Cu-s, SGA-g)

526-R.* (French.) Corrosion Protection by Paint and by Galvanizing. P. Morisset. *Corrosion et Anticorrosion,* v. 7, May 1959, p. 203-220.

555-R.* (German.) Oxidation of Iron-Molybdenum Alloys by Air at Elevated Temperatures. Alfred Rahmel, Willi Jager and Klaus Becker. *Archiv fur das Eisenhuttenwesen,* v. 30, June 1959, p. 351-360.

Retarding effect of Mo content on oxidation. Composition of surface layers after oxidation at different temperatures. 41 ref. (R1h, 2-60, 2-62; Fe-b, *Mo*)

556-R.* (Report.) Corrosion and Deposits in Coal and Oil-Fired Boilers and Gas Turbines. Battelle Memorial Institute. Report of ASME Research Committee on Corrosion and Deposits from Combustion Gases. American Society of Mechanical Engineers, 29 W. 39 St., New York 18, N. Y. 1959, 198 p.

Mineral constitutents in coal and heavy-fuel oil, and their behavior during combustion; the action of SO_2 and SO_3; physical aspects of deposition; origin and composition of deposits and their prevention; corrosion of metals exposed to combustion gases below 400° F. and removal of solids from combustion gases turbines or air heaters. 349 ref. (R7d, R7k, W11m, T26q)

557-R. (Translation--Brutcher no. 4570.) Change in Corrosion Resistance of Nitrided Stainless Steels. A. G. Andreeva and L. Ya. Gurvich. *Metallovedenie i Termicheskaya*

Obrabotka Metallov, v. 5, Apr. 1959, p. 34-40.

Changes in resistance of nitrided Cr-Ni-W-Mo and Cr-Ni-W steels, depend on the depth of the innermost layer and correspond to the magnitude of electrode potential. There are four zones with definite corrosive properties, each having a corresponding electrode potential. (R-general, J28k; SS, *W, Mo*)

558-R. (Translation--Brutcher no. 4571.) Corrosion of Stainless Steel Welds in Acid Solutions. M. M. Kuptepov and A. S. Gryasanova. *Metallovedenie i Termicheskaya Obrabotka Metallov*, v. 5, Apr. 1959, p. 41-44.

Study of argon-arc welded stainless steel samples hardened at 1050° C., water quenched, stabilized for 3 hr. at 850° C. and air cooled showed that the greatest corrosion resistance was in welds that were not heat treated or hardened. Short-time tempering of heat treated samples considerably increases the corrosion rate. 8 ref. (R6g, 2-60, 2-64; 7-51, SS)

559-R.* Mechanism of Stress-Corrosion Cracking. *Corrosion*, v. 15, July 1959, p. 106-108, 110.

Stress-corrosion cracking in AZ31B Mg alloy in an aqueous solution of 3.5% sodium chloride plus 2.0% potassium chromate. Specimens immersed in the corrodent and extending at an average rate of 500 ± 100 micro-in. per in. per min., one min. after the stress was applied generally failed within 5 min. For slower rates, specimens did not fail in 1000 min. Cracking was stopped by application of a cathodic current of 0.5 milliamp. per sq. cm. of exposed area. (R1d, Q26q; Mg-b)

560-R.* Comparisons of Wagner's Analysis of Cathodic Protection With Operating Data for Ships. J. H. Greenblatt. *Corrosion*, v. 15, July 1959, p. 339t-340t.

The predicted values of the key parameters in Wagner's analytical expression for the conditions for cathodic protection are compared with values found empirically from operating experience in the protection of ships. Agreement is good over certain ranges of the key parameters. Possible reasons are suggested for the occurrence of discrepancies in values. 8 ref. (R10d, T22g)

561-R.* Corrosion Resistance of Titanium and Zirconium in Chemical Plant Exposures. P. J. Gegner and W. L. Wilson. *Corrosion*, v. 15, July 1959, p. 341t-350t.

Ti possesses low or, in many cases, nil corrosion rates in such varied exposures as wet chlorine gas, hypochlorous acid, sodium and calcium hypochlorites, sodium and potassium chlorides, sea water and a number of solutions containing wet chlorine. It is, however, very resistant to many concentrations of calcium chloride, sodium and potassium hydroxides, nitric acid and chlorine-saturated sulfuric acid. Zr shows low corrosion rates in nitric acid, sodium and potassium hydroxides, hydrochloric acid and dry chlorine. 21 ref. (R6, T29; Ti, Zr)

562-R.* Corrosion of Types 316 and 317 Stainless Steel by 75% and 85% Phosphoric Acid. Albert R. Morgan, Jr. *Corrosion*, v. 15, July 1959, p. 351t-354t.

Corrosion rates were found to be considerably affected by acid temperatures and by testing conditions. Plant data showed 316 and 316L to be acceptable only at 100° C. or less. Type 317 proved more resistant than 316L in both pilot and plant tests. Aerated and agitated samples showed lower corrosion rates than stagnant samples. (R6; SS)

563-R.* Mechanism of Stress-Corrosion of Austenitic Stainless Steels in Chloride Waters. R. W. Staehle, F. H. Beck and M. G. Fontana. *Corrosion*, v. 15, July 1959, p. 373t-381t.

Stress-corrosion cracking of austenitic stainless steels studied under various conditions of stress, chloride concentration, complete immersion of specimens, intermittent wetting and drying and presence of oxygen. Stress-corrosion cracking will occur at stresses as low as 2,000 psi. at 50 ppm. NaCl. A three-dimensional analysis of stress-corrosion cracks is presented. 13 ref. (R1d, Q26q; SS-e)

564-R.* Corrosion of Reinforcing Steel in Concrete in Marine Atmospheres. D. A. Lewis and W. J. Copenhagen. *Corrosion*, v. 15, July 1959, p. 382t-388t.

Corrosion reaction proceeds by electrochemical mechanisms whose emf.'s derive from differences in pH, aeration or other factors but whose severity is influenced mainly by presence of sodium chloride in the concrete. Significant factors are cover to the steel, protective coatings to the mortar, and the curing, cement content and water cement ratio of the mortar. 17 ref. (R3p; ST)

565-R.* Cathodic Protection of Lead Cable Sheath. W. H. Bruckner and Ole G. Jansson. *Corrosion,* v. 15, July 1959, p. 389t-394t.

Corrosion of Pb can occur while under cathodic protection when the potential is not sufficiently negative to prevent corrosion in the environment. Corrosion of Pb has also been demonstrated upon cessation of cathodic protection when the environment had a high pH resulting from previous cathodic protection. 4 ref. (R10d, T1b; Pb)

566-R.* (Russian.) Radioactive Tracer Studies of the Corrosion Resistance of Solid Solutions. Pt. 2. Magnesium-Cadmium System. N. N. Gratsianskii and P. F. Kaluzhnaya. *Zhurnal Fizicheskoi Khimii,* v. 33, May 1959, p. 997-1001.

Determination of the formation of a surface layer on Mg-Cd alloys in 0.1N H_2SO_4 by means of radioisotope Rb^{86} Cd^{115} isotope was employed to study corrosion rate. (R6g, R11, 1-59; Mg-b, *Cd,* 14-67)

567-R.* (Russian.) Sodium Salicylate as a Corrosion Inhibitor in Neutral Media. E. V. Bogatyreva and S. A. Balezin. *Zhurnal Prikladnoi Khimii,* v. 22, May 1959, p. 1071-1076.

$Na_7H_5O_3$ retards corrosion in distilled and tap water for many steels. Minimum protective concentrations are given together with optimum temperatures. 7 ref. (R10b, 2-66; CN)

568-R.* (Russian.) Corrosion Resistance of Several Galvanic Alloys Under Conditions of Tropical Heat and Humidity. N. P. Fedot'ev, P. M. Byacheslavov, E. G. Kruglova and S. Ya. Grilikhes. *Zhurnal Prikladnoi Khimii,* v. 22, May 1959, p. 1165-1167.

Double and triple-coated galvanic alloys as well as Zn and Cd coatings proved to be corrosion resistant. Data for Zn-Cd, Sn-Zn, Sn-Cd, Cu-Sn, Cu-Sn-Zn and Cu-Sn-Cd alloys. (R3s; Zn-b, Sn-b, Cu-b, *Cd,* SGA-g)

569-R.* (Russian.) Corrosion of Metals in Thionyl Chloride. V. A. Tomov, Yu. A. Babkin and I. M. Balandin. *Zhurnal Prikladnoi Khimii,* v. 22, May 1959, p. 1167-1169.

E.T. 461 (steel) possesses a high corrosion resistance, the rate being 0.01 mm. per year. An effective and cheaper substitute is provided by 18-8 Cr-Ni-Ti steel possessing high corrosion resistance (0.02 mm. per year) high plasticity, good weldability and high impact strength. (R7p, K9s, Q-general; SS, *Ti*)

570-R. Corrosion Protection Features of the Hyperion Ocean Outfall. Harry J. Keeling. *Corrosion,* v. 15, July 1959, p. 363t-368t.

Planning, design and installation of corrosion protection facilities to provide 100-year design life for a 7-mile, 22-in. steel pipe sewer outfall, the outer end of which is in ocean water 340 ft. deep. 6 ref. (R-general, T26r; ST)

571-R. Pitting Corrosion of Aluminium in Sodium Chloride Solutions. T. Hagyard and J. R. Santhiapillai. *Journal of Applied Chemistry,* v. 9, June 1959, p. 323-330.

Anodic corrosion process in an artificial pit in Al undergoing active corrosion in dilute sodium chloride examined by pH, potential measurements and Schlieren observations. (R2j; Al)

572-R.* Oxidation Resistance of Binary Chromium-Base Alloys. E. P. Abrahamson and N. J. Grant. Paper from "High Temperature Materials". John Wiley & sons, Inc., New York 16, 1959, p. 501-509.

Study of Cr alloyed with elements in groups IV_A, V_A, VI_A, VII_A and VIII. All elements investigated, with the exception of Ir, cause an initial increase in oxidation resistance of Cr. (R1h, 2-60; Cr-b, SGA-h)

573-R.* The Oxidation of Tungsten and Molybdenum From 1800 to 2500° F. J. W. Semmel. Paper from "High Temperature Materials". John Wiley & Sons, Inc., New York, 16, 1959, p. 510-519.

Specimens were tested in dry air flowing at 75 cu.ft. per hr. Mo oxidizes linearly low between 1800 and 2500° F. Oxidation of tungsten undergoes transition from predominantly linear to parabolic oxidation as temperature is increased. 4 ref. (R1h, 2-62; Mo, W, SGA-h)

Complete oxidation and destruction of Ti in media containing oxygen. The oxide layer is dissolved by the metal reaching melting temperature as a result of the oxidation process. (R1h, 2-66; Ti)

616-R. Carbon Steel Has Its Problems, Too: When Piping Steam at 800° F. *Heating, Piping & Air Conditioning*, v. 31, June 1959, p. 108-111.

Graphite formation is not limited to carbon-molybdenum material but also occurs in carbon steel piping at even lower operating temperatures. (R4d, N8s; CN, 4-60)

617-R.* TTS Diagram for Types 304L and 316L Stainless. Hilmer F. Ebling and Merrill A. Scheil. *Metal Progress*, v. 76, Aug. 1959, p. 87-91.

Studies of three types of widely used stainless steels after being reheated or aged for varying times at various temperatures show that their corrosion rates vary widely, and that true "stabilization" may be impracticable by commercial heat treatments. (R11, R2h; SS)

618-R.* (French.) Corrosion Resistance in Marine Atmosphere of Metal Specimens and Parts Protected With Metallized Zinc Coating. J. Cauchetier. *Corrosion-Anticorrosion*, v. 7, June 1959, p. 261-264.

Metallized Zn provides excellent protection for parts and structures continually above or below water. Supplementary measures of various kinds are needed for surfaces subjected to alternating action of salt water and air. (R3p, R4b; ST, Cu, Fe, 8-67, *Zn*)

619-R.* (Italian.) Corrosion Resistance of Stainless Steels. Giampiero Colombo. *Acciaio Inossidabile*, v. 26, May-June 1959, p. 85-101.

Causes of pitting corrosion; methods of prevention. 15 ref. (R2j; SS)

620-R.* The Corrosion of Road Vehicle Engines by Anti-Freeze Solutions. H. H.

Collins and R. I. Higgins. *British Cast Iron Research Assoc., Journal*, v. 7, June 1959, p. 667-691.

Factors believed to be responsible for the rapid oxidation of glycol in antifreeze solutions with a resulting rapid rate of corrosion of the cast iron and steel components include excessive aeration of the coolant; the present of sites of very high temperature in the cooling system; operation of the coolant at consistently high temperatures; presence of large amounts of Cu or Cu alloys in the cooling system. 9 ref. (R7f, T21b; CI, *Cu*)

621-R. Research on Coatings for Protection of Niobium (Columbium) Against Oxidation at Elevated Temperatures. E. C. Hirakis. Horizons Inc. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151684, Feb. 1959, 74 p. $2.

The oxidation rate of Cb at 2000° F. is reduced by a factor of 20 by additions of Ce, Cr, Ti and Al. Flame spraying and electrodeposited coatings give Cb 4 to 6 hr. protection at 2500° F. Arc-melted alloys are superior to pure Cb in oxidation resistance. Specimens produced by the two coating methods equaled or surpassed the minimum standard at 2000° F. (R1h, L23, L17, 2-62, 2-60; Cb, *Ce, Cr, Ti, Al*)

622-R. Oxidation of Experimental Alloys. J. C. Richmond and H. R. Thornton. National Bureau of Standards. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151741, Feb. 1959, 19 p. $.50.

Oxidation resistance of five new high-temperature sheet alloys—two Ni-Mo-Cr alloys and three Fe-Cr-Al alloys. The average depth of external oxidation and maximum depth of oxide penetration were measured for specimens subjected to stress in air at high temperatures for 100 hr. and on specimens stressed in air under fluctuating-temperature conditions for 100 hr. (R1h, 3-66, 2-62; Ni-b, *Mo, Cr, Al*, Fe-b)

623-R.* Germanium and Silicon Surfaces. Sumner P. Wolsky. Paper from "Advances in Semi-Conductor Science". Pergamon Press Inc., New York 22, 1959, p. 114-116.

Oxidation of Ge and Si at 22° C. The Ge samples (0.1 to 3-mm. slices from single crystals) were exposed to ion bombardment or baked in a vacuum. The Si sample (3 mm. thick) was ion bombarded, subsequently exposed to air and then baked. 13 ref. (R1h, 2-67, 2-64; Ge, Si, 14-61)

624-R.* (Czech.) Corrosion Protection of Small Steel Articles. J. Domorazek. *Strojirenstvi*, v. 9, Apr. 1959, p. 283-286.

Protection of needles and small products. Corrosion is minimized by elimination of hand contact and use of wrapping paper and inhibitors. (R10b, R10e; ST)

625-R.* (Japanese.) Stress-Corrosion of Austenite Stainless Steels. M. Tagaya, H. Imagawa and D. Ishihara. *Metal Finishing Society of Japan, Journal*, v. 10, June 1959, p. 227-232.

Influence of cold drawing, heat treatment, presence of oxidizing agents and cathodic protection on susceptibility to stress-corrosion of austenitic stainless steel wires. (R1d, R10d, 2-64; SS-e)

626-R. (Russian.) Mechanism of Intercrystallic Corrosion of Stainless Steels in Nitric Acid. A. I. Krasil'shchikov, L. M. Volkhova, I. K. Burtseva and V. D. Plyasunov. *Doklady Akademii Nauk, SSSR*, v. 125, June 1959, p. 1285-1287.

An electric current is formed when two stainless steel electrodes are immersed in nitric acid of different concentrations. The electrode in the more concentrated acid is the cathode while the electrode immersed in the weaker acid is subjected to anodic dissolution. 4 ref. (R2h, R6q; SS)

627-R.* High Temperature Corrosion of Metals. C. J. Guare. *Materials in Design Engineering*, v. 50, Aug. 1959, p. 110-114.

Types of corrosion and factors which affect the rate. (R-general, 2-62)

628-R.* (German.) Cathodic Protection of Ships by Magnesium Anodes. Anton Schwarz. *VDI-Zeitschrift*, v. 101, Aug. 1, 1959, p. 1063-1064.

Cylindrical anodes are connected to the ship's hull and surrounded with a thick-walled rubber ring to avoid increased current densities likely to damage the paint protecting the hull. (R10d, T22g; ST, *Mg*)

629-R. Corrosion Research. *U. S. National Bureau of Standards, Technical News Bulletin*, v. 43, Aug. 1959, p. 150-154.

Review of NBS research on the fundamental mechanisms of corrosion and the corrosion properties of various materials. (R-general, A9)

630-R.* Corrosion of Aluminum Alloy in Glycol-Water Cooling Systems. N. S. Dempster. *Corrosion,* v. 15, Aug. 1959, p. 13-16.

Galvanic corrosion in 52S Al alloy tubes in an aircraft oil cooler. Corrosion mechanism in presence of dissolved Cu; results of inhibitor tests involving 25 solutions. 22 ref. (R1a, R10b; Al-b, 4-60)

631-R.* Notch Sensitivity Effects in Stress-Corrosion and Hydrogen Embrittlement Tests on High-Strength Steels. B. F. Brown. *Corrosion,* v. 15, Aug. 15, 1959, p. 17-20.

Notch sensitivity may terminate a stress-corrosion test to give erroneous impression of rate of stress-corrosion cracking. Extensive fracture strength data are reported on modified Type 422 steel specimens tempered at 875 and 1075° F. and stress-corrosion cracked. 4 ref. (R11s, Q23s, Q26, 2-64; SS, SGB-a)

632-R.* Uses and Abuses of Aluminum in Wooden-Hulled, Aluminum-Frame Minesweepers. T. H. Rogers and W. K. Chinn. *Corrosion,* v. 15, Aug. 1959, p. 21-26.

Results of laboratory experiments and periodic examinations on board ship to determine service behavior of Al alloys. Corrosion of Al in contact with other metals and materials such as rubber; protection provided by Zn chromate; Al corrosion products, corrosion effects of greases and lubricants containing graphite. (R-general, T22g; Al-b)

633-R.* Zinc in Marine Environments. E. A. Anderson. *Corrosion,* v. 15, Aug. 1959, p. 27-30.

Atmospheric studies of cast and rolled Zn and galvanized Fe; sea-water immersion tests of Zn; atmospheric and sea-water studies of Zn-rich paint. 11 ref. (R3p, R4b, R11; Zn)

634-R.* The Internal Cathodic Protection of Large Steel Pipes Carrying Sea Water. John H. Morgan. *Corrosion,* v. 15, Aug. 1959, p. 35-40.

Theoretical and practical aspects in the corrosion of bare and coated steel pipe. Types and locations of anodes; design of a potential measuring device; comparative costs of various protection methods. 4 ref. (R10d, R4b, T26r; ST)

635-R.* Duct Anode Development and Experience in Protection of Underground Cables From Corrosion. J. E. Johnson. *Corrosion,* v. 15, Aug. 1959, p. 41-45.

Graphite anodes in silt-filled ducts have short life because gases, liberated by electrolysis and trapped by silt, attack graphite binder, tape adhesive and wire insulations. Excellent results are obtained with silicon iron anodes. 4 ref. (R10d, R8, T1b; Pb)

636-R. Corrosion Research at the National Bureau of Standards. *U.S. Dept. of Commerce, Technical News,* STR-2370, July 1959, 12 p.

Current studies on corrosion reactions at metal surfaces. Electrochemical polarization and other electrical phenomena associated with corrosion. Mechanism of stress-corrosion cracking. Effect of free radicals on metals at low temperatures and nature of corrosion in large single crystals. 14 ref. (R-general, A9)

637-R.* Corrosion Problems Associated With Sour Gas Condensate Production. D. R. Fincher. *Corrosion,* v. 15, Aug. 1959, p. 31-34.

Experience in controlling corrosion of stainless steel and Ni alloy components of well and pilot plant designed to separate liquid hydrocarbons from gases containing hydrogen sulphide and carbon dioxide, with ultimate injection of dried residue gases into reservoir. (R7, R10a, T28p, 2-66; SS, Ni-b)

638-R.* Anchor Pattern Profile and Its Effect on Paint Performance. Joseph Bigos. *Corrosion,* v. 15, Aug. 1959, p. 46-50.

Techniques for examination and measurement of anchor pattern profile of cleaned surfaces. Effects of various cleaning techniques on surface roughness of low-carbon steels. Height of anchor pattern profile had limited effect on corrosion protection afforded by paints in atmospheric tests. (R10, L10c, L26n; CN-g)

639-R.* Probability as Related to Stress Corrosion Cracking of Copper Alloys. D. H. Thompson. *Corrosion,* v. 15, Aug. 1959, p. 51-54.

Cases of failure of red-brass pipe, cold drawn Cu water tubing, 70-30 cupro-nickel tubing, admiralty and aluminum brass condenser tubes and yellow brass screw shells. Role of ammonia in causing stress-corrosion cracking of Cu alloys. (R1d; Cu-b, Cu-n, 4-60)

640-R.* Stress Corrosion of Oil Country Tubular Goods. R. L. McGlasson and W. D. Greathouse. *Corrosion*, v. 15, Aug. 1959, p. 55-60.

Two types of failure are sulphide corrosion cracking and sweet corrosion cracking. A new test method is described which used a notched ring loaded to different percentages of yield deformation. Tabular data on hardness, applied stress and time-to-failure in saturated H_2S-brine system using J-55 and N-80. 13 ref. (R1d, Q26, T28p, 4-60, 2-66; AY)

641-R.* Corrosion of Type 310 Stainless Steel by Synthetic Fuel Oil Ash. Hugh L. Logan. *Corrosion*, v. 15, Aug. 1959, p. 61-64.

Minimum temperature at which steel is attacked by a mixture of V_2O_5 and Na_2SO_4 and by mixtures of V_2O_5 and $NaVO_3$ is determined. An unidentified phase was produced at the interface between steel and a V compound, or mixtures of compounds, in the temperature range 1075 to 1890° F. 6 ref. (R7d, 2-62; SS)

642-R.* Filming Amines Control Corrosion Utility Plant Condensate System. Edward E. Galloway. *Corrosion*, v. 15, Aug. 1959, p. 99-100, 103.

Protection of turbines and condensate systems against CO_2 and oxygen corrosion. Effects on corrosion test specimens before and after use of filming amines. Effects of amine on turbine erosion-corrosion. (R10b, R1c, 2-66; ST, Cu, Fe, Cu-b, 1-60)

643-R.* Kinetics of the Oxidation of Uranium by Carbon Dioxide. J. E. Antill and K. A. Peakall. *Journal of the Less-Common Metals*, v. 1, June 1959, p. 227-231.

Rates of oxidation over the range 500-1000° C. The rate increases with temperature from 500 to 780° C. with a sudden marked increase when the metal is near or at the beta-gamma transition (772° C.). At higher temperatures up to 1000° C. the rate decreases with increasing temperature. 4 ref. (R1h, 2-62; U)

644-R. Corrosion of Aluminum Alloys. G. Fitzgerald-Lee. *Automobile Engineer*, v. 49, June 1959, p. 215-217.

Bimetallic corrosion and preventive measures in road transport vehicles. (R1a, T21e; Al-b)

645-R. Sulfide Scaling Under Hydrorefining Conditions. Pt. 1. W. H. Sharp and E. W. Haycock. *Oil and Gas Journal*, v. 57, June 1, 1959, p. 117-120.

Principal variables which determine corrosion rates of steels are hydrogen, sulphide pressure, temperature and composition of steel. (R2q, R7, 2-60, 2-61, 2-74; ST)

646-R.* High Temperature Alloys for the Glass Industry. B. F. Richardson. *Glass Industry*, v. 40, Aug. 1959, p. 421-422. 445.

Alloys are melted in vacuum induction furnace to remove gaseous impurities. These alloys have a Ni base with Cr, Co and Mo additions which strengthens the Ni and increases corrosion and oxidation resistance. (R1h, 2-62, 2-60, T29a, 17-57; SS, *Co, Mo*, SGA-h, 9-69)

647-R.* (Italian.) Corrosion Resistance of Stainless Steels. N. D. Greene and G. Fontana. *l'Acciaio Inossidabile*, v. 26, no. 2, Mar-Apr. 1959, p. 37-50.

Critical analysis of theories and methods of investigating pitting corrosion. Details on theory of absorption, penetration, pH, ion exchange and growth of pits. (R2j; SS)

648-R.* (Italian.) Corrosion Resistance of Stainless Steels. Pt. 10. The Sigma Phase. Lars Morsing. *l'Acciaio Inossidabile*, v. 26, July-Aug. 1959, p. 125-139.

Formation of sigma phase in ferritic, ferritic-austenitic, 18-8 austenitic and highly alloyed austenitic steels, and particularly in a number of Avesta steels. Influence of sigma phase on corrosion resistance and mechanical properties. (R-general, Q26s, N6p; SS)

649-R.* Influence of Sea Water on Corrosion of Reinforcement. R. Shalon and M. Rafael. *American Concrete Institute, Journal*, v. 30, June 1959, p. 1251-1268.

The alkalinity of air-exposed concrete was found insufficient for corrosion inhibition of reinforcements. Sea water used for mixing of air-exposed reinforced structures makes the reinforcement highly vulnerable to corrosion. Adequate surface covering and depth of cover or special surface treatment is suggested. (R4; ST)

650-R.* The Study of Effect of Atmospheric Environment on Corrosion Rates of Steel. K. K. Moore and M. A. Grumbles. *American Paint Journal*, v. 43, Aug. 10, 1959, p. 68, 84.

Corrosion loss during salt water exposure was as much after one month as the loss for similar structures exposed

for two years in a semi-acid region. Corrosion is shown to be dependent on climate, humidity, temperature, exposure time, chloride content, exposure location, precipitation, wind direction and speed. (R3, R4b; ST)

651-R.* Selection and Use of Precipitation Hardening Stainless Steels. M. E. Holmberg. *American Society of Mechanical Engineers*, Paper no. 59-PET-17, 1959, 8 p. $.80.

Mechanical properties and high-temperature strength of Armco 17-4 PH steel. Resistance to stress cracking and brine corrosion. Freedom from Cu acetylide formation. Applications in petroleum and petrochemical industries. (R-general, Q-general, 2-62; SS)

652-R.* Designing to Prevent Corrosion in the Process Industry. F. L. Whitney, Jr. *American Society of Mechanical Engineers*, Paper no. 59-SA-58, 1959, 11 p. $.80.

Plant site and layout. Design of equipment to reduce general process, galvanic, crevice and stress corrosion. (R-general, 17-51)

653-R.* (French.) Study of 2 3/8 In. 10M4 APS Steel Pipe After 18 Months Use in the No. 103/ Gas Well at Lacq. E. Herzog. *Corrosion et Anticorrosion*, v. 7, July-Aug. 1959, p. 281-287.

Weight loss; composition and structure of products of corrosion, and protection they provide. Hydrogen content and mechanical properties of specimens after service. (R7k, T26r; ST, *S, H*)

654-R.* (French.) Protection of Steel Ships Against Corrosion by Sea Water and Electrolysis by Means of Metallizing. Manley H. Clark. *Corrosion et Anticorrosion*, v. 7, July-Aug. 1959, p. 294-297.

Sprayed Al or Zn plus finish painting with polyvinyl Al paint gives excellent protection to steel exposed alternately to sea water and air. (R10, L23, L26, T22j, 8-67; ST, *Zn, Al*)

655-R.* (French.) Structure of the Interface Between Iron and Iron Oxide. Insolubility of Oxygen in Iron Refined by Zone Melting. R. Sifferlen. Paper from 'Symposium on Solid State Diffusion". Centre d'Etude Nucleaires de Saclay, Gif-sur-Yvette (S-et-O), France, 1959, p. 137-145.

High-purity Fe is exposed to a hydrogen atmosphere containing H_2O. Under the oxide layer, a thin metallic zone showing structural irregularities was discovered. Its structure as well as diffusion of oxygen are influenced by degree of purity. 8 ref. (R1h, N1c, 3-69; Fe-a, *O*)

656-R.* Structure and Properties of Austenitic Alloys Containing Aluminum and Silicon. Duane J. Schmatz. *American Society for Metals, Transactions*, v. 52, Preprint no. 160, 1959, 13 p.

Fe-base alloys containing Al, Mn and C were investigated in an attempt to obtain a useful alloy deriving its oxidation resistance from Al and having an austenitic structure and mechanical properties comparable to commercial stainless steels. Among several minor additions only Si was found to improve both the oxidation resistance and strength of the base alloys. One promising alloy contained 8% Al, 30% Mn, 1.0% C, 1.5% Si. 8 ref. (R1h, Q-general, 2-60; Fe-b, *Al, Mn, C, Si*)

657-R.* The High-Temperature Oxidation of Tungsten-Columbium Alloys. J. W. Semmel, Jr. *American Society for Metals, Transactions*, v. 52, Preprint no. 161, 1959, 7 p.

The presence of an inner, continuous oxide and an outer, porous oxide on unalloyed tungsten leads to oxidation which begins parabolically and soon becomes linear with respect to time at 2000° F. At 2300° F., the outer oxide is liquid and semiprotective, resulting in only parabolic oxidation. Tungsten alloys with less than 15 at .% Cb oxidize according to the same kinetic laws as unalloyed tungsten. 5 ref. (R1h, 2-62, 2-60; W-b, Cb)

658-R.* Some Metallurgical Factors Affecting Stress-Corrosion Cracking of Austenitic Stainless Steels. H. H. Uhlig and R. A. White, *American Society for Metals, Transactions*, v. 52, Preprint no. 167, 1959, 18 p.

Tests on stress-corrosion cracking of 18-8 stainless steels in boiling 42% $MgCl_2$ (154° C.) show that alloys low in C or N do not fail within maximum time of exposure (200-260 hr.) Commercial type 304 alloys. fail within 0.2 to 1.4 hr. Stable austenitic 20% Cr, 20% Ni alloys are similarly resistant if the nitrogen content is sufficiently low (about 0.002%). Carbon, contrary to its effect in 18-8, confers resistance to cracking. Effects of Cb, Ti and Si additions. 18 p. (R1d, 2-60; SS, *C, N, Cb, Ti, Si*)

659-R.* Stress Corrosion, the Engineers View. P. H. Wall. *Royal Aeronautical*

Society, Journal, v. 63, June 1959, p. 354-365.

Accelerated rate of corrosion damage by static stress; stress-corrosion cracking as the combined results of stress and corrosion. Percentage losses of strength of stressed and unstressed steels. (R1d; ST)

660-R.* Metallographic Study of Stringers in Inert Atmosphere-Melted Zircaloy-2. J. D. Grozier, L. S. Rubenstein and J. G. Goodwin. *American Society for Metals, Transactions,* Preprint no. 148, v. 52, 1959, 12 p.

A unique corrosion phenomenon associated with the melting of Zircaloy-2 consumably in an inert atmosphere was observed as stringers of tan corrosion product in the black oxide of hot rolled or extruded material which had been corrosion tested in 750° F., 1500-psi. steam or 680° F. water. Corrosion stringers were shown to be directly related to microstructural stringers; microstructural stringers were shown to be related to ingot porosity. 5 ref. (R-general, M27; Zr-b, 5-59, 9-68)

661-R.* The Corrosion Behavior of Titanium-Palladium Alloy. Milton Stern and Claude R. Bishop. *American Society for Metals, Transactions,* Preprint no. 165, v. 52, 1959, 14 p.

Corrosion properties of a consumable arc-melted ingot. The material retains all the desirable properties of Ti. It has equivalent mechanical properties and corrosion resistance in oxidizing environments. In addition, it exhibits good corrosion resistance in a variety of nonoxidizing acids. 4 ref. (R-general; Ti-b, *Pd*)

662-R.* Prime Reasons for Metal Failures. G. A. Nelson. *Chemical Engineering,* v. 66, June 29, 1959, p. 132-136.

Principal causes of failure in industrial plants prove to be effects of temperature and corrosion. (R1e, R-general, Q7b, W-general)

663-R.* (English.) Micro-Organisms and Corrosion of Lead-Sheathed Cables. G. Bonde and Borge Lunn. *Ingenøren,* v. 2, Aug. 1958, p. 103-107.

The "phenol corrosion" of Pb-sheathed cables is not caused by catalytic action from phenols present in the impregnating material but is derived from bacterial decomposition of the jute which develops corrosion-promoting organic acids. (R2, T1b; Pb)

664-R.* (English.) Is the Phenol Corrosion Theory False? H. L. Halstrom. *Ingenøren,* v. 2, Aug. 1958, p. 108-109.

Flaws in cables showed appearance of typical phenol corrosion while jute analysis showed presence of appreciable amounts of phenol. No correlation was found between the presence of phenol and the corrosion of the Pb sheath. This contradicts the accepted theory. (R2, T1b; Pb)

665-R.* (Finnish.) Galvanic Corrosion of Copper Alloys and Stainless Steels in Cellulose Wash Waters. Eino Uusitalo. *Teknilisen Kemian Aikakauslehti,* v. 16, May 1959, p. 273-281.

Corrosion in waters containing sulphur dioxide with pH values ranging from 3.5 to 10 at 18° C. Effect of agitation of the solution on the galvanic couples. (R1a; Cu, SS)

666-R.* Corrosion Inhibitors for Carbon Tetrachloride-Water Vapor Atmospheres. K. W. Calkins and R. W. Hawley. *Corrosion,* v. 15, Sept. 1959, p. 15-17.

Use of 0.4% by weight of 2-aminoethanol in CCl_4 decreased corrosion rate of mild steel in test atmosphere by 99%. (R10b; CN)

667-R.* Screening Tests of Inhibitors to Prevent Chloride Stress-Corrosion. J. H. Phillips and W. J. Singley. *Corrosion,* v. 15, Sept. 1959, p. 18-22.

Tests were run in tilting autoclaves to evaluate performance of selected potential inhibitors in preventing chloride stress corrosion attack of Type 347 austenitic stainless steel in alkaline-phosphate boiler water containing 50 to 500 ppm. chloride. Nitrate appeared to be a satisfactory inhibitor for boiler applications. Sodium sulphite also effectively prevented chloride corrosion cracking by scavenging oxygen. 5 ref. (R10b, R1d, R11s; SS)

668-R.* Action of the XO_4^{N-} Inhibitors. G. H. Cartledge. *Corrosion,* v. 15, Sept. 1959, p. 37-40.

Effect of ions and molecules of type XO_4^{n-} on corrosion of iron and steel. Measurements of electrode potentials in inhibited solutions and effect of foreign electrolytes on these potentials reveal the competitive and reversible nature of surface state associated with inhibition. 28 ref. (R10b, P15m; ST, Fe)

669-R.* Corrosion Processes in Carbonated Beverage Cans. E. L. Koehler, J. J.

Daly, Jr., H. T. Francis and H. T. Johnson. *Corrosion,* v. 15, Sept. 1959, p. 45-50.

Work undertaken to minimize occurrence of perforations and excessive iron pick-up in cans. Corrosion mechanism was attack on steel base of cans stimulated by reduction processes occurring at areas of exposed Sn or other cathodic regions. Best solution was limiting galvanic current in can by reducing corrosivity of beverage, and control of metal exposure in can fabrication. 4 ref. (R1a, R10n, R11a; ST, *Sn,* 8-65)

670-R.* Principles and Criteria for Cathodic Protection of Steel in Sea Water. M. H. Peterson. *Corrosion,* v. 15, Sept. 1959, p. 51-55.

Development of cathodic protection is traced from initial work of Davy to formation of adequate theory of cathodic protection. Techniques used in experimental determination of criteria for protection in laboratory and in field advantages; and limitations of each. 84 ref. (R10d; ST)

671-R.* Four-Tower Water Treatment Test Facility. R. G. Murray and M. E. Tester. *Corrosion,* v. 15, Sept. 1959, p. 60-64.

Corrosion in Freon condenser tubes in a water circulating system, where severe pitting corrosion had occurred on water side of tubes. A two-by-two factorial experiment was run using phosphate-treated water. After a 90-day run, pits were found in tubes from towers operating at low water velocity, with pitting more severe in high-temperature units. (R2j, R4, R11)

672-R.* Use of Magnesium for Cathodic Protection of Pipe Lines in High Resistivity Soil. A. W. Peabody. *Corrosion,* v. 15, Sept. 1959, p. 65-70.

Satisfactory protective potentials were attained on approximately 400 miles of enamel coated pipeline with a total current of 2 to 3 amp. from nine Mg anode beds. (R10d, T26r, 8-71; ST, *Mg*)

673-R.* Mechanisms and Some Theoretical Aspects of Stress Corrosion Cracking of Austenitic Stainless Steels. W. B. Brooks. *Corrosion,* v. 15, Sept. 1959, p. 103, 106, 108, 110.

Review of generally accepted causes of stress-corrosion in stainless steels. Design of heat exchangers intended for use with chloride-containing waters. (R1d, Q26, W13b; SS-e)

674-R.* Case Histories of Differential Aeration Corrosion in Underground Telephone Cables. David T. Jones. *Corrosion,* v. 15, Sept. 1959, p. 116-118.

Cases involving lead-sheathed cables in conditions of water-entrapment due to dips in conduit. Cathodic protection of cables and problems of obtaining sufficient current without causing interference to foreign substructures near cables. 5 ref. (R4f, R10d; Pb)

675-R.* Prevention of Sulfide-Stress Cracking in Sour-Condensate Well Equipment. W. J. McGuire and L. W. Vollmer. *American Society of Mechanical Engineers,* Paper no. 59-PET-36, 1959, 11 p. $.80.

Factors influencing cracking; causes and prevention of service failures; specific data on 4140 steel, 410 stainless and K-Monel. (R1d, R7k, T28; SS, AY)

676-R.* Corrosion Resistance of Titanium Alloys. *Chemical Engineering Progress,* v. 55, July 1959, p. 94-99.

Comparative study of the most commonly used Ti alloys in a variety of corrosive media. Ti alloys proved to be less corrosion resistant in strong acids than commercially pure Ti with the exception of MST 3A1-2.5 V. All alloys were completely resistant to ferric chloride, sodium chloride and sodium hydroxide. A plentiful supply of O_2 reduces the Ti corrosion rates. (R6g; Ti-b)

677-R.* Corrosion of Magnesium Alloys Containing Iron and Nickel. J. H. Greenblatt. *Journal of Applied Chemistry,* v. 9, Aug. 1959, p. 401-405.

Corrosion rates were measured in sea water when these alloys were coupled to steel cathodes of various sizes, inserted in plastic or steel box, and compared with those of Mg alloys corroding alone. Decreased corrosion rates on coupling to steel cathode were due to formation of oxide film over the alloy. 8 ref. (R4b; Mg-b, *Fe, Ni*)

678-R.* (English.) Oxidation of Metals. The General Oxidation Equation. T. Hurlen. *Acta Chemica Scandinavica,* v. 13, no. 4, 1959, p. 695-704.

A general rate equation for metal oxidation is derived in the case of processes controlled by material transport of defect species in the oxide film and where the area of oxidation is constant. (R1h, P13b)

679-R.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Zinc Anodes for Cathodic Protection. T. J. Lennox, Jr. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 534-551.

History of cathodic protection of metals. Application of Zn anodes to the protection of ship's hulls, pilings, lock-gates, storage tanks and pipelines. Variables affecting performance. Protection criteria. 15 ref. (R10d; ST)

680-R.* (German.) The Attack of Liquid Zinc on Iron. K. Ruttewit. *Metall*, v. 13, Aug. 1959, p. 735-738.

The corrosion of soft iron and malleable iron is independent of the purity of the liquid. The effect is pronounced in the temperature range of 440-580° C. and is twice as great for malleable iron as for soft iron. 35 ref. (R6m; Fe, 14-60, Zn)

681-R.* (German.) Cathodic Protection With Zinc as a Sacrificial Anode. E. Eberius and H. Bohnes. *Metall*, v. 13, Aug. 1959, p. 743-746.

Immersion of a Zn-electrode and an iron part in a 3.5%-NaCl solution. Effects of the surface ratio Fe:Zn and of rotation on the dissolution of Zn and the current intensity. 4 ref. (R10d; Fe, *Zn*)

682-R.* (German.) Corrosive Effects of Detergents and Syndets on Zinc. Pt. 1. H. Stupel and F. Koch. *Seifen-ole-Fette-Wachse*, v. 85, July 8, 1959, p. 411-414.

Influence of hard and soft water, hardness composition, syndets and detergent composition on the corrosion of Zn in washing machines. Corrosion is diminished in proportion to the number of times washer is used. (R7m, T10c; Zn)

683-R.* (German.) Corrosive Effects of Detergents With Special Reference to Syndets on Zinc. Pt. 2. H. Stupel and F. Koch. *Seifen-ole-Fette-Wachse*, v. 85, July 22, 1959, p. 435-438.

Effect of surface active agents on Zn. Corrosion of Zn is caused by detergents and sodium carbonate at different concentration levels. Inhibition of corrosion by means of acid orthophosphates. (R7m, R10b; Zn)

684-R.* (German.) Chlorine Ions Influencing the Attack of Nitric Acid on Copper Single Crystals. Eginhart Biedermann. *Zeitschrift fur Metallkunde*, v. 50, Aug. 1959, p. 481-486.

Exposure to the action of HNO_3 containing 0-0.003% Cl-ions, the amount of which was modified by adding diluted HCl. Effect of the ions present on the solubility of Cu in HNO_3 and on the structure of etched surface. 8 ref. (R6g; Cu, 14-61)

685-R.* The Corrosivities of Plastics and Rubbers. H. A. Perry, A. M. Chreitfberg, J. Silver and H. E. Mathews. *Society of Plastics Engineers, 13th Annual National Technical Convention*, v. 3, n.d., p. 33-55.

Abnormal corrosion problems in naval ordnance. Environmental factors contributing to corrosion; effect of plastics and rubbers on Cd-plated steel. Certain plastics contribute to the corrosion of metals in tropical environments. Phenolic molding compounds, foams and casting resins are most corrosive. (R11; ST, *Cd*, 8-62, NM-d31)

686-R. Corrosion of 1100 Aluminum in Boiling H_2O and D_2O. J. E. Draley, S. Mori and R. E. Loess. Argonne National Laboratory. *U. S. Atomic Energy Commission*, ANL-6015, July 1959, 9 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

After an initial exposure period, corrosion rates of 1100 Al are approximately the same in boiling H_2O and D_2O. More corrosion was observed during the initial period in H_2O. This is probably due to differences in the purity of the H_2O. (R4j; Al-b)

687-R. Corrosion of Stainless Alloys in High-Temperature Nitrogenous Environments. Donald L. Keller, Editor. Battelle Memorial Institute. *U. S. Atomic Energy Commission*, BMI-1361, July 14, 1959, 46 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Atmospheric pressure tests show that small additions of oxygen to nitrogen inhibit the nitriding of 316, 318 and 347 stainless steels, Timken 16-15-6 and Timken 16-25-6. Tests at 200 psi. indicate that the oxidation rate is not affected by pressure. Stress does not influence oxidation rate. (R1d, R1h, J28k; SS)

688-R.* Iron Corrosion Study. *U. S. Dept. of Commerce, National Bureau of Standards, Technical News*, STR-2403, Sept. 1959, 4 p.

Corrosion pitting of prepared Fe specimens in distilled water depends on the

crystallographic orientation of the metal surfaces, according to N.B.S. experiments. Test specimens had flat surfaces cut parallel to the {100} (cubic); {110} (dodecahedral); and {111} (octahedral) planes. General level of attack is lower for the purer Fe specimens. (R2j, 3-72; Fe, 14-61)

689-R. Multicolor Coatings for Corrosion Protection. Norman I. Gaynes. *Metal Finishing*, v. 57, Sept. 1959, p. 73-76.

Salt spray tests on phosphated steel panels treated with five types of primers and five brands of multicolor paints revealed importance of prime coating in corrosion prevention systems. (R10f, R11j, L26n; ST)

690-R. Corrosion Research in Great Britain and Its Results. W. E. Ballard. *South African Institute of Mining and Metallurgy, Journal*, v. 59, July 1959, p. 623.

Review of recent British corrosion research in relation to industrial corrosion problems. (R-general, A9)

691-R.* Inhibition by Sugar of Copper Corrosion in Ammonia Solutions. J. A. Radley, J. S. Stanley and G. E. Moss. *Corrosion Technology*, v. 6, Aug. 1959, p. 229-231.

Corrosion of Cu and Cu alloys by NH_4OH is inhibited by small amounts of glucose and other sugars. The rate of corrosion of Al by NH_4OH is increased by the addition of glucose. (R6j, R10b; Cu, Al)

692-R.* Significance of Copper Deposits Associated With a Boiler Tube Failure. J. C. Spurr. *Corrosion Technology*, v. 6, Aug. 1959, p. 233-237.

Metallic Cu deposits found on burst marine boiler tubes are caused by overheating of the tubes; the Cu is associated with more completely intergranular cracking than is usual in simple cases of failure due to overheating. (R1d, R4c, T26q; Cu)

693-R.* Sacrificial Corrosion and the Relative Corrodibility of Metals. G. Fitzgerald-Lee. *Corrosion Technology*, v. 6, Aug. 1959, p. 245-247.

Corrodibility of metals is correlated with electrode potential, atomic number and atomic weight. (R1a, 17-52)

694-R.* Mechanical Properties and Corrosion Resistance of Zirconium and Its Alloys in Water, Steam and Gases at High Temperatures. R. S. Ambartsumyan, A. A. Kiselev, R. V. Grebennikov, V. A. Myshkin, L. J. Tsuprun and A. F. Nikulina. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 12-33.

Corrosion and properties of alloys in water, steam, oxygen, hydrogen, air and carbon dioxide. Zr-Cb alloys and alloys containing Sn, Fe, Cb and Cu. 10 ref. (R-general, Q-general, 1-62; Zr-b, *Cb, Fe, Cu, Sn*)

695-R.* Electron Diffraction and Kinetic Investigations of the Oxidation Reactions of Zirconium and Some of Its Alloys. I. I. Korobkov, D. V. Ignatov, A. I. Evstyukhin and V. S. Emelyanov. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 60-68.

Oxidation and structure of oxide films of Zr and its alloys with Al, Ti and Sn during heating in oxygen and air at 20-1300° C. 13 ref. (R1h, 2-62, M22h; Zr-b, *Al, Ti, Sn*, 14-62)

696-R.* Development of Zr Alloys Resistant to Gaseous Oxidation. W. G. O'Driscoll, C. Tyzack and T. Raine. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 75-105.

Binary additions of Mo, W and Cu improve oxidation resistance of Zr in CO_2. Additions of Cb and Ta are beneficial up to 0.25 at .%. 27 ref. (R1h, 2-60; Zr-b, *Mo, W, Cu, Cb, Ta*)

697-R.* Corrosion of Aluminum With Additions of Iron and Silicon in High-Temperature Water. Ketil Videm. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 121-127.

Effect of structure and alloying of Fe and Si on grain boundary attack at 20-200° C. 14 ref. (R4, 2-60, 2-62, 3-71; Al-b, *Fe, Si*)

698-R.* Al-Fe-Ni Alloys Corrosion Resistant in Hot Water and Steam. H. Coriou, R. Fournier, L. Grall, J. Herenguel, J. Hure and P. Lelong. Paper from

"Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 128-152.

Corrosion mechanism and kinetics and the influence of microstructure on corrosion in hot water and steam. 29 ref. (R4, 2-62, 2-60, 2-59, M27; Al-b, *Ni, Fe*)

699-R.* Corrosion of Magnesium and Some of Its Alloys in Gas-Cooled Reactors. R. Caillat and R. Darras. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 220-233.

Oxidation of Mg, Mg-Zr alloys and a Mg-Zn-Zr alloy in humid air, dry air, CO_2 and CO_2 water at 350-500° C. Protection during fluoride treatment. 22 ref. (R1h, T11, 2-62; Mg-b, *Zr, Zn*)

700-R.* Magnesium-Beryllium Alloys as Materials for Nuclear Reactors. K. D. Sinelnikov, V. E. Ivanov and V. F. Zelensky. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 234-240.

Mg-Be alloys with low Be content as a protective coating for fuel elements of gas-cooled reactors operating at 530° C. Solubility of Be in Mg, corrosion resistance and $MgBe_{13}$ found. 7 ref. (R1h, P12e, T11g, 2-62; Mg-b, Be, 17-57)

701-R.* Oxidation of Ordinary Steel Heated in Carbon Dioxide Under Pressure. R. Darras, D. Leclercq and C. Bunard. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 261-265.

Weight increases are small after heating at 350° C. for 1300 hr. 16 ref. (R1h, 2-62, 3-74; ST)

702-R. Corrosion Resistance of Mo-0.5% Ti Alloy, Tantalum, and Beryllium in Liquid Bismuth. J. W. Seifert. Babcock & Wilcox Co. *U. S. Atomic Energy Commission*, BAW-1067, May 14, 1959, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

The alloys have good corrosion resistance in liquid bismuth containing small amounts of U, Zr, and Mg. (R6m; Mo-b, *Ti*, Be, Ta)

703-R. High-Temperature Water and Steam-Corrosion Behavior of Zirconium-Uranium Alloys. Stanley Kass. Bettis Plant, Westinghouse Electric Corp. *U. S. Atomic Energy Commission*, WAPD-TM-167, July 1959, 20 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Corrosion behavior of Zr alloys containing 10-60% uranium in 600 and 680° F. water and in 750° F. steam at 1500 psi. Effects of various heat treatments on corrosion resistance. (R4d, R4a, 2-62, 2-64; Zr-b, *U*)

704-R.* Effect of Titanium Addition in Alpha Brass. S. K. Biswas and S. C. Das Gupta. *Indian Institute of Metals, Transactions*, v. 12, June 1959, p. 175-184.

Modification of corrosion resistance, oxidation resistance, mechanical properties and grain growth characteristics of 70:30 brass, resulting from addition of 0.08 to 1.22% Ti. (R1h, 2-62, R4b, R6, Q29n, N3n, 2-60; Cu-n, *Ti*)

705-R. Detergent Resistance of Enamels Tested and Improved. F. G. Morriss. *Industrial Finishing (London)*, v. 12, Aug. 1959, p. 29-30.

Methods of testing and factors affecting resistance. (R6, R7; ST, 8-71)

706-R.* The Stress-Corrosion Cracking of Mild Steel in Coal Gas Liquors. R. N. Parkins and R. Usher. *Journal of Applied Chemistry*, v. 9, Sept. 1959, p. 445-456.

Laboratory and plant studies. Cracking is likely to occur where the liquor has a concentration between 1 and 2 equivalents of NH_3 or total acids (H_2S, CO_2 and HCN). (R1d, R6p; CN)

707-R.* Resistance of Various Steels to Cavitation Corrosion. M. G. Timerbulatov and G. I. Babushkima. *Metallovedenie i Termicheskaya Obrabotka Metallov*, no. 8, 1959, p. 5-12.

A number of toolsteels and high-Cr steels are annealed after quenching to obtain a hardness of Brinell 330-350. Effect of annealing temperature on resistance to cavitation corrosion. Relationship between hardness and cavitation resistance tested with the help of a magnetostrictive vibrator. (R2m, 2-64, Q29n; TS, SS-b)

708-R. (Book—Translation.) Corrosion of Chemical Apparatus. G. L. Shvartz and M. M. Kristal. 250 p. 1959. Consultants

Bureau, Inc., 227 W. 17th St., New York 11, N. Y. $7.50.

Theory of intercrystalline and stress-corrosion; causes and character of corrosion cracking of carbon steels, alloy steels and nonferrous metals. 219 ref. (R1d, T29; CN, ST, EG-a38)

709-R. (Translation—ConBur.) Passivating Properties of Pigments. I. L. Rozenfeld, F. I. Rubinshtein and V. V. Zhebrovskij. *Bulletin of the Academy of Sciences of the USSR*, no. 6, June 1958, p. 659-662.

Electrochemical mechanism of corrosion processes is influenced by film-forming substances and pigments. Their effect on the kinetics of electrode reactions is determined by the corrosion process. The protection of metals is dependent on mechanical insulation of the metal from the corrosive medium and retardation of electrode reactions. (R10c, P15; NM-g30)

710-R.* Studies on the Influence of Chemical Factors on the Corrosion of Metals. W. Feit Knecht. *Chemistry and Industry*, no. 36, Sept. 5, 1959, p. 1102-1109.

Chemistry of solid corrosion products in terms of chemical kinetics of oxidation, hydroxide and carbonate formation of Zn and Cu. Stability of products in acid vapors or aqueous solutions and conditions for formation of protective films. (R1h; Zn, Cu, 2-61, 2-65)

711-R.* The Fundamentals of Wet Corrosion, Its Manifestations and Mitigation. F. P. A. Robinson. *South African Industrial Chemist*, v. 13, June 1959, p. 120-130.

Outline of electrochemistry of corrosion in terms of polarization, passivity, oxide film formation and electron configuration in metals. Methods of corrosion inhibition. (R1h, R10b, P15)

712-R.* Mechanism by Which Nonferrous Metals Corrode in the Atmosphere. P. M. Aziz and H. P. Godard. *Corrosion*, v. 15, Oct. 1959, p. 39-43.

Influence of common atmospheric constituents and pollutants. Composition and properties of corrosion film. 27 ref. (R3, 2-60; Al, Cu, Mg, Ni, Zn, EG-a38)

713-R. (Translation—ConBur.) Study of the Influence of Various Inhibitors on the Corrosion Cracking of Metals. S. A. Balezin, V. V. Romanov and I. I. Podobaev. *Proceedings of the Academy of Sciences of the USSR, Chemistry Technology Section*, v. 122-123, Sept-Dec. 1958, p. 147-151.

See item 432-R, 1959. (R1d, R10b; SS-e, Cu-n)

714-R.* Principles and Procedures Employed in the Design and Interpretation of Atmospheric Corrosion Tests. H. R. Copson. *Corrosion*, v. 15, Oct. 1959, p. 43-51.

Accelerated tests involving specimen size and shape, location of test sites, different atmospheres, influence of alloy elements, mounting procedures; test duration, climatic variations and drainage. 19 ref. (R3, 1-54)

715-R.* Deterioration of Materials in Polluted Atmospheres. John E. Yocom. *Corrosion*, v. 15, Oct. 1959, p. 51-55.

Physical and chemical principles. 34 ref. (R3)

716-R.* Corrosion Experience Associated With Hydrometallurgical Refining of Nickel at Sheritt Gordon Mines. R. B. McIntosh. *Corrosion*, v. 15, Oct. 1959, p. 57-63.

Comparison of pilot plant results with four years refinary operations with reference to 316, 316 ELC, 304, 304ELC and 347 stainless and mild steels. 6 ref. (R6, C19n, 1-52; CN, SS)

717-R.* Simple Screening Test for Determination of Inhibitor Film Persistance. John A. Knox and Roy Stout. *Corrosion*, v. 15, Oct. 1959, p. 64-66.

Results of extended Cu ion displacement tests and standard NACE screening test on 1010 steel with 17 compounds. 6 ref. (R10-b, 1-54; CN)

718-R.* Corrosion Inhibitor Evaluation From Cathodic Polarization Measurements. R. A. Legault and Norman Hackerman. *Corrosion*, v. 15, Oct. 1959, p. 517t-522t.

Relative corrosion rates of Fe and steel from cathodic polarization measurements in the presence of amine inhibitors. (R10b; Fe, CN)

719-R.* Mechanisms by Which Metals Corrode in the Atmosphere. C. P. Larrabee. *Corrosion*, v. 15, Oct. 1959, p. 526t-529t.

Effect of contaminants in the atmosphere and on metal surfaces. Effect of alloying elements in retarding corrosion. Experiments illustrating electrochemical theory. 14 ref. (R3, 2-60, P15; Fe, CN, AY, SS)

720-R. The Ubiquity of Localized Corrosion. R. B. Mears. *Electrochemical Society, Journal*, v. 106, May 1959, p. 467-468.

Localized corrosion develops at dislocation sites, therefore all metals exposed to corrodents develop localized corrosion. 7 ref. (R1a)

721-R. The Role of the Metal-Ion Concentration Cell in Crevice Corrosion. G. J. Schafer and P. K. Foster. *Electrochemical Society, Journal*, v. 106, May 1959, p. 468.

It is concluded that the cell cannot be a mechanism. 6 ref. (R1b)

722-R.* The Anodic Oxides of Lead. Jeanne Burbank. *Electrochemical Society, Journal*, v. 106, May 1959, p. 369-376.

Oxides formed under varying potential and pH. Relation to electrolytic corrosion of Pb. 50 ref. (R1a, R1h; Pb)

723-R.* Some Corrosion Effects in Accelerated Cavitation Damage. W. C. Leith and A. Lloyd Thompson. *American Society of Mechanical Engineers*, Paper no. 59—A-52, 1959, 8 p.

The conjoint mechanical-chemical destruction of metals by accelerated cavitation in a magnetostriction apparatus indicates relative effects of the metal properties (hardness, metallurgical structure, corrosion fatigue limit) and liquid characteristics (temperature, pressure, wettability) which have been confirmed by field experience in hydraulic turbines and water-cooled diesel cylinder liners. 21 ref. (R2m)

724-R.* High-Temperature Alloy Considerations in Steam Turbine Designs. N. L. Mochel. *American Society of Mechanical Engineers*, Paper no. 59-PWR-12, 1959, 31 p.

Action of steam at high temperatures and pressures on ferritic and austenitic steels. Resistance to corrosion and thermal shock; metallurgical stability; effects of oxide films on thermal conductivity. 18 ref. (R4d, 2-62, P11h; SS-a, SS-e)

725-R.* Stainless Steels and Nickel-Containing Alloys in the Chemical Industry. J. Hinde. *Australian Institute of Metals, Journal*, v. 4, Aug. 1959, p. 103-113.

Use of Ni, certain high-Ni alloys and the austenitic Cr-Ni stainless steels. Behavior in nitric acid and sulphuric acid applications. 29 ref. (R6g, T29; SS, Ni-b, 17-57)

726-R.* The Structure of Steel. Edwin Gregory and Eric N. Simons. *Edgar Allen News*, v. 38, July 1959, p. 156-157.

Corrosion, weld decay and work-hardening of stainless steels. (To be continued.) (R1; SS)

727-R.* Aqueous Uranium Corrosion at 100° C. J. B. Schroeder, D. A. Vaughan and C. M. Schwartz. *Electrochemical Society, Journal*, v. 106, June 1959, p. 486-489.

A film of UO_2 and metallic uranium is formed. UO_2 film produced by heating above 400° C. but below 650° C. in O_2 gives temporary protection against H_2O corrosion. Films of beta UH_3 offer no protection. 8 ref. (R4a, R10; U)

728-R.* Oxide Nucleation and the Substructure of Iron. E. A. Gulbransen and K. F. Andrew. *Electrochemical Society, Journal*, v. 106, June 1959, p. 511-515.

Nucleation sites of oxides formed on pure Fe are related to embrittling rather than nonembrittling annealing. Nucleation sites show the substructure of Fe responsible for embrittlement. 10 ref. (R1h, 2-64; Fe)

729-R.* Rectification by Zircaly 2 in High-Temperature Water. J. N. Wanklyn and R. Aldred. *Electrochemical Society, Journal*, v. 106, June 1959, p. 529.

Unexpectedly great corrosion is obtained when alloy is heated in water by alternating current. This is related to rectification produced by the alloy. (R11, R4, 1-66; Zr-b)

730-R.* Current and Potential Relations for the Cathodic Protection of Steel in a High Resistivity Environment. W. J. Schwerdtfeger. *Journal of Research of the National Bureau of Standards*, v. 63C, July-Sept. 1959, p. 37-45.

Laboratory evaluation of potential and current criteria for cathodic protection of bare low-carbon steel exposed to soil having a resistivity of 20,000 ohm-cm. Use of cathodic polarization curves for determination of current density requirements for protection. Protection achieved on specimen controlled at -0.77 volt with reference to a saturated calomel half cell. Importance of *IR* drop caused by the protective current in potential measurement. 11 ref. (R10d; ST)

731-R. Fireside Corrosion of Superheater and Reheater Tubing. James Jonakin, G. A. Rice and J. T. Reese. *American Society of Mechanical Engineers*, Paper no. 59-FU-5, 1959, 8 p. $.80.

Products of combustion from coal containing high sulphur and alkalies are associated with low melting ash temperatures which can form bonded deposits in the temperature range of 1800° F. and result in chemical corrosion. In order to obtain steam temperatures of 1050° F., superheater and reheater tubing are placed in the boiler gas passes where gas temperatures range from 1400 to 2200° F. Consequently, fireside chemical corrosion can result when these conditions are satisfied. (R7k, T26q; SS)

732-R.* Embrittlement of Solid Metals in a Liquid Metal. W. A. Morgen. *Metal Treatment and Drop Forging*, v. 28, Sept. 1959, p. 333-339.

Mercury penetration, molten solder penetration, effect of brazing and other metals. Variables affecting penetration include surface condition, grain size, stress distributions, strain rate, composition and temperature. 57 ref. (R2h, R6m, 2-61, 3-68, 2-60, 3-66; 14-60)

733-R.* Corrosion Inhibition With Sodium Nitrite. Jess Beecher, Charles Dinkel and Steve Corwin. *American Water Works Assoc., Journal*, v. 51 no. 9, 1959, p. 1175-1180.

Results of testing in a cooling-water system with sodium nitrite and zinc sulphate, polyphosphate and sodium nitrite. 6 ref. (R4a, R10b; CN-g)

734-R.* The Investigation of Corrosion Failures of Ferrous Metals. E. E. White and K. A. Chandler. *Chemistry and Industry*, Aug. 15, 1959, p. 1028-1035.

Causes, methods of investigation of factors; analysis of specific failures and preventive measures. (R-general; Fe)

735-R.* Potential Studies on Passivity to Corrosion Induced by Pretreatment Processes. Pt. 2. Comparative Study of Chromate Treatment and Chromate Inhibition. K. S. Rajagopalan and K. Balakrishnan. *Electrochemical Society, Journal*, v. 106, July 1959, p. 562-566.

Potential and polarization studies of Zn in NaCl solution. 8 ref. (R10b, R10c, R11m; Zn)

736-R.* The Study of the Passivity of Metals in Inhibitor Solutions Using Radioactive Tracers. Pt. 2. The Mechanism of Film Growth. O. Kubaschewski and D. M. Brasher. *Faraday Society, Transactions*, v. 55, July 1959, p. 1200-1206.

A direct linear relationship exists between film thickness and logarithm of time of growth of very thin oxide films formed on mild steel in air and chromate solutions at room temperature. 10 ref. (R1h, 3-67; CN, 14-62)

737-R. Corrosion of Aluminum Alloys in High Temperature Water. A Survey. Ketil Videm. *Journal of Nuclear Materials*, v. 1, July 1959, p. 145-153.

Autoclave and loop tests to determine effect of temperature, heat transfer, boiling and flow rate. Influence of alloying elements such as Ni, Fe, Si or Cu. Probable mechanism of grain boundary accelerated and uniform types of attack. Weldability and mechanical properties of corrosion resistant Al alloys. 21 ref. (R4, 2-62, K9s, Q-general, 2-60; Al-b, *Fe, Ni, Si, Cu*, SGA-g)

738-R. The Corrosion of Austenitic Stainless Steels Under Heat Transfer in High Temperature Water. J. N. Wanklyn and D. Jones. *Journal of Nuclear Materials*, v. 1, July 1959, p. 154-173.

Corrosion of 18-8 austenitic stainless steel under stress and boiling heat transfer in oxygen free water at pH 11 and 280° C. Influence of crevices and caustic alkali on intercrystalline stress-corrosion cracking. 14 ref. (R4c, R4d, R2h, 2-62, 3-66; SS-e)

739-R.* Effects of Water Quality on the Corrosion of Metals in Glycol Antifreeze Solutions. M. A. Boehmer and J. W. Compton. *Proceedings of the 45th Mid-Year Meeting of Chemical Specialties Manufacturers Assoc. Inc.*, Mar. 18-20, 1959, p. 73-81.

Al corrodes faster than ferrous metals in antifreeze solutions. Chlorides in water increase corrosion and high sulphate (ppm.) contamination in the absence of chlorides causes high ferrous corrosion. 16 ref. (R4, R6, 2-60; ST, CI, Al)

740-R.* Some Studies of the Abrasion and Corrosion of Fourdrinier Wires. J. D. Boadway, J. Friesse and R. M. Husband. *Pulp and Paper*, Aug. 1959, p. T231-T237.

Effect of operating variables, pH of the water and nature of the paper stock on Cu alloys used in papermaking equipment. Inhibitors and protective coatings reduce corrosion rate. (R1c, R4, R6g, R10, T29r, 4-61; Cu-b)

741-R.* Application of the Formation of Titanium Hydride. Rikuro Otsuka. *Scientific Paper of the Institute of Physical and Chemical Research (Tokyo)*, v. 53, June 1959, p. 66-67.

The thin oxide film formed by oxidation of Ti can be removed in a form suitable for electron microscopy and diffraction study by the action of HCl. (R1h, M20q; Ti)

742-R.* Iron-Aluminum Base Alloys—Cheap Stainless of the Future? Blake King, J. J. Mueller, N. N. Ida and F. G. Tate. *Society of Automotive Engineers, Transactions,* v. 67, 1959, p. 335-342.

Fe-Al base alloys have higher high-temperature oxidation resistance than stainless. 11 ref. (R1h, 2-62; Fe-b, *Al, Cr*)

743-R.* Chalk River Experience With Zircaloy-2 and Aluminum-Nickel-Iron Alloys in High-Temperature Water. F. H. Krenz, G. J. Biefer and N. A. Graham. Paper from "Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials". United Nations, Geneva, 1958, p. 241-249.

Effects of heat flux, hydriding and flowing water on corrosion rates of Al and Zr alloys. Characteristics and mechanism of sheath failure. 15 ref. (R4d; Zr-b, Al-b, *Fe, Ni*)

744-R.* Titanium and Zirconium as Primary Cell Anodes. Milton A. Thompson, Allen B. Scott, Donald Chittick and Paul M. Gruzensky. *Electrochemical Society, Journal,* v. 106, Sept. 1959, p. 737-741.

Polarization and corrosion rates for Ti and Zr electrodes were measured in various electrolytic solutions. (R-general, R1j, P15n; Ti, Zr)

745-R.* Electrochemical Behavior and Passivitiy of Titanium. Milton Stern and Herman Wissenberg. *Electrochemical Society, Journal,* v. 106, Sept. 1959, p. 755-759.

Controlling the corrosion of Ti by addition of low amounts of metals not easily oxidized to the Ti, rendering the metal passive. (R1j, R10c; Ti-b)

746-R.* The Influence of Noble Metal Alloy Additions on the Electrochemical and Corrosion Behavior of Titanium. Milton Stern and Herman Wissenberg. *Electrochemical Society, Journal,* v. 106, Sept. 1959, p. 759-764.

Controlling corrosion of Ti by addition of small amounts of noble metals, rendering the metal passive. (R1j, R10c, 2-60; Ti-b, EG-c)

747-R.* High-Temperature Sulfiding of Iron Alloys in Hydrogen Sulfide-Hydrogen Mixtures. E. W. Haycock. *Electrochemical Society, Journal,* v. 106, Sept. 1959, p. 764-771.

Rates of sulphide scale formation on pure Fe and Cr steel measured from 400-550° C. under pressures of 600 psi. with an H_2S partial pressure of 0.6 psi. for periods up to 500 hr. (R2q, 2-62; Fe-a, SS, 14-68)

748-R.* Use of Nickel-Aluminum Alloy Coatings for the Protection of Molybdenum From Oxidation. W. Beck. *Electrochemical Society, Journal,* v. 106, Sept. 1959, p. 783-786.

Coatings produced on Mo by electrodeposition, protecting it from high-temperature oxidation. Composition of Ni-Al phases determined by metallographic analysis. (R1h, 2-62; Mo, Ni-b, Al-b, 8-62)

749-R.* The Intercrystalline Cracking of Binary and Complex Beta Brasses Resulting From Moisture in the Atmosphere. A. R. Bailey. *Institute of Metals, Journal,* v. 87, July 1959, p. 380-384.

Cracking in binary and complex brasses under a sustained tensile load is found to take place only in moist atmospheres and does not occur in dry argon or in dried air. Effect of moisture is particularly noticeable with binary (beta + gamma) alloys, which display distinctly better strength and ductility in a dry atmosphere than in the ordinary air. 8 ref. (R2h, R3; Cu-n)

750-R. Erosion of Magnesium. Albert H. Peters and R. G. Beck. E. I. du Pont de Nemours & Co. *U. S. Atomic Energy Commission,* DP-377, June 1959, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Mg alloy specimens containing 8, 3 and 1% Al exposed to flowing deionized water at 40° C. Erosion rates were established at 0.1, 0.2 and 0.5 in. per year, respectively. Erosion rate was several times higher for specimens with lower concentration of Al. (R1c, R4, 2-60; Mg-b, *Al*)

751-R. Behavior of Structural Materials Exposed to an Organic Moderated Reactor Environment. N. J. Gioseffi and H. E. Kline. Atomics International. *U. S. Atomic Energy Commission,* NAA-SR-2570, Oct. 1, 1959, 36 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.25.

Behavior of 1020 carbon steel, Types 304 and 410 stainless steel, 4130 alloy steel, Al and Mg in relation to corrosion resistance after neutron irradiation. (R7, 2-67; CN, SS, AY, Mg, Al, SGB-s)

752-R.* (French.) Oxidation After Heat Treatment of Germanium Surfaces Oriented on a Plane. Pt. 3. Leone Gouskov. *Comptes Rendus*, v. 249, Aug. 3, 1959, p. 671-673.

Corrosion figures and oxide products visible on Ge monocrystals under microscope after oxidation at 450° C. under pressures of 10^{-2} and 10^{-4} mm. Hg. (R1h, R2g, M26c, 2-64, 1-73; Ge, 14-61)

753-R. (Flemish.) Corrosion of Pipe in Ships. V. Ferdinande. *Revue de Mecanique (Tijdschrift)*, v. 5, no. 2, 1959, p. 67-75.

12 ref. (R1a, T22; Cu-b, Cu-n, CI-r, 4-60)

754-R.* The Action of Cathodically Evolved Hydrogen on Iron and Nickel as Special Cases of Corrosion-Embrittlement of Metals. Michael Smialowski. *Chemistry and Industry*, no. 35, Aug. 29, 1959, p. 1078-1083.

Tempering temperature and hydrogen diffusion affect corrosion embrittlement. 15 ref. (R1e, Q26s; Fe, Ni, CN)

755-R.* (Japanese.) Conductometric Test of the Efficiency of Rust Preventive Oil. Ken'ichi Goto and Teruzo Asahara. *Metal Finishing Society of Japan, Journal*, v. 10, Aug. 1959, p. 301-305.

Steel wire and Cu ribbon were treated with rustproof oil and exposed to electrolytes. Corrosion was determined by measuring the electrical resistivity. (R11h, R10; ST, Cu-a, 4-61, NM-h)

756-R. (Russian.) Changes of Internal Friction and Frequency of Natural Oscillations of Kh18N9 Type Steel Caused by Intercrystalline Corrosion. M. A. Vedeneeva and N. D. Tomashov. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat Moscow, 1958, p. 483-494.

Samples of varying composition were quench hardened and tempered. Effect of intercrystalline corrosion, produced by boiling in an acid, on internal friction, resistivity and natural oscillation. 9 ref. (R2h, Q22, P15, 3-67; SS)

757-R. (Russian.) Effect of Static Tensile Loads and Alternate Loading on Corrosion of 1Kh18N9 Steel. N. D. Tomashov, M. A. Vedeneeva and K. N. Gedgovd. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 574-583.

Samples exposed to tensile or cyclic loads and subjected simultaneously to the action of a 0.8 N solution of HNO_3 containing $FeCl_3$. Effects of stress, previous heat treatment and the amount of $FeCl_3$ on intercrystalline corrosion. 14 ref. (R2h, 2-64, 2-66, 3-66; SS)

758-R. (Russian.) Pitting Corrosion of Stainless Steel. N. D. Tomashov, N. P. Zhuk and N. K. Kernich. Paper from "Production and Further Processing of Steel and Alloys. Collection of Papers, no. 38, Moscow Steel Institute". Metallurgizdat, Moscow, 1958, p. 584-602.

Measurement of the electrical potential that destroys the protective surface layer of the sample surrounded by a corrosive medium. Factors that influence pitting such as composition, pH number and temperature of electrolyte. Alloying elements improving or decreasing corrosion resistance. 17 ref. (R2j, 2-66, 2-60, 2-61; SS)

759-R. (Russian.) Correlation Between the Tendency of Copper Alloys to Cracking and Properties of the Alloying Component. A. V. Bobylev. *Tsvetnye Metally*, no. 2, 1959, p. 65-70.

12 ref. (R1d, 2-61; Cu-b)

760-R.* (Japanese.) Corrosion Resistance of Aluminum and Aluminum Alloys. Takuichi Morinaga, Shigeo Zaima and Motoo Kagami. *Light Metals*, v. 9, July 1959, p. 22-37.

Corrosion of Al containers by ethyl alcohol. (R7f; Al)

761-R. Corrosion in Steam and Steam-Condensate Systems. J. S. Connors and C. L. Seyer. *Petrochemical Industry*, v. 2, May 1959, p. 27.

(R4d; Fe)

762-R. Corrosion Control at Grand Isle. A. E. Hiller. *Petroleum Engineer*, v. 31, July 1959, p. B41-B42, B44-B45.

Cathodic protection of steel against salt water corrosion. (R4b, R10d; ST)

763-R. Anodic Polarization and Anodic Protection of Titanium in Hydrochloric and Sulphuric Acid. Rikuro Otsuka. *Scientific Papers of the Institute of Physical and Chemical Research (Tokyo)*, v. 53, Mar. 1959, p. 9-12.

5 ref. (R10, R6g; Ti)

764-R. (Russian.) Corrosion Resistance of Metal-Ceramic Alloys on TiC Base. I. S.

Brokhin and I. I. Ol'khov. *Tsvetnye Metally*, no. 3, 1959, p. 61-66.

Corrosion resistance at 900-1100° C. Effect of composition. .13 ref. (R1h, 2-62, 2-61; 6-70, *Co, Ta*)

765-R.* External Corrosion of Superheaters in Boilers Firing High-Alkali Coals. P. Sedor, E. K. Diehl and D. H. Barnhart. *American Society of Mechanical Engineers*, Paper no. 59—A-76, 1959, 10 p.

Effects of ash deposits soluble and insoluble on 18-8, Type 321 and 25-20 and Type 310 tubes show the latter more corrosion resistant. MgO reduced corrosion on 18-8 at 1200° F. by 85%. (R6p, T26q; SS)

766-R.* Titanium Valves and Piping Resist Corrosive Slurry at 500° F. Gordon Weyermuller and L. F. Engle. *Chemical Processing*, v. 22, Nov. 1959, p. 113-115.

Produced from Ti plate with a yield strength of 55,000 psi. and maximum Brinell hardness of 210. Test and pilot plane operations show a corrosion rate of essentially zero. (R6; Ti, 4-60)

767-R.* The Oxide Films Formed on Copper Single Crystal Surfaces in Pure Water. Pt. 1. Nature of the Films Formed at Room Temperature. Jerome Kruger. *Electrochemical Society, Journal*, v. 106, Oct. 1959, p. 847-853.

Physical and chemical characteristics of oxide films on clean Cu surfaces as determined by crystallographic orientation, pH, irradiation by light and gases present. Epitaxial relation to Cu substrate. (R2r, M22g, 2-66; Cu-a, 14-61)

768-R.* An Electron Microscopic Study of the Formation of Oxide on Copper Single Crystals Immersed in an Aqueous Solution of Copper Sulfate. G. Tyler Miller, Jr., and Kenneth R. Lawless. *Electrochemical Society, Journal*, v. 106, Oct. 1959, p. 854-856.

Oxide film on Cu single crystal in aqueous solution of $CuSO_4$ examined by electron microscope and electron diffraction methods. Effect of pH and dissolved oxygen upon growth of oxide polyhedra. (R2r, M21e, M22h, 2-66; Cu-a, 14-61)

769-R.* Influence of Silicon on the High-Temperature Oxidation of Copper and Iron. J. W. Evans and S. K. Chatterji. *Electrochemical Society, Journal*, v. 106, Oct. 1959, p. 860-866.

Oxidation rates determined by glass-spring thermobalance for pure Cu, Fe, Fe-Si and Cu-Si alloys. Diffusivity of oxygen in base metal is related to depth of subscale. (R1h, 2-62, 2-60; Cu-a, Fe-a, Fe-b, Cu-b, *Si*)

770-R.* The Behavior of Rhenium in Electron Tube Environments. Gordon B. Gaines, Chester T. Sims and Robert I. Jaffee. *Electrochemical Society, Journal*, v. 106, Oct. 1959, p. 881-885.

Re subjected to carburizing atmospheres, contact with alumina, water-cycle attack and boron-containing atmospheres forms borides rather than carbides and is more stable than tungsten. Re-clad W and Th-clad Re filaments examined. (R2g, 2-60, 2-62; Re)

771-R.* Oxides on the Silver Electrode. Charles P. Wales and Jeanne Burbank. *Electrochemical Society, Journal*, v. 106, Oct. 1959, p. 885-890.

Mechanism of oxide formation on Ag determined by X-ray diffraction and electrode potentials. Structure of Ag oxides. (R1a, R1h, M22; Ag-a)

772-R.* The Diffusion of Corrosion Hydrogen in Aluminum Alloys. W. E. Tragert. *Electrochemical Society, Journal*, v. 106, Oct. 1959, p. 903-904.

Absorption of hydrogen into Al and consequent corrosion is inhibited in 1% Ni alloy by the reduced permeability to hydrogen of the corrosion product film rather than local cathodic discharge of hydrogen. (R10b, 2-60; Al-b, *Ni*)

773-R.* Studies on the Metallurgy of Silicon Iron. Pt. 4. Kinetics of Selective Oxidation. A. U. Seybolt. *Metallurgical Society of AIME, Transactions*, v. 215, Oct. 1959, p. 756-759.

Kinetics of a 3.2% Si-Fe to form SiO_2 was explored over a temperature range 800 to 1000° C. using a flowing gas mixture of water and hydrogen. Results at 850° C. seem to admit the possibility of a lowered Si activity due to partial Fe-Si ordering in the alloy solid solution. The presence of 0.023% C. caused a pronounced reduction in the rate of gain in weight. (R1h, 2-62; Fe-b, *Si*, 14-67)

774-R.* (German.) Cavitation Phenomena. H. H. Piltz. *Metalloberflache*, v. 13, Sept. 1959, p. 285-288.

Cavitation is considerably accelerated by chemical and electrochemical processes. Hardness, strength and surface

workability qualities of the material are of secondary importance in cavitation resistance. The principal factor is the structural condition of the metal. (R2m)

775-R.* (German.) Zinc Additions in Protection Paints. H. J. Schuster. *Werkstoffe und Korrosion,* v. 10, Aug. 1959, p. 490-494.

Corrosion resistance of Zn coatings is based on the electrochemical interaction between the pigment and the parent metal surface. A nonsoluble basic Zn composition is thereby created which insulates and therefore protects the cathodic regions of the base metal. (R10, R10d; Zn, NM-g30)

776-R.* (German.) Contact Corrosion Between Metals and Nonmetallic Materials Both in the Atmosphere and in Electrolytes. F. Podbreznik. *Werkstoffe und Korrosion,* v. 10, Aug. 1959, p. 495-498.

Galvanic corrosion of two metals with potential difference; physical contact of two metals by means of infiltration, gaseous and liquid media. (R1a, R4b)

777-R. Chromate Inhibitors Furnish Effective Low-Cost Corrosion Control. Gordon Weyermuller. *Chemical Processing,* v. 22, Nov. 1959, p. 56-59.

Chromate is blended with other compounds to form a synergized product to provide better protection in cooling water systems. (R10b)

778-R. (German.) Recent Applications of Epoxy Resins to Surface Protection. H. Zumstein. *Werkstoff und Korrosion,* v. 10, Oct. 1959, p. 605-608.

795-R. (Hungarian.) Stress-Corrosion of Brass Condenser Tubes. L. Janos. *Kohaszati Lapok*, v. 92, Aug. 1959, p. 375-380. (R1d; 4-60, Cu-n)

796-R. Controlling Internal Corrosion of Tank Ships. J. Franklin Koehler. *Corrosion*, v. 15, Nov. 1959, p. 557t-560t.

Methods include partial and complete cathodic protection, inhibition, coatings and combinations of these methods. Coatings currently are considered to offer the best promise of adequate control at lowest costs. (R-general, R10, T22)

797-R. Electrical Bonding of Cathodically Protected to Unprotected Ships. G. A. Bennett, N. S. Dempster and A. J. Wallace. *Corrosion*, v. 15, Nov. 1959, p. 587t-590t.

A need is established for low resistance electrical bonding between a cathodically protected and an unprotected ship when berthed together. (R10d, T22)

798-R. (Russian.) Effect of Sea Acorns on the Corrosion of Stainless Steels. I. B. Yulanovskii, N. T. Tarasov and Yu. M. Korovin. *Doklady Akademii Nauk, SSSR*, v. 125, May, 1959, p. 1015-1018.

Behavior of Black Sea acorns in contact with 1KH13 and 1KH18V9T stainless steel. Corrosion is galvanic in nature. 7 ref. (R1a; SS)

799-R. (Russian.) Heat Resistance of Silicon Cast Iron. B. S. Milman and N. N. Alexandrov. *Liteinoe Proizvodstvo*, Sept. 1959, p. 35-37.

5-6% of Si assures adequate heat resistance. Scale resistance is attained because of a protective oxide of the spinel type formed on the metal's surface. 5 ref. (R1h, 2-60; CI, *Si*)

800-R. (Russian.) Removal of Corrosion Products From Various Steels. M. A. Tolstaya, S. V. Bogtyreva and G. N. Gradusov. *Zavodskaya Laboratoriya*, v. 25, no. 10, 1959, p. 1205-1206.

Methods for stainless steel. (R11; SS)

801-R. (Russian.) Evaluation of Results Obtained in Pitting Corrosion Tests. M. D. Bezboradko and G. S. Krivoshein. *Zavodskaya Laboratoriya*, v. 25, no. 10, 1959, p. 1238-1240.

5 ref. (R2j)

802-R.* Can Corrosion Problems. *Corrosion*, v. 15, Nov. 1959, p. 100-102, 104, 106.

Various types of internal and external can corrosion normally encountered and their effects on the technical adequacy of the container and on consumer acceptance. Methods presented for corrosion control include product modification, container materials selection, packaging methods, storage conditions, protective coatings and chemical treatments. (R-general, T29p; ST, *Sn*, 8-65)

803-R.* Corrosion of Titanium in Boiling 2N Hydrochloric Acid. Roger Buck, Billy W. Sloope and Henry Leidheiser, Jr. *Corrosion*, v. 15, Nov. 1959, p. 566t-570t.

Rate of corrosion of Ti when contacted to Al, Cd, Sn, Zr, Pb, Bi, Hg, Ag, Cu, Sb, V, 70:30, 50:50 and 30:70 Cu-Ni alloys, Fe, Pd, Co, Ni, Au, Rh, Pt and Ir. Corrosion measurements of the same type were also made in 0.6 and 2N H_2SO_4. 13 ref. (R6g; Ti)

804-R.* Lead-Silver Alloy Anodes in Cathodic Protection of Ships. K. N. Barnard, G. L. Christie and D. G. Gage. *Corrosion*, v. 15, Aug. 1959, p. 581t-586t.

A Pb alloy with 2% Ag has been used experimentally as an impressed current system for cathodic protection of an active destroyer. Comparison of performance and costs are made with existing impressed current and galvanic systems. (R10d, T22; Pb-b, *Ag*)

805-R.* Some Platinum Anode Designs for Cathodic Protection of Active Ships. H. S. Preiser and B. H. Tytell. *Corrosion,* v. 15, Nov. 1959, p. 596t-600t.

Voltage-current relationships determined for Pt wires, gauze and disk and a Pt-clad Ta disk in sea-water tests in the laboratory and in Boston harbor. The Pt-clad Ta disk produced the best current-voltage ratio. 32 ref. (R10d, T22; Pt-b)

806-R.* The Residual Oil Ash Corrosion Problem. C. J. Slunder. *Corrosion,* v. 15, Nov. 1959, p. 601t-606t.

Review of progress being made in combatting accelerated high-temperature corrosion caused by combustion products of residual fuel oils. Available high-temperature alloys do not have adequate resistance to oil-ash attack at temperatures above 1200° F. Improved corrosion resistance has been attained with certain experimental alloys but these have inferior mechanical properties. Surface treatments such as aluminizing, chromizing and siliconizing appear to have some inherent protective value, but further development of procedures for applying impervious and adherent coatings is needed. 57 ref. (R6, 2-62; SGA-h)

807-R. Electrical Resistance Method for Studying Corrosion Inhibitors in Automotive Anti-Freezes. J. C. Cessna. *Corrosion,* v. 15, Nov. 1959, p. 607t-612t.

Corrosion of Fe, Al and cuprous metals under varying test conditions of temperature, glycol concentrations and synthetic waters. Effect of some corrosion inhibitors upon these metals. 16 ref. (R7f, R10b, R11, 2-61; Fe, Al, Cu)

808-R.* Effect of Silicon on High Temperature Oxidation of Stainless Steels. John F. Radavich. *Corrosion,* v. 15, Nov. 1959, p. 613t-617t.

Growth of oxide films at 600 and 800° C. on a series of 16-10 Cr-Ni stainless steels with Si contents ranging from 0.17 to 3.55%. As the Si content increases, oxidation resistance increases rapidly until at the Si level, 3.55%, a very thin oxide film is formed at 600 and 800° C. and very little oxide scale forms at 1000° C. Mechanism of oxidation resistance imparted by Si appears to be that it decreases the number of defects in the initial oxide films formed at the metal-oxide interface. 10 ref. (R1h, 2-62, 2-60; SS, *Si*)

809-R.* Corrosion Resistance of Non-Ferrous Castings. A. H. Rollins. *Corrosion Technology,* v. 6, Sept. 1959, p. 259-262.

Factors in the selection of desirable alloys for castings intended for use in corrosive or heavy stress conditions. Data on performance of Monel, Al bronze, gunmetal, Cu-Zn and Cu-Sn alloys. (R-general; 5-60, Cu-b, Cu-s, Zn, Sn, Al, SGA-g)

810-R.* Corrosion Resistance of Aluminum Bronzes. G. Fitzgerald-Lee. *Corrosion Technology,* v. 6, Sept. 1959, p. 263-266, 284.

Behavior of aluminum bronze in gaseous, liquid and solid corrosive media. The addition of Al to Cu results in a marked improvement in corrosion resistance. (R-general, 2-60; Cu-s, *Al*)

811-R.* Observations on the Corrosion Products of Tin. T. K. Ross and W. Harris. *Corrosion Technology,* v. 6, Sept. 1959, p. 269-271.

White deposits formed on Sn by corrosive action in relation to crystal structure and behavior under various conditions of time, surface and concentration of corrosive agent. (R6; Sn)

812-R.* The Hot-Dip Galvanized Coating and Corrosion Resistance. Pt. 1. John H. Nicholls. *Corrosion Technology,* v. 6, Sept. 1959, p. 275-276, 284.

Corrosion under conditions of immersion in water of various compositions, burial and attack by micro-organisms and exposure to corroding atmospheres. (To be concluded.) (R-general; ST, 8-65, *Zn*)

813-R.* The Growth of Barrier Oxide Films on Aluminum. W. J. Bernard and J. W. Cook. *Electrochemical Society, Journal,* v. 106, Aug. 1959, p. 643-646.

Weight, capacitance and rate measurements on barrier oxide films show an increase in thickness at constant voltage. 5 ref. (R1h; Al)

814-R.* Kinetics of the Dissolution of Copper in Oxygen-Containing Solutions of Various Chelating Agents. J. Halpern, H. Milants and D. R. Wiles. *Electrochemical*

Society, Journal, v. 106, Aug. 1959, p. 647-650.

Dissolution rate is found to be zero-order in oxygen and first order in complexing agent. Rate-determining process is believed to be the chemical attack of oxygen-covered Cu surface by complexing agent. 7 ref. (R7j; Cu)

815-R.* Influence of Crystallographic Orientation on the Pitting of Iron in Distilled Water. Jerome Kruger. *Electrochemical Society, Journal,* v. 106, Aug. 1959, p. 736.

Surfaces of Armco iron and a purer Fe having an orientation near the {110} plane showed greatest amount of pitting. Pitting was lower for the purer Fe. (R2j, R4e; 3-72; Fe-a)

816-R.* Simultaneous Action of Organic Inhibitors and Cathodic Polarization on the Corrosion of Iron. L. I. Antropov. *Journal of Scientific & Industrial Research,* v. 18B, Aug. 1959, p. 314-319.

Calculation of increase in cathodic protection of metals, particularly Fe, by alteration of anodic and cathodic polarization. Data show a decrease in corrosion rate when electric current is applied to organic inhibitors in solutions. (R1b, R10d; Fe)

817-R.* Corrosion by Liquid Metals and Aqueous Solutions. P. H. Eisenberg. Paper from "Metals for Nuclear Reactors". American Society for Metals, Metals Park, Novelty, Ohio, 1959, p. 47-62.

Mass transfer and intergranular penetration in corrosion of Inconel and stainless steels by liquid metals. Reaction of impurities in liquid metal and purification techniques. Intergranular corrosion, stress-corrosion cracking and galvanic corrosion of stainless steels by aqueous solutions at high temperatures. Static and dynamic testing. (R1, R2, R4, R6m; SS, Ni-b)

818-R.* (French.) The Cathodic Protection of Steel Immersed in Sea Water. A. Hache. *Corrosion et Anticorrosion,* v. 7, Sept. 1959, p. 307-311.

Summary of previously published results of work at IRSID's Biarritz corrosion testing station. Projected program for study of cathodic protection. (R1d, R4b, R10d; AY)

819-R.* (French.) Results of Marine Corrosion Tests on 4% Chromium Steels. E. Herzog. *Corrosion et Anticorrosion,* v. 7, Sept. 1959, p. 312-316.

Weight loss and depth of corrosion of specimens containing slight additions of Ni or Al. Conditions included exposure to marine atmosphere, immersion in sea water, various types of surface preparation and heat treatment and asphalt painting of surfaces. 6 ref. (R3p, R4b, L26n, 2-60, 2-64; AY, *Cr, Ni, Al*)

820-R.* (French.) Marine Corrosion. G. Dechaux. *Corrosion et Anticorrosion,* v. 7, Sept. 1959, p. 317-321.

Electrolytic corrosion of floating and stationary steel structures; effect of bacteria and other organisms and impurities found in sea water; cathodic protection and protection afforded by antirust paints. (R3p, R4b, R10d, 3-69, T22; ST, SGB-s)

821-R.* (French.) Use of Titanium and Titanium Alloy Anodes for Cathodic Protection With an Independent Current Source. H. Richaud. *Corrosion et Anticorrosion,* v. 7, Sept. 1959, p. 322-324.

Cathodic protection tests in sea water on steel using Ti anodes due to the inertia of Ti to corrosive media, particularly chloride solutions. A 4% Mn-Ti alloy gave good results for anodic voltages of 10 to 15 milliamp. per sq. dm. For higher voltages, Pt-coated Ti anodes were used with great success. (R4b, R10d, R11m; ST, Ti, Ti-b, *Mn*)

822-R. (Translation—AIP.) Regarding the Problem of the Volume of Molten Metal During Electrical Erosion. A. S. Zingerman. *Soviet Physics, Solid State,* v. 2, no. 1, n.d., p. 255-260.

Expression for depth of the molten metal zone during electrical erosion determined. 31 ref. (R1c; ST, Al, Cu, 14-61)

823-R. (Translation—ATS.) Effect of Sulphur-Bearing Diesel Fuels on Metals Under Conditions of Prolonged Contact. G. G. Koznov. *Chemistry and Technology of Fuels and Oils,* v. 4, no. 8, 1959, p. 68-71.

Corrosion of steel and Cu in fuel with 0.9 and 1.25% sulphur is compared with that in sulphur-free fuel. (R7k; ST, Cu)

824-R. (Translation—ATS.) Effect of Some Organic Compounds in the Anodic Oxidation of Aluminum. L. Donev and L. Boyadzhiev. *Journal of Applied Chemistry of the U.S.S.R.,* v. 32, no. 9, 1959, p. 2031-2034.

Ethanol, glycerol and aniline hydrosulphate tested as inhibitors with the latter proving the most effective. 8 ref. (R7, R1h; Al)

825-R. (Translation—ATS.) A Study of Corrosion Stability of Sheet Iron. A. S. Afanas'ev and B. Sh. Shteinberg. *Journal of Applied Chemistry of the U.S.S.R.*, v. 32, no. 9, 1959, p. 2046-2056.

Effect of structure and chemical composition on corrosion resistance in various atmospheres. 17 ref. (R3, 3-71, 2-60; Fe-b, 4-53)

826-R. (Translation—Brutcher no. 4611.) Alloying of Metal Borides With Silicon. K. I. Portnoi, G. V. Samsonov and K. I. Frolova. *Izvestiya Akademii Nauk SSSR, Otdelenie Tekhnicheskikh Nauk, Metallurgiya i Toplivo*, no. 2, 1959, p. 117-121.

Effect on oxidation resistance. (R1h, 2-60; Ti, Cr, 14-68)

827-R. (Translation—ConBur.) Electrochemical Behavior of Zirconium in Sulfuric Acid. N. A. Balashova and B. N. Kabanov. *Proceedings of the Academy of Sciences of the USSR, Physical Chemistry Section*, v. 121, July-Aug. 1958, p. 489-491.

Cathodic and anodic behavior of Zr, and the potential change in 1N H_2SO_4 solution at 25° C. in the absence of current. 7 ref. (R6g, P15; Zr)

828-R. (Translation—ConBur.) Electrochemical Properties and Corrosion Behavior of Titanium in Sulfuric Acid Solutions. V. V. Andreeva and V. I. Kazarin. *Proceedings of the Academy of Sciences of the USSR, Physical Chemistry Section*, v. 121, July-Aug. 1958, p. 577-580.

Relationship between dissolution rate, H_2SO_4 concentration and temperature. 4 ref. (R6g, P15j; Ti)

Chemical methods for the determination of C, O (as NaO_2) and K; emission spectroscopic methods for determination of Rb and Cs. (S11; *C, Rb, Cs, O,* K, Na, 14-68)

52-S. A Pulsed Eddy Current Technique for Measuring Clad Thickness. D. L. Waidelich, J. A. DeShong and W. J. McGonnagle. Argonne National Laboratory. U. S. Atomic Energy Commission, ANL-5614, July 1958, 49 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Electromagnetic field is applied at the surface of the clad fuel element by means of a probe coil. When the waves encounter a sudden discontinuity, such as an interface, "echoes" are produced. The crossing point between the positive and negative peaks or the amplitude of the echo is used to determine the thickness. (S14c, T11g; 8-66)

98-S. (French.) Recent Progress in the Complexometric Determination of Calcium and Magnesium in Slags. V. Kuhn. *Chimie Analytique*, v. 40, Sept. 1958, p. 340-344.
Ca in presence of Mg can be determined by EDTA with help of new indicator, RF chromium blue black. Use of Teriochromium black then permits determination of Mg in same solution. In analysis

of slags and refractories, elements that would impede analysis are first removed in form of complexes by chloroform extraction. 6 ref. (S11j; Ca, Mg, RM-q)

99-S. (French.) Methods of Improving the Exactness and Reproducibility of Spectral Sources. H. Guyer. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 308-312.

Parameters influencing character and reproducibility of spectrographic discharge. Design of new rotary interruptor based on theoretical requirements and previously known but seldom used high-frequency device for measuring energy crossing analytical gap. 8 ref. (S11k, X3b)

100-S. (German.) Reducing Scrap by Statistical Methods of Control. Heribert A. Krall. *Giesserei*, v. 45, June 5, 1958, p. 321-325.

Magnitude of scrap in production of castings. Calculation of scrap control limits. Evaluation of current production. 5 ref. (S12g, S12j, E-general; RM-p)

101-S. (German.) Rapid Method for Quantitative Analysis of Nickel Plating Baths. Hans Birik Bomskov. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Nov. 1958, p. 487-489.

Rapid titration analysis for Ni in solutions of nickel chloride and sulphate and boric acid. Also with organic additives. (S11j, L17c; Ni)

102-S. (German.) Limitations of Gamma Radiographs in Flaw Detection as Used for Circumferential Pipe Welds. W. H. Papke. *Schweissen und Schneiden*, v. 10, Nov. 1958, p. 439-441.

Relationship between wall thickness, intensity and focus. Distortion of results. 4 ref. (S13e; 4-60, 7-51)

103-S. (Italian.) Influence of Photographic Emulsion on Effective Line Width. A. Lais and R. Intonti. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 296-300.

Fine-grain emulsions give steeper log b/log t curves. 6 ref. (S11k, X5s)

104-S. (Italian.) Advantages of Selective Volatization and Phenomena of Enhancement in Spectrographic Analysis. G. Rigault. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 301-304.

Methods of increasing spectral sensitivity with excitation in a d-c. arc; application in analysis of rare earth elements, Ga and In. 14 ref. (S11k; Ga, In, EG-g)

105-S. (Italian.) Observations on So-Called Flame Spectrophotometry. V. Gazzi. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 305-307.

Apparent simplicity of use of this technique leads to neglect of factors influencing line intensity and measures required to reduce errors. Elements that can be successfully "flame-analyzed" and appropriate lines. (S11k)

106-S. (Italian.) Production Control With the "Spectro-Lecteur". H. Pfundt. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 313-316.

Device used primarily to analyze fusion products and follow charging of furnaces. Results on three types of Al alloys. Workroom conditions and analytical errors. (S11k; Al-b)

107-S. (Italian.) Applications of Effective Line Widths. A. Fiorenza and M. Lachin. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 319-324.

Application to spectrographic analysis of high-concentration mixtures of metallic powders; procedures, equipment, methods of evaluation. Use of effective line widths offers considerable extension of analytical curves, compensation for variations of emission, rectification of instrumental variations, remarkable independence from characteristics of photographic emulsion. Hypothesis on interpretation of compensating method inherent in "method of averages". 10 ref. (S11k; 6-68)

108-S. (Italian.) Spectrographic Control of the Bath During Zinc Plating of Steel Strip by the Sendzimir Process. A. Porta. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 325-328.

Method uses arc-like discharge between a flat Zn specimen and a graphite counter-electrode. Al is determined in concentration field ranging from 0.01 to 0.30%, Pb between 0.05 and 0.60%. Preparation of standard specimens, reproducibility, precision of method. 8 ref. (S11k, L17; Al, Pb, *ST, Zn*)

109-S. (Italian.) Spectrographic Analysis of Leaching Solutions of Lead and Zinc Ores. M. Civera. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 329-331.

Direct analysis of solutions permits rapid preparation of samples, gives approximate results. Elements furnishing reference lines under conditions of operation are: Tl for Zn, Ag for Fe and Zn simultaneously, Cu for Fe and Pb simultaneously. Also, new simple method

of testing solution by spark technique. (S11k; Pb, Zn, RM-n)

110-S. (Italian.) New Spectrophotometric Method for Rapid Visual Analysis of Metals. C. Mielenz. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 332-336.

New Spectrophotometer (Feuss "Spekromat") incorporates ultra-luminous and highly dispersive self-collimating spectroscrope with optical system equivalent to five prisms and active base of about 460 mm.; provides wide slit even in line-rich steel spectra; makes possible accurate quantitative analysis; solves previously unsolved problem of quantitative determination of Si. (S11a, X3c; Si)

111-S. (Italian.) Effects of Variation of Pressure on Intensity of Emission in Arc of Some Elements. Giulio Brautti. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 340-342.

Variation of pressure of gas in which arc burns causes increase or dimunition of intensity of emitted lines; effect was observed with Cu and Zn electrodes in N_2, Ne, A, air and CO_2. (S11k)

112-S. (Japanese.) Chloride Content of Galvanized Coatings. Yoshifumi Mima. *Metal Finishing Society of Japan, Journal*, v. 9, Nov. 1958, p. 411-415.

Photometric analysis of coating on cast iron and steel. (S11a; *Zn*, ST, CI, 8-65)

113-S. (Russian.) Checking Metal for Seams in Billets and Finished Products. G. S. Chernyak and M. I. Vinograd. *Stal'*, v. 18, Oct. 1958, p. 946-947. 4 ref.

118-S.* X-Ray Spectrophotographic Determination of Tantalum, Niobium, Iron, and Titanium Oxide Mixtures. B. J. Mitchell. *Analytical Chemistry*, v. 30, Dec. 1958, p. 1894-1900.

Accurate analysis of metal oxides found using arithmetic correction factors based on empirical calibration curves to compensate for interelement effect. 12 ref. (S11k; Ta, Cb, Ti, Fe, 14-68)

119-S.* Spectrographic Determination of Boron and Silicon in Low-Alloy Steel by Fluoride Evolution. James E. Paterson and William F. Grimes. *Analytical Chemistry*, v. 30, Dec. 1958, p. 1900-1902.

After decomposing and distilling copper fluoride, the fluorides give spectrum lines of Si and B. Determines concentration in steels in range of 0.001 to 0.02% with a coefficient of variations of ± 3% for B and ± 3.2% for Si. 5 ref. (S11c; AY, *Si, B*)

120-S.* Ion Exchange Spectrographic Method for Determination of Impurities in Uranium and Plutonium. James K. Brody, John P. Faris and Robert F. Buchanan. *Analytical Chemistry*, v. 30, Dec. 1958, p. 1909-1912.

Separation of impurities from Pu by the ion exchange-hydrochloric acid system reduces the amount of radioactive material on the electrodes compared with the carrier distillation method. In the ion exchange-copper spark produced each electrode pair contained about 4 microns each of Pu and americium. 11 ref. (S11c, S11f; U, Pu, 9-51)

121-S.* Spectrophotometric Determination of Copper in Titanium and Titanium Alloys by Dithizone Extraction. Howard W. Pender. *Analytical Chemistry*, v. 30, Dec. 1958, p. 1915-1917.

Rapid, quantitative method determining Cu in range 0.0001 to 1% without preliminary chemical separation. 6 ref. (S11a; Ti-b, *Cu*)

122-S.* Determination of Tungsten or Molybdenum by X-Ray Emission Spectrography. J. E. Fagel, Jr., H. A. Liebhafsky

and P. D. Zemany. *Analytical Chemistry*, v. 30, Dec. 1958, p. 1918-1920.

W in alkaline solution determined when bromine used as internal standard. Mo in ores or residues with known W content found by measuring ratio of Mo K alpha to W L gamma . (S11p; Mo, W)

123-S.* Determination of Titanium With Cupferron. K. L. Cheng. *Analytical Chemistry*, v. 30, Dec. 1958, p. 1941-1945.

(Ethylenedinitrilo) tatraacetic acid as masking agent. Photometric method. 5 ref. (S11a; Ti)

124-S.* Polarographic Determination of Iron and Manganese in Ores and Metallurgical Products. I. M. Issa, R. M. Issa and I. F. Hewaidy. *Chemist-Analyst*, v. 47, Dec. 1958, p. 88-90.

Sulphite used to remove dissolved oxygen and hydrogen peroxide after tri-ethanolomine had been used. Permits study in steel, cast iron, ores and synthetic mixtures. 8 ref. (S11m; ST, CI, *Fe, Mn,* RM-n)

125-S.* Photometric Determination of Manganese in Steel and Cast Iron. J. E. Bolzan. *Chemist-Analyst*, v. 47, Dec. 1958, p. 95-96.

Persulphate-silver method employing a filter photometric and bleached blank. 4 ref. (S11a; ST, Ci, *Mn*)

126-S.* Determination of Hydrogen in Steel by a Carrier Gas Technique. E. A. Shanahan and F. Cooke. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 381-385.

H content can be determined by heating the sample at about 650° C. in a stream of an inert carrier gas. Evolution of the H occurs substantially at the same rate as in the well-known vacuum heating technique. The rate-controlling factor is the diffusion of the H within the solid sample. The procedure overcomes the need for vacuum apparatus. 4 ref. (S11r; ST, *H*)

127-S.* Gamma Radiography With Iridium. R. A. Mintern and J. C. Chaston. *Platinum Metals Review*, v. 3, Jan. 1959, p. 12-16.

Gamma ray spectrum or iridium 192. Radiographic technique, exposure, availability of sources. (S13e; Ir, 14-63; 17-57)

128-S.* Sample for Rapid Measurement of Gas in Aluminum. H. V. Sulinski and S. Lipson. *Modern Castings*, v. 34, Jan. 1959, p. 102-110.

Gas content is determined by a single weighing of a 20-cc. sample solidified at approximately 0.1 atmospheric pressure. Resin-bonded shell mold and knock-off riser system of special design permit control of as-cast specimen volume. 5 ref. (S11r; Al, 5-60)

129-S.* (Polish.) Comparison of Two Methods of Preliminary Isolation of Inclusions of Oxides in Low-Carbon Steels by Electrolysis. J. Foryst, J. Orzechowska and W. A. Mczedliszwili. *Prace Instytutow Ministerstwa Hutnictwa*, v. 9, no. 4, 1957, p. 161-165.

Chemical composition of oxide inclusions was determined in low-carbon steel deoxidized by Fe-Mn-Si-Al. 9 ref. (S11; CN-g, 9-69)

5 ref. (S11a; Sn, *Pb*)

159-S. (Russian.) Ultrasonic Quality Control of Spot and Seam-Welded Lap Joints. S. T. Nasarov and J. P. Panov. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1214-1217.
Determination of actual diameter of weld; location of pores and cracks. (S13g; 7-51)

160-S. (Russian.) Rapid Determination of Silicon in Carbon-Free and Low-Carbon Ferrochrome. M. I. Gasik and B. I. Emlin. *Zavodskaya Laboratoriya*, v. 24, Oct. 1958, p. 1218-1219.
Determination of Si during the smelting process; utilizing the thermo-electric properties of the vapor. 5 ref. (S11g; Si, AD-n)

161-S.* A Review of Methods for Assessing Non-Metallic Inclusions in Steel. T. R. Allmand. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 359-372.
Microscopic, microradiographic and magnetic methods, with typical inclusion-count results. Main factors affecting results of inclusion counts are rolling, method of sampling, type of microscope used, selection of field to be examined. Recommendations for more effective use of existing methods. 23 ref. (S11; 9-69, ST)

162-S.* Development of Methods for Isolating Structural Constituents in Steels. W. Koch and H. Sundermann. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 373-381.
Items of apparatus, electrolytes used and possible sources of error. Electrolytic dissolution of steel specimens can be classified as ferrous iron active, ferrous iron partly passive, and ferric iron active. Structural components isolated are carbides, oxides, sulphides, phosphides and nitrides. 32 ref. (S11g; ST, 9-69, 14-68)

163-S.* Electromagnetic Testing of Tubing: Standardization of Specifications and Test Methods. Pt. 1. Richard Hochschild. *Nondestructive Testing*, v. 16, Nov-Dec. 1958, p. 495-499.
Standardization is impeded by discontinuities (flaws, porosity, inclusions, etc.), heat treatment condition, chemical composition, internal and applied stresses, crystal orientation, lattice dislocations, noise pick-up and temperature. (S13h; 4-60)

164-S.* Magnetic Flaw Detection. A. G. Gardner. *Metallurgia*, v. 58, Dec. 1958, p. 309-312.
Principles of the magnetic particle method of detecting flaws in iron and steel components. Method can be used to disclose defects other than cracks, such as slag streaks, which can be detrimental under certain conditions of service. (S13j; ST, CI)

165-S.* (Swedish.) Isolation and Investigation of Oxidic Slag Inclusions in an Acid Openhearth Steel With 0.7% C. N. A. Hovgard. *Jernkontorets Annaler*, v. 142, no. 10, 1958, p. 589-612.
Isolates were analyzed spectrographically, by X-ray diffraction and microscopically. Inclusions appear to be mainly endogeneous and consist chiefly

of SiO_2 or Al_2O_3 and are not deformed by hot rolling. A uniform distribution of Al was not attained before solidification when the Al was added in the mold. 22 ref. (S11; ST, 9-69, *Si, O,* Al, NM-a34)

166-S.* (Russian.) Magnetic Testing of Rails. Pt. 2. Use of Analogies in Examination of Electromagnetic Phenomena. V. V. Vlasov. *Fizika Metallov i Metallovedenie,* v. 6, no. 1, 1958, p. 74-81.

Method and apparatus for examining electromagnetic phenomena produced by moving magnetic field. 41 ref. (S13h, T23q)

167-S. Determination of Uranium in Flotation Concentrates and in Leach Liquors by X-Ray Fluorescence. G. L. Smithson, R. L. Eager and A. B. VanCleave. *Canadian Journal of Chemistry,* v. 37, 1959, p. 20-28. 9 ref. (S11p; U)

168-S. Analysis of Gases in Metals. *Metal Industry,* v. 94, Jan. 2, 1959, p. 6, 11.

Methods of analyzing hydrogen in Ti and oxygen in Mo, Si, Ta and Ge. (S11r; Ti, Mo, Si, Ta, Ge, *H, O*)

169-S. Principles of Eddy Current Testing. Friedrich Foerster. *Metal Progress,* v. 75, Jan. 1959, p. 101-105.

This versatile method of nondestructive testing is becoming more and more useful by the day. A defective sample will cause the impedance of a test coil to vary; these variations can be measured to determine several properties such as hardness, tensile strength, diameter, conductivity and permeability. (S13h)

170-S. Volumetric Determination of Magnesium in Aluminum Alloys by Ethylene-Diamine-Tetra-Acetic Acid (EDTA). R. C. Jackson, W. Stross and L. H. Wadsworth. *Metallurgia,* v. 58, Dec. 1958, p. 305-308.

Elimination of interference by Ca has now been achieved. (S11j; Al, *Mg*)

171-S. The Absorptiometric Determination of Molybdenum in Uranium Metal. *United Kingdom Atomic Energy Authority,* IGO-AM/S-120, June 1958, 5 p.

Metal is dissolved in HCl, extracted as the thiocyanate-complex into diethyl-ether-petroleum ether mixture and determined absorptiometrically. (S11k; U, *Mo*)

172-S. The Absorptiometric Determination of Nickel in Uranium Metal. *United Kingdom Atomic Energy Authority,* IGO-AM/S-42, Apr. 1958, 6 p.

Ni is extracted as its dimethyl glyoxime complex into chloroform from an alkaline solution of the metal. The chloroform solution is acid extracted and the Ni in the extract determined absorptiometrically as the oxidized dimethyl glyoxime complex. (S11k; U, *Ni*)

173-S. The Spectrographic Determination of Calcium in Uranium Metal. *United Kingdom Atomic Energy Authority,* IGO-AM/S-118, July 1958, 7 p.

The metal is ignited to U_3O_8 and arced on Cu electrodes at 7 amp. The spectra are recorded on a Jarrell-Ash fully automatic grating spectrograph. (S11k; U, *Ca*)

174-S. The Absorptiometric Determination of Combined Nitrogen in Uranium Metal Including Swarf and Powder. *United Kingdom Atomic Energy Authority,* IGO-AM/S-121, June 1958, 9 p.

N is converted to ammonia which is then steam-distilled and determined absorptiometrically using phenate reagent. (S11k; U, *N*)

175-S. The Spectrographic Determination of Aluminium in Uranium Metal. *United Kingdom Atomic Energy Authority,* IGO-AM/S-125, June 1958, 12 p.

The metal is ignited to U_3O_8 which is mixed with sodium fluoride and spectrographed using the carrier distillation technique. (S11k; U, *Al*)

176-S. The Absorptiometric Determination of Boron in Uranium Metal. *United Kingdom Atomic Energy Authority,* IGO-AM/S-124, June 1958, 15 p.

The metal is dissolved in HCl and oxidated with the minimum quantity of nitric acid. B is separated by distillation as methyl borate and the B determined absorptiometrically. (S11k; B, *U*)

177-S. Uranium Analysis by Gamma Absorptiometry. R. E. Connally, U. L. Upson, P. E. Brown and F. P. Brauer. Hanford Atomic Products Operation. *U. S. Atomic Energy Commission,* HW-54438, May 20, 1958, 28 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Major advantages of the absorptiometer as compared to the X-ray photometer are dependability and simplicity of the source, essentially monochromatic emission, and low cost. (S11k; U)

205-S. Recent Developments in the Analytical Chemistry of Zirconium. E. B. Read and F. A. Bauman. Nuclear Metals Inc. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Applications". *U. S. Atomic Energy Commission, TID-7555*, p. 116-126.

Gravimetric, volumetric, colorimetric or spectrophotometric, spectrographic, X-ray fluorescent, and vacuum fusion methods for the determination of Zr, Hf and the weight ratio of Hf to Zr in metals, compounds, and solutions. 13 ref. (S11; Th, Hf)

206-S. Recent Developments in the Analytical Chemistry of Titanium. Arnold L. Gahler. Electro Metallurgical Co. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Applications". *U. S. Atomic Energy Commission, TID-7555*, 1958, p. 127-137.

Methods for determination of O, H, N, C and Fe which adversely affect properties of Ti alloys. Comparative test results for two vacuum fusion methods for determining O. (S11; Ti-b, *O, H, N, C, Fe*)

207-S. Analytical Chemistry of Beryllium. E. Stanley Melick. Brush Beryllium

Co. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Technology". *U. S. Atomic Energy Commission, TID-7555,* 1958, p. 158-174.

Gravimetric, volumetric or colorimetric methods for estimation of Be in Be ores, process materials, biological and air samples and for the determination of 21 components in Be metal and alloys. 78 ref. (S11; Be)

208-S. Determination of Trace Elements in Reactor Materials by the Methods of Neutron Activation Analysis. G. W. Leddicotte, W. T. Mullins, L. C. Bate and J. F. Emery. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission, TID-7555,* 1958, p. 192-215.

Elements determined include U in low-grade ores; Cr, Cu, Fe, Hf, Si, Ni, Mo in Zr metal; Cu, Zn, Mn, Ti and U in Be; Si, Cu, W, Y, Ni, Mn in Ti and its compounds. 13 ref. (S11q; U, Cr, Cu, Fe, Hf, Si, Ni, Mo, Mn, Ti, Be, W, Y)

209-S. Spectrochemical Analysis of Reactor Materials. Cyrus Feldman. Oak Ridge National Laboratory. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Technology". *U. S. Atomic Energy Commission, TID-7555,* 1958, p. 227-238.

Spectrochemical analysis of uraniferous ores, reactor materials and radioactive samples. Spectrographic estimation of O in metals and the isotope dilution techniques for the determination of H in metals. 9 ref. (S11c; U, RM-n, O, H)

210-S. (German.) Suggested Standards for Electrochemical Tinning on Steel, Copper and Copper Alloys. B. Keysselitz. *Galvanotechnik,* v. 50, Jan. 15, 1959, p. 36-37.

(S22, L17; ST, Cu-b, *Sn*)

211-S. (Russian.) Eddy Current Inspection of Rails. V. V. Vlasov. *Fizika Metallov i Metallovedenie,* v. 6, no. 4, 1958, p. 628-632.

5 ref. (S13h, T23q)

212-S. (Russian.) Separation of Iron From Other Metals by Ion Exchange Chromatography. R. N. Galovatyi. *Ukrainskii Khemicheskii Zhurnal,* v. 24, no. 3, 1958, p. 379-383.

Separation of Fe from Ca, Mg, Al, Co, Ni, Cu and Ti by use of bisodium salt of ethylenediamine tetra-acetate oxide-trilon B. 8 ref. (S11f; *Fe,* Ca, Cu, Al, Co, Mg, Ni, Ti)

213-S.* (German.) Measurement of Roof Temperature in Openhearth Furnaces With the Aid of Photoelectric Pyrometer. A. K. Adabaschjan. *Neue Hutte,* v. 3, Oct. 1958, p. 615-619.

Temperature measuring technique in openhearth plants of the USSR. New measuring techniques developed for determining roof temperatures. Water-cooled photoelectric pyrometers proved the most reliable. (S16, W18r, X9r)

214-S.* (German.) Results of Flame Radiation Measurements in Openhearth Furnaces. Horst Schicke. *Neue Hutte,* v. 3, Oct. 1958, p. 622-629.

Brightness of the flame characteristic of heating adequacy in openhearth; color brightness pyrometers used to measure flame temperature and soot radiation. Influence of natural gas and oil properties, of gas preheating, heat supply and air on flame properties. Relation between soot radiation and melting-down capacity. 4 ref. (S16c, D11p, X9r)

215-S.* Magnetic-Particle Inspection Paces Production Line at Griffin Wheel. A. J. Panozzo. *Modern Castings,* v. 35, Feb. 1959, p. 38-40.

Inspection of cast steel railroad car wheels, using the continuous wet method of fluorescent magnetic particle inspection. (S13j, T23p; ST-f, 5)

216-S. Analysis of Uranium and Its Compounds. C. J. Rodden. New Brunswick Area Office, AEC. Paper from "First Conference on Analytical Chemistry in Nuclear Reactor Applications". *U. S. Atomic Energy Commission, TID-7555,* 1958, p. 24-42.

Separation of rare-earth elements by ion-exchange; methods for determination of C, N, O, H and Si in U metal; methods for estimation of Mo, Ni, Cr, Mn, W, V, Si, S and phosphate in UO_3, UF_4 and in other compounds of U. 32 ref. (S11f; U, EG-g, C, N, O, H, Si, Ni, Cr, Mn, W, V)

217-S. (Pamphlet.) Steel Products Manual; High Strength Low Alloy Steel. *American Iron and Steel Institute,* Dec. 1958, 57 p. Free.

Tolerances, inspection, definition, manufacturing processes and properties of sheet, strip, plate, structural shapes. bar and bar sections. (S22; AY-n, 4-53, 4-55, 4-57)

218-S. (Book.) First Conference on Analytical Chemistry in Nuclear Reactor Technology. C. D. Susano, H. S. House and

Margaret A. Marler. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission, TID-7555,* Aug. 1958, 261 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $3.50.

Recent advances in methods for analysis of reactor construction materials, fuels, moderators, coolants and blanket materials, presented at a conference held at Gatlinburg, Tenn., Nov. 4-6, 1957. Papers abstracted separately. (S11, T11)

219-S. (Translation—BISI, no. 1159.) Investigation of Ingot Cooling. V. M. Dementev and M. M. Kotrovsky. *Stal',* Sept. 1958, p. 847-851.

See item 752-S, 1958. (S16, X9q, X9r; ST, 5-59)

220-S. (Translation.) Composition of Anosovite and Titanium Sesquioxide in Titanium-Rich Slags. V. V. Lapin, N. N. Kurtseva and O. P. Ostrogorskaya. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, p. 264-268.

8 ref. (S11; Ti, RM-q)

221-S. (Translation.) Analytical Determination of Carbon Fluorides in Anode Gases From Aluminum Baths. V. P. Mashovets and E. L. Zakharov. Paper from "Soviet Research in Fused Salts". Pt. 2. Consultants Bureau, Inc., New York, 1958, p. 152-160..

16 ref. (S11r, C23n; Al)

222-S.* Investigation of Radioisotopes for Inspection of Ship Welds. D. Polansky, D. P. Case and E. L. Criscuold. *Nondestructive Testing,* v. 17, Jan-Feb. 1959, p. 21-25.

Technique and sensitivity curves for thulium, iridium, cesium and cobalt. For the inspection of welds in 1/2-in. to 1-in. plate, iridium is the most promising isotope. 6 ref. (S13e, T22, K9r, 1-59)

223-S.* Ultrasonic Weld Inspection. John E. Bobbin. *Nondestructive Testing,* v. 17, Jan-Feb. 1959, p. 26-28.

Advantages include instantaneous results, no work stoppage, sensitivity, safety and low cost. 6 ref. (S13g, K9r)

224-S.* Radiographic Inspection of Welded Turbine Wheels for Jet Starters. Albert R. Potenski. *Nondestructive Testing,* v. 17, Jan-Feb. 1959, p. 29-31.

Turbine wheels manufactured from a hub and individual blades which are joined by fusion welding. Radiographic inspection procedure and standards evolved. (S13e, T7h; 7-51)

225-S.* Qualitative Analysis of Brazed Sandwich. Frank J. Filippi. *Nondestructive Testing,* v. 17, Jan-Feb. 1958, p. 39-45.

Principles of radiographic, ultrasonic and thermal gradient methods. 7 ref. (S13; 7-59)

226-S. (Spanish.) Radiographic Inspection of Welded Structures. Alfonso Ruiz. *Ciencia y Tecnica de la Soldadura,* v. 8, Sept-Oct. 1958, 7 p.

Final acceptance tests greatly facilitated by this method. Principles, comparative study of X-ray and gamma-ray techniques, including facility of use of apparatus, safety, quality of radiographs, etc. (S13e, 7-51)

227-S. Production of Ball and Roller Bearings. *Machinery (London),* v. 94, Jan. 21, 1958, p. 120-131.

Quality control methods and equipment at Hoffman Manufacturing Co., Ltd., Chelmsford, England. (S-general, T7d, 1-52)

228-S. Ultrasonic Testing Procedures. J. B. Morgan. *Nondestructive Testing,* v. 17, Jan-Feb. 1959, p. 32-36.

Effect of the following factors on tests; alloy composition, distance of discontinuity below entry surface, thermal treatment, discontinuity size, direction of ultrasonic beam, nature of the product, working or reduction. (S13g; SS, TS, SGA-h)

229-S. (German.) Noise Interference in Ultrasonic Flaw Detection. Pt. 1. F. Linhardt. *Metall,* v. 12, Dec. 1958, p. 1085-1092.

27 ref. (S13g, X8)

230-S. (Russian.) Spectrophotometric Determination of Molybdenum in Alloys. K. B. Yatsimirskii and I. I. Alekseeva. *Zavodskaya Laboratoriya,* v. 24, Dec. 1958, p. 1427-1429.

Determination of Mo in steel and Ni alloys by measuring light absorption by alkaline molybdate. 7 ref. (S11a; ST, Ni-b, *Mo*)

231-S. (Russian.) Photocolorimetric Determination of Minute Quantities of Vanadium in Chromium. P. Ya. Yakovlev and G. P. Rasumova. *Zavodskaya Laboratoriya,* v. 24, Dec. 1958, p. 1430-1431.

(S11a; Cr-b, *V*)

232-S. (Russian.) Cobalt Determination in Nickel. B. B. Resnik, R. E. Dwgach and R. T. Pudskaya. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1431-1432.
4 ref. (S11a ; Ni-b, *Co*)

233-S. (Russian.) Determination of Strontium in Silicates and Carbonates by a Photometer Flame and a Liquid Light Filter. G. I. Ksandopuldo and D. P. Shcherbov. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, pf. 1432-1434.
11 ref. (S11a; Si, *Sr*, NM-a)

234-S. (Russian.) Chromatographic Determination of Magnesium in Zirconium. S. V. Blinson and M. S. Limonik. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1434-1436.
(S11a; Zr-b, *Mg*)

235-S. (Russian.) Separation of Zinc From Indium by Electrolysis With Mercury Electrode. M. G. Sayun, P. P. Tsyb and K. Kh. Latkher. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1436-1439.
(S11g; In, *Zn*)

236-S. (Russian.) Rapid Method of Analyzing Lead and Zinc in Brasses by Potentiometric Titration or Precipitated Metal Sulphides. V. A. Kremer, E. I. Vail', F. P. Frizyuk and L. S. Sonchik. *Zavodskaya Laboratoriya*, b. 24, Dec. 1958, p. 1440-1441.
4 ref. (S11j; Cu-n, Zn, Pb)

237-S. (Russian.) X-Ray Investigation of Spot-Welded Duralumin. D. G. Bykhovskii. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1458-1459.
Micro-X-ray photography and X-ray structure analysis. (S13e; Al-b, Cu, 7-51)

238-S. (Russian.) Measuring Thicknesses by the Ultrasonic Thickness Gage. I. F. Lopatko and G. I. Usoskin. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1464-1467.
Measuring apparatus for objects that are accessible from one side only. (S14g, X20c)

239-S. (Russian.) Determination of Impurities in Ferro-Columbium by Spectrographic Analysis. A. B. Shaevich, Ya. M. Kalinskii, N. I. Chabachenko and M. A. Perepelkkina. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1478-1479.
Determination of Al, Ti, Cr, Zr, Sn, Cu and Mn. (S11k; AD-n31, Cb, *Al, Ti, Cr, Zr, Sn, Cu, Mn*)

240-S. Comparison of Various Methods of Spectrographic Determination of Nickel in Steel. E. I. Brainin. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1479-1483.
Accurate results produced where a spark was used for spectra excitation. (S11k; ST, *Ni, Cu*)

241-S. (Russian.) Spectrographic Analysis of Binary Iron-Chromium Alloys. E. V. Lifshits, V. G. Konovalov and V. F. Erko. *Zavodskaya Laboratoriya*, v. 24, Dec. 1958, p. 1483-1484.
(S11k; Fe-b, *Cr*)

242-S.* The Use of Radioisotopes in Metallurgical Research and Industry. A. Kohn. *Metallurgical Reviews*, v. 3, no. 10, 1958, p. 143-201.
Production and characteristics of radioisotopes; autoradiographic methods and measurement of activity. Use of radioactive tracers for study of segregation, chemical composition, solid phase diffusion, evaporation, condensation, chemical processes, friction and wear of dies in cutting tools, blast furnace processes and steel refining. Radioisotopes as source of radiation for inspection by gamma radiography and in thickness gaging. 161 ref. (S11q, S13e, S14e, Q9n, Q9p, 1-59)

243-S. In Selecting Copper and Copper Alloys Make the Specifications Work for You. Pt. 2. *Canadian Machinery*, v. 70, Jan. 1959, p. 69-71.
(S22; Cu)

244-S.* (German.) Measuring Anodic Layers on Al. W. Illig. *Metalloberflache*, v. 13, Feb. 1959, p. 33-35.
Optical method termed "light section process" measures the difference in light diffraction caused by the surface layer with a special microscope. (S14d; Al, 8-73)

245-S.* Porosity Detection in Magnesium Alloys Using Paraffin Containing Pd^{109}. S. M. Makin. *International Journal of Applied Radiation and Isotopes*, v. 4, Jan. 1959, p. 253-255.
Pores extending from a surface area of 1.5×10^{-5} sq.cm. and within 0.4 mm. of the surface can be detected on samples soaked in hot oil containing Pd^{109}. A polished surface and a finish equivalent to 0000-grade emery gave satisfactory autoradiographs, but roughly turned samples were unsuitable. (S13e, 1-59; Mg-b, 9-68)

246-S.* Ingot Surface-Temperature Measurement in Forging Furnaces. J. R. Pattison. *Iron and Steel Institute, Journal,* v. 191, Feb. 1959, p. 163-171.

Performance of surface pyrometers inside furnaces. Design of a disappearing filament pyrometer incorporating a hemisphere enclosure to correct for surface emissivity. Effects of scale on temperature readings. 8 ref. (S16b, X9r; ST, 4-52)

247-S.* Ultrasonic Testing at Douglas. W. C. Hitt. *Metal Progress,* v. 75, Mar. 1959, p. 80-85.

Internal soundness and good bonds are essential in forgings and honeycomb panels for today's aircraft. Improvements in ultrasonic testing methods help the produces of components to maintain quality at all times. (S13g, T24)

248-S. (Translation—BISI no. 803.) Determination of Trace Elements in Steel With Moving Electrodes. Siegried Eckhard and Walter Koch. *Archiv fur das Eisenhuttenwesen,* v. 28, Nov. 1957, p. 731-738.

See item 216-S, 1958. (S11k; ST)

249-S. (Translation—BISI no. 1028.) Magnetic Separation of Electrolytically Isolated Structural Constituents From Metallic Materials. Walter Koch and H. Sundermann. *Archiv fur das Eisenhuttenwesen,* v. 29, Apr. 1958, p. 219-224.

See item 382-S, 1958. (S11f; ST)

250-S. (Translation—BISI no. 1029.) Electrochemical Basis of the Isolation of Structural Components in Steels. Walter Koch and Heinz Sundermann. *Archiv fur das Eisenhuttenwesen,* v. 28, Sept. 1957, p. 557-566.

See item 102-S, 1958. (S11g, 1-53; ST)

251-S. (Translation—Brutcher no. 4382.) Electrical Method of Measuring Carburized Case Depths and Thickness of Nonmagnetic Electrodeposited Coatings. T. I. Pavlov. *Zavodskaya Laboratoriya,* v. 23, no. 1, 1957, p. 67-69.

Precise determination of depth of carburized cases on steel; quality of case as well is indicated. Application of method to measurement of thickness of nonmagnetic electrodeposits. (S14c, J28; ST, 8-62)

252-S. (Translation—Brutcher no. 4418.) Flaw Detection by a Coloring Technique. N. V. Khimenko. *Zavodskaya Laboratoriya,* v. 23, 1957, p. 803-806.

See item 541-S, 1957. (S13d, 9-21)

253-S. (Translation—Brutcher no. 4419.) Improved Methods of Flaw Detection by Coloring. S. I. Kalashnikov and N. P. Kichin. *Zavodskaya Laboratoriya,* v. 23, 1957, p. 806-808.

See item 542-S, 1957. (S13a, 9-21)

254-S.* (German.) Coulometric Determination of Oxygen in Steel by Melt-Extraction Process in Argon Stream. Karl Abresch and Helmut Lemm. *Archiv fur das Eisenhuttenwesen,* v. 30, Jan. 1959, p. 1-6.

5 ref. (S11m; ST, O)

255-S.* (Italian.) Theoretical and Practical Bases for a Rational Standardization of Cast Irons. G. Cola. *Fonderia Italiana,* v. 7, Nov. 1958, p. 433-471.

Collective research by 20 Italian foundries provided data for proposed standard specifications covering mechanical properties of gray iron castings. 17 ref. (S22; CI-n)

256-S.* Use of the Beam Deflector to Ultrasonically Test Bronze Castings. John C. Smack. *Nondestructive Testing,* v. 17, Mar-Apr. 1959, p. 85-88.

Immersed ultrasonic testing of gears for fine porosity. (S13g, T7a; Cu-s, 5-65, 9-68)

257-S. Spectrographic Determination of Scandium, Yttrium and the Rare Earths in Thorium. J. P. Faris. *Applied Spectroscopy,* v. 12, no. 6, 1958, p. 157-161.

9 ref. (S11k; Th, *Sc, Y,* EG-g)

258-S. Structure of Steel. Simple Explanation for Students, Engineers and Buyers of Steel. Edwin Gregory and Eric N. Simons. *Edgar Allen News,* v. 38, Feb. 1959, p. 32-35.

Flaw detection methods. (To be continued.) (S13; ST)

259-S. Quantitative Spectrographic Analysis of the Rare Earth Elements. Pt. 10. Determination of Rare Earth Impurities Commonly Associated With Purified Thulium, Ytterbium, Lutetium and Scandium. R. N. Kniseley, V. A. Fassel, R. W. Tabeling, B. G. Hurd and B. B. Quinney. *Spectrochimica Acta,* v. 13, Jan. 1959, p. 300-303.

4 ref. (S11k; Lu, Sc, Tn, Yb, EG-g)

260-S. Status Report on Eddy Current Theory and Application. C. J. Renken, R. G. Myers and W. J. McGonnagle. Argonne National Laboratory. *U. S. Atomic Energy Commission, ANL-5861,* Nov. 1958, 76 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $2.00.

Applications of eddy current testing include gaging plating thickness, testing liquid metal bonding and measurement of the thickness of claddings on alloys. (S14c)

261-S. (German.) Various Test Methods for Determining Oxygen Content of Steel. Eberhard Grossfuss. *Neue Hutte*, v. 3, Oct. 1958, p. 608-615.

Comparative tests made with various methods such as the hot extracting process, the Gotta-process and the residue isolation process. 31 ref. (S11r; ST, *O*)

262-S. (Italian.) Measurement, Regulation and Recording of Temperatures. *Trattamenti Termici*, v. 1, Nov-Dec. 1958, p. 22-25.

(To be continued.) (S16)

263-S. Make the Specifications of Copper Alloy Rod and Bar Serve You Better. Pt. 3. G. S. Mallett. *Canadian Machinery*, Mar. 1959, p. 86-92.

(S22; Cu, 4-55)

264-S. Why and How to Use Die Castings. David Laine. *Modern Castings*, v. 35, Mar. 1959, p. 45-46.

Application of American Die Casting Institute product standards. (S22, 5-61)

265-S. Rotary Radiographic Scanner, an Aid to the Inspection of Swaged Tubing. Alvin N. Hammer. *Nondestructive Testing*, v. 17, Mar-Apr. 1959, p. 89-91.

(S13e, X8g; Al-b, 4-60)

266-S.* (Italian.) Ultrasonic Testing of Light Alloy Extrusions by a Semi-Automatic Dip Method. M. Robba and C. Fatigati. *Alluminio*, v. 28, Jan. 1959, p. 5-17.

New apparatus developed by Light Metals Experimental Institute (Novara, Italy) and results obtained on hundreds of 65 TA Ergal extrusions. 6 ref. (S13g, 1-52; Al-*b*, 4-58)

267-S. Methods of Determining Surface Roughness. M. K. Testerman. University of Arkansas. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151268, June 1958, 48 p. $1.25.

Measurement of polarization capacitance to determine surface roughness by the bridge method on inert metals such as stainless steel, Cu and Ni. (S15e; SS, Cu, Ni)

268-S.* (Russian.) Effect of Surface Finish on the Precision of Spectral Analysis. S. I. Berger. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 235.

An adequate machine finish is preferable to an emery finish. The composition of machine finished steel samples was determined more exactly than that of emery finished samples. (S11k, 3-70; AY, CN)

269-S.* Recommended Practice for Radiographic Inspection of Fusion-Welded Joints. *British Welding Journal*, v. 6, Mar. 1959, p. 126-128.

Techniques for gamma or X-ray examination of welded steel plates up to 2 in. thick. Image quality indicators; sensitivity of method. (S13e; ST, 7-51, 4-53)

270-S.* (German.) Degree of Purity of Aluminum as a Decisive Factor in Finishing Operations. H. Ginsberg. *Metall*, v. 13, Mar. 1959, p. 171-174.

Techniques for testing the quality, surface structure, electric conductivity, corrosion resistance and chemical composition of Al sheets. (S-general, F-general; Al, 4-53)

271-S. Specifications for Copper-Alloy Ingots and Castings. *Foundry Trade Journal*, v. 106, Mar. 19, 1959, p. 337-338.

Suggestions on impurity content advanced by the British Bronze and Brass Ingot Manufacturer's Assoc. (S22, 3-69; Cu-b, 5-59, 5-60)

272-S. Is Laminated Steel Your Problem? John M. St. John. *Industry & Welding*, v. 32, Apr. 1959, p. 45, 96.

Application of ultrasonic testing. (S13g; ST, 4-53, 9-71)

273-S. (Russian.) Automatic Inspection for Point Shaped Defects in Enamel Insulated Wire. K. Z. Strashun. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 231.

(S13c; 8-71, 4-61)

274-S. (Russian.) Use of the Stylometer ST-7 for Rapid Spectral Analyses of Steel and Slag. E. I. Babadzhan and L. D. Rosenshtrauch. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 233-234.

(S11k, 1-53; ST, RM-q)

275-S.* Spectrochemical Analysis Using the Quantovac. Digest of "The Quantovac—a Direct Reading Instrument for the Control of Carbon, Phosphorous, Sulphur and Other Important Elements in Iron and Steel". H. W. Clakins and M. F. Hasler. Paper presented at the A.I.M.E. Electric Furnace Steel Conference, Pittsburgh, Dec. 1957. *Metal Progress*, v. 75, Apr. 1959, p. 172, 174.

Instrument extends the spectrum range available for useful, high-speed spectrochemical analysis into the far ultraviolet. The all-important, most sensitive arc lines of carbon, P, S, Hg, As and Se lie in this region as well as the most sensitive spark lines of Sb, Ge, He, Al, Pb, Au, Pt, Si and Bi. (S11k; CI, ST, *P, S, Hg, As, Se, Sb, Ge, He, Al, Pb, Au, Pt, Si, Bi*)

276-S. (Translation.) New Method of Detecting Welding Stresses. W. Radeker. *Engineers' Digest*, v. 20, Feb. 1959, p. 83-86. (From *Schweissen und Schneiden*, v. 10, Sept. 1958, p. 351-358.)

See item 615-K, 1958. (K9r, Q25, 1-54; 7-51, ST)

277-S. (Translation—BWRA.) Simultaneous Spectrographic Determination of Carbon and Other Elements in Iron and Steel. A. S. Dem'yanchuk. *Automaticheskaja Svarka*, v. 65, Aug. 1958, p. 39-44.

High-frequency discharge spark excitation permits spectra for determining both the carbon and the other alloying elements to be photographed simultaneously. (S11k; ST, Fe, C)

278-S. (Translation—ConBur.) Spectrographic Determination of Calcium, Magnesium, Aluminum, Silicon and Tin in Refined Rhodium and Iridium. A. V. Babaeva and O. N. Evstaf'eva. *Journal of Analytical Chemistry of the USSR*, v. 13, May-June 1958, p. 341-345.

Use of eddy currents in testing the wall thickness of fuel element sheaths. (S14c, T11g)

338-S. (Dutch.) Testing of Materials for Nuclear Reactors in U.S.A. and Canada. A. de Sterke. *Metalen*, v. 14, May 15, 1959, p. 132-136.

Ultrasonic testing of fuel elements; penetration tests with fluorescent oil; X-ray tests; helium leak test. (S13g, S13k, T11g)

339-S. (German.) German Standards for S. G. Cast Iron. Horst Muhlberger. *Industrie-Anzeiger*, v. 81, May 12, 1959, p. 585-586.

Standardization with reference to mechanical properties. Some foreign standards are also shown. (S22, Q27; CI-r)

340-S. A Spot Test Procedure for Iron and Copper Inclusions in Aluminum Cans. W. E. Stavig. Hanford Atomic Products Corp. *U. S. Atomic Energy Commission*, HW-57485, Nov. 17, 1958, 10 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Al cans, used to clad uranium fuel elements, are coated with a solution consisting of a film former, an electrolyte, an opacifier to form a cover over the metal surface, a wetting agent and an indicator to complex the ions. The coating is sprayed on the Al surface, dried at room temperature and electrolyzed. Metallic impurities are changed into ions which react with the indicator to form colored compounds. The colored spots are measured by microscopy to determine the size of the inclusion. (S13a; Al, *Fe, Cu*, 9-69)

341-S.* A Look at Russian Steels. Arthur B. Tesmen. *Metal Progress*, v. 75, June 1959, p. 101-105.

Russian carbon, alloy, stainless and tool-steel grades are surveyed. Russian steel nomenclature is explained to permit easy identification of composition, properties and type. (S22; ST)

342-S. Determination of Iron, Chromium, and Nickel by Fluorescent X-Ray Analysis. William W. Houk and Louis Silverman. *Analytical Chemistry*, v. 31, June 1959, p. 1069-1072.

Aqueous solution method. (S11p; Fe, Cr, Ni)

343-S. Radiochemical Evaluation of Fire Assay Method for Determination of Silver. F. H. Faye and W. R. Inman. *Analytical Chemistry*, v. 31, June 1959, p. 1072-1076.

Radiochemical techniques using Ag-110 as means for measuring the loss of Ag in its determination by fire assay. 10 ref. (S11q, S11s; Ag)

344-S. How to Apply the ASTM Specifications Selecting Copper Alloy Pipe, Tube, Wire. Pt. 4. G. S. Mallett. *Canadian Machinery*, May 1959, p. 86.

(Conclusion.) (S22; Cu-b, 4-60, 4-61)

345-S. Nondestructive Testing Symbols. Digest of "Nondestructive Testing Symbols" Prepared by Committee on Nomenclature, Definitions and Symbols, American Welding Society, 1958, 10 p. $1.00. *Metal Progress*, v. 75, June 1959, p. 184, 188, 192.

Basic symbols, general provisions, methods of specifying extent of nondestructive tests. (S-general, S22)

346-S. The Immersed Ultrasonic Inspection of Metal Plate. R. W. McClung. Oak

Ridge National Laboratory. *U. S. Atomic Energy Commission,* ORNL-2650, Apr. 6, 1959, 23 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Techniques for the ultrasonic inspection of plate in thicknesses down to ¼ in. (S13g; 4-53)

347-S. (Pamphlet.) Standard Materials, National Bureau of Standards Circular 522. 3rd Ed. 27 p. Apr. 1959. U. S. Government Printing Office, Washington 25, D. C. $.35.

Descriptive listing of standard materials, schedule of fees and weights, ordering instructions and summarized tables of analyses. (S22)

348-S. (Book.) ASTM Specifications for Steel Piping Materials. 507 p. Apr. 1959. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. $6.

Compilation covers pipe used to convey liquids, vapors and gases, tubes for refinery service, heat exchangers, condensers, boilers and superheaters. (S22; 4-60)

349-S.* (English.) Spectrometric Determination of Carbon in Metals Under Controlled Atmosphere. B. Breckpot, J. Morris and K. De Clippeleir. *Revue Universelle des Mines, de la Metallurgie, de la Mecanique,* v. 15, May 1959, p. 266-270.

The carbon line was recorded in Co and steel in gaseous atmospheres of oxygen, nitrogen, argon and hydrogen and compared with recordings made in air and under reduced pressure. Increased concentrational sensitivity for carbon leads to an appreciable improvement in reproducibility while it is still considerably lower than for other elements such as Si or Mn. 10 ref. (S11k; ST, Co, CI, C)

350-S.* (French.) Cast Carbon Steels. *Journal d'Informations Techniques des Industries de la Fonderie,* Supplement to no. 104, Mar-Apr. 1959, 5 p.

Tabular summary of principal French, British, German, Austrian standard specifications. (S22; CN, 5)

351-S.* (French.) Magnetoscopic Inspection of Ferrous Alloy Parts. Pt. 4. *Machine Moderne,* v. 53, May 1959, p. 31-39.

Demagnetization of parts inspected by magnetoscopy. Applications of magnetic inspection. Magnetoscopes for flaw detection and for sorting according to hardness, heat treat condition, composition, structure or thickness of case-hardened layer. (S13h, X6n)

(S13h, 4-60; EG-a38)

353-S. (Russian.) Photo-Electric Apparatus to Control Geometric Dimensions of Rolled Steel. T. Kh. Zarezankov and P. V. Lyamkov. *Metallurg,* May 1959, p. 30-34.

Of the four types of photo-electric instruments, photo-compensating, photo-light emission and photo-impulsating and time-impulsating, the latter was most effective in measuring rod diameters of 4.5-8.5 mm. within 1 to 1.5% accuracy and strip width of 700-1500 mm. within ± 50 mm. accuracy. (S14c; 4-53, 4-55, ST)

354-S. (Russian.) Determination and Regulation of the Optimum Air-Fuel Ratio. A. L. Malyi. *Metallurg,* May 1959, p. 34-38.

A new method to regulate combustion in metallurgical furnaces by finding automatically the air consumption at which the fuel flame reaches its maximum efficiency. (S18s)

355-S. (Russian.) Automatic Regulation of Heating Process of Continuous and Recuperative Furnaces. M. D. Klimovitskii and B. I. Sinchuk. *Metallurg,* May 1959, p. 38-42.

A one-line diagram illustrating the control of heating process in continuous and recuperative furnaces. This control reduced the fuel consumption by 7-10%. (S18s, W20h)

356-S.* Cermet Body Nondestructive Test Data Evaluated by Spin Tests of Blades and Bend Tests of Bars. A. G. Holms and A. J. Repko. *Nondestructive Testing,* v. 17, May-June 1959, p. 156-164.

Correlation of cermet turbine blade strength with results of penetrant oil inspection, X-ray radiography, sonic inspection and physical property measurements. 12 ref. (S13, Q5g, Q27a, T24b; Ti, C, Ni, 6-70)

357-S.* Radiography With a Large Cobalt 60 Source. Victor G. Behal. *Nondestructive Testing,* v. 17, May-June 1959, p. 172-176.

Sensitivity of radiographic method for detecting grooves and drill holes in steel plates 2 to 12 in. in thickness. (S13e; ST, 4-53)

358-S.* (German.) Ultrasonic Testing of Products in the Iron and Steel Industry. Herman-Josef Kopineck, Hans Kraechter and Werner Rauterkus. *Stahl und Eisen,* v. 79, May 28, 1959, p. 786-797.

Application of ultrasonic testing to sheets, heavy plates, forgings and welded and seamless tubes. (S13g, S14g; 4-51, 4-53, 4-60, ST)

359-S.* (German.) Statistical Comparison of the Chemical Composition of Steel Determined by Spectrographic and Chemical Methods. Hans Buehler, Walter Schreiber and Fritz Thorn. *Industrieblatt*, v. 59, May 1959, p. 179-181.

Chemical composition of 26 steels determined for their Si, Mg, Cr and Ni contents. (S11k; ST, *Si, Mg, Cr, Ni*)

360-S.* (Italian.) Neutron Activation Analysis of Aluminum Alloys. *Alluminio*, v. 38, Apr. 1959, p. 192.

Radiochemical and spectrometrical process for analysis of very small samples. (S11q; Al-b)

361-S. (Russian.) X-Ray Method to Control Decarburization Depth of High Speed Steels. P. L. Beldstotskaya, V. S. Dmitrieva and M. F. Longinov. *Zavodskaya Laboratoriya*, v. 25, May 1959, p. 558-559.

X-ray method applied to high speed R9 and R18 boron steels utilizing intensity lines (111) as used in carbon steels is inadequate in itself because the change in the width of intensity bands shows no relationship between the martensite and carbon contents of the steels. 4 ref. (S11p; TS-m, *B*)

362-S. A Rotary Sampling Machine for the Sampling of Cast Iron. H. Green. *B.C.I.R.A. Journal*, v. 7, Apr. 1959, p. 644-650.

Machine for sampling white, gray and nodular graphite iron for determination of C, S, Si, Mn or P. (S11, 1-53, S12h; Ci)

363-S. Analytical Techniques for Vacuum Processed Metals and Alloys. Frank C. Benner. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 407-432.

Vacuum fusion and vacuum extraction techniques. 33 ref. (S11r)

364-S. (Swedish.) Alkalimetric Determination of Phosphorus. Goran Alfelt. *Jernkontorets Annaler*, v. 143, no. 3, 1959, p. 167-174.

Determination of P in steel. 5 ref. (S11j; ST, *P*)

365-S. (German.) Instruments for Optical Inspection. H. Kluge. *Giesserei-Praxis*, no. 11, June 1959, p. 201-204.

(S13d, E-general, 1-53)

366-S. (Czech.) Nephelometric Determination of Oxygen in Low-Alloy Steels. Miroslav Sicha. *Hutnicke Listy*, v. 15, June 1959, p. 513-515.

4 ref. (S11a; AY, *O*)

367-S. (Rumanian.) Rapid Determination of Types of Steel. M. Suliteanu. *Revista Transporturilor*, Feb. 1959, p. 64-69.

Rapid determination of elements by chemical methods, spark and magnetic testing. (S11a, S10n, S10r; ST)

368-S.* Investment Casting Institute Standards. Pt. 2. Visual, Penetrant and Magnetic Particle Inspection. Precision *Metal Molding*, v. 17, July 1959, p. 40-41.

Types of inspection used for classifying and evaluation of irregularities and defects. (S13k, S13j, S22; 5-62)

369-S.* Instantaneous Inspection of Ship Welds With Scattered Gamma Radiation. J. I. Bujes. *Welding Journal*, v. 38, July 1959, p. 301s-304s.

Present status of filmless technique and procedure evolved for utilizing only one side of the ship's hull during testing. The filmless method was applied with a Co-60 isotope of about 300 mc. as a source and a Geiger counter as a detector of the transmitted gamma radiation through the various points in the steel plate. (S13e, T22g; ST, 4-53)

370-S. (German.) Standards. *Neue Hutte*, v. 4, June 1959, p. 370.

Standards for material sampling sheet metal, profiles, nonferrous metals and alloys. (S22, S12h)

371-S. (Slovenian.) Chemical Determination of Arsenic, Antimony and Copper in Steel and Iron Ores. Sergej Gomiscek. *Rudarsko-Metalurski Zbornik*, no. 1, 1959, p. 51-62.

29 ref. (S11j; ST, Fe, RM-n, *As, Sb, Cu*)

372-S. Determination of Cladding Thicknesses of Nuclear Fuel Elements by X-Rays. Paul Lublin. *Norelco Reporter*, v. 6, May-June 1959, p. 57-59.

Cladding thicknesses of Zr on fuel pins approximately 30 in. long and 0.125 in. in diameter. X-rays impinging on the fuel pin penetrate the cladding and secondary X-rays of uranium are produced. (S14e, T11g; Zr, 8-66)

373-S. (Chinese.) Determination of Boron in Steel and Iron by the Aluminum

Spark Method. Wan Hong-Jang. *Acta Metallurgia Sinica*, v. 4, Mar. 1959, p. 75-80.
Samples are dissolved in perchloric acid, containing an amount of NaOH. A drop is placed on an Al electrode. Determination of boron by testing a spark spectrum. 12 ref. (S11k; ST, Fe, *B*)

374-S. (Chinese.) Spectrographic Analysis of Small Amounts of Rare Earths in Alloy Steel. Li Shuh-cho and Wang Yu-me. *Acta Metallurgia Sinica*, v. 4, Mar. 1959, p. 81-86.
Chemico-spectrochemical method. (S11k; AY, EG-g)

375-S. (Chinese.) Effect of Carbon on the Spectrochemical Analysis of Chromium Steels. Chang Kung-soo and Ho I-djen. *Acta Metallurgia Sinica*, v. 4, Mar. 1959, p. 87-91.
Effect is considerable only when carbon was present in the solid solution and its content higher than 1%. 8 ref. (S11k, 2-60; AY, *Cr*, *C*)

376-S. (French.) Use of the Filter Colorimeter. G. Blet. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, June 1959, p. 35-40.
In the analysis of metals. (S11a, 1-53)

Visual, pressure and leak, penetrant, thermal, radiography, acoustic, electrical and electromagnetic methods. Relative advantages, sensitivity and limitations. 17 ref. (S13, T11g)

428-S.* Quality Control With Eddy Current Techniques. C. E. Quinn. *Metal Progress*, v. 76, Sept. 1959, p. 70-73.
Inspection instrument, the Laminagage, measures the thickness of thin gages and plates. Useful for locating fine cracks, this tester employs plug-in coils and several types of probes. (S13h, S14h, 1-53)

429-S.* New Tool for Case Carbon Evaluation. Alan Goldblatt. *Metal Progress*, v. 76, Sept. 1959, p. 87-88.
A direct-reading, vacuum spectrograph determines the carbon gradient in steel. Method compared with analyses of carbon by combustion. (S11k, 1-53; ST, C)

430-S.* New Aluminum Hard Coating Quality Control Standards Devised. Ellis P. Owen. *Western Metalworking*, v. 17, Aug. 1959, p. 36-38.
Comparison of microscopic, abrasion, adhesion, indentation, dielectric strength, corrosion and density tests for evaluating quality of anodized coatings. (S-general, Q9; Al-b, 8-73)

431-S. Modern Methods of Analysis for Cast Iron. *Foundry Trade Journal*, v. 107, Sept. 10, 1959, p. 139-142.

Review of papers presented at a recent *BICRA* conference held in London, England, covering sampling of pig and cast iron for carbon determination; application of rotary sampling machined to cast iron; solvent extraction techniques in ferrous analysis and analyses of cupola slags and trace elements in cast iron. (S11; CI)

432-S. (Russian.) Comparative Exactness of Methods for Determination of Cerium, Manganese, Chromium and Vanadium in Ferrous Melts. S. A. Gusinskaya. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya*, no. 2, 1959, p. 256-263.

12 ref. (S11; Fe, *Ce, Mn, Cr, V*, 14-60)

433-S.* Analyzing Gases in Steel. E. Mang. *Foundry*, v. 87, Oct. 1959, p. 178, 180-181.

Method and equipment for determining amounts of H, C and N, evolved from steel during vacuum melting. Equipment employs vacuum extraction technique to obtain rapid and accurate analyses. (S11r, D8m, 1-53; ST, *H, C, N*)

434-S. (German.) Experiences With Directly Recording Spectrographic Instruments. Pt. 2. Gerhard Hartleif and Heinz Kornfeld. *Archiv fur das Eisenhuttenwesen*, v. 30, Aug. 1959, p. 485-488.

Instruments used in process control during production of bessemer steel. (S11k, S18, D3, 1-53)

435-S. (German.) Experiences With Directly Recording Spectrographic Instruments. Pt. 3. Peter Dickens and Asko Bahr. *Archiv fur das Eisenhuttenwesen*, v. 30, Aug. 1959, p. 489-491.

Tests with pig iron, basic bessemer, openhearth and electric steels. (S11k, 1-53; CI-a, ST-g, ST-e, ST-f)

436-S. (German.) Experiences With Directly Recording Spectrographic Instruments. Pt. 4. V. Mathien, M. Lacomble and L. Charlet. *Archiv fur das Eisenhuttenwesen*, v. 30, Aug. 1959, p. 493-496.

Tests with pig iron, basic bessemer, openhearth and electric steels. (S11k, 1-53; CI-a, ST-g, ST-e, ST-f)

437-S.* Immersed Ultrasonic Inspection of Metal Plate. R. W. McClung. *Nondestructive Testing*, v. 17, Sept-Oct. 1959, p. 270-275.

Ultrasonic investigation of laminar discontinuities. (S13g; 4-53, 9-71)

438-S. Spectrophotometric and Photometric Microdetermination of Vanadium. F. Bermejo and M. Paz Castro. *Chemist-Analyst*, v. 48, Mar. 1959, p. 2-3.

Method based on intense coloration of acidic solutions of the vanadyl ion on addition of ethylene glycol. (S11d; V)

439-S.* Isotope Techniques for Inspection and Evaluation of Ship Welds. E. L. Criscuolo. *Welding Journal*, v. 38, Aug. 1959, p. 324-s-328-s.

Radiographic techniques utilizing Tm^{170}, Ir^{192}, Cs^{137} and Co^{60} for the inspection of welds in 1/2 to 2-in. steel plate. 12 ref. (S13e, T22g; 4-53, 7-51, ST, *Tm, Ir, Cr, Co*, 14-63)

440-S. Polarography of Mixtures. Determination of Iron and Nickel. Sidney L. Phillips and Evan Morgan. *Analytical Chemistry*, v. 31, Sept. 1959, p. 1467-1469.

Rapid method of analyzing mixtures of Fe and Ni without the necessity of separation. (S11m; Fe, Ni)

441-S. Application of X-Ray Fluorescence Method to the Analysis of Zircaloy. R. W. Ashley and R. W. Jones. *Analytical Chemistry*, v. 31, Oct. 1959, p. 1632-1635.

Determination of Sn, Fe, Cr and Ni in Zircaloy-2. (S11p; Zr-b, *Sn, Fe, Cr, Ni*)

442-S. Spectrographic Analysis of Molybdenum Metal Powder. Rudolph Dyck and Thomas J. Veleker. *Analytical Chemistry*, v. 31, Oct. 1959, p. 1640-1643.

(S11k, 6-68; Mo)

443-S. (Book.) Selected Methods of Analysis of Foundry Materials. Pt. 1. Pig Iron and Cast Iron. 97 p. July 1959. British Cast Iron Research Assoc., Alvechurch, Birmingham, England. $2.50.

Sampling and analysis of pig and cast irons for C, Si, Mn, S, P, Ni, Cr, Mo, Cu, Ti and V. (S11; CI, CI-a, *C, Si, Mn, S, P, Ni, Cr, Mo, Cu, Ti, V*)

444-S.* Fluorescent Penetrant Method for Casting Inspection. Arthur Lindgren. *Modern Castings*, v. 36, Oct. 1959, p. 105-110.

Use of fluorescent penetrant for magnetic inspection of castings. (S13k)

445-S.* (French.) Analysis of Nonmetallic Inclusions in Steel. H. Bizouard and J.

Philibert. *Revue de Metallurgie*, v. 51, July 1959, p. 123-124.

Analysis by means of spectrometer and microscope. The set of instruments allows quantitative determination of elements such as Na, Mg, Al and Si present in oxide inclusions. (S11k, S11e; ST, 9-69)

446-S.* (Russian.) Quality Control of Weldments With Ultrasound. Yu. M. Gofman. *Svarochnoe Proizvodstvo*, Sept. 1959, p. 39.

Weldments performed on pressure vessels were tested by means of gamma rays and, for comparison, by the ultrasonic method. The latter proved to be more dependable in the detection of pores, inclusions, cracks and incompletely filled joints. (S13, T26q; ST, 7-51)

447-S. Radiographic Inspection Assures Flawless Steel Castings. *Western Metalworking*, v. 17, Sept. 1959, p. 43.

Brief description of mobile cobalt-60 unit for large parts. (S13e, X8g; ST, 5-60)

448-S. (Swedish.) Standards for Aluminum Semi-Products. Gosta Lindblom. *Metallen*, v. 15, no. 2, 1959, p. 68-71.

(S22; Al, 4-55, 4-53, 4-61, 4-60)

449-S. (Russian.) Standardization of Steels Used in Welded Constructions. *Svarochnoe Proizvodstvo*, Sept. 1959, p. 40-43.

(S22; ST)

450-S* Porosity of Plated Coatings. *U. S. Dept. of Commerce, National Bureau of Standards, Technical News*, no. 2389, 1959, 6 p.

Physical and chemical methods of detecting pores; influence of gas on pore formation. (S13a; 9-68, 8-62)

451-S.* (Dutch.) Radiographic and Ultrasonic Testing of Weldments Performed on Gas Pipes. G. J. Janssen. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 248-250.

Comparison of the two methods. The ultrasonic method offers the advantages of more sensitivity in the discovery of cracks and better economy. (S13e, S13g, T26r, 7-51)

452-S. (Dutch.) Automatic Testing of Weldments by Ultrasonics. A. de Sterke. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 240-241.

Description of methods. (S13g, 7-51)

453-S. The Spectrographic Determination of Residual Elements in Steel. *Iron and Steel Institute, Journal*, v. 192, July 1959, p. 253-256.

Experimental procedures for spectrographic analysis of steel to determine residual elements present in amounts as low as 0.01% give good results for Co, Ni, Ti, Sn, Mo, Cb, V, Al and Cr, but less definitive accuracy for Zr and Cu. (S11k; *ST, Co, Ni, Ti, Sn, Mo, Cb, Al, Cr, Zr, Cu*)

454-S.* (English.) Determination of Oxygen in Cast Iron. Hidehiro Goto, Shin Suzuki, Jin Kimura and Akira Onuma. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 271-275.

Method for determining oxygen in oxides in cast iron. Technique is a fractional vacuum method using a tin bath. FeO can be extracted at 1050° C., MnO at 1150° C., Al_2O_3 at 1750° C. (S11g; CI, *O*)

455-S.* (English.) Microdetermination of Metals by Extracting the Inorganic Compounds With Organic Solvents. Pt. 3. Microdetermination of Molybdenum. Hidehiro Goto and Shigero Ikeda. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 276-284.

Use of stannous chloride or hydrazine sulphate as reducing agents and extraction of the compound of Mo by proper organic solvent. The microdetermination is made by light absorbency of the compound within certain regions where absorbence is a function of the amount of Mo. (S11d; Mo)

456-S.* (English.) Radioactive Tracer Study for the Determination of Trace Elements in Metals. Pt. 1. Determination of Zirconium in Steel. Hiroshi Amano. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 296-303.

Use of Zr^{95} as a tracer; the phosphate arsenate, basic selenite and mandelate methods. (S11q, 1-59; ST, Zr)

457-S.* (English.) Radioactive Tracer Study for the Determination of Trace Elements in Metals. Pt. 2. Determination of Niobium and Tantalum in Steel. Hiroshi Amano. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 304-311.

Use of Cb^{95} and Ta^{182} as tracers. Hydrolysis with perchloric acid and

treatment with saturated solution of sulphur dioxide is found to be the best method. (S11q, 1-59; ST, *Cb, Ta*)

458-S.* (English.) Variable Depth Echelette Gratings. Takemaro Sakurai. *Tohoku University, Science Reports of the Research Institutes*, Series A, v. 11, Aug. 1959, p. 352-354.

Various types of echelette gratings are necessary for the measurement of a wide spectral region, since the spread of wave length for a single grating is quite limited. This difficulty can be avoided by making the depth of the echelette grating variable. (S11k, 1-53)

459-S.* (French.) Shop and Site Inspection of Forced Piping Installations. R. Bouchayer, G. Rambaud and J. Picard. *Soudage et Techniques Connexes*, v. 13, July-Aug. 1959, p. 249-259.

Techniques and equipment for inspecting welded joints in steel lines installed in mountainous sites where slope of lines may be as high as 380°. Method adopted for gamma-ray inspection of circumferential joints which have difficult access. (S13e, S13g, T26r; ST, 7-51)

460-S.* (German.) Sand Casting, Chill Casting and Die Casting of Aluminum Alloys. *Giesserei Praxis*, no. 17, Sept. 10, 1959, p. 307-309.

In latest edition of DIN-1725 Standard degree of purity of alloys was increased by decreasing the allowable deviations. Composition, strength, hardness and elongation properties. (S22, E11, E13, 2-60; Al-b)

461-S. (French.) Contribution to the Spectrographic Deformation of Tantalum and Niobium in Stainless Steels of the 18/8 Type. M. Neuilly. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, Oct. 1959, p. 484-490.

7 ref. (S11c; SS, *Cb, Ta*)

See item 331-S 1959. (S13h; 4-55, ST, 9-72)

SECTION T

APPLICATIONS of METALS in EQUIPMENT and INDUSTRY

1-T.* Low-Carbon Manganese-Chromium-Molybdenum-Vanadium Steel for Pressure Vessels. I. M. MacKenzie. *Alloy Metals Review*, v. 9, Sept. 1958, p. 2-8.

Use of Ducol "W.30" steel allows fabrication of pressure vessels with thinner walls, satisfactory weldability, high strength, good high-temperature properties. (T26q, 17-57; SS, *Cr, V, Mo*)

2-T.* Preview of Space Metals. *Metal Progress*, Oct. 1958, v. 74, p. 96-113.

Parelleling the need for new materials for aircraft, missiles and satellites is the need to develop improved capabilities in common metal systems. Present and future prospects are reported for Al, Mg, steels, Ti, Be, superalloys, refractory metals, ceramics and cermets, graphite, composite materials, sandwich construction, surface treatment and coatings. (T24, 17-57; SGA-h).

3-T.* Selecting Sleeve Bearing Materials. Richard Booser. *Materials in Design Engineering*, v. 48, Oct. 1958, p. 119-130.

Relative compatibility and other performance characteristics of common bearing alloys. Sn babbitt has less tendency to pickup on a shaft than Pb babbitt; Al, because of its short dwell period and high wear rate needs a good oil supply; leaded Sn bronze does not cause any shaft scoring; Zn bronze has an exceptionally low wear rate; Cd-Ni has a long dwell period which makes it useful where oil supply is limited. 17 ref. (T7d; SGA-c, Sn, Cd, Ni, Pb, Al)

4-T. Engineering Experience at Brookhaven National Laboratory in Handling Uranium-Bismuth Reactor Fuels. R. J. Insler, C. J. Raseman, H. Susskind and C H. Waide. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/459, 1958, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

A molten solution of U, Zr, and Mg in Bi can now be circulated in piping systems at 500° C. for thousands of hours at velocities up to 10 ft. per sec. Piping design, repair proceedures and safety. 4 ref. (T11p; 14-60, U, Zr, Mg, Bi, 17-57)

5-T. Manufacture of the Seed Fuel Elements for PWR. H. F. Turnbull, W. J. Hurford, L. B. Prus and A. W. Klein. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/787, 1958, 11 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Seed region of the Pressurized Water Reactor core contains 32 enriched U fuel units, termed clusters. Each fuel plate is a metallurgically bonded assembly of a fuel alloy clad with Zircaloy-2. The fuel alloy consists of 6.7% enriched U alloyed with Zircaloy-2. (T11g; U, Zr)

6-T. Manufacture of EBR-1, Mark III Fuel and Blanket Elements. R. A. Noland, N. J. Carson and C. C. Stone. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF. 15/P791, 1958, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Fuel rods were made of lengths of 2% U-Zr alloy clad with a 20-mil. jacket of Zircaloy-2 by co-extruding alloy billets sealed in Zircaloy-2 cans. Rods were cut into shorter lengths appropriate for

assembly into either fuel or blanket rods, which were then assembled with Zircaloy-2 end caps and fuel sections. Sections were joined at the jackets by tungsten inert gas welding. 10 ref. (T11g; Zr, U)

7-T. Metallurgical Problems in Molten Fluoride Systems. W. D. Manly, J. H. Coobs, J. H. DeVan, D. A. Douglas, H. Inouye, P. Patriarca, T. K. Roche and J. L. Scott. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/Conf.15/P/1990, 1958, 30p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Ni-base alloys and austenitic stainless steels are the most promising of available construction materials for containing molten fluorides. An Inconel alloy composed of 15% Cr, 7% Fe, balance Ni, afforded most promising corrosion properties together with excellent mechanical properties. 7 ref. (T11; R6j; Ni-b, SS-e, 17-57)

8-T. Plutonium Fuels for Fast Reactors. D. B. Hall. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2286, 1958, 19p. (Available from U. S. Office of Technical Services. Washington 25, D. C.) $.50.

Metallurgical and physical properties of possible alloys with the neutron economy and operating potential of reactors fueled with Pu. Pure Pu is diluted to improve its thermal properties and to permit operation at practical levels of power density. Inert, or nonfertile, diluents may be added to Pu to improve its basic properties. Solid alloy forms with melting points above 800° C. and Pu contents in the range of 10-30% (atomic ratio) discussed. (T11g; 17-57, Pu)

9-T. Liquid Metal Fuel Reactor and LMFRE. Clarke Williams and Robert T. Schomer. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/2355, 1958, 17 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Reactor uses U-Bi circulating fuel. 2 1/4% Cr, 1% Mo has been tested in thermally convected and pumped loops and appears to be a possible container material. Graphite exposed to Bi-U solution appears to be a satisfactory container material. (T11p, T11g, R6m; U, Bi, AY, NM-k36)

10-T. Recent Structural Aluminium Developments in Belgium. H. R. Craggs. *Light Metals*, v. 21, Aug. 1958, p. 248-250.

(T26n; Al, 17-57)

11-T. The Spring-Back of Coil Springs. Harold C. R. Carlson and Frank J. Gardiner. *Wire Industry*, v. 25, Sept. 1958, p. 847, 850-851.

How to calculate the exact arbor diameter required to produce a specified outside diameter of spring for any material; comprehensive set of tables based upon the formulas. (T7c, 17-51)

12-T. (French.) Beryllium and Nuclear Reactors. *Metallurgie et la Construction Mecanique*, v. 90, Oct. 1958, p. 739-741.

Be ores and principle producing countries; world reserves. Use of Be as hardening agent, uses in the nuclear industry, (T11, A11a; Be, 17-57)

13-T. (German.) Sandwich Structures in Aircraft and Other Industries. Pt. 1. B. R. Noton. *Aluminium*, v. 34, Aug. 1958, p. 446-457.

Historical development, definition, cover materials, adhesives, Al honeycomb cores. Comparison of compressive longitudinal shear and transverse shear strengths of core materials now available. (T24a, K12; Al, SS, NM-d34, 7-59)

14-T. (German.) Prefabricated Aluminum Exhibition Hall. R. Brechtel and J. Schickling. *Aluminium*, v. 34, Aug. 1958, p. 466-469.

(T26n; Al-b, 17-57)

15-T. (German.) Aluminum House Which Can Be Dismantled and Reshaped. A Reischl. *Aluminium*, v. 34, Aug. 1958, p. 470-473.

(T26n; 17-57, Al-b)

16-T. (German.) New Unit for Street Lighting. *Aluminium*, v. 34, Aug. 1958, p. 474-479.

(T1; 17-57, Al-b)

17-T. Utility of Cutting Tools Expanded by New Materials. *Automotive Industries*, v. 119, July 1, 1958, p. 52-53, 83.

New grades of cemented carbides, ceramics and special high-speed carbides. (T6n; SGA-j, 6-69, 6-70)

18-T. Automotive and Aircraft Uses of Tin. Andrew W. Shearer. *Automotive Industries*, v. 119, July 15, 1958, p. 54-58.

Poundage figures used per unit are slight but total tonnage consumed runs to sizable amount in plating, solders, alloys and chemicals. (T21, T24; Sn, 17-57)

19-T. Lead as a Material of Construction for Chemical Plant. J. G. Openshaw. *Chemical and Process Engineering*, v. 39, Oct. 1958, p. 350-352.

Fabrication problems; corrosion behavior. (T29, G-general, R-general; Pb, 17-57)

20-T. Comparative Economics of Plutonium Fuel Utilization and U-235 Fuel Utilization in Thermal Power Reactors. E. A. Eschbach, D. P. Granquist and Milton Lewis. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1068, 1958, 19 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.

Minimum costs in a wide range of reactor types and sizes are compared for each of the two fuel systems. Pu may be recycled economically with natural or depleted U feed materials in high efficency reactors typified by those with low neutron leakage rates and high thermal utilization factors. (T11g, 17-53; Pu, U)

21-T. Resources of Nuclear Fuel for Atomic Power. J. C. Johnson. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.-15/P/1921, 1958, 7 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .50.

Uranium ore reserves and production costs. (T11g, A11a, B-general; U)

22-T. (German-French.) Light Metal Facade of Swiss Pavillion at the Brussels World Exhibition. R. Siebold. *Aluminium Suisse*, v. 8, May 1958, p. 75-83.

28-T.* Electronic Tubes of Forged Molybdenum. *Design Engineering*, v. 4, Nov. 1958, p. 53.

Uses for clad Mo in magnetron tubes. Tensile strength, elongation, reduction in area of unannealed Mo rod. (T1j, 17-57, Q27, Mo, 8-66)

29-T. Manufacture and Chief Uses of Aluminium Foil. L. W. Swann. *Light Metals*, v. 21, Aug. 1958, p. 255-257.

Consumer goods manufacturers, especially food manufacturers, are finding coated Al foil or laminated foil lined with paper provide attractive, moisture-proof wrappers and packages. Laminated foil lined with paper gives mechanical strength and thickness needed. (T10g, 17-57; Al-b, 4-56)

30-T. Ceramic-Oxide Cutting Tools. *Australasian Manufacturer*, v. 43, Oct. 4, 1958, p. 62-65, 70-73.

(T6n; SGA-j, 6-70)

31-T. For Nuclear Reactors: Zr Is More Popular Than Ever. R. B. Norden. *Chemical Engineering*, v. 65, Nov. 17, 1958, 174, 176.

High strength, resistance to irradiation and corrosion boosts use of Zr. (T11; Zr, 17-57)

32-T. Magnesium Extrusions Make Ideal Airfield Landing Mats. *Modern Metals*, v. 14, Nov. 1958, p. 31-32.

(T24d; Mg-b, 4-58)

33-T. Sinter Alumina for Cutting Tools. Felix Singer and Sonja S. Singer. *Refractories Journal*, v. 34, Oct. 1958, p. 456-462.

11 ref. (T6n; SGA-j, 6-70)

34-T. High Strength Castings for High Speed Rotating Parts. J. C. Buck and D. V. Lippenberger. *Space Aeronautics*, v. 30, Nov. 1958, p. 78-84.

High-strength Al castings for turbines, fans, inducers, impellers. Properties. (T7h; Al-b, SGB-a, 5-60)

35-T. Fuel Enrichment and Reactor Performance. C. Starr. Second United Nations International Conference on the Peaceful Uses of Atomic Energy. A/CONF.15/P/1078, 1958, 18 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Reactor performance as a function of fuel enrichment over a wide range of natural U to about 4% U 235 and the use of Pu recycle for enriched reactors. Proper scope of natural U fuel cycles and of enriched U fuel cycles. (T11g; U, Pu)

36-T. (French.) Design and Calculation of Pressure Vessels. W. B. Carlson. *Revue de la Soudure*, v. 14, no. 3, 1958, p. 125-133.

(T26q, 17-51)

37-T. (French.) Testing of Pressure Vessels. W. Soete and R. Dechaene. *Revue de la Soudure*, v. 14, no. 3, 1958, p. 134-140.

(T26q, 1-54)

38-T. (German-French.) Modern Aluminum Roofing. Carl E. Scherrer. *Aluminium Suisse*, v. 8, Sept. 1958, p. 143-147.

(T26n, 17-57; Al-b)

39-T. (German-French.) Light Metal Ladders. W. Schramme. *Aluminium Suisse*, v. 8, Sept. 1958, p. 161-166.

(T26, 17-57; Al-b)

40-T.* Steels for the Petroleum Industry. A Comparison of British and American Qualities. Pt. 2. F. A. Kirk and J. Williams. *Corrosion Technology*, v. 5, Nov. 1958, p. 357-360.

Physical and mechanical properties of typical British heat and corrosion resistant steels. (T29n, Q-general, P-general; SGA-g, SGA-h, SS)

41-T.* (German.) Metallurgical Studies on the Capacity of Cast and Hot Worked Tools of High-Speed Steel. Karl-August Krekeler. *Stahl und Eisen*, v. 78, Oct. 30, 1958, p. 1575-1585.

Red hardness tests and working experiments with turning and milling tools. When no excessive heating of the edge was caused by the working conditions, cast tools from steels ABC III and EV 4 (both with about 0.10% C) and EV4Co (with about 0.20%C) showed better properties and longer life than forged tools from the same materials. 63 ref. (T6n, Q-general; TS-m)

42-T.* (English.) One-Piece Wheels in Special Steel for Railway Equipment. *Aciers Fins & Speciaux Francais*, no. 29, July 1958, p. 44-46.

Operations in hot working of wheels in one piece include forging, rolling, heat treating, machining. (T23p, F-general; SS, 1-66)

43-T.* (English.) High Nickel-Chrome Alloys for Electrical Resistances. *Aciers Fins & Speciaux Francais*, no. 29, July 1958, p. 67-73.

Certain additives affect resistance to oxidation remarkably. Other factors which shorten the life of these elements are rapid heating and cooling, selected oxidation from a weakly oxidizing atmosphere, attack of sulphur which is catalyzed by the presence of dust or lime, carburization from strongly carburizing gases, sulphur and greases, rupture from flying particles or molten alloys and overheating. 16 ref. (T1p, 17-57; Ni-b, Cr-b, SGA-q)

44-T.* Metallic Heating Element Materials for High-Temperature Furnaces. R. Kieffer and F. Benesovsky. *Metallurgia,* v. 58, Sept. 1958, p. 119-124.

Physical properties and behavior of Mo, W and Ta toward various atmospheres and ceramic structural parts of furnaces. Examples of practical layouts in high-temperature furnaces. 14 ref. (T1p, P11, P12; Mo, Ta, W, SGA-h)

45-T. Fuel Elements for Natural Uranium Reactors. B. W. Dunnington. *Nuclear Technology Briefs Reactor Materials,* no. T1-6, Sept. 9, 1958, 8 p.

Problems of radiation-induced expansion, neutron absorption, and corrosion in developing safe and economical U metal fuel elements. Possibilities for using alloy elements, high-strength cladding and special element designs. Characteristics of oxide and carbide elements. 12 ref. (T11g, P10d, R2g, 2-67; U-b)

46-T.* (French.) Production of Plutonium-Aluminum Fuel Elements for Atomic Reactors. W. B. H. Lord and R. J. Wakelin. *Revue de Metallurgie,* v. 55, July 1958, p. 620-626.

Spikes for experimental reactors; plant and procedures for making cores and their Al sheaths; problems of Pu metallurgy. (T11g, 17-57; Pu, Al)

47-T.* (German.) Water Pipes From Copper. G. Wiedemann. *Metall,* v. 12, Nov. 1958, p. 1001-1003.

Chemical behavior of Cu in water of different composition. Development of protective film. (T26r, R4a; Cu-b)

48-T.* (German.) Hardenable Cemented Carbides. *Werkstatt und Betrieb,* v. 91, Nov. 1958, p. 688.

Titanium carbide grains are enclosed in a steel matrix, the hardness of which can be altered by heat treatment following the sintering process and working of the sintered product. Cemented carbides can thus be machined by conventional methods and after being worked to final shape and dimensions, heat treated to the required operating hardness. (T6n, 2-64; ST, 6-69)

49-T.* (French-German.) Copper as Roofing Material. K. Eichhorn. *Pro-Metal,* no. 65, Oct. 1958, p. 35-39.

Mechanical, physical and chemical properties which make Cu an economical material for roof coverings, especially if longevity is taken into consideration. (T26n; Cu-b, 17-57)

50-T.* (French-German.) Copper Construction Plumbing. O. H. C. Messner. *Pro-Metal,* no. 65, Oct. 1958, p. 43-53.

Roofs, gutters, rain pipes and fittings. (T26n; Cu-b, 17-57)

51-T. Titanium and Zirconium in Chemical Plant Applications. Leo J. Barron. *Chemical Engineering Progress,* v. 54, Nov. 1958, p. 51-54.

(T29, 17-57; Ti, Zr)

52-T. An Automobile Manufacturer Looks at Aluminum Casting Use. Darl F. Caris and Robert F. Thomson. *Foundry,* v. 86, Nov. 1958, p. 92-95.

(T21; 17-57, Al-b, 5-60)

53-T. Something New in Aluminum Furniture. M. J. Schmidt. *Modern Metals,* v. 14, Aug. 1958, p. 46-48.

(T10b; Al, 17-51)

54-T. Beer in Aluminum Cans. *Modern Metals,* v. 14, Aug. 1958, p. 50-52.

(T10g; Al, 17-57, 18-74)

55-T. (German.) Aluminium in Fireships. *Aluminium,* v. 34, Nov. 1958, p. 654.

(T22, 17-57; Al-b)

56-T. (German.) All-Welded Aluminium Working Boats and Tugs. *Aluminium,* v. 34, Nov. 1958, p. 657-658.

(T22, 17-57; Al-b, 7-51)

57-T. (German.) Performance of Newly Developed Cutting Materials. C. Agte and R. Kohlermann. *Fertigungstechnik,* v. 8, Aug. 1958, p. 349-352.

Recommends use of ceramics and multipurpose hard metals. 12 ref. (T6n, 17-52, SGA-j)

58-T.* (Russian.) Aluminum Bimetal Shells With ACM Alloy Instead of Lead Bronze Shells for Tractor Engine Bearings. Yu.Ya. Zil'berg. *Vestnik Mashinostroeniya,* v. 38, Oct. 1958, p. 34-36.

Use of lead bronze shells, while effective antifriction material, is very costly and difficult to produce. The ACM Al antifriction alloy recommended as substitute includes 4% Sb, 0.3% Mg. 3 ref. (T7d; Al-b, *Mg, Sb,* 17-57)

59-T. (Book.) The Contemporary Curtain Wall. William Dudley Hunt, Jr. 454 p. 1958. F W. Dodge Corp., 119 W. 40th St., New York 18, N. Y. $12.75.

Function of the wall, design considerations, physical and mechanical properties of construction materials, recommended practices for erection, resistance to weathering, corrosion, damage. (T26n, 17-57; Al, SS)

60-T. Development of Ferritic Stainless Steel-UO_2 Dispersion Fuel Elements. W. K. Barney, W. E. Ray and H. G. Sowman. Knolls Atomic Power Laboratory. *U. S. Atomic Energy Commission,* KAPL-1908, Aug. 26, 1958, 22 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $ .75.

Fabrication process consists of the cold binder extrusion of a plastic powder dispersion which is fired in dry hydrogen, fitted with welded end caps and electroplated with Ni. This core is inserted into a length of 430 stainless steel cladding and the assembly is bonded by hot swaging at 800° C. (T11g, F21g; SS-d, U, 8-66)

61-T. Materials for Guided Missiles. Paper from "Materials Evaluation in Relation to Component Behavior". *U. S. Office of Technical Services,* PB 131783, p. 601-609.

Applications and limitations of Al, Mg, and Ti alloys, alloy steels. Rich alloys of Co or Ni, because of their high cost and critical supply, are difficult to justify. The outlook for cermets is most promising. (T24e; AY, SS, Al-b, Mg-b, Ti-b, 6-70, 17-57)

62-T. A Low Cost Porous Bushing. *Precision Metal Molding,* v. 16, Dec. 1958, p. 32.

Fe-base bushings have advantage of being about one-fourth the cost of comparable bronze bushings and can operate at higher temperatures. Mechanical properties and corrosion resistance are inferior. (T7d; Fe, Cu-s, 6-71)

63-T. Extrusions Lower Model Costs. *Precision Metal Molding,* v. 16, Dec. 1958, p. 49.

Extruded crankcase of model airplane gasoline engine gives precise shape and superior strength over comparable castings. (T24b; 4-58, 17-53)

64-T. Rolling Mill for Nuclear Fuel Elements. *Sheet Metal Industries,* v. 35, Dec. 1958, p. 928-930.

Remote control of roll changing. (T11g, W23)

65-T. Material Solves Problems in Forging Reactor Parts. *Steel,* v. 143, Dec. 22, 1958, p. 72-76.

Composition for heavy forged sections is equal in tensile, impact strength and weldability to ASME Boiler Code analysis SA 302 but does not flake. (T26q; ST, Cr, *Mn, Mo, Ni,* 9-70, 17-57)

66-T. (French.) Production, Fabrication and Canning of Thorium. M. D. Jepson and L. M. Wyatt. *Revue de Metallurgie,* v. 55, Sept. 1958, p. 847-852.

Processes developed for United Kingdom Atomic Energy Authority: reduction of thorium oxide by calcium, cold compaction, sintering, swaging and/or machining to size and canning in Al containers. Methods of sealing cans and testing finished cartridges. (T11g, H-general; Al-b, Th)

67-T.* Low-Speed Cascade Study of a Simply Generated Compressor Blade Shape. D. Banerjee and P. Pal. *Journal of Technology (Calcutta),* v. 3, June 1958, p. 43-52.

Method of manufacture without use of special purpose machine tools. Effect of deviation in the blade shape from the true aerodynamic profile. 10 ref. (T7h, 17-51)

68-T. Development of Fabrication Techniques and Manufacturing Specifications for APPR Fuel Plates. W. Weinberger. Sylvania-Corning Nuclear Corp. *U. S. Atomic Energy Commission,* SCNC-262, Apr. 1958, 49 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Fuel plates contained U^{235} in the form of highly enriched UO_2 and B_{10} in the form of normal elemental B powder. Samples were prepared for evaluation of core material, picture framing techniques, fuel plate fabrication, and subassembly fabrication employing both brazing and welding methods. (T11g, K-general; U, B)

69-T.* (French.) All-Aluminum Conductors for Electrical Equipment at Edea. J. Touze, *Revue de l'Aluminium,* no. 257, Sept. 1958, p. 881-884.

For connection of Enelcam hydroelectric plant to Alucam reduction works over a distance of 660 yd., a 10.2-kv. line has been constructed consisting of 42 cables in seven circuits. Cable conductors are pure Al 708 sq. mm. in section. (T1b, 17-57; Al-a)

70-T.* (French.) Detection and Prevention of Defects in Electric Heating Elements Used Under Unfavorable Conditions. *Revue du Nickel*, v. 24, Sept-Oct. 1958, p. 90-92.

Tests conducted in special apparatus to study wear of heating elements; influence of furnace atmosphere, heat radiation, breakages of wires, oxidation, overheating and corrosion. (T1p, R1; ST, Ni-b, *Cr*, 9-72, 9-74)

71-T. The Step Bearing—a New Concept in Air Lubrication. Clarence R. Adams. *Product Engineering*, v. 29, Dec. 8, 1958, p. 96-99.

Bearings which can be operated with air, gas, water or mercury at high or low temperatures and speeds. (T7d, 18-73)

72-T.* (French.) Modern Submarine Cables—Miracles of Precision. M. Bourdier *Cuivre, Laitions, Alliages*, no. 45, Sept-Oct. 1958, p. 3-17.

Structure and function of cables; use of Cu and Cu alloys for core and surrounding strips; operations in a wire-producing plant. (T1b; Cu-b, 17-57)

73-T.* (French.) Automobile Radiators. *Cuivre, Laitons, Alliages*, no. 45, Sept-Oct. 1958, p. 19-25.

Historical review, use of nonferrous metals, importance of extreme purity for thermal conductivity, metallurgical problems encountered. (T21c, EG-a38; 17-57)

74-T.* Some Applications of High Nickel Alloys in the Petroleum Industry. Pt. 2. G. L. Swales. *Petroleum*, v. 21, Dec. 1958, p. 439-443.

Behavior of Inconel, Incoloy, Monel, S Monel and Hastelloy C in an alkylation plant utilizing hydrofluoric acid as a catalyst. 11 ref. (T29n, 17-57, R7; Ni-b)

75-T.* Ceramic Fuel Materials for Nuclear Reactors. J. R. Johnson. Paper from "Powder Metallurgy in Nuclear Engineering" American Society for Metals, 1958, p. 193-206.

Radiation damage, engineering and fabrication of ceramics. Properties and behavior of some 20 ceramic materials. Cermet-type fuel elements include SiC-Si and Cr-Al_2O_3. 6 ref. (T11g, 17-57; NM-f40, Si, *C*, Cr, *Al*, *O*, 6-70)

76-T.* Dispersion-Type Fuel Elements. C. E. Weber and H. H. Hirsch. Paper from "Powder Metallurgy and Nuclear Engineering". American Society for Metals, 1958, p. 224-241.

Dispersion-type fuel systems offer increased endurance life in high specific-power reactors, decreasing the refueling frequency. High U concentrations can be attained and fuel-diluent metal combinations used that are unattainable by conventional alloying techniques. The major damage in the fuel system is due to fission products. By proper choice of particle size this damage can be confined to the fissile particles and a small adjacent region, leaving a continuous network of undamaged matrix metal to maintain the integrity of the element. 10 ref. (T11g, 17-57; U, 6)

77-T. Rubber and Ebonite-Lined Storage Tanks. T. H. Brooke. *Corrosion Technology*, v. 5, Dec. 1958, p. 377, 378, 397.

(T26q, L26r; ST)

78-T. Heavy-Duty Tank Linings. W. G. Martin. *Corrosion Technology*, v. 5, Dec. 1958, p. 379-380.

Constructed in acid-resisting bricks or tiles. (T26q, L27)

79-T. Aluminium and Copper Busbars in the Plating Shop. D. W. Taylor. *Electroplating and Metal Finishing*, v. 11, Nov. 1958, p. 383-387, 411.

(T1b, L17; Cu-a, Al-a, 17-57)

80-T. Metallic Constructional Materials for the Chemical and Allied Industries. S. Rowden. *Engineers' Digest*, v. 19, Nov. 1958, p. 473-476.

Applications of mild steel, Ni alloys, Al alloys, Cu alloys, Pb alloys. (T29; 17-57; CN, Cu-b, Ni-b, Al-b, Pb-b)

81-T. Production of Ball and Roller Bearings. *Machinery (London)*, v. 93, Dec. 24, 1958, p. 1448-1456.

Methods employed by the Hoffman Manufacturing Co., Ltd. (T7d)

82-T. Manganese Steel in Industry. *Mechanical World and Engineering Record*, v. 138, Dec. 1958, p. 543-544.

Applications include dipper teeth, shovel wearing posts, gear pinions,

flanges of crane and truck wheels and pulverizing hammers. (T28, T21e, 17-57; ST, *Mn*)

83-T. Aluminum Will Replace Cast Iron in Auto Engines. Darl F. Caris and Robert F. Thomson. *Modern Metals*, v. 14, Dec. 1958, p. 56, 58, 60.
(T21b, 17-57; Al-b)

84-T. Bavaria's Tin Sarcophagi. *Tin and Its Uses*, no. 44, Autumn 1958, p. 12.
(T10; Sn, 17-57)

85-T. (French.) Use of Ceramic Tools in Soviet Union. A. U. Margouless and N. G. Neuweiller. *Machine Moderne*, v. 12, Dec. 1958, p. 51-52.
Cutting tools as used in a Russian locomotive factory. Feed, cutting depth and speed for different tools. (T6n; G17; 6-70)

86-T. (French.) Aluminum Construction in Civil Engineering. Jacques Ernst. *Revue de l'Aluminium*, no. 257, Sept. 1958, p. 885-894.
Use of Al in large metallic frames. Use of extruded shapes with bulbs affords great stability and makes possible use of sections with high slenderness factor. Lattices should be extremely dense, structures hyperstatic. Combination of Al and steel advantageous in reducing sag. Economy in making high purlins by welding. 11 ref. (T26, 17-57; Al-b)

87-T. (French.) Production and Use of Large Extruded Profiles of Aluminum and Light Alloys. Pt. 2. Michel Costeraste and Pierre Bandet. *Revue de l'Aluminium*, nc. 257, Sept. 1958, p. 897-905.
Large homogeneous sections can be used without need of assembly on the job. Increased height is particularly advantageous for single section beams under flexure. In transmission of electricity increased section profiles permit greater intensity. Cost of construction reduced. (T26, 17-57; Al-b, 4-58)

88-T. (French.) Aluminum Welded Yachts. Maurice Victor. *Revue de l'Aluminium*, no. 257, Sept. 1958, p. 907-910.
(T22g; Al-b, 7-51)

89-T. (French.) A Road Bridge of Welded Aluminum. Andre Chevrier. *Revue de l'Aluminium*, no. 258, Oct. 1958, p. 1012-1017.
(T26p; Al-b, 7-51)

90-T. (Italian.) Preparation and Control of Carbon Electrodes for Use in Spectroscopy. Nidia Meng-Chierego. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 337-339, 346.
Heating to 1200° C. in stream of chlorine gas resulted in only partial purification; better results were obtained by heating 10 to 30 sec. with 250-300 amp. by means of a modified Gatterer apparatus. (T1f, S11k)

91-T.* Metal Powders in Missile and Rocket Fuels. Loring R. Frazier. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 65-70.
Application of B, Al, Zr, Mg, Ti, Be, Li powders. Powder properties affecting flammability are particle size distribution, particle shape, surface condition, availability of oxidant, dispersion, temperature. (T24e, T2p, H11; B, Al, Zr, Mg, Ti, Be, Li, RM-j, 17-57)

92-T.* Falcon Airframe Uses Die Casting, Magnesium Structure. Irwin Stambler. *Space Aeronautics*, v. 30, Dec. 1958, p. 18-19, 80, 82, 84, 86, 87.
Outside tolerances of 0.005 to 0.01 in. for Mg sheet; production problems for air-to-air missile. (T24a; Mg, 4-53, 5-61)

93-T.* (Japanese.) Materials for Slide Contacts. T. Matsumae. *Metals*, v. 28, Dec. 1958, p. 887-889.
Brass, bronze, phosphor bronze, Be-Cu, Ag-plated spring steel, Cu, C, Ag, Rh, Ag-Cu, Pd-Cu used. Ag, Ag-In, Ag-Pd clad on phosphor bronze, brass are newer materials. (T1, 17-57; Cu-b, Ag-b, 8-66)

94-T.* (Japanese.) Stainless Spring Steel for Meters. K. Matsumoto. *Metals*, v. 28, Dec. 1958, p. 883-886.
Structure, corrosion and mechanical properties of spring steels. (T7c, 17-57; SS-e)

95-T.* (Japanese.) Ferromagnetic Materials for Meters. M. Yamamoto. *Metals*, v. 28, Dec. 1958, p. 890-894.
Ni-Fe alloy is most frequently used. B and C class Permalloy used for transistor-transformers, cores of gages and Selsyns. (T1, 17-57, P16; Ni-b, Fe, SGA-n)

96-T.* (Japanese.) Free Cutting Steel for Meters. C. Asada and T. Fujiwara. *Metals*, v. 28, Dec. 1958, p. 899-902.
Machinability of steels and stainless steels. (T1, 17-57; G17k; ST, SS, 17-57)

97-T.* (Japanese.) Oil Treated Sintered Bearings for Controllers. I.Naitoh. *Metals*, v. 28, Dec. 1958, p. 903-906.

Do not become oil-stained and produce less noises, but friction coefficient is too high. Fe and Cu alloys are used. Fe alloy is sintered at 1100 to about 1200° C. and Cu-alloy at 750 to about 800° C. (T7d, H15; Cu, Fe, 17-57)

98-T.* (Japanese.) Printed Circuits. H. Nagatsu. *Metals*, v. 28, Dec. 1958, p. 912-916.

Cu foil on plastic plate; photo-etching process. (T1c; Cu, SS, 17-57)

99-T.* Materials of Construction for Head-End Processes. Aqueous Processing of Nuclear Fuels. Charles L. Peterson, Paul D. Miller, Earl L. White and Walter E. Clark. *Industrial and Engineering Chemistry*, v. 51, Jan. 1959, p. 37

Materials for the Zircex and Darex processes. Ta, Ti, Mo, Ni, the Hastelloys, Inconel, Haynes 25, Type S-816 and Illium R are promising. Ni, the Hastelloys, and Mo perform well in the alternate liquid-phase Zircex process, while unalloyed Ti serves the requisites of the Darex process. (T11g, C19n; Ta, Ti, Mo, Ni-b, 17-57, U)

100-T. Wanted: 20,000° Metals. Norman L. Baker. *Missiles and Rockets*, v. 4, Dec. 29, 1958, p. 18, 20.

Properties and missile applications of high melting oxides, graphite and Be. (T24e, SGA-h, 17-57, 2-62, Be, NMk36, 6-70)

101-T. (German.) Stresses in Cutters in Woodworking Machines. H. Flemming and L. Knospe. *Fertigungstechnik*, v. 8, no. 11, 1958, p. 525-527.

Influence of cutter shape on stresses and resulting economics of mass production in woodworking. (T6n, Q25)

102-T. (Japanese.) Materials for Microswitches. A. Naitoh. *Metals*, v. 28, Dec. 1958, p. 895-898.

(T1, 17-57)

103-T. Plastic Design of Steel Frames. Lynn S. Beedle. 406 p. 1959. John Wiley & Sons, Inc., 440 Fourth Ave., New York 16, N. Y. $13.

Plastic design in solving practical building frame design problems. (T26n, 17-51; ST)

104-T. (Polish.) Durability of Winding Rope in Polish Collieries. Jerzy Kowalczyk. *Hutnik*, v. 25, Sept. 1958, p. 335-346.

(T7g)

105-T. (Polish.) Sawing Needles Made of New Kind of Wire. Jozef Pechanski. *Hutnik*, v. 25, Sept. 1958, p. 351-354.

106-T. (Polish.) Diamond-Metal Carbides for Tools for Cutting Optical Glass. W. Cegielski. *Prace Instytutow Ministerstwa Hutnictwa*, v. 9, no. 2, 1957, p. 71-80.

Methods, equipment and tests applied in production of saws and polishers for optical glass. Comparison of properties of imported tools and tools manufactured in Poland. 4 ref. (T6n; SGA-j)

107-T. Metallurgical Developments in Brake Drums. V. A. Crosby. *Society of Automotive Engineers*, Preprint 14S, Jan. 1959, 14 p.

Properties required of brake drum materials. Effect of carbon content and alloy additions on tensile strength at elevated temperatures on thermal conductivity and wear resistance of gray cast irons. Relation of graphite content and matrix structure to properties. 9 ref. (T21c, Q9n, Q27a; CI-n, SGA-m, 17-57)

108-T.* How Can Aluminum Best Be Used to Improve Today's Brakes. R. L. Atkin and F. J. Weber. *Society of Automotive Engineers*, Preprint 14R, Jan. 1959, 9 p.

Braking performance of high Si-Al alloy drums and Al drums with cast iron or sprayed steel liners. (T21c; Al-b, 17-57)

109-T. Information Bibliography—Materials for Use in Nuclear Reactors. B. Yates. *United Kingdom Atomic Energy Authority*, IGRL-IB/R-15, Aug. 28, 1958, 55 p.

References to 366 books, unclassified reports, and journals relating to Al, Be, B, ceramics and refractories, Cu, Mg, Mo, Ni, Cb, steel, Ta, Sn, Ti, W, V and Zr in reactor applications. (T11; Al, Be, B, Cu, Mg, Mo, Ni, Cb, ST, Ta, Sn, Ti, W, V, Zr, 17-57)

110-T.* (German.) Stainless Spring Wire and Spring Strip. Karlheinz Kayser. *Draht*, v. 9, Dec. 1958, p. 491-496.

Properties for an age hardening austenitic steel with 17% Cr and 7% Ni. Influence of heat treatment on the elasticity modulus

and elastic limit; influence of aging; properties at elevated temperature; magnetic properties. (T7c, P16, Q-general, 2-62, 2-64; SS, SGA-b, 4-61, 4-53)

111-T.* Development of Beryllium for Nuclear Reactor Applications. G. C. Ellis. *Metallurgia*, v. 58, Dec. 1958, p. 265-269.

Development of maximum properties in commercial grade Be by improved purity and fabrication control of structure and orientation; application of grain orientation control to tube fabrication processes; determination of effects of improved metal purity on single-crystal deformation characteristics. 25 ref. (T11; Be, 17-57)

112-T.* (German.) Effect of Heat on Strength Properties of Overhead Cables. G. Dassetto. *Aluminium*, v. 34, Dec. 1958, p. 716-718.

Experiments with conductors of Al, Aldrey, Cu and steel; strength tested at 180, 200, 250, 400 and 500° C. Tensile strength at these temperatures for 5 min. decreased for Al from 100 to 45.7%, for Aldrey to 56.1%, for Cu to 52.8%, for steel to 91.5%. 8 ref. (T1b, Q27a, 2-61, 2-62; Al, Al-b, Cu, ST)

113-T. Costume Jewellery. R. King. *Birmingham Metallurgical Society, Journal*, v. 38, Dec. 1958, p. 107-115.

Applications of Cu, brass, bronze, gilding metals, Sn, nickel silver and Al. Casting, fabrication and finishing techniques. (T9s, E-general, G-general, L-general; Cu-n, Sn, Ni, Al)

114-T. Aluminium Crown Closure for Bottles. *Light Metals*, v. 22, Jan. 1959, p. 9-10.

Methods of constructing bottle caps. (T10g, 17-57; Al-b)

115-T. Architectural Metal at the Brussels Fair. F. Charles Thum. *Metal Progress*, v. 75, Jan. 1959, p. 71-74.

Steel cables were widely used as main tension members from which roofs are hung, clearing the exhibit space of all supporting columns. Light and strong supporting members enabled the architect to use colored plastics effectively. Brilliant metal more than held its own in the aesthetic balance. (T26n, 17-57)

116-T. Aluminium Pressure Vessels. *Metallurgia*, v. 58, Dec. 1958, p. 295-296.

Summaries of papers presented at a symposium on pressure vessel design, manufacture and use held by the British Institution of Mechanical Engineers, Oct. 28, 1958. (T26q; Al, 17-57)

117-T. We Need Better Materials for Rockets. *Steel*, v. 144, Feb. 2, 1959, p. 96-97.

Plastics, graphites, ceramics, refractory metals suggested. (T24e, T2p; NM-k36, NM-f, NM-d31, SGA-h)

118-T. (German.) Aluminum Used in the Merlin-Nuclear Reactor. H. Croscha. *Aluminium*, v. 34, Dec. 1958, p. 714-716.

Pressure vessel inside the protective concerte block is made from Al approximately 10 mm. thick. Reactor core is suspended in an Al cage. Each heating element consists of nine plates composed of U^{235} and an Al sheath. (T11; Al, U, 17-57)

119-T. (German.) Sandwich Construction in Aircraft and Related Industries. B. R. Noton. *Aluminium*, v. 34, Dec. 1958, p. 719-727.

Behavior of sandwich panels made from various cores and the adhesives under shear stress. (T24a, K12, Q2, 7-59; Al-b, NM-d34)

120-T. (German.) Unhardened Gears. H. Rettig. *Industrieblatt*, v. 58, Dec. 1958, p. 513-519.

Tabular survey on the strength and hardness of gears from gray cast iron, nodular cast iron, cast steel, unalloyed and unhardened engineering steel and heat treated steel. (T7a, Q27a, Q29n; CI-n, CI-r)

121-T. (German.) Technical Considerations on Gear Defects. Heinz Glaubitz. *Industrieblatt*, v. 58, Dec. 1958, p. 524-528.

Effects of heat treatment. 11 ref. (T7a, J-general; ST, 9)

122-T. (German.) Reaming With Hard Metal Tools. Herman Haidt. *Industrieblatt*, v. 58, Dec. 1958, p. 557,563.

Technology, considering the mechanical properties of materials dealt with in reaming operations. (T6, G17e; 6-69)

123-T. (German-French.) Use of Aluminum in New Buildings. A. Gilliand and J. Rejhon. *Aluminium Suisse*, v. 8, Nov. 1958, p. 175-186.

Roofing, chimneys, facades, interior doors, partitions, framework, air-conditioning and heating system, parking areas and fencework. (T26n; Al-b, 17-57)

124-T. (German-French.) Freight Car With Retractable Roof. *Aluminium Suisse*, v. 8, Nov. 1958, p. 187-192.
(T23p; Al-b, 17-57)

125-T. (German-French.) Light Metal Silo Wagon for Bulk Cargo Loads. H. Zysset. *Aluminium Suisse*, v. 8, Nov. 1958, p. 192-200.
(T23p; Al-b, 17-57)

126-T. (German-French.) Modern Shelter in Swiss Alps. A. Gilliand. *Aluminium Suisse*, v. 8, Nov. 1958, p. 201-203.
(T26n; Al-b, 17-57)

127-T.* (German.) Sandwich Structures in Airplane and Other Industries. Pt. 5. B. R. Noton. *Aluminium*, v. 35, Jan. 1959, p. 36-44.
(T24a; 7-51, 17-51)

128-T. Application of Aluminium to Pressure Vessels. *Light Metals*, v. 21, Dec. 1958, p. 375-376.
Summaries of four papers presented at a symposium on Al pressure vessels held by the Institute of Mechanical Engineers, London, covering materials, codes of practice for construction, fabrication and user experience. (T26q; Al, 17-57)

129-T. Magnesium Wheels for Road Vehicles. *Light Metals*, v. 21, Dec. 1958, p. 380.
Main obstacle, apart from cost, is that heating of both the part and the tooling is at present required for forming Mg. (T21c, Mg, 17-57)

130-T. Hand-Operated Pump in Cast Aluminum. *Light Metals*, v. 21, Dec. 1958, p. 395.
New marine bilge pump gravity die cast in LM6 alloy. (T22m, Al-b, 5-61)

131-T. Aluminium Bridge Construction. *Welding and Metal Fabrication*, v. 27, Jan. 1959, p. 14-16.
Design, fabrication and welding techniques, structural properties. (T26p, K-general; Al, 17-57, 17-51)

132-T. Anodized Aluminium Windings. *Metal Industry*, v. 94, Jan. 16, 1959, p. 48.
Building-up of an oxide film to enable Al foil or strip to be used as a conductor "sheathed" with its own insulation. (T1g, T1m, L19; Al-b, 4-53, 4-56)

133-T. A Guide to Nuclear Power. W. D. Biggs. *Welding Engineer*, v. 44, Feb. 1959, p. 34-36.
(T11; SS, Al-b, Ti-b, Zr-b, 17-57)

134-T. (English.) Design Against Excessive Deformation. W. P. Kerkhof. *Lastechniek*, v. 25, Jan. 1959, p. 1-7.
Design of pressure vessels. (T26q, 17-51)

135-T. (French.) Service Behavior and Economic Efficiency of Ceramic Cutting Tools. Walther Dawihl and Emil Klingler. *Machine Moderne*, v. 53, Jan. 1959, p. 41-46.
25 ref. (T6n; 6-70)

136-T. (French and German.) Uses of Nonferrous Metals in the Decoration of Buildings. P. Suter. *Pro-Metal*, v. 11, Dec. 1958, p. 74-80.
(T26n, 17-57; EG-a38)

137-T. (Italian.) Applications of Aluminum at the Brussels Fair. *Alluminio*, v. 27, Oct. 1958, p. 442-448.
(T-general, T26n, 17-57; Al)

138-T. (Slovenian.) Mechanized Transportation of Tailings. Samo Cermelj. *Rudarsko-Metalurski Zbornik*, no. 3, 1958, p. 311-316.
(T28q, W12)

139-T.* (French.) Uranium Alloys of Low or Medium Alloying Element Content. M. Englander. *Revue de Metallurgie*, v. 55, Dec. 1958, p. 1177-1187.
Alloys offering higher resistance to thermal and nuclear fatigue than pure U when used as nuclear fuel. Medium content alloys developed a single isotropic crystalline phase and low content alloys develop through solid state transformation an anisotropic matrix strengthened either by a fine homogeneous precipitate or by a eutectoidal decomposition. (T11g, Q7h; U-b)

140-T.* (French.) Welded Hollow Bodies for High Pressures and Temperatures. Design and Calculation. F. Maier. *Soudage et Techniques Connexes*, v. 12, Nov-Dec. 1958, p. 404-412.
Stresses in hollow cylindrical bodies under internal pressure. Designs of pressure vessels; tensile strength of notched cylindrical specimens of steel. 12 ref. (T26q, K-general, 17-51)

141-T.* (German.) Light Metal Piston With Ferrous Ring Carrier Inserts. W. Kohler. *Metall*, v. 13, Jan. 1959, p. 36-41.

Review of various applications both by mechanical means and by bonding, description of designs, materials selected for piston and carrier, results expressed in reduced piston wear. Evaluation of technical advantages and economic aspects. 4 ref. (T7, Q9; Al-b, 17-51, 17-57)

142-T. Need Low-Cobalt Stainless for Nuclear Applications. W. L. Fleischmann. Iron Age, v. 183, Feb. 12, 1959, p. 106-107. (T11, 17-57; SS, *Co*)

143-T. Reactor Element Processing Goes Automatic. *Metalworking Production*, v. 103, Jan. 30, 1959, p. 199-203.

At the UKAEA's Springfields (Preston) plant, recently greatly enlarged and re-equipped to produce canned U reactor fuel elements, high output and minimum handling requirements have led to installation of new semi-automatic transfer lines for machining and fabrication. (T11g, A5a, 18-74; U)

144-T. (French.) Design of Pressure Vessels. *Soudage et Techniques Connexes*, v. 12, Nov-Dec. 1958, p. 461-462. (T26q, 17-51)

145-T.* Better Aircraft Engines. W. Paul Eddy. Digest from "The Aircraft Engine—Proving Ground for New Materials". 16th Annual William Park Woodside Lecture Presented before the Detroit Chapter A.S.M., Oct. 13, 1958. *Metal Progress*, v. 75, Feb. 1959, p. 124, 126, 128, 130.

High temperatures involved impose rigid demands on materials of construction. Relative advantages and properties for low-alloy steels, Ni and Co-base alloys, and dispersion hardened Al and Ti. (T24b; Ni-b, Co-b, Al, Ti, 17-57, 2-62)

146-T.* Aluminum and Its Alloys. W. A. Gardner and D. H. G. Abel. *Nuclear Energy Engineer*, Jan. 1959, p. 45-49.

Properties of Al alloys, such as neutron absorption cross section, weight, thermal and electrical conductivity, corrosion resistance and ease of fabrication make them highly desirable as reactor construction materials. (T11; Al-b, 17-57)

147-T.* A Guide to Nuclear Power. Pt. 2, Nuclear Reactors. W. D. Biggs. *Welding Engineer*, v. 44, Jan. 1959, p. 31-34.

Main types of heterogeneous reactors include water moderated and cooled reactors, graphite-moderated gas-cooled reactors, graphite-moderated, liquid-metal cooled reactors. Materials currently available for sheaths, cans and fuels. (T11; 17-57)

148-T. Stainless Steel in Automobiles. Digest from "Paper presented at A.I.M.E. Electric Furnace Conference", Dec. 1958. *Metal Progress*, v. 75, Feb. 1959, p. 132-134, 136, 138.

Cr coating techniques; applications of stainless in engine exhaust valves, trim and fittings. (T21, 17-57, L17; SS, *Cr*)

149-T. Automatic Manufacture of Bearings: Timken Roller Bearing's Bucyrus Plant. *Metallurgia*, v. 59, Jan. 1959, p. 13-16.

(T7d; W-general)

150-T.* Reactor Fuel Elements. James F. Schumar. *Scientific American*, v. 200, Feb. 1959, p. 37-43.

Design of fuel element, composition of fuel, life of fuel. (T11g, 2-60, 2-67; U, Al, Pu, Th, Zr, 17-51)

151-T. Metallurgy and Fuels. Fissile and Fertile Materials. *Engineering*, v. 187, Jan. 23, 1959, p. 106-109.

Report on the 1958 Geneva Atomic Energy Conference. (T11g; U, Pu, Th)

152-T. Metallurgy and Fuels. Canning Materials. L. M. Wyatt. *Engineering*, v. 187, Jan. 30, 1959, p. 136-141.

Report on the 1958 Geneva Atomic Energy Conference. 45 ref. (T11; Al, Mg, ST, Be, 17-57)

153-T. Has Chromium Plating Deteriorated? R. Silman. *Product Finishing*, v. 12, Feb. 1959, p. 65-72.

Quality and service life of today's auto trim compared to that of before 1940. (T21a; *Cr, Ni*, 8-62, 17-57)

154-T. What's New in Brake Linings. Newell H. McCuen. *Society of Automotive Engineers*, Preprint no. 14T, Jan. 1959, 8 p.

Sintered metallic linings are composed of powdered Fe or Cu, graphite, inorganic fillers and friction modifier. (T21c, 17-57; Cu, Fe, 6-68)

155-T.* (French.) Solid Nuclear Elements Used as Reactor Fuels. Jean A. Ternisien. *Metaux Corrosion-Industries*, v. 33, Nov. 1958, p. 441-456.

Properties of nuclear metals, alloys, metalloids and cermets suitable for this application. (T11g, 2-67; 6-70, Th, U, Pu, Ni-b)

156-T.* (German.) Behavior of Metal Electrodes in a Vacuum. R. Balzer. *Schweiz. Technische Zeitschrift.*, v. 55, Dec. 11, 1958, p. 976-977.

Properties of Ni, Cu, Ta, Mo, W, Pt and graphite electrodes, such as stability of shape at high temperatures, vapor pressure, separation of gases, electron emission. (T1f, Q-general, P-general, 2-62, 1-73; Ni, Cu, Ta, Mo, W, Pt, NM-k36)

157-T.* (Rumanian.) Heat Resistant Alloys in the Construction of Aircraft Turbines. P. Popescu and C. Mincu. *Revista Transporitulor*, v. 5, Nov. 1958, p. 513-520.

(T24b, 2-62; 17-57, SGA-h)

158-T. Nuclear Power Through Metallurgy on France. *Journal of Metals*, v. 11, Feb. 1959, p. 106-111.

Role of uranium, thorium, plutonium, aluminum-plutonium alloys and cermets in French reactor technology. (T11g; 17-57, U, Pu-a, Pu-b, Al, 6-70)

159-T. Electroplated Magnesium for Electronics Applications. *Magnesium*, Feb. 1959, p. 2-3.

(T1, 17-57; Mg, 8-62)

160-T.* Titanium Carbides Wear Better. E. J. Egan, Jr. *Iron Age*, v. 183, Mar. 19, 1959, p. 101.

Lab and shop tests of new Ti carbide cutting tools, developed by Ford Motor Co. (T6n; 6-69, Ti)

161-T.* Fuel Containers for Rockets. Donald E. Nulk. *Metal Progress*, v. 75, Mar. 1959, p. 66-72.

Weight restrictions, high pressures and wide operating temperature ranges must be considered in producing missile fuel vessels. Material choice is limited and optimum joining methods are still to be developed. Careful testing is needed to determine the quality of both factors. (T2p)

162-T.* Metals Used in the Vanguard. Charles Hirst. *Metal Progress*, v. 75, Mar. 1959, p. 73-76.

Stainless steel, Al and Mg alloys and Ti are employed in various areas of the vehicle. Future missiles will benefit from the evaluation of materials for this application. (T24e, 17-57; SS, Al, Mg, Ti)

163-T.* Hot Work Toolsteel for Aircraft. P. E. Ruff. *Metal Progress*, v. 75, Mar. 1959, p. 103-107.

Used for many years in special dies, the 5% Cr toolsteels (H-11) are being accepted as a structural material in supersonic aircraft and missiles. Heat treatable to 280,000 to 300,000 psi. tensile strength, the steel resists softening up to 925° F. Impact and fatigue strengths are also adequate. (To be continued.) (T24, 17-57, Q-general; TS, *Cr*)

164-T.* Designed to Fly High. Tom Bishop. *Metal Progress*, v. 75, Mar. 1959, p. 108-111.

New Comets use metal of higher endurance and slow crack propagation and the design is based on thousands of fatigue tests on material, joints, members, subassemblies and completed structure. (T24, Q7; Al-b)

165-T. (Translation—BISI no. 1059.) Carbide Tools for Shaping and Cutting. J. Witthof. *Draht*, Nov. 1957, p. 465-470.

See item 134-T, 1958. (T6n, Q-general, G17; W, Co, 6-69)

166-T.* How to Increase High Temperature Reliability of A-286 Fasteners. Robert L. Sproat. *Steel*, v. 144, Mar. 16, 1959, p. 114-117.

Six design and fabrication techniques greatly extend life. (T7f; SS, 17-57)

167-T.* Special Steels for Nuclear Power. J. A. Stafford. *Iron & Steel*, v. 32, Mar. 1959, p. 106.

Effect of neutron irradiation on notch ductility and creep. (T11, Q23p, Q3, 2-67; ST, 17-57)

168-T.* (French.) Use of Nickel Alloys in Aircraft Construction. P. Egre. *Revue du Nickel*, v. 24, Nov-Dec. 1958, p. 116-124.

Compositions, mechanical properties, heat treatment and specific applications in French and American aircraft components of high-strength alloy steels and stainless steels. (To be continued.) 13 ref. (T24; AY, SS, 17-57)

169-T. Use of Stainless Steel in the Oil Industry. *Iron and Steel*, v. 32, Feb. 1959, p. 75-76.

Compositions of some 12 standard wrought stainless steels correlated with specific applications in oil refining and distillation. (T28; SS, 17-57)

170-T. Progress of Aluminum as a Building Material. E. H. Laithwaite. *Metallurgia*, v. 59, Feb. 1959, p. 74-78.

Application to curtain walling, domestic construction, flashings and weatherings. (T26n; Al-b, 17-57)

171-T. New Look on Bridges. *Precision Metal Molding*, v. 17, Mar. 1959, p. 40-42.

Application of Al castings and tubing in bridge railings. (T26p; 4-60, 5-60, Al-b, 17-57)

172-T. Plutonium System Study With an Application to the MTR. W. B. Lewis and G. D. Marshall. Phillips Petroleum Co., Atomic Energy Div. *U. S. Atomic Energy Commission, IDO-16455*, Nov. 20, 1958, 27 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Effects of concentrations of Pu^{239}, Pu^{240} and Pu^{241} on Pu fuel mixtures. (T11g; Pu, 17-57)

173-T.* Workpiece Compatibility of Ceramic Cutting Tools. M. C. Shaw and P. A. Smith. Paper from "Lubrication Science and Technology". v. 1, no. 2. Pergamon Press, Inc., New York, 1958, p. 336-344.

Performance characteristics, cutting force and chip formation, of ceramic and cemented carbide tools and various speeds are compared when machining wide variety of ferrous and nonferrous metals. 5 ref. (T6n, G17; 6-69, NM-f)

174-T.* These Chips Were Produced by High Speed Steel. John F. McAuliffe. *Carbide Engineering*, Mar. 1959, p. 11-14.

High-speed steel is suitable for taps, form tools, milling cutters, hobs, broaches, thread dies, cut-off tools and reamers. (T6n, 17-57; TS-m)

175-T.* High Strength-to-Weight Magnesium Sheet Alloy Meets Ramjet Needs. C. P. King. *Western Metalworking*, v. 17, Mar. 1959, p. 55-56.

Mechanical properties, corrosion, welding, forging and forming of the new Mg sheet alloy HM21A-T8. (T24b, A-general; Mg-b, 4-53, 17-57)

176-T.* Problems in Rocket Engine Materials. Donald E. Rhoda. *Western Metalworking*, v. 17, Mar. 1959, p. 58-59.

Mechanical and corrosion properties of steel, stainless steel and Al alloys. (T2p, Q-general, R-general; ST, SS, Al-b, 17-57)

177-T.* (German.) Welded Hollow Bodies for High Pressures and Temperatures. Design and Calculation. F. Maier. *Soudage et Techniques Connexes*, v. 12, Nov-Dec. 1958, p. 404-412.

12 ref. (T26q, K-general, 17-51)

178-T. What Makes a Good Asphalt Pipe Enamel? Lloyd Bramble. *Petroleum Engineer*, v. 31, Mar. 1959, p. D34-D35. (T26r; NM-g)

179-T.* Airite Products Fabricates Titanium Pressure Vessels for the Atlas Missile. *Crucible Titanium Review*, v. 7, Mar. 1959, p. 1-3.

Deep drawing, machining, welding and heat treatment of Ti alloy. (T26q, 17-57, G-general; Ti)

180-T. Applications of Ductile Cast Iron in the Field of Pipelines. Maurice C. M. Grandpierre. *British Foundryman*, v. 52, Feb. 1959, p. 61-65. (T26r, 17-57; CI-r)

181-T.* Alloys for the Aircraft Industry. F. R. Morral. *Cobalt*, no. 2, Mar. 1959, p. 23-36.

Review of the industry's requirements together with corresponding data on Co-containing alloys of particular interest. 13 ref. (T24, Q-general, 2-62; Co-b, 17-57)

182-T.* Steels for Use in Steam Power Plant Operating Above 950° F.: Creep, Stress-Relaxation and Metallurgical Properties. *British Electrical and Allied Industries Research Assoc., Technical Report J/T170*, 1957, p. 7-15.

High-temperature properties of three steels intended for turbine casing bolts, and other, smaller bolts in steam power plant. The steels consist of an oil quenched and tempered $\frac{1}{2}$% Mo, $\frac{1}{4}$ %V steel, a 1% Cr, $\frac{1}{4}$% Mo, $\frac{3}{4}$% V steel in a tempered condition following either oil quenching or water quenching, and an oil quenched and tempered 1% Cr, $\frac{1}{2}$% Mo steel. (T7f, W11g, Q-general, 2-62; AY, *Mo, V, Cr*, 17-57)

183-T. Structural Materials. G. Matz. *Organisation for European Economic Co-Operation, Information Conference on Nuclear Energy for Management*, June 1957, p. 195-199.

Al, Be, Mg and Zr as nuclear reactor core materials. (T11; Al, Be, Mg, Zr, 17-57)

184-T. (French.) Steel Framework of the French Pavilion at the Brussels Exposition. J. Corpelet. *Soudage et Techniques Connexes*, v. 13, Jan-Feb. 1958, p. 61-67. (T26n, 7-51; ST)

185-T.* Fuel for the Atomic Engine. B. Lustman. *Metal Progress*, v. 75, Apr. 1959, p. 72-78.

The fuel in the Shippingport atomic power plant consists of long metallic elements of highly enriched U, arranged in a hollow square which encloses and is surrounded by a "blanket" of natural uranium oxide. The reactive metal is U highly enriched in the fissionable isotope U^{235} alloyed with 99.3% by weight of Zr, and bonded by hot rolling to Zircaloy-2 by the well known "picture-frame" method. (T11g, 17-57, R4; U)

186-T.* (German.) Core Meterials for Magnetic Amplifiers. *VDI Zeitschrift*, v. 101, Mar. 21, 1959, p. 341-342.

The magnetic properties of cold rolled 50% ferronickel sheet are improved by a special heat treatment. The magnetic properties along preferred directions must be taken into account in core design. (T1g, P16, 2-64; Fe-b, *Ni*)

187-T. How Lightweight Materials Will Be Used in the Convair 880 Jet. T. L. Heid. *Materials in Design Engineering*, v. 49, Apr. 1959, p. 100-104.

Use of Al alloys and Al honeycomb in the airframe. (T24a; Al-b, 7-59, 17-57)

188-T. Aluminum Winning Out in Wheel-Drum Drive. R. L. Atkin and F. J. Weber. *Modern Metals*, v. 15, Mar. 1959, p. 50-54.

Performance of high-silicon Al alloy drums and Al drums with sprayed steel liner shrunk-fit or metallurgical bonded cast iron liner. (T21c, K13r, K5k; Al-b, *Si*)

189-T. Titanium Vs. Stainless in Chemical Processing Equipment. R. W. Wirta. *Modern Metals*, v. 15, Mar. 1959, p. 78-82.

(T29; Ti-b, SS, 17-57)

190-T. Magnesium in Airborne Photo Gear. M. J. Mraz and C. Ellman. *Modern Metals*, v. 15, Mar. 1959, p. 86-88.

(T9p; Mg, 5-60, 17-57)

191-T.* Reactor Materials Pace Nuclear Progress. R. F. Dickerson. *Battelle Technical Review*, v. 8, Apr. 1959, p. 3-6.

U, Al-U alloys, uranium oxide in stainless steel, and Zr. (T11; U, Al, SS, Zr, 17-57)

192-T.* (Russian.) Use of Cermets for Pressure Vessels. Yu. N. Ryabinin. *Fizika Metallov i Metallovedenie*, v. 6, no. 5, 1958, p. 893-899.

Use of cobalt-tungsten carbide cermets in manufacture of pressure vessels. Correlations between hardness and pressure strength; pressure strength, Young's modulus, thermal expansion and conductivity as functions of the Co content. Effect of temperature on hardness and on Young's modulus. (T26q, Q-general, 2-60, 2-61; W, Co, 6-69, 6-70, 17-57)

193-T.* Neutron Bombardment of Reactor Metals. *Australasian Manufacturer*, v. 43, Mar. 7, 1959, p. 80-85.

Effect of radiation on uranium and boron. (T11, 2-67; B, ST, U, 17-57)

194-T.* Steels for Nuclear Reactors. C. V. Mills. *Iron & Steel*, v. 32, Apr. 1959, p. 149-153.

Boron steels, low-cobalt steels, low-manganese steels, pressure vessel steels. (T11, T26q; ST, *B*, 17-57)

195-T. More Sinterings in '59 Cars. *Precision Metal Molding*, v. 17, Apr. 1959, p. 34-35, 106.

(T21c, 6-72, 17-57)

196-T. (German.) Fuel Metals and Construction Metals for Nuclear Reactors. H. O. Nicolaus. *Werkstoffe und Korrosion*, v. 10, Mar. 1959, p. 152-158.

Materials used in construction of nuclear reactors, such as carbon steel, Ti alloys, Cr-Fe alloys, stainless steel, Ni and its alloys. 27 ref. (T11, 17-57; CN, Cr-b, *Fe*, Ti-b, SS, Ni-a, Ni-b)

197-T.* What Materials Beat High Nuclear Heat. *Chemical Engineering*, v. 66, Apr. 20, 1959, p. 202, 204, 206.

Advantages and disadvantages of metals capable of operating at over 1470° F. (T11, 2-62; SGA-h)

198-T.* Big Obstacles Beset Aluminum Food Cans. L. P. Gotsch, E. F. Bike and K. W. Brighton. *Modern Metals*, v. 15, Apr. 1959, p. 60, 64, 66, 68.

Manufacture of containers, strength, corrosion resistance, effect on color and flavor. (T10g, R7n; Al, 17-57)

199-T.* NASA Research Bearing on Jet Engine Reliability. S. S. Manson, G. M. Ault and B. Pinkel. *Society of Automotive Engineers*, Preprint no. 49 T, 1959, 34 p.

Prediction of service performance; principal failure mechanisms under design, creep, stress-rupture, mechanical fatigue, thermal fatigue, stress-corrosion and

foreign object damage. Inspection and maintenance. 23 ref. (T24b, Q3m, Q7k; SGB-s, 17-57)

200-T.* (French.) Cupro-Aluminums and Their Applications in Naval Construction. Pierre Weill-Couly. *Fonderie,* Feb. 1959, p. 63-74.

Properties of binary and complex cupro-aluminums. Selection of alloy for specific parts of vessels in terms of service requirements. (T22, Q-general; Cu-b, *Al*)

201-T.* (French.) High-Uranium Alloys. G. Cabane. *Metaux Corrosion-Industries,* v. 34, Feb. 1959, p. 49-57.

U-Mo alloys with varying Mo content and U-Cb-Zr systems in relation to reactor applications at elevated temperatures. (T11g, 2-62; U-b, *Mo, Cb, Zr*)

202-T. (French.) Aluminum Radiator Grills. Charles Guinard. *Revue de l'Aluminium,* v. 36, Feb. 1959, p. 213-217.

Renault and Simca adopt light-alloy grills. Finishing procedures. (T21c; L-general; Al-b)

203-T.* (English.) NRU—Some of Its Special Testing Problems. A. J. Mooradian. *Metalen,* v. 14, Apr. 1959, p. 98-102.

Tests of nuclear reactor fuel units for leakage between the Al sheath and the uranium core and for displacements of the core within the sheath. (T11g, 1-54; U, Al)

204-T.* Metals for the Atomic Boiler. B. Lustman. *Metal Progress,* v. 75, May 1959, p. 97-102.

Water at 530° F. and 200 psi. is highly corrosive, even when alkalinized and carrying hydrogen in solution. The Shippingport reactor vessel is lined with Type-304 stainless steel, and all piping and heat exchanger tubing are made of the same alloy. (T11, 17-57; SS, Zr-b)

205-T.* Iron Castings in the Chemical Industry. G. A. J. Begg. *British Foundryman,* v. 52, Apr. 1959, p. 183-193.

Strength soundness, corrosion resistance and heat resistance necessary for use in chemical industry. (T29; CI)

206-T.* Low-Carbon Mn-Cr-Mo-V Steel for Pressure Vessels. I. M. Mackenzie. *Chemical & Process Engineering,* v. 40, Apr. 1959, p. 132-136. (From *Alloy Metals Review.*)

As the size of welded pressure vessels increases, the use of mild steel plates becomes less satisfactory and material of higher strength becomes essential. The only satisfactory solution is to introduce alloying elements while maintaining the carbon content at a relatively low level. (T26q, Q-general, K9s; AY, Cr, Mn, Mo, V, 17-57)

207-T.* Rotor Forgings for Power Equipment Manufacturers. T. G. Foulkes. Paper from "Symposium on Brittle Failure of Rotor Forgings". American Society for Testing Materials, STP no. 231, 1958, p. 10-11.

Melting and casting of steel; ingot forging; heat treatment; machining and inspection. (T7h; ST, 4-51)

208-T.* Requirements for Turbine and Generator Rotor Forgings. A. W. Rankin. Paper from "Symposium on Brittle Failure of Rotor Forgings" American Society for Testing Materials, STP no. 231, 1958, p. 16-27.

Temperature, pressure and stress additions encountered in operation of steam turbines. (T7h, 17-52; ST, 4-51)

209-T. (Italian.) Copper-Lead Alloys in Journal Bearings. Vittorio Rizzardini. *Macchine,* v. 14, Apr. 1959, p. 319-322.

Properties and service behavior. (T7d; Cu-b, *Pb*)

210-T. (English.) Stainless Steel and the French Dairy Industry. *Aciers Fins & Speciaux,* no. 31, Mar. 1959, p. 46-49. (T3s; SS)

211-T.* Wear and Life of Single-Point Carbide Tools. H. W. Babel and F. W. Boulger. Paper from "An Evaluation of the Present Understanding of Metal Cutting". American Society of Tool Engineers, Detroit, 1959, p. 89-134.

Types of failure encountered with carbide cutting tools: Flank wear; crater wear; combination of crater and flank wear; spalling or crumbling of the cutting edge; fracturing or major chipping of the cutting edge. 53 ref. (T6n, Q9n)

212-T. Sodium and Bismuth Liquid Metal Fuel Systems. Richard C. Vogel and Walton A. Rodger. Argonne National Laboratory. *U. S. Atomic Energy Commission,* ANL-5933, Nov. 1958, 54 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.

Criteria for the selection of liquid metal fuel carriers for U and Pu fuels. Corrosion behavior of each fuel carrier is

summarized together with data on the fabricability of components from possible materials of construction. 142 ref. (T11g, R-general; U, Pu, 14-60, Na, Bi)

213-T. (Japanese.) Metals for Space Applications. *Metals*, v. 29, Jan. 1959, p. 1-7.

Properties needed correlated with currently available materials. (T24e, T24f, 17-57)

214-T.* (French.) Liquid Metal Slurry Fuels and Breeder Blankets. B. R. T. Frost. *Revue de Metallurgie*, v. 56, Mar. 1959, p. 272-278.

Specifications for fuel and blanket compositions and possible solid-liquid combinations. Experiments on the circulation of "soluble" slurries through temperature gradients. Soluble slurries are not found appropriate for these applications and suitable insoluble slurries are being developed. 14 ref. (T11g)

215-T.* Testing in the Hot Rod Engine. R. C. Downey. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 174-185.

Design and manufacture of Mo alloy turbine buckets. Engine tests at 200° F. (T24b, F22, 2-62, 17-51; Mo-b)

216-T.* Fabrication of Electronic Tube Components. R. W. Yancey. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 205-213.

Forging, rolling, extrusion, drawing, wire drawing, cladding, spinning, annealing and joining techniques used in the manufacture of tube components. (T1j, F22, F24, F28, G-general; Mo)

217-T. Development of Silicon-Modified 48 Wt.% U-Al Alloys for Aluminum Plate-Type Fuel Elements. W. C. Thurber and R. J. Beaver. Oak Ridge National Laboratory. *U. S. Atomic Energy Commission*, ORNL-2602, Mar. 23, 1959, 52 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

Casting procedures, mechanical working characteristics, composite fuel plate fabrication and fuel element assembly methods; resultant mechanical properties. (T11g, E-general, Q-general; U-b, *Al*, Si)

218-T. Ceramic Tooling: Progress, Problems and Predictions. W. B. Kennedy. *Metalworking*, v. 15, June 1959, p. 6-7.

(T6n, G17; 6-70)

219-T. Missile Structures and Powerplants. John M. Siergiej. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 215-216.

(T24b, T24e, 17-57; Mo)

220-T. Molybdenum Requirements in the Petrochemical Industry. Eugene H. Edwards. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, p. 217-219.

(T29m, T29n, 17-57; Mo)

221-T. Molybdenum Requirements in the Nuclear Energy Field. C. C. Woolsey. Paper from "Fabrication of Molybdenum". American Society for Metals, Cleveland, 1959, p. 220-221.

(T11, 17-57; Mo)

222-T. (German.) Cast Iron Equipment for Chemical Plants. Peter von der Forst. *Werkstoffe und Korrosion*, v. 10, Apr. 1959, p. 213-218.

Composition and properties of various types of cast iron used in chemical equipment with special reference to laminar and nodular cast irons, enamelled gray cast iron, low and high alloyed cast irons. (T29; CI, 17-57)

223-T.* (Czech.) Forged Rotors of Vanadium-Steel for Turbo-Generators. Jiri Novak. *Hutnicke Listy*, v. 14, May 1959, p. 436-442.

A Ni-V openhearth steel (2.0% Ni, 0.20% V) used in Czechoslovakia is compared with foreign steels with regard to mechanical properties and structure. With vanadium additions a favorable ratio ductility/strength can be achieved. 18 ref. (T7h, Q-general, F22g; AY, *Ni, V*)

224-T. Welding and the Nuclear Power Programme. Leonard Owen. *British Welding Journal*, v. 6, May 1959, p. 197-204.

(T11, K-general)

225-T. Engineers Discuss Space Flight. *Metal Progress*, v. 75, June 1959, p. 113-116.

Rocket research as reviewed at meeting of American Society of Mechanical Engineers. (T24e, T24f)

226-T.* Ceramic-Coated Copper Wire. Burnham W. King, George D. Kelly, Winston H. Duckworth and Jack H. Terry. *American Ceramic Society Bulletin*, v. 38, May 1959, p. 251-255.

Development of a ceramic coating for Cu wire. Decreasing the diameter of the mandrel to 0.1 in. decreased the dielectric

strength to 180 v. When the coated wire was wound hot (near upper enameling temperatures of the coating) no decrease in dielectric strength was observed. 7 ref. (T1b, L27; Cu, NM-34g)

227-T. (Book.) Symposium on Brittle Failure of Rotor Forgings. 43 p. 1958. American Society for Testing Materials, STP no. 231, 1916 Race St., Philadelphia 3, Pa. $2.

Requirements for turbine and generator rotor forgings. Ultrasonic and other inspection techniques; brittle fracture. Papers abstracted separately. (T7h, S13, Q27s; ST, 4-51)

228-T. Use of Lead in Chemical and Metallurgical Plant Construction. A. Turner, J. R. Wellington and L. Williams. *Canadian Journal of Chemical Engineering*, Apr. 1959, p. 55-64.

17 ref. (T29, R-general; Pb, 17-57)

229-T. Ceramics for Supersonic Missiles. James Castelfranco. *Ceramics*, v. 10, May 1959, p. 13-18, 20.

To provide resistance to severe thermal shock, sustain elevated temperatures and induce stress by differential thermal expansion. (T24e; 17-57, NM-f)

230-T. Stainless for Condenser Tubing. *Iron Age*, v. 183, June 11, 1959, p. 144.

Heat transfer rates for light-wall stainless ranged from 91.6 to 96.1% of admiralty. (T1j, P11k; SS)

231-T. Controlled Contact Cutting Tools. B. T. Chao and K. J. Trigger. *Journal of Engineering for Industry*, v. 81, May 1959, p. 139-151.

Substantial reduction in power consumption, increase in tool life, more effective ultilization of cutting fluids and improved surface finish on machined workpiece. 6 ref. (T6n, G17)

232-T. (Russian.) Cast Iron Automobile Crankshafts. A. A. Dudnik and G. A. Ukhabin. *Liteinoe Proizvodstvo*, May 1959, p. 8-12.

Hollow automobile crankshaft of Mg cast iron successfully replaced crankshafts forged from low-carbon steel. (T7j, E-general; CI-q, *Mg*)

233-T.* (French.) Application of Nickel Alloys in Aircraft Construction. Pt. 3. P. Egre. *Revue du Nickel*, no. 2, Mar-Apr. 1959, p. 35-41.

Mechanical properties and applications of Inconel, Monel and Monel K. (T24, Q-general; Ni-b, 17-57)

234-T.* Nuclear Power Plant Materials. Arthur P. Beard. Paper from "Vaccum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 350-359.

Vacuum techniques in the preparation, purification, and fabrication of Zr, U, Hf, Be, V and Th. Behavior of various amounts of hydrogen in these metals. 30 ref. (T11; Zr, U, Hf, Be, V, Th, 17-57)

235-T.* Electronic Materials. C. W. Horsting. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 360-369.

Applications of vacuum techniques include processing of metals at high temperatures in a vacuum to drive out adsorbed and dissolved gases; vacuum annealing processes designed to remove metalworking stresses without oxidation or other gas-metal reactions; jointing of metals-to-metals and of metals-to-ceramics by vacuum brazing; vacuum evaporation of metals to create a metallic deposit; preparation of alloys by melting in a vacuum. 4 ref. (T1, C5, K8, J23, 1-73)

236-T. Advances in Nuclear Fuel Elements. J. J. Burke. *Journal of Metals*, v. 11, May 1959, p. 323-324.

(T11g; U-b)

237-T.* (German.) Crankshafts from S. G. Cast Iron. Horst Muhlberger. *VDI Zeitschrift*, v. 101, June 1959, p. 713-718.

Mechanical properties and costs. The elongation is influenced by the phosphorus content. Structural improvements are achieved by reduced wall thicknesses and heat treatments. 23 ref. (T21c, Q-general, 2-60, 3-74; CI-r, *P*)

238-T.* Fuel Elements. *Power Reactor Technology*, v. 2, June 1959, p. 40-50.

Irradiation history, thermal stress, fuel loss and impact strength of uranium-magnesium and graphite-uranium fuel elements. 13 ref. (T11g; U-b)

239-T. (German.) Applications for S.G.-Cast Iron. *VDI Zeitschrift*, v. 101, June 1959, p. 707-708.

(T26r, W24n; CI-r, 17-57)

240-T. (Swedish.) Use of Hard Metals. Chr. Kjaergaard Nissen. *Industriell Teknik*, v. 87, Jan. 21, 1959, p. 33-38; Feb. 4, 1959, p. 57-60.

Use and properties of hard metal cutting tools. (T6n; EG-d, 17-57)

241-T.* Metal Powders for Missile Fuels. L. R. Frazier. Digest of "Metal Powders in Missile and Rocket Fuels". Paper presented at Indiana ASM Chapters 11th Annual Symposium, Purdue University, Apr. 1959. *Metal Progress*, v. 76, July 1959, p. 134, 136, 138, 140.

Requirements of metals for missile and rocket fuels include high energy, light weight, physical control, physical stability, chemical stability, abundance, generation of gas and minimum residue. Data for a number of metals. (T11g, P-general, 17-57; 6)

242-T.* Silver-Indium-Cadmium Alloys for PWR Control Rods. I. Cohen, E. F. Losco and J. D. Eichenberg. Digest of "Metallurgical Design and Properties of Silver-Indium-Cadmium Alloys for PWR Control Rods" Paper presented at Third Nuclear Engineering and Science Conference, Chicago, Mar. 1958, 27 p. *Metal Progress*, v. 76, July 1959, p. 140, 142.

Indium was found to be particularly effective in imparting prolonged corrosion resistance in high-temperature water. The concentration of In required for adequate neutron absorption was too high to insure metallurgical and radiation stability. Replacement of some In with Cd gave a single-phase f.c.c. alloy (15% In, 5% Cd) which met all requirements for PWR control rods. (T11j, R-general, P18; Ag-b, In, Cd)

243-T. (Book.) Materials for Nuclear Reactors. Bernard Kopelman, ed. 411 p. 1959, McGraw-Hill Book Co., 330 W. 42nd St., New York 36, N. Y. $12.00

Advantages and limitations of materials as fuel elements, moderators, coolants, shields and structure formers. Fabrication, testing and evaluation of fuel elements; the stability or instability of the fuel to irradiation; and the chemical processing of the spent fuel to recover the unburned portion. (T11)

244-T. (Book.) Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy, v. 8, Nuclear Power Plants, Pt. 1. Geneva, Sept. 1-13. 1958, 584 p. United Nations, Geneva. $14.00

Relevant papers abstracted separately. (T11, W11p)

245-T.* Titanium in Aircraft Power Plants. W. H. Sharp. *Crucible Titanium Review*, v. 7, June 1959, p. 1-4.

Use of commercially pure Ti, 2.8 Cr, 1.5 Fe alloy, 2 Cr, 2 Fe, 2 Mo alloy, 4 Al, 4 Mn alloy, 6 Al, 4 V alloy and 5 Al, 2.5 Sn alloy for compresser parts. (T24b; Ti, 17-57)

246-T. Reactor at Shippingport Uses Stainless Steel to Resist Corrosion, High Temperatures and Pressures. *Inco*, v. 27, Apr. 1959, p. 10-11.

(T11; SS, 17-57)

247-T. 24-Foot Diameter Propellers to Drive Largest Tankers Ever Built in U. S. A. *Inco*, v. 27, Apr. 1959, p. 22-23.

Ni-Al bronze propeller. (T22h; Cu-s, *Ni, Al*)

248-T. Argonne Opens Plutonium Facility. *Journal of Metals*, v. 11, July 1959, p. 456-457.

Equipment and layout at the new fuel fabrication facility. (T11g, A9h; Pu)

255-T. Effect of Irradiation on Fuel Materials. J. H. Kittel and S. H. Paine. *Nuclear Energy Engineer,* v. 13, June 1959, p. 301-305.
Determination of the effects of relatively high burn-up on natural unalloyed uranium. About 2 at.% burn-up was obtained on some specimens as a result of conversion of appreciable amounts of U^{238} into Pu^{239}. (T11g, 2-67)

256-T.* (German.) Welded Steel Used in Construction Materials and Cranes in Nuclear Engineering and Isotope Production. O. Jungbluth. *Schweissen und Schneiden,* v. 11, June 1959, p. 209-216.
Welding is best suited for the construction of reactor shells and reactor cranes. Complex loading requires the use of steel. Welding methods, testing of seams and gas tightness and safety measures. 5 ref. (T11, W12q, K-general; ST, SGB-s)

257-T.* (German.) Materials and Welding in Reactor Construction. W. Liebig. *Schweissen und Schneiden,* v. 11, June 1959, p. 217-218.
Welding of reactor parts requires special considerations due to the close tolerances demanded. Ferritic parts must be accessible for metal spraying. Steels of high Al content are mostly used. Parts exposed to electron bombardment should be free of Co. Argon-arc welding is recommended for austenitic materials. (T11, K-general; SS)

258-T.* (Sloviakian.) Cracks in Ships' Hulls. Oskar Izdinsky. *Zvaracsky Sbornik,* v. 8, no. 1, 1959, p. 108-130.
Chemical and structure tests, mechanical tests and investigation of internal stress and fatigue strength performed on materials and weldments used in the construction of boats for river traffic. Cracks are ascribed to stress accumulation avoidable by a modified design of welded assemblies. 6 ref. (T22g, K-general, 9-72)

259-T.* (French.) Scythes, Sickles and Forks in Special Steels. *Aciers Fins et Speciaux,* no. 32, July 1959, p. 62-65.
High-quality steel with high wear and shock resistance demands hard and extra hard special carbon steel. The hardness is Rockwell C-40 to 45. The production process involves six successive heatings from the first forging operation through the flattening and heel forming process. Oxidation and decarburization are avoided by careful furnace temperature control. (T3, 17-57, J-general, F22; CN)

260-T. Future Application Trends for Titanium and Steel in Military Aircraft. W. Stuart Lyman and Fred L. Bagby. *Defense Metals Information Center,* DMIC Memo. 17, May 8, 1959, 6 p.
Role of Ti alloys in airframe parts and power plants. Ti usage in missiles will not be great until it is shown that it possesses a marked superiority over steel for Ti alloys in welded high-performance solid-propellant rocket motor cases, accompanied by a large reduction in the price of reasonably weldable high-strength Ti alloy sheet. (T24; Ti-b, 17-57)

261-T.* (Czech.) Heat Resistant Bolts for High-Pressure Installations. A. Chitkov. *Strojirenstvi,* v. 9, May 1959, p. 353-364.
Steel selection and composition; stress relaxation and fatigue studies; creep tests; stress concentrations, impact ductility; cyclic load conditions. New methods for tightening heavy bolts. (T7f, Q3, Q6n, Q7a; ST)

262-T.* Missiles and Metals. Pt. 1. *Corrosion Reporter,* v. 6, July 1959, 16 p.
History of rockets and missiles with comparative graphs showing falling point and effects of subzero temperatures on tensile, impact strengths of light, super and refractory alloys. (T24e, T2p, Q-general)

263-T.* Materials for Springs. John T. Milek. *Materials in Design Engineering,* v. 50, Aug. 1959, p. 115-126.
Tabular comparison and survey of six major groups of materials—carbon steels, alloy steels, stainless steels, Ni, Co and Cu alloys. (T7c, Q21; CN, AY, SS, SGA-b, Ni-b, Co-b, Cu-b, 17-57)

264-T. Railroad Car Journal Bearings. *Lubrication,* v. 45, Aug. 1959, p. 101-116.
Good performance of worn-in railway car journal bearings when lubricated with

straight mineral oil of the proper viscosity. 7 ref. (T7d, T23p, NM-h)

265-T.* Aluminum Engines—Design for Modern Fabrication. James M. Smith and Richard M. Smith. *Society of Automotive Engineers*, Preprint no. 68A, June 1958, 25 p.
Design considerations for Al cylinder blocks, cylinder heads, crankcases, intake manifolds, pistons, bearings and other parts. Corrosion and production problems. (T21b, T21f, 17-51; Al-b)

266-T.* (German.) New Wear Resistant Castings Used to Crush Hard Materials. Telfer E. Norman and Gerhard E. Ott. *Giesserei*, v. 46, Aug. 13, 1959, p. 471-478.
Wear behavior of hammers and edges fabricated from pearlitic chilled cast iron as components of mining equipment. 7 ref. (T28, Q9n; CI-p)

267-T.* (German.) Reaction Between Tool and Workpiece in Cutting of Metals. T. N. Loladse. *Industrie Anzeiger*, v. 81, Aug. 4, 1959, p. 21-26.
Principal causes of tool wear; methods of predicting rate of wear in given applications. (T6n, Q9)

268-T.* (German.) Underground Fuel Oil Tanks From Steel Sheet. F. Brixa. *Industrie-Anzeiger*, v. 81, Aug. 14, 1959, p. 1033-1035.
Materials prescribed, dimensions and corrosion protection. (T26q, R10, L26a)

269-T. (English.) Steel-Backed Copper-Lead Bearings. *Copper*, Winter 1958, p. 13-15.
(T7d; Cu, *Pb*, *ST*)

270-T.* (German.) Openhearth Steel and Electric Steel as Materials for Hoist Ropes. Bruno Ansorge. *Neue Hutte*, v. 4, Apr. 1959, p. 210-218.
Tensile, bend, torsion and flexural fatigue tests performed with wires as used in hoist ropes. Openhearth steel is preferable due to the unfavorable aging behavior of electric steel. 5 ref. (T7g, Q27a, Q1a, Q7g, 2-65, 2-60; ST-e, ST-f)

271-T. Mercedes-Benz Experience With Aluminum Parts in Automotive Engines. Eberhard Hundt. *Society of Automotive Engineers*, Preprint no. 68B, June 1958, 8 p.
Al intake manifolds, pistons, connecting rods, cylinder heads, engine blocks and crankcases. Discussion. (T21b; Al-b, 17-57)

272-T.* Cathodic Protection in Storage. W. Lambert and G. Campbell. *Gas Age*, v. 124, July 9, 1959, p. 21-24.
Protection of underground storage facilities including well casings and field gathering lines. Annealing was proved to eliminate stress potentials. Presence of water enhances the formation of galvanic cells. (T26r, 2-64, R10d)

273-T.* (Czech.) Carbon Steels Used for Watch Springs. O. Modracek. *Hutnicke Listy*, v. 14, Aug. 1959, p. 674-679.
Strength as a function of hardening and annealing temperatures. Strength, elastic limit and elongation of spring wire measured for several drawing steps. Effect of cycling on the minimum spring momentum. 11 ref. (T7c, Q27a, Q21, Q23p, F28h, Q7, 2-61, 2-64; CN)

274-T.* Sintered Alumina for Cutting Tools. F. Singer, S. S. Singer and S. Croydon. *Interceram*, no. 6, 1957, p. 22-25.
For successful use as a cutting tool at high speeds and elevated temperatures sintered alumina tools should possess strong resistance to thermal shock and fatigue phenomena. Tensile strength-temperature curves of sintered alumina, thermal properties, modulus of elasticity, tool performance and tool geometry are tabulated. (T6n, Q-general, P11, 2-62; Al, NM-a34)

275-T.* Titanium and Zirconium: Their Future in Plant and Power Services. G. W. Bauer. *Plant Power Service Engineer*, v. 1, July 1959, p. 22-23.
Ti because of its outstanding strength-to-weight ratio and Zr with its low neutron absorption cross section and good corrosion resistance have large applications in fuel elements. Promising applications for Ti include use in rectifiers, resistors and capacitors. (T11g, T1; Ti, Zr, 17-57)

276-T. Next Breakthrough in Autos? Aluminum in Bumpers. E. P. White. *Modern Metals*, v. 15, Aug. 1959, p. 34-38.
(T21a; Al-b, 17-57)

277-T. Redesign in Die Castings Sparks Power Mower Sales. Kim Darby. *Modern Metals*, v. 15, Aug. 1959, p. 54, 56, 58.
(T10k; Al, 5-61, 17-51)

278-T. (Book.) Aluminum Construction Manual. 1st Ed. 389 p. 1959. Aluminum Assoc., 420 Lexington Ave., New York 17, N. Y.

Data on design of Al structures; dimensioning and weight; load data on beam connections for 6061-T6 alloy. Specifications for structures of Al alloys 6061-T6 and 2014-T6. (T26, S22, 17-51; Al, 17-57)

279-T. (Book.) Bearing Design and Application. Donald F. Wilcock and E. Richard Booser. 464 p. 1957. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 36, N. Y. $12.50.

Analysis of load capacity, speed, temperature, dimension tolerance and lubrication factors in selecting ball and roller bearings. (T7a, 17-51, 17-57)

280-T.* Application of Tubes to Structures. G. B. Godfrey. *West of Scotland Iron and Steel Institute,* v. 66, 1958-1959, p. 104-121.

Basic design formulas; conditions of stress, yield, corrosion, section shapes and prestressing. (T26, Q-general, 4-60; 15-57)

281-T. (Russian.) Factors Influencing the Quality of Automobile Sheet. B. S. Natapov, D. E. Tsivirko and E. S. Fal'kevich. *Nauchnie Doklady Vysshei Shkoly-Metallurgiya,* no. 1, 1959, p. 254-258.

Effects of nitrogen, aluminum and oxygen on the aging process in deep drawn auto body parts. 5 ref. (T21a, G4b, N7e, 2-60; ST, *N, Al, O,* 4-53)

282-T. Bronze Sleeve Bearing. Harry C. Rippel. *Machine Design,* v. 31, Sept. 17, 1959, p. 173-206.

Bearing size; clearances; oil-flow rates; operating temperatures; power required; lubricant film thickness; journal eccentricity ratio; whirl speed; allowable shock load. 6 ref. (T6d; Cu-s, 17-51, NM-h)

283-T.* Design and Materials for Reduced Pump Corrosion. Jack E. Piccardo. *Corrosion,* v. 15, Sept. 1959, p. 41-44.

Critical metal parts in seal-less pumps and pumps with packing gland or mechanical seals used in chemical and allied industries. 6 ref. (T29, R-general, 17-51, 17-57)

284-T.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Grades of Zinc and Fields of Use. C. H. Mathewson and G. H. Turner. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 386-400.

Common grades, principal forms and uses of metallic Zn. Specifications, preparation analysis and properties of super-purity Zn. 25 ref. (T-general, S22; 17-57, Zn)

285-T.* The Processing and Uses of Metallic Zinc and Zinc-Base Alloys. Miscellaneous Processes and Applications. Ernest W. Horvick. Paper from "Zinc. The Science and Technology of the Metal, Its Alloys and Compounds". ACS Monograph no. 142. Reinhold Publishing Corp., New York 22, 1959, p. 551-572.

Use of metallic Zn dust in the chemical industry as a metallurgical precipitant and in paints. Zn alloy for soldering and brazing Al. Hot and impact extrusion of Zn. Composition of Zn-base bearing metals. Use of Zn in wet batteries. Peen plating with Zn. Determination of Zn content in ores and other raw material. 8 ref. (T-general, L17, S11, K7; Al, Zn-b, SGA-f, SGA-c)

286-T. (Russian.) Steel Wire Used for Overhead Lines. S. I. Fuks. *Nauchnye Doklady Vysshei Shkoly—Metallurgiya,* no. 2, 1959, p. 238-244.

Atmospheric corrosion of Zn plated and unplated wire and its effect on tensile and bend strength. Compositions for optimum corrosion resistance. 8 ref. (T1b, R3, Q27a, Q5g, 2-60; ST, 4-61, 8-62, *Zn*)

287-T. Present Status of Nuclear Power. Karl P. Cohen. Digest of "Current Nuclear Power Developments and Their Outlook". Paper Presented to Energy Resources Conference, Denver, Colo., Oct. 16, 1958. *Metal Progress,* v. 76, Sept. 1959, p. 184-, 186, 188.

Nuclear power stations in U. S., Great Britain and Russia; costs and development. (T11)

288-T.* The Foundry Approaches the Space Age. A. H. Langenheim. *Foundry,* v. 87, Oct. 1959, p. 138, 140, 142, 144, 146-148, 151, 154, 156, 158.

Specifications required of castings to be used in space travel. Processing and properties of Mg, Al, low-alloy steel, superalloys and refractory metals. 4 ref. (T24e; 5, Mg, Al, AY, SGB-a, 17-57, EG-d37)

289-T.* (French-German.) Watch Jewels and Copper Alloys. *Pro-Metal,* v. 12, Aug. 1959, p. 182-186.

Use of Be bronze bearings in watches. The bearings are produced from cylindrical rods and then Rh plated. (T7d, L17; Cu-b, *Be*)

290-T.* (German.) New Wire Ropes. Pt. 1. D. van de Moortel. *Draht*, v. 10, Aug. 1959, p. 353-357.

Testing equipment, results of fatigue tests and cross sections of modern wire ropes. (T7g, Q7a)

291-T.* (German.) Heat Treatment of Tools Used in the Manufacture of Screws and Nuts. Pt. 1. Jacques Garnier. *Draht*, v. 10, Aug. 1959, p. 357-358.

Forging provides equal distribution of carbides in a ledeburitic structure. Heat treatment is performed in a protective atmosphere or in enclosed packing. Normalizing temperature depends on carbon content. Choice of hardening temperature and quenching medium is determined by composition. (T6, J24, J26, 2-60; CN-r, AY)

292-T. Application of Light-Gauge Steel Sheet and Strip in Roofing, Flooring and Side-Wall Cladding. R. J. Shaw. *Sheet Metal Industries*, v. 36, July 1959, p. 481-493.

(T26n; ST, 4-53, 17-57)

293-T. Vitreous-Enamelled Steel Sheets for Curtain Walling. T. J. MacArthur. *Sheet Metal Industries*, v. 36, July 1959, p. 494-496.

(T26n; ST, 4-53, 8-71)

294-T.* (German.) Friction Bearings From Gray Cast Iron. *Industrieblatt*, v. 59, Aug. 1959, p. 390-391.

Oxidation of surface graphite by the Kolene-E process, an anodic treatment in a salt bath, followed by dip tinning and lining with white metal by casting. (T7d, L19, L16, E-general; CI-n, Sn, SGA-c)

295-T. Reactor Control Materials. W. Kermit Anderson and Donald N. Dunning. Paper from "Progress in Nuclear Energy. Series 5. Metallurgy and Fuels". v. 2. Pergamon Press, Inc., New York 22, 1959, p. 193-205.

Application of the new boron-containing stainless steels and boron alloys with Ti and Zr; Hf as a control material; applications of rare earths for reactor control. 4 ref. (T11; SS, *B, Ti*, Zr, Hf, EG-d, 17-57)

296-T.* Carbide Grade Selection. Pt. 2. W. E. Montgomery. *Carbide Engineering*, v. 11, Aug. 1959, p. 15-17.

Classification of carbide tool-tip material in terms of use. Criteria of size and shape of chip indicate tool wear and ease of cutting for given work. (T6n; 6-69)

297-T.* (Russian.) Evaluation of Alloys for Electric Heating Elements. N. V. Semenova and L. L. Zhukov. *Stal'*, July 1959, p. 652-655.

Determination of optimum amounts of Cr, Al and rare earth elements to obtain a heat resistant Fe-Cr-Al alloy with best electric and scale resistant properties. 4 ref. (T1p; 17-57, Fe-b, *Cr, Al*, EG-g, SGA-q)

298-T. Curtain Walling With Vitreous Enamelled Steel Sheet. T. J. Macarthur. *Industrial Finishing (London)*, v. 11, Aug. 1959, p. 36-38.

(T26n; ST, 8-71, 4-53)

299-T. (Book.) Progress in Nuclear Energy. Series 5. Metallurgy and Fuels. v. 2. H. M. Finniston and J. P. Howe, Editors. 653 p. 1959. Pergamon Press, Inc., 122 E. 55th St., New York 22, N. Y. $21.

Basic materials, solid-state physics and physical metallurgy of U, Th, Mg, Pu, Zr and Be. Papers are abstracted separately. (T11q; U, Th, Mg, Pu, Zr, Be)

300-T. (Book.) Proceedings of the Second United Nations International Conference on the Peaceful Uses of Atomic Energy. v. 5. Properties of Reactor Materials. Geneva. Sept. 1-13, 1958. 627 p. United Nations, Geneva. $14.

Corrosion resistance properties and radiation effects of reactor materials, structural and sheathing alloys, steels and concrete, at various temperatures; neutron absorbers. Papers abstracted separately. (T11, R-general, 2-67, 2-70; SGB-s)

301-T.* Feasibility of Titanium for Welded Missiles. Carl E. Hartbower, George M. Orner and Daniel M. Daley, Jr. *Welding Journal*, v. 38, Sept. 1959, p. 345s-353s.

Welded Ti alloys are evaluated for missile applications by means of short-time elevated-temperature tensile properties and notch-tensile-impact testing. 4 ref. (T24e, K1d, Q27a; Ti-b, 17-57)

302-T.* (Swedish.) Properties of Metal Bellows. Bengt Hokby. *Metallen*, v. 15, no. 2, 1959, p. 56-62.

Manufacture and tests by exposure to internal or external pressure. Life as a function of length and frequency of longitudinal compressions. 9 ref. (T-general, Q7b; Cu-n)

303-T.* Bellows Joints. C. M. Daniels. *Machine Design*, v. 31, Oct. 15, 1959, p. 147-155.

Factors that influence selection and application in flexible ducting systems with severe operating requirements. 9 ref. (T6m; SS, Ti, Al)

304-T. A Portable Pipe-Welding Machine, H. L. Saunders. *Welding Journal*, v. 38, Sept. 1959, p. 876-884.

For welding Al pipelines. (T26r, K1, 1-52; Al)

305-T.* Hard Metal in Mining. F. Kolbl. *Murex Review*, v. 1, no. 20, 1959, p. 589-594.

Tungsten carbide hard metals; effect of Co content on hardness, compressive and transverse strength, modulus of elasticity. Importance of size and shape of carbide particles. 11 ref. (T28, 2-60; W, *Co*, 6-69)

306-T.* (Dutch.) Poor Welding Practices With Pressure Vessels. P. Bongers. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 253-260.

A collection of examples relating to defective weldments. (T26q, K-general)

307-T. Material Considerations in Superheater Design. Paul M. Brister and George N. Emmanuel. *American Society of Mechanical Engineers*, Paper no. 59-PWR-11, 1959, 13 p. $.80.

Basic requirements for high-temperature superheater design, using carbon steel, C-Mo steel and Croloy with reference to high temperature, strength, surface and structural stability and fabrication requirements. 4 ref. (T26q; 17-57, CN, AY)

308-T.* Applications of Curent Materials to Hot Airframe Design. M. B. Dunn, M. D. Musgrove and O. T. Ritchie. *Society of Automotive Engineers*, Preprint no. 104U, 1959, 27 p.

Hot airframe design problems employing Al, Ni and Mo alloys with emphasis on radiant cooling; advantageous thermal characteristics. (T24a; 17-57, Al-b, Mo-b, Ni-b, 17-51)

309-T. Flat-Rolled Steel. Guenther Frank. *Metal Treatment and Drop Forging*, v. 26, July-Aug. 1959, p. 284-288.

(T26; ST, 4-53)

310-T.* Sleeve-Bearing Bronzes. *Machine Design*, v. 31, Oct. 29, 1959, p. 135-138.

Composition, mechanical and physical properties, characteristics and applications of cast bronze bearing materials. (T7d, Q-general; Cu-s, 17-57)

311-T.* An Approach to Wire Rope Lubrication. Louis A. Stanzione. *Iron and Steel Engineer*, v. 36, Sept. 1959, p. 126-132.

Problems include the choice of lubricant to be applied during fabrication and while in service. Laboratory tests were designed to stimulate the field performance of a lubricant to predict its behavior under high and low temperatures and to check its ability of wetting and adhesion to the wire surface. (T7g; NM-h, 1-54)

312-T.* Strength and Thermal Limitations of Materials for Airframe Components. J. C. Ekvall. *Society of Automotive Engineers, Transactions*, v. 67, 1959, p. 590-595.

Applications at 0-1200° F. of Mg, Al and Ti alloys, low alloy and corrosion resistant steels, and Ni, Co and mixed-base steel. 18 ref. (T24a, 2-62; Mg-b, Ti-b, AY, SS, Ni-b, Co, 17-57)

313-T.* (Japanese.) 9% Chromium-1% Molybdenum Steel Tubes. Jimpei Omori, Katsujiro Takehara, Toyohiko Okamoto, Shoji Terai and Hidetoshi Maruoka. *Sumitomo Metals*, v. 11, Apr. 1959, p. 11-22.

Creep rupture tests over 10,000 hr. at 600° C. and 3400 hr. at 650° C. Creep and creep rupture strengths were compared with the allowable stresses of the ASME Boiler Code. Oxidation test proved that the steel has superior resistance. Sound welded joints might be obtained by arc welding or inert gas arc welding. (T26q, R1h, Q3q, K1; 4-60, AY, *Mo*)

314-T. Magnesium in Aircraft Tooling. Karl F. Melde. *Institution of Production Engineers, Journal*, v. 38, Sept. 1959, p. 480-484.

Properties, processing techniques and applications. (T24; Mg, 17-57)

315-T. The Advancement of Powder Metallurgy Applications in the Automobile. Roy E. Blue. Paper from "General Session on Powder Metallurgy". 15th Annual Meeting.

Metal Powder Industries Federation, New York 17, 1959, p. 94-98.

Current and future applications of powder metal parts. (T21; 6, 17-57)

316-T.* (French.) Steels, Cast Irons and Alloys for Oil Field Equipment. Be. de Borde. *Revue du Nickel*, v. 25, July-Aug. 1959, p. 87-96.

Property requirements, heat treatment and structural characteristics of drilling and extraction equipment. Specific materials suitable for boring tools, pumps, filters power transmission and hoisting equipment in oil field conditions. (To be continued.) (T28; AY, CI, Cu-b, Ni-b, 17-57)

317-T. Metallurgical Developments Outlined at the 1958 Geneva Conference on Peaceful Uses of Atomic Energy. H. M. Finniston. *Institute of Metals, Journal*, v. 87, July 1959, p. 360-375.

Progress in physical metallurgy of U, Pu, Th, Zr, Al, Mg, Be, Cb, and some solid and liquid fuel elements with reference to mechanical and chemical behavior and radiation effects. (T11g; U, Pu, Th, Zr, Al, Mg, Be)

318-T. (Russian.) Use of Two-Metal Bushings in Conical Ore Crushers. K. P. Shmidt. *Tsvetnye Metally*, no. 1, 1959, p. 89-91.

Comparison of the life of one-metal bronze bushings and that of bushings lined with a layer of babbitt. (T7d, W15n, Q9; Cu-s, SGA-c)

319-T.* Nodular-Cast-Iron Piston-Rings With a Ferritic Matrix. Traian Dumitrescu and Pascal Popescu. *Foundry Trade Journal*, v. 107, Oct. 15, 1959, p. 319-323.

Rings have greater elasticity and maintain their physical and mechanical properties at high temperatures to a greater extent than those made from alloyed flake-graphite Fe or pearlitic nodular Fe. The wear resistance is superior and the rings are free from internal stresses. 9 ref. (T7, Q9n; CI-r)

320-T.* The Future of All-Metal Sandwiches. *Machine Design*, v. 31, Nov. 12, 1959, p. 32-34.

Use of honeycomb, corrugated and waffle structures in aircraft and missiles. Applications for all-metal sandwich material. (T24; 7-59, 17-57)

321-T. (Russian.) Correlationship Between the Wear Resistance of Carbon Steel and Its Structure. A. A. Soroko-Novitskaya. Paper from "Friction and Wear of Machine Parts". Akademiya Nauk SSSR, Moscow, 1959, p. 5-18.

Effect of heat treatment. 5 ref. (T7, Q9n, 3-71, 2-64; CN)

322-T. (Russian.) Position of the Pinion Within the Housing of a 120-Degree Friction Bearing With Liquid Friction Under Constant and Alternated Loads. E. F. Zommer. Paper from "Friction and Wear of Machine Parts". Akademiya Nauk SSSR, Moscow, 1959, p. 136-188.

12 ref. (T7d)

323-T. (Russian.) Distribution of Pressure in the Oil Film of a Friction Bearing. L. B. Khrisanova. Paper from "Friction and Wear of Machine Parts". Akademiya Nauk SSSR, Moscow, 1959, p. 189-196.

9 ref. (T7d, 3-74)

324-T.* Titanium Fasteners in Aircraft. R. T. Allsop. *Light Metals*, v. 22, July-Aug-Sept. 1959, p. 201-204.

Advantages of Ti fasteners, problems and recommended procedures for producing them. (T7; Ti, 17-57)

325-T.* Structural Design in High-Temperature Reactors. N. H. Triner. *Nucleonics*, v. 17, Oct. 1959, p. 78-81.

Uniaxial and biaxial creep tests, high-temperature plastic-strain cycling, thermal-shock and relaxation tests. (T11, Q25p, Q3, 1-54, 17-51)

326-T.* The Manufacture and Properties of Basic Oxygen Steel for Wire Products. H. B. Emerick and S. Kreisberg. *Wire and Wire Products*, v. 34, Oct. 1959, p. 1331-1335, 1395.

Characteristics of product properties and applications of rod and wire made from basic oxygen steel. 5 ref. (T7g, Q-general; CN, 4-61)

327-T.* (German.) Steel Wire Used for Steel Ropes. F. Kohlhase. *Draht*, v. 10, Sept. 1959, p. 471-475.

Mechanical properties of steel used in ropes; effect of phosphorus and sulphur on quality. (T7g, Q-general, 2-60; ST, *S*, *P*, 17-57)

328-T.* Process Applications and Construction Materials for a High-Temperature Nuclear Reactor. Leon Davidson and Alfred A. Strasser. *Chemical Engineering Progress Symposium Series (Nuclear Engineering, Pt. 5.)*, v. 55, no. 22, 1959, p. 167-171.

Fuel element design for the 2000 to 3000° F. range; criteria for selection of fuel element materials; materials suitable for fuel element cladding in various atmospheres. (T11g, 17-51)

329-T.* Reprocessing Uranium-Zirconium Alloy Reactor Fuel Elements. C. B. Leek, R. B. Lemon and F. K. Wrigley. *Chemical Engineering Progress Symposium Series (Nuclear Engineering, Pt. 6.)*, v. 55, no. 23, 1959, p. 171-176.

Dissolution of the fuel elements in hydrofluoric acid, adjustment of the dissolver solution and separation of the uranium from fission products in three extraction cycles. (T11g, A11d)

330-T. (Dutch.) Copper and Copper Alloys. W. G. R. de Jager. *Metalen*, v. 14, Sept. 30, 1959, p. 284-286.

Cu alloys as material for springs. Electrical, thermal conductivity, modulus of elasticity, shear modulus. (T7c, P15g, P11h, Q21; Cu, SGA-b)

331-T. (German.) Design of Welded Chemical Equipment From Nonferrous Metals and Austenitic Steels. H. Canzler, *Chemische Rundschau*, v. 12, Oct. 1, 1959, p. 529.

(T29, K-general, 17-51; EG-a38, SS-e)

332-T. (German.) Welding of Chemical Apparatus. W. Grien. *Chemische Rundschau*, v. 12, Oct. 1, 1959, p. 529.

Design and fabrication of weldments. Choice of materials. (T29, K-general, 17-51)

333-T. (German.) Rapid Welding Processes in the Construction of Long Distance Lines. H. Geilenkeuser. *Chemische Rundschau*, v. 12, Oct. 1, 1959, p. 530.

(T1b, K-general)

334-T. (German.) Design of Weldments on Chemical Equipment From Aluminum. P. T. R. Moller. *Chemische Rundschau*, v. 12, Oct. 1, 1959, p. 530.

(T29, 17-51; Al-b, 7-51)

335-T. (German.) Design of Weldments on Chemical Equipment. H. Titze. *Chemische Rundschau*, v. 12, Oct. 1, 1959, p. 530.

(T29, 17-51; 7-51)

336-T. (German.) Automatic Resistance Welding in the Construction of Railroad Cars. Ernst Guder. *Deutsche Eisenbahn Technik*, v. 7, Aug. 1959, p. 395-405.

(T23p, K3)

337-T. The Development of Oscillatory Rolling-Contact Bearings for Airframe Applications in the Temperature Range 300 to 600° F. W. A. Glaeser. Battelle Memorial Institute. (Wright Air Development Center.) *U. S. Office of Technical Services*, PB 151909, Mar. 1959, 104 p. $2.50.

Evaluation of more than 1000 commercially available high-temperature aircraft roller bearings. (T24a, T7d; SGA-c)

338-T. (Russian.) Direct Cold Deformation as a Means for Increasing the Corrosion-Fatigue Strength of Pump Rods. R. A. Bagramov and R. M. Raskin. *Vestnik Mashinostroeniya*, v. 39, no. 10, 1959, p. 9-13.

Oil well pump rods are deformed in the direction of main stress to which they will be exposed in service in order to increase strength. 3 ref. (T28, R1e, 3-68, G23q; ST)

339-T. Notch Sensitivity Wall Will Crack. *Missiles & Rockets*, June 22, 1959, p. 15-19.

Progress in production of rocket motor cases with minimum notch sensitivity and 300,000 psi. yield strength. (T24e, Q23b, Q23s)

340-T. Study of the Metallurgical Properties That Are Necessary for Satisfactory Bearing Performance and the Development of Improved Bearing Alloys for Service up to 1000° F. T. V. Philip, A. E. Nehrenberg and G. Steven. Crucible Steel Co. of America. *Wright Air Development Center Technical Report* no. 57-343, Oct. 1958, 56 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.75.

(T7d, Q-general, 2-62; AY, *Co, Cr*, SGA-c)

341-T. Current Status of Knowledge on Design Criteria for Bearings Used in High Temperature Aircraft Electrical Accessories. P. Lewis, S. F. Murray and A. A. Schwartz. General Electric Co. *Wright Air Development Center Technical Report* no. 58-519, Sept. 1958, 58 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $1.50.

40 ref. (T7d, T24, 17-51; SGA-h, SGA-c)

(W27n)

12-W.* (German.) Laminated Grinding Wheels. H. Leich. *Metallwaren-Industrie und Galvanotechnik*, v. 49, Sept. 1958, p. 385-390.

Development, operation and application of flexible grinding wheels with radial sheets of abrasive, based on experience in

woodworking industry. Application to fine grinding of steel plates and slightly curved surfaces. Since abrasive grain size is limited to from 150 to 320, prior grinding with hard wheels is required where large amounts of material are to be removed. Small grain size increases tool life up to 200% and with generous lubrication 250 hr. service life may be expected. High tip speed of up to 100 ft. per sec. makes the tool particularly suitable for automatic machinery. (W25c, G18; ST, 4-53)

13-W.* Survey of Furnaces for Melting Copper Alloys, With Cost Data Compiled Under Production Conditions in Sand Foundries. J. L. Rice. *Association of Bronze and Brass Founders,* no. 58, June 1957, 71 p.

Crucible, reverberatory, semirotary, rotary, electric furnaces; pro and con on fuels; crucibles, refractories, electrodes, burners; furnace costs. 23 ref. (W18, E10; Cu-b, 17-53, 1-52)

14-W.* Cast and Rammed Sections in Electric-Arc Furnace Roofs. Pt. 2. *Industrial Heating,* v. 25, Nov. 1958, p. 2325-2326, 2328.

Monolithic constructions in center sections of arc-furnace roofs reduced refractory costs; materials installed by ramming, failure frequently results from laminations; use of high-temperature castable refractories offers maximum economies, both when rammed and cast. (W18s; RM-h, 2-62, 18-69)

15-W.* (German.) Testing and Standardizing of Wire Shot Used in Surface Cleaning. Hans Krautmacher. *Stahl and Eisen,* v. 78, Oct. 16, 1958, p. 1433-1440.

Testing apparatus in which wire shot is thrust against plates at an initial velocity of 80 m. per sec. Shot of 160-180 kg. per sq. mm. tensile strength, 1.2 mm. diameter, showed no notable wear after passing the tester 1200 times, 3% wear after 1500 passes; slowly increasing wear up to 1900 passes, and wore out after 2100 passes. 33 ref. (W2a, Q9n; 4-61)

16-W. Universal Heat-Treatment Furnace —Stress-Relieving Large Welded Fabrications. *Iron and Steel.* V. 31, Nov. 1958, p. 549-550.

Furnace designed to meet exacting heat treatment requirements for large nuclear reactor power vessels. Covers full range of treatments of steel vessels from 200 to 900° C. (W27g, J1a, T11; ST)

17-W. Soaking Pits With a High Velocity Combustion System. David C. Haney. *Iron and Steel Engineer,* v. 35, Nov. 1958, p. 82-89.

Soaking pit capacity increased without expanding existing building by replacing two batteries of four small, gas-fired regenerative pits with two batteries of three larger, one-way, top-fired recuperative pits. (W20g, 18-70)

18-W. Grinding Wheel Grades. Makoto Okoshi and Hanju Watanabe. *Japan Science Review,* v. 4, no. 1, Oct. 1958, p. 146-147.

48-W.* Steels for Extrusion Tools. F. Rodgers. *Metal Industry*, v. 93, Nov. 28, 1958, p. 449-452.

Steel for liners, linear holders and containers. Temperature and stress conditions in extrusions resulting in embrittlement and creep. (To be continued.) 4 ref. (W24n, F24; AY, 17-57)

49-W.* Plasma Gas Guns Reach 30,000° F. William M. Stocker, Jr. *Metalworking Production*, v. 102, Nov. 28, 1958, p. 2088-2089.

Plasma is ionized gas. Plasma guns, in which gas is forced through an electric arc, are for metal spraying, cutting and melting applications. (W29d, G22h, L23)

50-W.* Steels for Extrusion Tools. F. Rodgers. *Metal Industry*, v. 93, Dec. 5, 1958, p. 469-473.

Required characteristics and suggested composition of liners, mandrels and dies. (W24n; SS)

51-W.* Metal Fibres Reinforce Plastic Dies. A. P. Maszucchelli. *Metalworking Production*, v. 102, Dec. 5, 1958, p. 2129-2130.

Longer wear, better thermal properties and greater accuracy result when cast epoxy dies are filled with metal fibers. New technique wherein short fibers are flocked to outside wear surfaces. (W24n, H17; ST, Al-b, NM-d)

52-W. Performance Tests of a Vertical Steam Generator for Nuclear Power Plants. R. L. Coit and C. C. Peake. *Mechanical Engineering*, v. 80, Dec. 1958, p. 56-60. (W11p; 17-52)

53-W. Welding and Forming Combined. *Metalworking Production*, v. 102, Dec. 5, 1958, p. 2133-2134.

Integrated machine performs a complete manufacturing sequence to produce wire bolsters at the rate of 5000 ft. per hr. (W29, W24, 18-74)

54-W. Survey of General and Specialized Machine Tools for Press-Tool Production. J. A. Waller. *Sheet Metal Industries*, v. 35, Dec. 1958, p. 931-938, 951. (To be continued.) (W25)

55-W. (German.) Problem of Air Control in Foundry Planning. Karl Nilsson and Yngve Bovin. *Giesserei*, v. 23, Nov. 6, 1958, p. 689-698.

Installations for controlling temperature, humidity, air circulation, dust, fumes and gases in foundries. Improved working conditions and lower cost of air control per ton of steel produced are the functions of integrated air control planning at time of plant construction. (W10d, W19; ST)

56-W.* (Japanese.) Introduction to Vacuum Furnaces. S. Ikeuchi. *Metals*, v. 28, Nov. 1958, p. 817-820.

Advantages of vacuum melting are removal of gases and impurities whose vapor pressures are high, protection from adulteration and deoxidation. Description of 500-kg. high-frequency vacuum induction furnace operating under 10^{-3} mm. Hg. (W18a, C5j, D8m, 1-73; Ni-b)

57-W.* (Russian.) Modernization of Slabbing Mill at 'Zaporozhstal' Works. M. E. Krivitskii, G. A. Dubrovin and A. V. Sysoev. *Stal'*, v. 18, Oct. 1958, p. 910-916.

Replacement of top roll positioning and balancing arrangement and of vertical roll drive by more efficient mechanism operated by a 50-atm. hydraulic system has resulted in 25% increased mill productivity, in reduced wear on working parts and in improved reliability of mechanisms. Vertical roll drive with roller bearings was of particular help. (W23a)

58-W.* (Russian.) Dependence of Duration of Openhearth Furnace Campaign on Schedule of Repairs. V. A. Romenets. *Stal'*, v. 18, Nov. 1958, p. 1039-1045.

Frequency of hot repairs depends on annual productivity of furnace. All other factors being the same, the main influence on annual furnace productivity is duration of each melt. Short and long repair schedules worked out. Choice of schedule depends on technological level and indexes of each furnace. (W18r, 18-71)

59-W.* (Russian.) Results of Discussion on Quality of Ingot Molds. N. V. Zinov'ev. *Stal'*, v. 18, Nov. 1958, p. 1046-1055.

Major factor determining the performance of ingot molds is metal structure which depends not only on chemical composition but on casting technique. Pearlite and pearlite-ferrite (with 10-40% ferrite and soft graphite) recommended. Also ferrite-pearlite (with 50-80% ferrite). Charge should contain 40% scrap and 15% pig iron by weight. 24 ref. (W19c, 2-60, 3-71; ST)

60-W. Mechanical Presses: Their Selection, Design and Function. Chpt. XI. *Metal Forming and Fabricating*, v. 20, Nov. 1958, p. 32-35.

Gap frame presses. (W24g)

61-W. (Czech.) Industrial Furnace Foundations. Vladimir Balabanov. *Hutnicke Listy*, v. 13, Nov. 1958, p. 984-987.

Distribution of temperatures in a blast furnace foundation is studied. Where the temperature exceeds 250-300° C., red bricks are suggested instead of concrete. Compositions of cements used in foundations. 6 ref. (W17g, 18-69; RM-h)

62-W. (Russian.) Installation for Assembly and Welding of Crane Bridges. L. A. Zhivotinskii, A. D. Gitlevich and V. Ya. Belov. *Svarochnoe Proizvodstvo*, Oct. 1958, p. 33-35. (W29, W12q)

63-W. (Russian.) Friction Welding Machine From a Lathe. M. I. Kunis and A. I. Korablev. *Svarochnoe Proizvodstvo*, Nov. 1958, p. 37.

Conversion of a lathe into a friction welding machine. (W29)

64-W.* Economic Advantages of Electric Furnaces. Walter H. Holcroft. *Metal Treating*, v. 9, Nov-Dec. 1958, p. 10-11, 29, 34, 36, 40.

Box-type batch furnace, car-type, conveyor-type, pusher-type furnaces, roller-hearth continuous furnace, continuous rotary furnace, shaker-hearth furnace and walking-beam furnace. (W27j, W27k, W29m, 17-52)

65-W.* (French.) Ventilation of Foundries. K. Nilsson and Y. Bovin. *Fonderie Belge*, v. 28, Nov. 1958, p. 317-331.

Gravity and forced-air ventilation systems; provision of fresh air and individual ventilation where fumes, dust, etc., must be exhausted. (W10d, E-general, A8a, 18-67)

66-W.* (French.) Accelerated Process in a Basic Heroult Furnace Used in Steel Casting. Andre Mal. *Fonderie Belge*, v. 28, Nov. 1958, p. 332-334.

Combines advantages of basic furnace method with that of acid furnace by simplifying and shortening operation, using one slag application. (W18s, D5a; ST)

67-W.* (Russian.) Continuous Rolling of Wire Rod. V. S. Makarenko. *Metallurg*, v. 3, Nov. 1958, p. 28-34.

Mill rolls wire of carbon steel 5-10 mm. diameter. Original bar is square, 60 mm. long, and weighs 330 kg. Production indexes from Jan. to Aug. 1958 given as 500,000 tons yearly. (W23d; CN)

68-W.* (Russian.) Continuous Small Section Rolling Mill 350. V. F. Bur'yanov and B. F. Cherkasov. *Vestnik Mashinostroeniya*, v. 38, Nov. 1958, p. 79-84.

Handles round sections 10-30 mm. diameter, squares 10-30 mm. and sheet 200 x 6 mm. of carbon steel, using ingots of 80 x 80 and 106 x 106 mm. 9-9.5 m. long. Ingots heated in trizonal recuperative furnace fueled by mixture of coke and blast furnace gases. (W23, F21b; CN)

69-W.* Metal Powders for Barrel Finishing. G. C. Madigan. Paper from "Proceedings of the 14th Annual Meeting". Metal Powder Assoc., New York, 1958, p. 71-78.

A blend of Cu metal powder and abrasive were formed into pellets by pressing in a suitable die. During tumbling trapped Cu pellets are dislodged by placing the casting in an acid until the pellets merely drop free. Tests indicate that the new media form small radii more rapidly than previously obtained with other madia, such as aluminum oxide stone. (W2a, L10d; Cu)

70-W. How Do Steel Dies Compare With Carbide Dies? Joseph P. Schmidt. *Carbide Engineering*, v. 10, Dec. 1958, p. 9-15.

Although carbide dies have higher initial cost than steel dies they can produce 12 times as many pieces. (W24n; 6-69, ST)

74-W. (French.) Buffing Machine With Rollers. C. R. Morris. *Machine Moderne*, v. 12, Dec. 1958, p. 59-60.

New method for obtaining superfinishes in borings. Machine used consists of a number of runners at inclined axle, placed at even intervals on outside of boring cylinder which is kept in place by outer housing. (W2n, L10a; ST)

75-W. (French.) Aluminum Conductors for Outdoor Transformers. Guy Souriou. *Revue de l'Aluminium*, no. 258, Oct. 1958, p. 1017-1026.

(W11r, 1-57; Al)

76-W. (French.) Calculating the Capacity of Crushers. Pt. 1. Huber Panu and Emil Popa. *Revue de Metallurgie (Bucharest)*, v. 3, no. 2, 1958, p. 59-83.

11 ref. (W15n, B13)

77-W. (Russian.) Overhauling 260-Ton Openhearth in 140 Hours. V. E. Pis'mennikov. *Metallurg*, v. 3, Nov. 1958, p. 26-27.

Work entailed removing 1300 tons of metal and relining furnace with 3000 tons of refractories. Speed made possible by careful planning and use of special cranes and hoisting equipment. (W18r, 18-72; RM-h)

78-W. (Russian.) Mechanization and Automation of Sand Blowing. G. S. Taburinskii and P. I. Kholodenko. *Liteinoe Proizvodstvo,* Oct. 1958, p. 11-16.

Mechanization of sand blowing is first step of elaborate program to modernize foundry industry. Sand blower used to fill mix in core boxes. While former machines could be only used for mixes of high-viscocity green sand of low strength and humidity up to 3.0%, new machine can be used for all types of core and molding mixes. It performs two-fold operation blowing the core and reloading the operating reservoir with a device consisting of reversible disk with two working holders. (W19h, 18-74)

79-W. (Russian.) Tube-Billet Mill at Dzerzhinsky Works. G. E. Tsukanov. *Stal',* v. 18, Nov. 1958, p. 1012-1017.

Installation of automatic seamless tube mill. High productivity impeded by shortages of certain parts due to poor plant layout. (W23h, 18-67; ST)

80-W. (Russian.) Mechanization and Automation of Tube Mills. M. G. Berdyanskii. *Stal',* v. 18, Oct. 1958, p. 928-930.

Automation in moving of billets from the heating furnace to the continuous stands. Various degrees of mechanization in different mills and plans for more complete automation. (W23h, W12r, 18-74; ST)

81-W.* Cupolas. F. Dunn and H. J. Leyshon. *Iron & Steel,* v. 31, Dec. 24, 1958, p. 632-636.

Cupola design and melting practice; cold blast acid-lined furnace, basic-lined, water-cooled and hot blast cupolas. Oxygen enrichment of blast. 37 ref. (W18d, E10a, 1-64, 1-65)

82-W.* Rotary Furnaces. F. Dunn. *Iron & Steel,* v. 31, Dec. 24, 1958, p. 637-638.

Rotary melting practice, pulverized fuel-fired furnaces, oil-fired furnaces. 21 ref. (W18b; CI)

83-W.* Electric Furnaces. F. S. Leigh. *Iron & Steel,* v. 31, Dec. 24, 1958, p. 643-646.

Principal design features and operating characteristics of induction melting furnaces of the core type and coreless types. Resistance furnaces and direct arc and rocking-arc furnaces. (W18a, W18s, E10r, 1-62; ST, CI)

84-W. Factors Effecting Press Tool Design. A. Chapple. *Australasian Engineer,* v. 50, Oct. 7, 1958, p. 60-64.

Pressure, shearing resistance, ductility and strain hardening of materials. (W24N, 17-51, 3-66, 3-74)

85-W. Drive and Control System for High-Speed Rod Mill. *Iron and Steel,* v. 31, Dec. 1958, p. 585-588.

Equipment and layout at the Cuyahoga Works of the United States Steel Corp., Cleveland. (W23n)

86-W. Standardization Increases Flexibility of Automation. *Machinery,* v. 65, Jan. 1959, p. 98-108.

(W12r, 18-74)

87-W. Equipment Requirements for High-Speed Machining. H. J. Siekmann. *Tool Engineer,* 42, Jan. 1959, p. 49-52.

(W25n)

88-W. (German.) Dynamic Loads on Rolling Mill Machinery. S. N. Koschewnikow. *Neue Hutte,* v. 3, Nov. 1958, p. 655-665.

(W23p, F23)

89-W.* (German.) Operation of Oil-Fired Pusher-Type Furnaces. Rudolf Muller and Franz Hollweger. *Stahl und Eisen,* v. 78, Nov. 13, 1958, p. 1676-1678.

Actual plant experience in transport, storage and preheating of fuel, operating characteristics of the preheating furnaces, oil consumption, influence of fuel on product quality and scaling rate. Performance report on low-pressure burners of recent design. (W20h, F23; RM-k, Al-b)

90-W.* (Hungarian.) Determining Flywheel Dimensions for Rolling Mills. Ervin Kiss. *Kohaszati Lapok,* v. 13, Feb-Mar. 1958, p. 131-135.

Methods for designing flywheels on reversible and on nonreversible rolling mill stands based on analysis of actual operational conditions of the rolling process. 4 ref. (W23p)

91-W.* Rolling Mill With Remote Control for Processing Nuclear Fuel Elements. *Process Control and Automation,* v. 5, Dec. 1958, p. 524-526.

Complex electro-hydraulic control system permits interchanging of four separate roll configurations by remote control. Mill has 600,000-lb. rolling load capacity, speed of 100 ft. per min. (W23f, 18-74, T11g)

92-W.* (French.) Efficiency and Costs in Arc Welding. W. Bonhomme and G. Jasmin. *Revue Universelle des Mines*, v. 14, Oct. 1958, p. 372-377.
Intensive research has provided improved electrodes and thereby reduced welding costs. Advantages and limitations of deep-penetration, high-efficiency, coated, basic, acid and rutile electrodes. (W29h, K1)

93-W. Fully Continuous Narrow-Strip and Wire-Rod Mill. Ludwig Wegmann. *Demag News*, no. 148, 1957, p. 16-29.
Mill in Luxembourg of a new design, to roll strip 10-70 mm. thick, 0.8-5 mm. thick and wire from 5-12 mm. diameter. (W23c, W23d)

94-W. Planning Heavy and Medium Plate Mills. W. Mullenbach. *Demag News*, no. 149, 1957, p. 23-31.
Survey of present mills which meet high standards of quality, finish and rolling tolerances and which can roll a variety of stock. (W23b)

95-W. Engineering Aspects of Modern Basic Bessemer Plants. Hans Hofmeister and C. Herrmann. *Demag News*, no. 149, 1957, p. 1-8.
Engineering development work on basic bessemer steelworks, plants being planned or built with bottom-blown converters. (W18p)

96-W. Burn-Off Cleaning and Paint Baking in One Radiant Oven. *Industrial Finishing*, v. 34, Aug. 1958, p. 82-83.
Overhead power-driven monorail conveyer moves material; quartz-lamp radiant oven, having three temperature ranges, degreases and bakes primer and top coating. (W4k, W12r, L26n, L10n; 18-74)

97-W. Mechanical Manipulation in Bar Mills. E. C. Peterson. *Iron and Steel Engineer*, V. 36, Jan. 1959, p. 67-78.
Devices available for handling pieces through guides and passes of bar mills. (W12, A5a, F23)

98-W. Mechanical Inching Devices. H. Kermit Fish, J. R. Shields, E. W. Barth and K. W. FitzSimmons. *Iron and Steel Engineer*, v. 36, Jan. 1959, p. 109-111.
(W23n)

99-W. A Survey of Forging Manipulators and Their Applications. P. L. Lillywhite. *Iron and Steel Institute, Journal*, v. 190, Dec. 1958, p. 394-413.
Use of manipulators in relation to the layout of various forging plants. (W22, W12s)

100-W. Tape Control Guides Welding System. *Tooling & Production*, v. 24, Jan. 1959, p. 54.
(W19, 18-74)

New welding generators and rectifiers. 5 ref. (W29a, K1, 1-52)

110-W. (Russian.) Universal Welding Equipment. V. P. Kolesnikov and S. M. Shklovskii. *Svarochnoe Proizvodstvo*, Dec. 1958, p. 31.

(W29)

111-W.* (Hungarian.) Production and Consumption of Cast-Iron Ingot Molds. Sandor Hargitay. *Kohaszati Lapok-Ontode*, v. 91, May-June 1958, p. 101-109.

Mold life extended by preheating, proper cleaning after use, avoiding water cooling, control of temperature and pouring rate and removal of molds as soon as possible after pouring. (W19c, D9k; CI)

112-W.* Steels for Extrusion Tools. F. Rodgers. *Birmingham Metallurgical Society, Journal*, v. 38, Dec. 1958, p. 117-138.

Application of 2% Ni-Cr, 2% Ni-Cr-Mo-V, 1-1/2% Cr-Mo-V, 5% Cr-Mo-V, 4% W-Cr, 10% W-Cr steels in extrusion containers, liners, liner holders, rams and stems, mandrels and dies. 4 ref. (W24p, F24, 17-57; TS, *Ni, Cr, Mo, V, W*)

113-W.* Aluminum Cooling Towers and Their Treatment. A. J. Haygood and J. Dean Minford. *Corrosion*, v. 15, Jan. 1959, p. 36-40.

Alloy selection, fabricating practice, surface finish and inhibition treatment. Specific applications and properties for 6061, 6062, 6051, 2024, 5052 and 3004 Al alloys. 8 ref. (W10g, R10b; Al-b, 17-57)

114-W.* Rolling Mill for Processing Nuclear Fuel Element Materials. *Metallurgia*, v. 58, Dec. 1958, p. 286-288.

Provision for operation in an inert atmosphere is provided in a new 2-high/4-high combination mill which is arranged for sealing within a glove box enclosure, the reduction gears, pinion stand and drive motor being outside. (W23, T11g, F23)

115-W. More Atoms for Peace. John P. Howe. *Metal Progress*, v. 75, Jan. 1959, p. 106-110.

Discussions at the Geneva Conference indicated that knowledge of fundamental physics is more advanced than the ability to harness the atomic forces. (W11p, P18)

116-W. Atomic Energy in Canada. David A. Keys. *Metal Progress*, v. 75, Jan. 1959, p. 90-94.

Canadian activities are restricted to peacetime uses of atomic energy. Over 100 "Cobalt-60 Theratrons" have been sold to 20 countries for treatment of malignant diseases. Long and successful experience with heavy water as a moderator for chain reaction in natural U enables them to use this principle in the design of their first power plants. (W11p, 1-52, 16-62)

117-W. New High Frequency Induction Equipment for Heating Billets for Rolling. J. C. Howard. *Metallurgica*, v. 58, Dec. 1958, p. 270-272.

Installation provides the cleanliness and flexibility required in heating a range of special alloys, some with high Ni content, whose rolling temperatures vary from 800 to 1250° C. (W28s, F23; Ni, 4-52)

118-W. Faster Roll Grinding Aided by Automatic Electronic Feed. *Metalworking Production*, v. 102, Dec. 26, 1958, p. 2265-2269.

(W23k, W25s; ST)

119-W. Auto Makers Tool Up With Magnesium Mill Products. Thomas Walker. *Modern Metals*, v. 14, Jan. 1959, p. 58, 60-61.

(W25b, X20, T21a, 17-57; Mg-b)

120-W. (Russian.) Increasing Productivity of Linear Heavy Section Rolling Mills. M. S. Karpyshev. *Stal'*, Dec. 1958, p. 1108-1112.

Alterations in a heavy section rolling mill increased the productivity by 20-25%. (W23e, 17-51)

121-W.* (German.) New Basic Converter and Openhearth Steel Plants. Werner Heischkeil, Karl Becker, Gerhard Leiber and Rudolf von Moos. *Stahl und Eisen*, v. 79, Jan. 8, 1959, p. 8-21

Reconstruction of an integrated iron and steel mill with latest design equipment. Data on types, capacities, controls, charging devices, operation, output, heat consumption and life expectancy of steel melting furnaces. Comparison with similar equipment in other reconstructed plants, economic aspects, quality of steel produced. 15 ref. (W10, W18p, W18r; ST)

122-W.* (Hungarian.) Shaping the Roll Surfaces for Hot Rolling of Sheets and Strips.

Jeno Mercader. *Kohaszati Lapok*, v. 91, July 1958, p. 317-321.

Compensating effects of roll and roll stand deflection, elongation of beams, wear of rolls and flexibility of journal bearing housings. Advisability of using preheated rolls for closer control of rolling accuracy. (W23k, F23, 17-51)

123-W.* (Hungarian.) Application of Suspended Form Panels for Furnaces. Ferenc Hammer and Arisztid Czeke. *Kohaszati Lapok*, v. 91, July 1958, p. 336-338.

Prefabricated steel form panels to rebuild openhearth furnaces. (W18r, 18-72; ST, 17-57)

124-W. Titanium/Platinum Anodes Developed. *Industrial Finishing (London)*, v. 11, Jan. 1959, p. 49.

(W3h; Ti-b, *Pt*, 8-62, 17-57)

125-W. Steelworks Lubrication. *Iron and Steel*, v. 32, Jan. 1959, p. 32-33.

German rolling mill practice. (W23, 18-73)

126-W. Metal-Working Processes and Equipment. Pt. 3. A. G. Thompson. *Welding and Metal Fabrication*, v. 27, Jan. 1959, p. 26-30.

Application of cold sawing machines, reciprocating hacksaws, bandsaws, section and bar croppers, hydraulic saw feed and clamping machines. (To be continued.) (W24m)

127-W. Annealing and Patenting Furnaces for Steel Wire. *Wire Industry*, v. 26, Jan. 1959, p. 73-74.

128-W. (German.) Replacement of a Cupola Bottom Without Pulling Down the Furnace. Gerhard Bienwald. *Giesserei*, v. 45, Nov. 20, 1958, p. 722-723.

Changing from cold blast to hot blast. (W18d, 18-57)

129-W.* (French.) Construction and Operation of Methane and Fuel-Oil Fired Openhearth Furnaces. Luigi Bruno. *Revue de Metallurgie*, v. 55, Dec. 1958, p. 1113-1125.

Calculations by formulas based on actual findings in plant practice, developed to direct furnace design and to forecast performance characteristics, particularly heat consumption and required composition of the charge. (W18r, 17-51)

130-W.* Composition and Application of Anodes. D. J. Fishlock. *Metal Finishing*, v. 57, Feb. 1959, p. 48-51, 57.

Anodes must have the following characteristics: free and uniform dissolution, high conductivity, high purity. (To be continued.) (W3h, P15g, 2-60; Ni-a, Ni-b, *Sn*, Cu)

131-W. Development of Filler Wire for Welding Army Ordnance Armor by the Inert-Gas Shielded Consumable-Electrode Process. S. M. Silverstein, R. P. Sopher and P. J. Rieppel. Battelle Memorial Institute. *U. S. Office of Technical Services*, PB 131689, Mar. 1956, 30 p. $1.

Mn-Ni-Mo-V and Mn-Mo-V ferritic steel filler wires with improved cracking resistance. Additions of 0.30% misch metal to the experimental filler wires improved the cracking resistance and notch toughness of the weld deposits. Titanium additions, when controlled very closely, had significant effects on notch toughness of the deposited weld metals. (W29h, Q23s; ST, *Mn, Mo, Ni, V*, 9-72)

132-W. (Book.) Hitchcock's Machine and Tool Directory. 926 p. 1959. Hitchcock Publishing Co., 222 E. Willow Ave., Wheaton, Ill. Free.

Products, toolsteel, trade name and association sections. (W25, T6; TS, 11-67)

133-W. (Translation—BISI, no. 1104.) Raw (Unfired) Converter Bottoms at the Seraing Basic Bessemer Steelworks, Cockerill-Ourgree. R. S. Schuermans and J. Van Neste. *Revue Universelle des Mines*, v. 14, Aug. 1958, p. 270-279.

134-W. (Translation—BISI, no. 1132.) Modern Hot Blast Cupolas for Steel Melting Plants. N. V. Zinov'ev. *Stal'*, Sept. 1958, p. 796-799.

See item 584-W, 1958. (W18d; ST)

135-W. (Translation—BISI, no. 1161.) The Volklingen Cross-Flow Shaft Kiln for Burning Small Lump Limestone. Werner Heiligenstaedt. *Stahl und Eisen*, v. 77, Apr. 4, 1957, p. 421-426.

See item 184-W, 1957. (W13a, NM-e)

136-W.* Three New Low-Hydrogen Iron-Powder Electrodes. D. C. Smith and W. G. Rinehart. *Metal Progress*, v. 75, Feb. 1959, p. 102-107.

Three new electrodes have been developed for high-strength weldments which

will respond to heat treatments such as are used in aircraft. Tests show that the weld metal matches hardness and tensile strength of the base at tempering temperatures between 450 and 1250° C. (W29h, Q-general; AY, SGB-a)

137-W.* Melting Furnaces. T. Bishop and A. G. E. Robiette. Paper from "Modern Foundry Practice". Philosophical Library, Inc., New York, 1959, p. 142-179.

Characteristics of lift-out, bail-out and tilting crucible furnaces. Arc, induction and resistance electric melting furnaces. Rotary furnaces, air furnaces, openhearth furnaces, converters and cupolas. Recent development in cupola operation. (W18, E10a)

138-W.* Heavy Plate Techniques. *Nuclear Energy Engineer*, Jan. 1959, p. 36-39.

Development of new low-hydrogen electrode "Fortex 35A" for welding 3-in. steel plates, giving welds with substantially higher Charpy impact strengths. (W29h)

139-W. Niobium-Uranium Alloys as Container Material for Molten Uranium Eutectic Alloys. G. W. Powell. Nuclear Metals Inc. *U.S. Atomic Energy Commission*, NMI-1183, Aug. 22, 1958, 20 p. (Available for U. S. Office of Technical Services, Washington 25, D. C.) $.75.

For periods up to one month the useful temperature range of oxidized crucibles of 5% Cb uranium alloy containing molten 5% Cr uranium alloy is from 860 to 950° C. If the oxidizing treatment is carried out so that the oxide layer is constituted wholly of UO_2 instead of U_3O_8 the useful temperature range can be extended to higher temperatures and the crucible life within the 860 to 950° C. interval increased. (W18h, R1h; U, Cb, 17-57, 2-61)

140-W. Automatic Equipment Brazes and Tests 7 Joints in 4 Minutes. *Industry & Welding*, v. 32, Feb. 1959, p. 28-29.

A 50-kw. induction heating machine silver brazes 85 joints an hour in automatic transmission cover assemblies. (W29n, T21, K8k)

141-W. Rolling Medium Width Steel Strip: Steel, Peech and Tozer's Brinsworth Mill. *Metallurgia*, v. 59, Jan. 1959, p. 3-9.

7 ref. (W3h; Cr)

154-W.* (English.) Liquid Hardening Media. *Aciers Fins & Speciaux Francais*, no. 30, Dec. 1958, p. 49-55.
Physical properties and quenching characteristics of water, aqueous solutions, quenching oils, molten salt baths and molten metal baths. Types of oils. (W28p, J26)

155-W.* (Russian.) Recirculation-Type Recuperative Steelmaking Furnace. M. A. Glinkov and G. I. Demin. *Stal'*, Jan. 1959, p. 24-31.
Quality of metal produced in the recirculation-type recuperative steel melting furnace is not inferior than that produced in openhearth furnaces. The use of the recirculation-type recuperative furnace may prove to be particularly effective when melting low-carbon metal, where the sum of C + Mn + S + P is less than 0.075%. 4 ref. (W18r, D2)

156-W.* (Russian.) Roll Pass Designing and Rolling Shapes of Alloy Steels. M. V. Shuralev and S. G. Nekrasov. *Stal'*, Jan. 1959, p. 58-63.
Necessary to take into consideration the higher properties of alloy steels in comparison with ordinary carbon steels. These include higher resistance to deformation, widening and shrinkage. (W23k, F23, 17-51; AY)

157-W.* A New Concept of Weld Metal for High-Strength Fabrication. D. C. Smith. Paper from "New Fabrication Techniques". American Society for Metals, Cleveland, 1958, p. 54-62.
Properties of three commercial, heat treatable electrodes developed for welding of SAE 4130, 4140 and 4340 steels. Low-hydrogen iron powders make it possible to add limited amounts of C to the covering and recover enough in the weld deposit to raise the C content to about 0.25% without impairing the weldability characteristics of the electrodes. Tensile strength of the deposit is raised to that of the base metal of higher C content. (W29h, K1; ST, C)

158-W. Cleaning Iron Oxide Fumes With a Bag Filter. Pilot-Plant Tests by British Oxygen Research Development, Ltd. K. H. Sargent. *Iron and Coal Trades Review*, v. 178, Jan. 9, 1959. p. 79-85.
Experiments provide basis for design when handling oxide fume generated by oxygen lancing. 20 ref. (W13c, A8a; ST)

159-W. (English.) Anzin Works of the Tubes Division of the Lorraine-Escaut Group. *Aciers Fins Speciaux Francais*, no. 30, Dec. 1958, p. 99-107.
Special steels, rolling mills and forging mills for production of tubes; cold drawing and heat treatment; inspection facilities. (W23h, F26)

160-W. (Russian.) Improved Brick Linings for Electric Furnaces. A. N. Glazov and V. I. Mesyats. *Metallurg*, Jan. 1959, p. 14-19.
(W18a; RM-h)

161-W. (Russian.) Rational Design of Blast Furnace Hearth Bottoms. B. N. Zherebin and N. V. Krepyshev. *Stal'* Jan. 1959, p. 10-14.
Air cooling of a blast furnace hearth bottom, applied under conditions of intensified operation, reduces the temperature and eliminates formation of cracks. 6 ref. (W17g; RM-h)

162-W. (Russian.) Rationalization of Conditions for Charging Raw Materials Into a

Blast Furnace. V. A. Sorokin. *Stal'*, Jan. 1959, p. 15.

Modified structure for charging raw materials into a blast furnace. (W17g, D1a, 1-52)

163-W. (Russian.) Mastering the Rolling of Stainless Steel Profiles. S. G. Terent'ev. *Stal'*, Jan. 1959, p. 64-67.

To overcome difficulties in rolling slitted shapes of stainless steel it is necessary to select a suitable material for manufacture of rolls with different pass design and to adjust carefully the guide accessories. (W23k, F23, 17-51; SS)

164-W.* High Volume Molten Metal Holding. *Modern Metals*, v. 15, Feb. 1959, p. 36, 38.

Seventy-five melting and holding furnaces having a total holding capacity of more than 700,000 lb. of hot metal are the key to Ford's volume production of die and permanent mold cast engine and transmission parts. (W19a, T21b, T21c; 5-61, 5-63, Al-b, 17-57)

165-W.* Compact Furnace Anneals Strip. D. L. Somers and C. A. Turner. *Iron Age*, v. 183, Feb. 26, 1959, p. 94-95.

Continuous annealing furnace for stainless steel strip provides controlled atmosphere and temperatures up to 2100° F. (W27n, J23n, 1-61; SS, 4-53)

166-W.* (German.) Aluminum Bronze Drawing Dies and Steel Dies Compared. K. Keller. *Werkstattstechnik*, v. 49, Jan. 1959, p. 55-59.

Deep drawing properties of three stainless steel dies (austenitic and ferritic), several steel dies, and of four copper-base die alloys. Less friction is produced by bronze dies permitting less expensive lubrication to be used. 6 ref. (W24n, 17-57; SS-d, SS-e, SGA-j, Cu-b, *Al, Fe, Mn, Si, Ni*)

167-W. The Expansion Program at Sparrows Point. Engineering and Mechanical Aspects. George C. Little. *Iron and Steel Engineer*, v. 36, Feb. 1959, p. 69-79.

Facilities for steel production and working; erection problems; design of openhearth furnaces, soaking pits and slab mills. (W18r, W20g, W23a, 18-70)

168-W. Jones & Laughlin Cleveland Works. T. J. Ess. *Iron and Steel Engineer*, v. 36, Feb. 1959, p. 85-104.

Characteristics of coke plant, blast furnace, openhearth furnace, blooming mill, strip mill, hot finishing, pickling, cold mill, annealing and temper mill facilities. (W18a, W17g, W18r, W23, 18-67)

169-W. (French.) Melting of Copper Alloys. Rene Liseau. *Fonderie*, no. 156, Jan. 1959, p. 3-13.

Various types of fuel heated and electric melting furnaces. (W18, E10; Cu-b)

170-W. (German.) Design and Service Life of Forming Tools. K. Sieber. *Werkstattstechnik*, v. 49, Jan. 1959, p. 49-55.

Relationship between shape of dies and forming process; wear and cracking of dies; materials for dies. (W24n, G-general, 17-51)

171-W. (Italian.) Graphite Crucibles. *Fonderia*, v. 7, Nov. 1958, p. 497-498.

Maintenance, use, handling; heating. (W18h, NM-k37)

172-W.* Nickel-Base Alloy for High-Temperature Heat Treating Equipment. L. M. Griffore. *Metal Treating*, v. 10, Jan-Feb. 1959, p. 10-14, 40.

Use of Hastelloy X in trays, hearth rollers and radiant heating tubes. Oxidation resistance and tensile strength at elevated temperatures. Welding and machining procedures. (W27p, W28a, 17-57; Ni-b, SGA-h)

173-W.* Van der Horst Evaluates Titanium Tubing for Heating and Cooling Chrome Solutions. *Products Finishing (London)*, v. 23, Feb. 1959, p. 59-60, 62.

Titanium provides good heat exchange and corrosion resistance (W13b, 17-57, R7g; Ti-b, 4-60)

174-W. (Book.) Filler Metals for Joining. Orville T. Barnett. 244 p. 1959. Reinhold Publishing Corp., 430 Park Ave., New York 22, N. Y. $7.

Fillers for arc welding, gas welding, thermit welding, brazing and soldering. Emphasis on iron powder electrodes, automatic welding wires and soldering filler wires. (W29h, SGA-f)

175-W. (Translation.) Design and Construction of the Openhearth Furnace. G. Grenier. *Iron and Coal Trades Review*, v. 178, Jan. 16, 1959, p. 149-152. (From *L'Echo des Mines et de la Metallurgie*, no. 6, 1958, p. 365-367.)

See item 154-W, 1958. (W18r, D2, A5b, 10-55)

182-W. (Translation—BISI no. 1064.) New Method of Vibrating Converter Bottoms. Ernest Glaesener. *Stal und Eisen,* v. 78, Aug. 21, 1958, p. 1169-1175.
See item 518-W, 1958, (W18p; RM-h)

183-W. (Translation—Brutcher no. 4372.) Design of a Vacuum Installation for Pouring Ingots of up to 120 Tons. V. K. Novitskii. Paper from "Problems of the Use of Vacuum in Metallurgy". Moscow, 1958, p. 107-111.
Vacuum chamber for pouring steel ingots weighing up to 132 net tons. Design details of vacuum chamber proper, the cover, the pouring ladel. (W19e, D9, 1-73)

184-W.* Compound Core Movements in Die Casting Dies. H. K. and L. C. Barton. *Machinery (London),* v. 94, Feb. 25, 1959, p. 439-449.
Core designs for compound core withdrawal. (W19n, 17-51)

185-W.* (German.) Reactions Between Solid Materials and Their Application to Arc Welding. O. Knotek. *Metall,* v. 13, Feb. 1959, p. 96-103.
Testing electrode coating materials by sintering techniques; welding electrodes with sintered cores. 12 ref. (W29h, K1a)

186-W.* (German.) Trends in Power and Blast Generation for Iron and Steel Works. Richard Simon. *Stahl und Eisen,* v. 79, Feb. 19, 1959, p. 199-204.
New trends in pig iron and steel ingot production related to power requirements in blast furnace operations. 30 ref. (W11g, D-general)

187-W.* Steel Based Compound Cuts Tool Cost 85%. *Production,* v. 42, Sept. 1958, p. 48-49.
Powdered metal bonded by thermosetting plastic produces punch and die set for prototype draws. (W24p, W24n; ST, NM-d30, 6-72)

188-W.* Arc Melting of Reactive and Refractory Metals. Maurice Cook and E. Swainson. *Institute of Metals, Journal,* v. 87, Feb. 1959, p. 161-173.
Historical development of techniques and equipment. Various types of arc furnaces with cooled crucibles and provision for melting in vacuum or under protective atmosphere. Design of consumable-electrode nonpouring furnaces. Applications. 43 ref. (W18s, C5h, 1-73; EG-d)

189-W.* The Recirculating Steel Melting Furnace as a New Unit for Producing Low Carbon Steel. Mark A. Glinkov. Paper from "Annealing of Low Carbon Steel, Proceedings". Lee Wilson Engineering Co., Inc., Cleveland, Oct. 1957, p. 43-50.
Application of recirculating principle to various types of furnaces. Steel can be easily produced with low C+Mn+S+P which is highly suitable for electrical purposes. 6 ref. (W18g, D10; CN-g)

190-W.* Rotary Melting Furnaces. *Automobile Engineer,* v. 49, Feb. 1959, p. 78-80.
Design, operation and uses of rotary and tilting types. (W18b)

191-W.* Composition and Application of Anodes. D. J. Fishlock. *Metal Finishing,* v. 57, Mar. 1959, p. 55-59.

Characteristics of inert anodes for Cr, Cd and Ni plating. 22 ref. (W3h; Pb-b, Ti, ST, SS, C)

192-W.* Trends in Furnace and Equipment Design. Lester F. Spencer and Charles Weiner. *Tooling & Production*, v. 24, Mar. 1959, p. 53-56.

Trends in heat treating and general classes of furnaces and components used. (W27)

193-W.* Air-Cooled Crucibles for Cold Mold Arc Melting. M. M. Kirk, P. C. Magnusson and G. L. Schmidt. *U. S. Bureau of Mines, Report of Investigations*, no.5443, 1959, 23 p.

Forced-air cooling of cold mold arc furnaces for melting Zr and similar metals investigated and found to be practical from the standpoint of heat transfer. This technique offers significant reduction in explosion hazard from that inherent in water cooling. (W18s, W18h; Zr)

194-W. A Russian Fine Wire Rolling Mill. O. Terder. *Iron and Steel*, v. 32, Feb. 1959, p. 44.

A 12-stand mill for the continuous rolling of fine wire developed by the Ministry of Machine Construction of the U.S.S.R. (W23, 4-61)

195-W. Cold Heading. *Iron and Steel*, v. 32, Feb. 1959, p. 53-54.

New four-blow progressive header having one shearing and four subsequent heading stations produces high-tensile bolts. (W24j, 1-67)

196-W. Mannesmann's New Seamless Mill at Saulte Ste. Marie. Robert Hartenstein and Astor L. Thurman. *Iron and Steel Engineer*, v. 36, Feb. 1959, p. 139-148.

(W23h, 18-67)

197-W. Remote Position Control of Screwdown Drives of Primary Rolling Mills. L. N. Bramley, F. Seredynski, L. J. Chant and G. K. Steel. *Iron and Steel Institute, Journal*, v. 191, Feb. 1959, p. 176-185.

6 ref. (W23p, 18-74)

198-W. Application of Remote Position Control to Forges. L. J. Chant and F. Seredynski. *Iron and Steel Institute, Journal*, v. 191, Feb. 1959, p. 185-191.

(W22p, 18-74)

199-W. Economic Advantages of Gas-Fired Heat Treating Furnaces. F. C. Schaefer. *Metal Treating*, v. 10, Jan-Feb. 1959, p. 2-3, 35, 48-50.

(W27g)

200-W. Vacuum Furnaces Aid Heat Treatment. *Metal Treatment and Drop Forging*, v. 26, Feb. 1959, p. 72.

Normal operating temperature is around 1200° C. Provision is made for the forced cooling of the furnace by introducing argon or hydrogen into the chamber. (W27, 1-73)

201-W. Vibration-Controlled Hammer. Rolt Hammond. *Metal Treatment and Drop Forging*, v. 26, Feb. 1959, p. 73-76, 78.

Vibrations in the forging process; design of foundations to minimize vibration and noise. (W22b)

202-W. (German.) Medium-Frequency Induction Furnaces. *Giesserei-Praxis*, no. 4, Feb. 25, 1959, p. 69-72.

Advantages of the medium-frequency induction furnace include fast melting, uniform bath composition and temperature as a result of electrodynamic mixing. (W27K)

203-W. (German.) Graphite Consumption During the Melting of Alloy Cast Iron in the 300-Kg Graphite Bar Electric Furnace. Karl Wagner. *Giesserei*, v. 46, Feb. 26, 1959, p. 114-116.

Scaling losses of the current-carrying graphite sections of the furnace. Service life of graphite bars and contacts. (W18, E10; NM-k36)

204-W. (German.) Power and Blast Generating Plants in Four Iron and Steel Works. *Stahl und Eisen*, v. 79, Feb. 19, 1959, p. 185-187.

Specific power requirements per ton of pig iron produced. (W11g, D-general)

205-W. (Hungarian.) Fundamentals of Molding Box Design. Imre Szilagyi. *Kohaszati Lapok-Ontode*, v. 91, Sept. 1958, p. 215-219.

Guide bushings and pins, recommended sizes, shapes and materials. (W19g)

206-W. (Italian.) Furnace Roofs. *Refrattari*, Dec. 1958, p. 93-101.

Thermal, static, chemical and structural problems of roof design. Refractories for openhearth, electric arc and heating furnace roofs; behavior or refractories during furnace operation. 5 ref. (W18r, W18s, W27; RM-h)

207-W. (Russian.) Coatings for Arc Welding Electrodes. A. A. Brokhin. *Svarochnoe Proizvodstvo*, Jan. 1959, p. 16-20.
6 ref. (W29h)

208-W.* (Polish.) Heat Conductivity, Expansion and Reactivity of Carbon Materials Used in Blast Furnace Brickwork. Eugeniusz Mazanek and Jan Janowski. *Hutnik*, v. 25, Nov-Dec. 1958, p. 447-456.
Results indicate great advantages in using carbon materials for brickwork of lower part of blast furnaces. Good heat conductivity of carbon bricks secures adequate heat removal. 13 ref. (W17g; RM-h, C)

209-W.* (German.) Construction and Design of Die Casting Dies. A. Hohmann. *Giesserei Praxis*, no. 5, Mar. 10, 1959, p. 77-78.
Toughness, heat resistance and service life are determined by steel type, hardening and heat treatment. (W19n, 17-51, 2-64)

210-W.* (Hungarian.) Operation and Metallurgy of Basic-Lined Cold Blast Cupolas. Ferenc Varga. *Kohaszati Lapok-Ontode*, v. 91, Oct-Nov. 1958, p. 235-242.
Preliminary experiments in 300 and 800-mm. and subsequent production-type operations in 900 and 1300-mm. diameter basic lined cupolas; wear resistance of magnesite, dolomite, corundum and acid linings. 8 ref. (W18d; RM-h38)

211-W. Which Welding-Power Source Should You Buy? C. A. McClean. *Iron Age*, v. 183, Mar. 26, 1959, p. 143-150.
(W29a)

212-W. Starch Content Effect on a Rammed Graphitic Mold Material for Casting Titanium. H. W. Antes and R. E. Edelman. *Modern Castings*, v. 35, Mar. 1959, p. 97-102.
(W19g, E-general; Ti)

213-W.* (German.) Czechoslovakian Experiences With Blast Preheaters Installed in Cupola Furnaces. Bretislav Sochor. *Freiberger Forschungshefte*, v. B30-2, 1958, p. 119-132.
New stoves installed in cupola furnaces work very satisfactorily. Since the blast preheating temperature does not exceed 400° C. they can be manufactured of ordinary boiler sheets. (W18d, W17m)

214-W.* Honeycomb Sandwich Fixtures at 2000° F. Frank J. Filippi. Paper from "ASTE Collected Papers", v. 58, Book no. 2, Paper no. 132. American Society of Tool Engineers, Detroit, 1958, 8 p.
Design of firing fixture and retort for brazing honeycomb sandwich in a controlled atmosphere. Pneumatic fixtures. (W29k, K8j, 2-62, 1-71; 7-59, SS)

215-W.* (Czech.) Crushing of Ferromanganese With the Help of Electrical Current. Josef Stloukal. *Zvaranie*, v. 8, Jan. 1959, p. 25.
Ferromanganese is crushed between two Cu plates moved in parallel directions while a transformer current passes. (W15n; AD-n31, *Mn*)

216-W. Review of Aluminum Cranes. A. H. Koepf. *Iron and Steel Engineer*, v. 36, Mar. 1959, p. 69-88.
Weight reduction effect of Al construction for overhead traveling cranes makes possible higher material handling rates by permitting higher bridge and trolley accelerations and speeds. (W12q; Al, 17-57)

217-W. Reactor Metallurgy. Bettis Technical Review, No. 10. *U. S. Atomic Energy Commission, WAPD-BT-10*, Oct. 1958, 115 p. (Available from U. S. Office of Technical Services, Washington 25, D. C. $2.75.
Covers fabrication, mechanical properties and corrosion of structural materials and fuel elements. Papers abstracted separately. (W11p, T11)

218-W. (Italian.) Use of Electric Induction Furnaces in Italy. *Fonderia*, v. 8, Jan. 1959, p. 7-17.
(W18a)

219-W. (Italian.) Controlled Atmospheres. Pt. 3. *Trattamenti Termici*, v. 2, Jan-Feb. p. 19-21, 27.
Atmospheres based on fuel gas reactions. Exothermic gas generators, operations, gases produced. (To be continued.) (W28q)

220-W. (Russian.) Flat-Bottom Ladles for Hot Pig Iron. G. I. Gerasimof, F. A. Korablin, V. M. Nemkin and V. A. Lednov. *Stal'*, Feb. 1959, p. 110-111.
Flat-bottom ladles are more economical and convenient than those with spherical bottoms. (W18n)

221-W. (Russian.) Operation of One-Way Fired Recuperative Soaking Pits. M. E. Boiko, V. S. Gulunov and I. M. Ezikov. *Stal'*, Feb. 1959, p. 170-175.
6 ref. (W20g)

222-W. (Russian.) Use of Central Molds Made of Cast Iron With Spheroidal Graphite. A. B. Bobrov and A. A. Sinitsyn. *Stal'*, Feb. 1959, p. 189-191.

Molds made from magnesium-inoculated cast iron are 2.17 times more durable than those fabricated from gray iron. Mold strength is reduced without heat treatment or when poured from cupola with excessive Mn, phosphorus or sulphur content. 4 ref. (W19c; CI-r, AD-p36, *Mg, P, S, Mn*)

223-W.* Filler Metals for Joining. Orville T. Barnett. *Welding Engineer*, v. 44, Apr. 1959, p. 48-50.

Classification of steel filler wires and electrodes; mechanical properties of weld metals deposited by rods or wires using submerged-arc or gas-shielded process. (W29h, K1d, K1e; ST)

224-W. (Translation.) Reheating Furnace for Alloy Steel. M. R. Courdille. *Iron and Coal Trades Review*, v. 178, March 6, 1959, p. 561-564. (From Centre de Documentation Siderurgique, CIT, no. 5, 1958.)

Advantages and disadvantages of walking beams and notches for moving items along the hearth. (W20h, W12, F21b, AY)

225-W. (Translation—BWRA.) Electrical Circuits of Machines for Resistance Welding of Thin Metal. M. P. Zaitsev. *Avtomaticheskaya Svarka*, v. 65, Aug. 1958, p. 83-88.

New circuit for a seam welding condenser machine enables high welding pulse frequency to be obtained with greater efficiency. (K3, 1-52)

226-W.* Vacuum Brazing Furnace Design. G. Jewett Crites. *Industrial Heating*, v. 26, Mar. 1959, p. 462-464, 466, 468, 470, 480, 482, 484, 486, 494.

Equipment details for brazing stainless steel and Ti honeycomb sandwiches in relation to atmospheres, temperature, mechanical and electrical requirements. (W29m, 17-51, K8j; SS, Ti, 7-59)

227-W. Automatic Controls for Protective Atmospheres. William C. Diman. *Metal Progress*, v. 75, Apr. 1959, p. 79-83.

Automatic proportioning valves, dew point indicators, flash back arrestors, blow-offs, flame controls, temperature regulators, pressure regulators, alarms, flow meters and system interlocks are assembled according to the needs for protecting workmen, equipment and material in progress. (W28q, X7, X13f)

228-W. Loose Abrasive Finishing Machines. Fred T. Hall. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 37-44.

Equipment employs principle of revolving parts through a static mass of loose abrasive. (W2s)

229-W. Plating Rack Design and Insulation. Frank J. Klein. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 135-138.

Use of synthetic resin coatings and plastisol as plating rack coatings and insulating material. (W3g, 17-51)

230-W. Annealing and Dies in Process Drawing of Wire. A. Mohrnheim. *Wire and Wire Products*, v. 33, Dec. 1959, p. 1465-1468B, 1507-1508.

Modern process drawing requires the calculation of the minimum number of drawing dies and annealing steps. Practical methods can determine, by ordinary calculating means, die sizes, length and speed of wire and the diameters of the take-up drums. 6 ref. (W24n, F28)

231-W. (German.) Melting Furnaces for Nonferrous Metals. H. Boswinkel. *Metall*, v. 13, Apr. 1959, p. 299-305.

Various furnace types, characteristics, production data, economy. 9 ref. (W18; EG-a38)

232-W. (German.) Continuous Annealing of Steel Strip Coils. Hans-Joachim Pohle. *Stahl und Eisen*, v. 79, Mar. 19, 1959, p. 361-362.

Substitution of the new rotary-type furnace for the conventional batch-type annealing furnace increases capacity ten-fold and integrates all pretreatment and annealing processes, which are performed in an automatic sequence. (W27h, J23, 1-63; CN, 4-53)

233-W. (Slovakian.) Nonrotating Power Supplies for the Automation of Argon-Shielded Arc Welding. Pavel Zuffa. *Zvaranie*, v. 8, Feb. 1959, p. 41-43. (W29a, 18-74, K1d)

234-W.* Modern Heat-Treatment Equipment. L. G. W. Palethorpe. *Wild-Barfield Heat-Treatment Journal*, v. 7, Mar. 1959, p. 2-8.

Batch-type controlled-atmosphere, shaker-hearth furnace, rotary-drum furnace and mesh-belt conveyor furnace. (W27)

235-W.* Basis of Selection of Quench Media. R. H. Lauderdale. Paper from "Quenching of Steels". American Society for Metals, Cleveland, 1958, p. 51-66.

Hardenability of steel; section size and symmetry; dimensional tolerances and mechanical property requirements. Quenching with water, water spray, water-base solutions, oil and compressed air. Effect of agitation. (W28p, J26n, J5; ST, SS)

236-W.* (Czech.) Effect of Composition on Quality and Mechanical Properties of Welds With 25% Cr, 20% Ni Type Electrodes. Jaroslav Vidrma. *Zvaranie*, v. 8, Mar. 1959, p. 85-88.

Effects of carbon, Si, Mn, phosphorus and sulphur and of the molecular ratio between these elements on the quality of weld metal. Influence of electrode coating. 6 ref. (W29n, K1, 2-60; SS-e, *Cr, Ni, P, S, C, Si*)

See item 42-W, 1959. (W23b; ST)

316-W. One Casting Machine for Aluminum or Zinc. *Precision Metal Molding*, v. 17, June 1959, p. 28-29.

Cold chamber vacuum die casting machine can be used with either metal simply by changing the melting pot. (W19f, E13; Zn, Al)

317-W.* (Russian.) Advantages of Wedge-Shaped Bottoms in Ingot Molds. Yu. V. Zavershinskii. *Stal'*, v. 19, May 1959, p. 413-417.

Wedge-shaped (28-30° to the vertical) bottoms in ingot molds reduce their susceptibility to metal adherence, improve ingots quality and reduce the amount of crop-shear discards. Specific heat impinged by a stream of molten metal on wedged-type bottoms is from 2 to 8 times les than in flat-type bottoms. 3 ref. (W19c)

318-W. Control of Carbon Pickup in Uranium Metal by Induction Furnace Tuning. J. W. Mahaffey. National Lead Co. of Ohio. *U. S. Atomic Energy Commission*, NLCO-768, Feb. 11, 1959, 12 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.50.

Tuning the high-frequency, coreless induction furnaces by adjusting the variable capacitator banks to obtain a standard impedance of 3.3 to 3.6 ohms is an effective means of standardizing these furnaces and provides control of carbon pickup by correct time-power control. (W18a, E10r; U)

319-W. (Russian.) Gland and Pneumatic Packing for Charge Distributor of Blast Furnaces. M. S. Voronov. *Stal'*, May 1959, p. 397-398.

Newly designed packing for revolving distributor of a blast furnace charge gives a much tighter seal of the mechanism when operating at higher gas pressure. (W17g, D1)

320-W. (Russian.) Improved Design of Secondary Circuits for Steelmaking Arc Furnaces. Yu. E. Efroimovich, V. V. Timoshenko and V. P. Tsukanov. *Stal'*, May 1959, p. 421-424.

New design of secondary circuits possess a sharply reduced reactance (1.2-2.5 times) and lowered resistance (10-15%). (W18s)

321-W. (Russian.) Modern Continuous Billet Mill. M. M. Shternov. *Stal'*, May 1959, p. 429-432.

Continuous billet mill with horizontal rolls compared with alternate vertical and horizontal rolls. (W23k, 1-61)

322-W. (Russian.) Mechanism for Feeding of Metal Into Rolls of a Rolling Mill. B. D. Smolovikov and L. Shevchenko. *Stal'*, May 1959, p. 441-443.

(W23p)

323-W. New Quenching Bath Chemical. Mack Gordon. *Metal Treating*, v. 10, May-June 1959, p. 10, 52.

Water soluble chemical which is non-inflammable and has no obnoxious odor. (W28p)

324-W. Arc Phenomena, Basic and Applied. E. W. Johnson. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 101-120.

Behavior of consumable electrode arcs at subatmospheric inert gas pressures and in vacuum investigated to provide a basis for predicting the behavior of vacuum melting arcs. 4 ref. (W18s, 1-73)

325-W. Selection of Power Supply and Methods of Arc Electrode Motion Control. E. J. Borrebach. Paper from "Vacuum Metallurgy". Reinhold Publishing Corp., 1958, New York, p. 121-137.

Atuomatic furnace electrode regulation in vacuum arc furnaces. 3 ref. (W18s, 1-73)

326-W. (German.) Electric Salt Bath Furnaces for the Heat Treatment of Wire. Carl Albrecht. *Draht*, v. 10, May 1959, p. 219-221.

(W27j, J2j; 4-61)

327-W.* Molybdenum-Base Alloy Is Superior Diecasting Die Core Material. *Foundry*, v. 87, July 1959, p. 136-138.

Advantages for Mo cores include decreased downtime for polishing, longer life before heat checking and replacement, and lower scrap from tears on the casting surface. Disadvantages are lack of mechanical strength and ductility, low hardness, low abrasion resistance, sensitivity to thermal shock at lower temperatures. (W19n; Mo-b, 17-57)

328-W. How to Ventilate Electric Arc Furnaces. D. M. Hysinger. *Modern Castings*, v. 36, July 1959, p. 30-32.

Types of exhaust hoods, ventilators and louvers. (W10d, E-general)

329-W. Core Boxes for Shell Cores. J. E. Stock. *Modern Castings*, v. 36, July 1959, p. 71-72.

Reasons for the use of gray iron shell core boxes in preference to those made of Al. (W19g, 17-57; CI-n, Al)

330-W.* Filler Wire for Welding Army Ordnance Armor. S. M. Silverstein, R. P. Sopher and P. J. Rieppel. *Welding Journal*, v. 38, May 1959, p. 232s-240s.

Mn-Ni-Mo-V ferritic steel and a Mn-Mo-V ferritic steel filler wire with desired strength, ductility, crack resistivity, and notch toughness when deposited by inert gas-shielded metal-arc process. Additions of 0.3% misch metal improved the properties. 9 ref. (W19h, K1d, T2g; SS-d, *Mn, Ni, Mo, V*, 4-53)

331-W. New Operational Features on Patricia Blast Furnace at Fairless Works. R. H. White, W. O. Smith and P. E. Hutchings. *Iron and Steel Engineer*, v. 36, June 1959, p. 75-86.

Basic characteristics, electrical controls and instrumentation. (W17g, D1a)

332-W. Mains Frequency Crucible Type Induction Melting Furnaces. *Wild-Barfield Heat-Treatment Journal*, v. 7, June 1959, p. 10-14.

(W18a, W18c)

333-W. (French.) Universal Molds. R. Grunberg. *Metallurgie et la Construction Mecanique*, v. 91, May 1959, p. 371-375.

Recessed and side-block molds used in the U. S. and Soviet Union for die casting of Zn and Al alloys. (W19g, E13; Zn-b, Al-b)

334-W. (German.) Propane Annealing and Hardening Furnace. *Werkstattstechnik*, v. 49, June 1959, p. 332.

Description and service data. (W27g)

335-W. (Polish.) Carbon Linings in Blast Furnaces. Stefan Zielinski and Wladyslaw

Woznacki. *Hutnik*, v. 26, May 1959, p. 178-186.
20 ref. (W17g; RM-h39)

336-W.* Molybdenum Die Casting Dies. *Precision Metal Molding*, v. 17, July 1959, p. 32, 52-53.
Melting and machining properties make sintered Mo attractive. (W19n; Mo, 6-71, 17-57)

337-W. (Book.) A Treatise on the Internal Mechanics of Ball, Tube and Rod Mills. H. E. Rose and R. M. E. Sullivan. 258 p. 1958. Chemical Publishing Co., Inc., 212 Fifth Ave., New York. $6.
Ball, tube, road, pebble, batch, grate-discharge, trunnion-overflow, hardinage and airswept mills; open and closed-circuit grinding; dry and wet milling. Power to drive a mill; surging; lifters; vibration frequency spectrum; destruction of gearing. Rose's theory of metal wear; factors affecting ball wear; influence of corrosion. Role of additives in milling. 110 ref. (W15, B13)

338-W. (Russian.) An Industrial Rotary Furnace. A. A. Garkusha and A. Z. Ryzhavskii. *Metallurg*, June 1959, p. 20-21.
(W18b)

339-W. (Russian.) Experience With Roller Coupling Boxes Made From Pipes. A. I. Fridland. *Metallurg*, June 1959, p. 32-33.
Roller coupling boxes previously produced either by forging or of cast iron subjected to cementation can be replaced by couplings made of pipes. (W23)

340-W.* Production of Medium-Sized Ingot Molds. H. P. Millar. *British Foundryman*, v. 52, June 1959, p. 292-301.
Manufacture, usage and failure characteristics of five-ton molds produced for the steeltube industry. Ingot molds should be manufactured from a low-phosphorus, high-carbon iron and be constant in section and free from cold laps, inclusions and shrinkage cavities. (W19c, E19; ST, 9)

341-W.* Developments in Vacuum Sintering Furnaces. M. Donovan. *Powder Metallurgy*, no. 1-2, 1958, p. 104-113.
Vacuum equipment, heating systems and thermal insulators. (W26e, 1-73)

342-W. Simplified Energy Calculations for Multiple Wire-Drawing Machines. F. Liekmeier. *Draht (English Edition)*, no. 41, June 1959, p. 55-59.
Energy requirements for a given drawing process on a certain machine with a known number of drafts and basic drafting plan to determine the drawing speed at which the existing motor is fully loaded. (W24k, F28)

343-W. Plating Drums for Mass-Production Electroplating. Horst von Uslar. *Draht (English Edition)*, no. 41, June 1959, p. 62-64.
Operating methods and equipment. (W3b)

344-W. Design Can Influence Foundry Cooling. H. E. Knowles. *Foundry*, v. 87, Aug. 1959, p. 57-59.
High heat loads ordinarily rule out conventional cooling methods in a foundry. Temperature control is primarily a question of ventilation—putting air in motion either naturally or artificially. (W10f, E-general)

345-W. The Windscale Atomic Piles. Tom Bishop. *Metal Progress*, v. 76, July 1959, p. 105-109.
Ten years ago the British Government built two Pu-producing piles at Windscale, similar to the American piles at Hanford except the coolant was atmospheric air rather than river water. Both of these piles were shut down about a year ago because the graphite moderator was dangerously overheated by "Wigner energy". It is unlikely that the British power-producing piles which use carbon dioxide as coolant and heat-transfer medium will be similarly endangered. (W11p)

346-W. (Dutch.) Seal Test Shutters for Observation Holes in Cupolas. D. H. Soeters. *Metalen*, v. 14, June 15, 1959, p. 168.
(W18d)

347-W. (Russian.) Application of Water-Cooled Mandrel Bars in Disk-Piercing Tube Mills. N. E. Protskii and P. D. Mavrodii. *Stal'*, June 1959, p. 546-550.
Improved design with graduated wall thicknesses prolonged mandrel life 10-15 times. Best results were obtained with mandrels made of 3KH2V8 steel. (W23h, F26q, W24p)

348-W. Foundry Melting Equipment Review—Trends in Nonferrous, Steel and Iron Foundries. Pt. 1. Melting in Nonferrous Shops. D. W. Brown. *Foundry*

Trade Journal (Special Exhibition Issue and Catalog), v. 106, May 1959, p. 15-17.
4 ref. (W18, E10; EG-a38, ST, CI)

349-W. Foundry Melting Equipment Review—Trends in Nonferrous, Steel and Iron Foundries. Pt. 3. Developments in Melting Equipment for Ironfounders. W. J. Driscoll. *Foundry Trade Journal (Special Exhibition Issue and Catalog)*, v. 106, May 1959, p. 20-24.
Lining-less, water-cooled and hot blast cupolas. Electric and other melting furnaces. (W18d, E10; CI)

350-W. Patternmaking Progress. W. D. Hartley. *Foundry Trade Journal (Special Exhibition Issue and Catalog)*, v. 106, May 1959, p. 25-28.
Wood, resin and metal pattern equipment used in the United Kingdom. (W19j)

351-W. Modern Foundry Mechanization. J. Bain. *Foundry Trade Journal (Special Exhibition Issue and Catalog)*, v. 106, May 1959, p. 29-34.
(W19, E-general)

352-W. Clean Air for Foundries. W. H. White. *Foundry Trade Journal (Special Exhibition Issue and Catalog)*, v. 106, May 1959, p. 35-40.

406-W. Factors Influencing the Performance of Grinding Wheels., E. J. Krabacher. *Journal of Engineering for Industry (ASME Transactions, Series B)*, v. 81, Aug. 1959, p. 187-199.

Grinding wheel wear curve and wear ratio as affected by work size, chip load, metal-removal rate and metal surface hardness. (W24c)

407-W.* (Russian.) Corrosion of Anode Fasteners in the Electrolysis of Aluminum. M. A. Korobov. *Tsvetnye Metally*, no. 7, 1959, p. 52-58.

Corrosion at 800-900° C. by products of the carbon anode and air and oxygen. Alloy steels had a higher corrosion resistance than carbon steel. Effect of the $FeS + Fe_2O_3$ film on the steel surface on the voltage of electrode. (W17k, R6q, 2-61; CN, AY)

408-W.* Development, Properties and Usability of Low-Hydrogen Electrodes. D. C. Smith. *Welding Journal*, v. 38, Sept. 1959, p. 377s-392s.

Fe-powder low-alloy high-tensile electrodes have been developed with sufficient notch toughness in the weldment when used on the new quenched and tempered steels such as T-1 and the HY-80 steels to prevent crack propagation of ship structure at freezing temperatures. 17 ref. (W29h, K1a; ST)

409-W.* (Russian.) Plasma Arc Heating in Welding. K. V. Vasil'ev and A. A. Isachenko. *Svarochnoe Proizvodstvo*, Sept. 1959, p. 5-6.

Thermal efficiency varying with the length of plasma jet. Relative quantity of nitrogen or argon particles as a function of temperature. 4 ref. (W29p)

410-W. A Comparison of Regenerative and Recuperative Soaking Pits. S. H. Brooks.

Iron & Coal Trades Review, v. 179, Oct. 2, 1959, p. 457-467. (W20g)

411-W. (Russian.) The Plasma Arc as a Source of Heat Used in Metalworking. I. D. Kulagin and A. V. Nikolaev. *Svarochnoe Proizvodstvo*, Sept. 1959, p. 1-4.
Technical characteristics of the plasma arc. 4 ref. (W29p)

412-W.* Introduction to Rollmaking. D. de W. Marais. *Engineer and Foundryman*, v. 24, Apr. 1959, p. 102-109.
Definition and classification of rolls; forged and cast steel rolls. Influence of alloying elements on chilled cast iron rolls in relation to surface hardness, chill depth and microstructure. (W23k, 2-60; CI, ST)

413-W.* (Dutch.) High-Efficiency Electrodes. C. J. Verzijlberg. *Lastechniek (NVL)*, v. 25, Sept. 1959, p. 244-245.
Effect of electrode coatings containing Fe powder on light irradiation of the arc, arc voltage, striking of the arc, removability of slag, welding practice and speed. (W29h, K1a)

414-W.* Pipe Mill Bearings Lubricated by Grease Pressure System. *Blast Furnace and Steel Plant*, v. 47, Oct. 1959, p. 1079-1080.
Li-based grease in the friction bearings of electric-weld pipe mill of Jones & Laughlin Steel Corp. withstands conditions of extreme heat and constant pressure. This results in minimum maintenance and high efficiency of the mill. (W23m, 18-73)

415-W. Electric Furnaces Solve Tough Heating Problems. J. E. Friess. *American Machinist*, v. 103, Sept. 7, 1959, p. 123-125. (W27j, W27n)

416-W.* Heating and Cooling in Continuous Furnace Closely Controls Annealed Structure for Machining. A. G. Sturrock. *Industrial Heating*, v. 26, Sept. 1959, p. 1704-1706, 1708, 1710, 1712, 1848.
Control of furnace atmosphere, heating and cooling are automatic. Furnace includes six chambers heated by gas fired "W" type radiant eductor tubes, insuring no atmosphere contamination. (W27n, 1-61)

417-W.* The B.C.I.R.A. Experimental Cupola Installation. *Metallurgia*, v. 60, July 1959, p. 12-16.
Air supply, heating and charging equipment of cupola; instrumentation, molten metal disposal. (W18d)

418-W. Basic Oxygen Furnace Construction and Operating Data. D. R. Loughrey. *Industrial Heating*, v. 26, Sept. 1959, p. 1816, 1818, 1820, 1822.
Description of the two vessels now in operation at Jones and Laughlin's Aliquippa Works. (W18g)

419-W. Modern Design of Slab Reheating Furnaces. H. C. Henschen. *Iron and Steel Engineer*, v. 36, Oct. 1959, p. 75-82.
A 5-zone furnace is flexible in that it can be operated as a 3-zone furnace for maximum efficiency at slow rolling rates, or operated with high preheat zone temperatures for fast rolling, expected increased rolling or quality heating and maximum soaking. (W20; 17-51)

420-W. Modern Regenerative Soaking Pits. Henry S. Hall. *Iron and Steel Engineer*, v. 36, Oct. 1959, p. 83-92.
Regenerative soaking pits can be designed for the entire range of fuels from straight blast furnace gas up to and including bunker C oil. (W20g)

421-W. Product Finishing Problems. Pt. 2. Barrelling. Frank H. Slade. *Product Finishing*, v. 12, Aug. 1959, p. 77-79.
Barrelling process equipment. (W2s, L10d)

422-W. Estimating Zinc Anode Purity. Pt. 3. *Product Finishing*, v. 12, Aug. 1959, p. 80-81.
Methods for detection and determination of As, Fe, Hg, Ag, Mo, Pb, Cd and Mn in Zn anodes. (W3h, S11; Zn)

423-W.* (French.) Metal Matrices and Coining and Embossing Dies Manufactured by Cold Impression. Jean Foucher. *Pratique des Industries Mecaniques*, v. 42, Aug. 1959, p. 218-224.
Compositions and properties of steels suitable for forming dies. (To be continued.) (W24n; AY, 17-57)

424-W. Heated Dies Produce Better Forgings. Paul R. Gouwens. *American Machinist*, v. 103, Oct. 19, 1959, p. 137-144.
Precision-cast Inconel 713C dies, heated to 1600° F., attain precision of form and increased depth of flanges. (W22a; Ni-b, 17-57, 5-62)

425-W. Modern Rolling Mill Gearings. Karl Breuer. *Demag News*, no. 154, 1958, p. 1-15.
(W23n)

426-W. Conversion of a Single-Stand Four-High Temper Mill to a Two-Stand Four-High Tandem Temper Mill. Heinrich Bischoff. *Demag News*, no. 154, 1958, p. 30-32.
An arrangement whereby only one work roll is driven and small work roll barrel diameters are used. (W23c)

427-W.* Cast High Alloy Belts Help Conversion From Batch Heat Treating. *Industrial Gas*, v. 38, Oct. 1959, p. 12-14.
ACI Type HT alloy is used for continuous feed belts and radiant tubes in a heat treating furnace, withstanding temperatures of 1550-1700° F., loads of 20-30 lb. per sq.ft., hot corrosive gases and thermal shock. (W27p, R3n; SGA-h, Fe, *Ni, Cr*, 17-57)

428-W.* (Russian.) Increasing the Durability of Ingot Molds. Yu. R. Mesnyaev and T. S. Kunovalova. *Metallurg*, Aug. 1959, p. 23-24.
Increased life of ingot molds was provided by better drying the chamotte joints connecting the portions of semipermanent molds that are used for casting ingot molds molds, reinforcement of the bottom of the semi permanent mold and adding ferrosilicon to the cast iron in the ladle. (W19c)

429-W. Survey of Special Furnaces for Rocket, Missile, and Aircraft Components. *Metal Treating*, v. 10, Sept-Oct. 1959, p. 4-7.
Inverted pit furnaces of bottom-opening gantry and top-opening and salt pot, electrically heated types. (W27)

430-W. (Russian.) Wear Between Piston and Cylinder of the Fuel Pump in a Diesel Engine. G. A. Tashkinov. Paper from "Friction and Wear of Machine Parts". Akademiya Nauk SSSR, Moscow, 1959, p. 34-47.
7 ref. (W11j, Q9)

431-W. (Russian.) The Electrical Charge Present in the Anode Fasteners of Electrolytic Equipment for Aluminum. M. F. Dogramadzhi. *Tsvetnye Metally*, no. 5, 1958, p. 50-53.
(W17k; Al)

432-W. Control of Large Electric Arc Furnaces in Relation to Their Effect on the Supply System. J. W. S. Payne. *Instrument Practice Automation & Electronics*, v. 13, Aug. 1959, p. 808-814.
Ratio between surges of different durations; effect of changes in electrode regulator performance. (W18s, 18-74)

433-W. (German.) Installation of a Modern Hardening Plant. B. Jousset. *Harterei-Technische Mitteilungen*, v. 14, no. 1, 1959, p. 1-13.
Plant equipment for heat treatment with salt and in gaseous atmospheres. (W27)

434-W. (Polish.) Centrifugal Blowers Used in Cupolas. Miroslaw Gregoraszczuk and Leszek Zurawski. *Przeglad Odlewnictwa*, v. 9, July 1959, p. 206-213.
(W18d)

435-W. (Russian.) Material and Thermal Balances of a Reverberatory Furnace. I. I. Surovov, A. Ya. Mikhailenko and A. A. Tseidler. *Tsvetnye Metally*, no. 10, 1958, p. 29-32.
(W18r, C21c)

436-W. (Russian.) Quality of Steel Used in Kettles for Lead Refining. A. P. Rogach, A. P. Ryzhikova and P. M. Slivinskii. *Tsvetnye Metally*, no. 11, 1958, p. 32-36.
Testing of structure and composition. (W18h, M26; CN-g)

437-W. A Large High-Temperature Vacuum Sintering Furnace. C. B. Sibley. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1958" (American Vacuum Society, Inc.) Pergamon Press Inc., New York 22, 1959, p. 181-184.
Design of a vacuum furnace having three-phase, resistance-heated tungsten elements and metallic shields for use at 2200° C. and above. (W26e, 1-73)

438-W. High-Temperature Resistance Furnace for Operations at 3000° C. James M. Dickinson. Paper from "Fifth National Symposium on Vacuum Technology Transactions—1959". (American Vacuum Society, Inc.). Pergamon Press Inc., New York 22, 1959, p. 192-197.
Furnace has been used for melting point determinations, sintering and heat treatment of metals. 4 ref. (W27j)

439-W. (German.) Welding and Soldering on Nuclear Reactors. H. R. Pufahl, G. M. Slaughter, P. Patriarca and R. E. Lorentz. *Chemische Rundschau*, v. 12, Oct. 1, 1959, p. 528-529.
(W11p, K1, K7)

440-W. Instrumentation for a New Open-hearth Furnace. William A. Dickinson. *ISA Proceedings. 1959 Conference*, v. 9, 1959, p. 1-12.

Description of component parts of combustion control system. (W18r, S18s)

441-W. (Polish.) Modern Preheating Furnace and Possibilities of Improving Polish Furnace Performance. Z. Warczewski. *Hutnik*, v. 26, no. 7-8, 1959, p. 276-288. (W20h, F21b)

442-W. Design and Construction of the New Basic-Bessemer Plant at Port Talbot. J. W. P. Jaffe. *Structural Engineer*, v. 37, Oct. 1959, p. 282-291. (W18, D3, 17-51)

443-W.* High-Speed Melting. J. G. Winget. *Modern Castings*, v. 36, Sept. 1959, p. 44-47.

New small batch-type furnace is versatile and produces clean castings. (W18, 1-62)

444-W. (Translation—Brutcher no. 4632.) Variation of Hydraulic Resistance of Sinter Bed During Sintering Process. G. V. Ksendzyk. *Izvestiya VUZ, Chernaya Metallurgiya*, July 1958, p. 3-16. (W15a)

445-W. (Translation—Brutcher no. 4668.) New Type Electrode, Shanghai-57-1, for Welding Constructional Steels. Weng-ling Wei. *Svarochnoe Proizvodstvo*, Jan. 1958, p. 30-31. (W29h, K1; ST, SGB-s)

SECTION X

INSTRUMENTATION

Laboratory and Control Equipment

1-X. Synthetic Mica High Temperature Strain Gage Research. G. A. Brewer. Brewer Engineering Laboratories. (Wright Air Development Center.) *U. S. Office of Technical Services,* PB 151045, Dec. 1957, 244 p. $3.50.

Sintering and utilizing an etched foil sensing element (Nichrome V) within a synthetic mica sandwich, capable of operation at 2000° F. Using a sectioned die and a 15-kw, 10-kc, induction generator, the gages were fabricated at 2050° F. under 1000 psi. pressure. The techniques produced sandwiches having a final thickness of 0.008 in. (X28j; Ni-b, Cr, NM-e, 7-59)

2-X. Simple, Gas-Tight Furnace for Induction Heating. R. D. Grinthal. *Powder Metallurgy Bulletin,* v. 8, June 1958, p. 68-69.

(X24f, 1-69)

3-X. Guide to Cam-Inspection Equipment. Harold A. Rothbart. *Metalworking Production,* v. 102, Nov. 7, 1958, p. 1962-1965.

(X20)

4-X. Processing Data From the Openhearth. R. H. Baulk. *Control Engineering,* v. 5, Nov. 1958.

Openhearth information is analyzed and totaled by electronic equipment. (X14g, D2, 1-53)

5-X.* An Apparatus for Heating Small Samples to Elevated Temperatures at High Pressures. J. Fennell, N. H. Hancock and R. S. Barnes. *Metal Treatment and Drop Forging,* v. 25, Aug. 1958, p. 332-334.

Apparatus incorporates pressure vessel which withstands internal gas pressure of 6000 psi. at 950° C. Shows effects of temperature and pressure on gas bubbles and voids contained in solids; effects upon reaction rates, solubilities and physical properties of materials in general. (X24f, N15d, 2-61, 3-74)

6-X. Cryogenics. Don Fabun. *Modern Metals,* v. 14, Aug. 1958, p. 54-61.

Al, with its low cost, workability, and improved properties at low temperatures, is ideal structural material for equipment used to produce, transport and ship liquid gases. (X24b, 17-57; Al)

7-X. (German.) Antenna Reflectors Made of Alucell. P. Lengrusser. *Aluminium,* v. 34, Nov. 1958, p. 663-664.

Honeycomb-like structure reduces total weight of antenna by 30-50%, allows easy transportation and replacement of parts. (X15q; Al-b, 7-59, 17-57)

8-X. A Programming Universal Elevated-Temperature Testing Machine. S. E. Bramer, K. G. Kahmann and R. Titus. Paper from "Short-Time High-Temperature Testing", American Society for Metals, Cleveland, 1958, p. 114-134.

Machine can produce accurate, reliable data on properties of materials subjected to simulated service conditions and can heat and load specimens rapidly for tests involving tension, compression, shear, creep, stress-rupture and fatigue at elevated temperatures. Materials tested were HM 21-T8 and HK 31-T6 Th-Mg alloys, Hastelloy R 235, Udimet 500 Ni-base alloy and N 155 mixed-base alloy. (X29n, Q-general, 2-62; SGA-h, Ni-b, Mg-b, Th)

9-X. Electrical "Firsts" Update Aluminum Plant. *Steel,* v. 143, Dec. 29, 1958, p. 60-61.

Closed circuit television, electronic and automatic controls help this modern rolling plant to get greater output, higher quality. (X20, X15p, W23; Al-b, 4-53, 4-56)

10-X. (Czech.) Combustion Regulation in Openhearth Furnaces. Vaclav Parma. *Hutnicke Listy*, v. 13, Nov. 1958, p. 979-983.

Apparatus used to automatically regulate the ratio of fuel gas to air in an openhearth furnace. 9 ref. (X13f, D2h, 18-74)

11-X. A Combined Electrolytic Polisher and Microscope. F. Rummele. *Engineers' Digest*, v. 19, Nov. 1958, p. 479-481.

New equipment permits the surface of the specimen to be continuously observed and photographed during specimen treatment. (X4e, X4a)

12-X. Design of a Structure Factor Computer for X-Ray Crystal Structure Analysis. P. V. Venkatakrishnan. *Journal of Scientific & Industrial Research*, v. 17B, Sept. 1958, p. 339-345.

9 ref. (X14j, M22d, 17-51)

13-X. Spotlight on the Plating Laboratory. D. J. Dishlock. *Metal Finishing Journal*, v. 4, Dec. 1958, p. 464-466, 476.

Equipment required. (X21, L17)

14-X. (Italian.) Design of a Variable Slit Photometer for Measuring Effective Line Widths. E. W. Salpeter. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 293-295.

(X3n, S11a)

15-X. (Italian.) New ARL Grating-Type Spectrographic Equipment. W. Barry and M. Scalise. *Metallurgia Italiana*, v. 50, Aug. 1958, p. 343-346.

Operates either as quantometer (with fixed phototubes), spectrograph (with photographic camera) or spectrometer (with movable phototubes). (X3, S11c)

16-X. (Italian.) Recent Applications of the Electronic Probe Microanalyzer. J. Philibert. *Metallurgia Italiana*, v. 50, Sept. 1959, p. 402-406.

13 ref. (X3, S11g)

17-X.* Testing and Examination of Electrodeposits. R. Quarendon. *Product Finishing*, v. 11, Dec. 1958, p. 52-63.

General principle of operation of mechanical surface analyzers is that a fine probe in a light pickup is caused to traverse a selected straight line path of suitable length over the surface of the work. An electromechanical or other form of transducer translates the vertical movement of the probe, relative to the general surface level, into the motion of a pointer on a dial or the pen of a recording meter. 7 ref. (X23, S15; 8-62)

18-X. Weighing Hot Metal Electrically. Ralph Lewtas. *Instrumentation*, v. 41, Nov-Dec. 1958, p. 25.

New electric weighing system at Armco Steel Corp's. Sheffield Div. substitutes load cells for beam and level scale. (X20g; 14-60, ST)

19-X.* Rapid-Quenching Hot Stage for Metallography. G. R. Speich and Morris Cohen. *Review of Scientific Instruments*, v. 29, Dec. 1958, p. 1129-1131.

A microscope hot stage designed for use at temperatures up to 1100° C. and for rapid quenching rates up to 500° C. per sec. The stage is designed for rapid quenching from the austenitizing temperature to some lower transformation temperature in order to study the bainitic reaction in a series of high-purity iron-carbon alloys. (X3p, N8m; ST)

20-X. Immersion Thermocouple Practice. H. V. Schubert. *Iron and Steel Engineer*. V. 36, Jan. 1959, p. 91-97.

Basic design, construction, application and maintenance of the bath thermocouple. (X9q, S16a)

21-X.* A Sensitive Method for Measuring Optical Scattering in Silicon. G. H. Schwuttke, O. A. Weinreich and P. H. Keck. *Electrochemical Society, Journal*, v. 105, Dec. 1958, p. 706-709.

Instrument for observing optical scattering in Si and in intermetallic compounds is also a supplementary tool suitable for studying crystal imperfections in conjunction with the optical methods. Scattering patterns are given for heat treated, crucible-grown Si crystals. 10 ref. (X13, P17d; Si, 14-61)

22-X.* (French.) Metallographic Microscope for Radioactive Specimens. J. Bloch and G. Cherel. *Technique Moderne*, v. 50, Sept. 1958, p. 415-416.

Apparatus capable of examining specimens of irradiated nuclear fuels having radioactivity of around 1000 curies permits study of enriched irradiated U after a cooling off period of three months. (X4a, T11g, U)

23-X. Tube Cameras for Investigating Corrosion Problems. A. G. Arend. *Corrosion Prevention & Control,* v. 5, Dec. 1958, p. 53-55.
(X5h, R11, 1-53)

24-X. (French.) Apparatus for Determination of Combined Carbon in Steels and Cast Irons by Selective Oxido-Reduction. Fernand Marion. *Societe Chimique de France, Bulletin,* Aug-Sept. 1958, p. 1187-1188.
(X21, S11g; ST, CI, *C*)

25-X. (German.) Application of Aluminum in Modern Computing Machines. H. Roth. *Aluminium,* v. 35, Jan. 1959, p. 29-35.
(X14; Al-b, 17-57)

26-X. (German.) Directing Production in Rolling Mills by Communication and Signalling System. Herbert Brosch and Helmut Waburek. *Stahl und Eisen,* v. 79, Jan. 8, 1959, p. 23-32.
Programming and delivery of hot ingots in controlled schedule. Working triangle—main control station, pit furnaces and cranes. Sequence of ingot processing. Application for blooming mills and shears, open and continuous finishing trains. Fundamentals and operating methods of communication and signalling system. (X15, F23, W23; ST)

27-X. (Translation—BISI, no. 1129.) Apparatus for Measurement of Losses in Whole Transformer Sheets. J. Siewierski. *Hutnik,* July-Aug. 1957, p. 333-334.
See item 6-X, 1958. (X26; SGA-n, AY)

28-X. (Italian.) Use of Nickel in Permanent Magnets. Vittorio Rosina. *Nickel,* Aug. 1958, p. 1-7.
Historical notes on development of permanent magnets; magnetic properties of permanent magnet materials, particularly Alnico alloys; production by fusion and sintering; applications of magnets. 4 ref. (X11g; SGA-n, 17-57)

29-X.* (Russian.) Continuous Temperature Measurements of Liquid Steel in a Ladle. P. Ya. Sorokin, A. V. Zabaikin, P. P. Babick and O. A. Zakharov. *Zavodskaya Laboratoriya,* v. 24, Dec. 1958, p. 1475-1477.
Thermocouple embedded in ladle bottom and protruding into the molten steel. 5 ref. (X9q, S16a; ST)

30-X. (Russian.) Some Sources of Error in Recording Temperatures With Thermocouples. A. N. Gordov and N. N. Ergardt. *Zavodskaya Laboratoriya,* v. 24, Dec. 1958, p. 1462-1470.
5 ref. (X9q, S16b)

31-X. (Russian.) Immersed Thermocouples. S. K. Danishevskii. *Zavodskaya Laboratoriya,* v. 24, Dec. 1958, p. 1470-1475.
Properties of thermocouples immersed in molten metal. (X9q, S16a; Pt, *Rh,* W, *Mo, Re*)

32-X. (Russian.) Anisometer to Determine Effects of Stresses and Deformation Upon Austenite Disintegration. P. V. Novichkov. *Zavodskaya Laboratoriya,* v. 24, Dec. 1958, p. 1510-1511.
Testing machine which creates stresses, elongational and torsional deformations. (X29)

33-X.* False Negative Permanent Strains Observed With Resistance Wire Strain Gages. Clarence J. Newton. *ASTM Bulletin,* no. 235, Jan. 1959, p. 42-44.
Optical gages proved this false indication probably due to creep in electrical gages or their bonding cement. 5 ref. (X28j; Q25; ST)

34-X.* A Machine for Evaluation of High-Temperature Alloys Under Combined Static and Dynamic Stresses. Paul E. Hawkes and C. Harold Ek. *ASTM Bulletin,* no. 235, Jan. 1959, p. 46-51.
Metals are tested with resonance-type machine which simulates centrifugal and vibrational forces between 1000-1800° F. 4 ref. (X29q, Q25, 2-62)

35-X. (Translation—Brutcher no. 4383.) Small-Size Instrument for Electropolishing and Electro-Etching of Microsections. L. Ya. Popilov. *Zavodskaya Laboratoriya,* v. 24, no. 7, 1958, p. 890-892.
See item 88-X, 1958. (X4e, X4f)

36-X.* Control Engineering in a Steelworks. M. Thomas. *Process Control and Automation,* v. 6, Feb. 1959, p. 50-55.
Instrumentation, communication and control problems, particularly in relation to heat, vibration and dirty atmospheres. (X-general, D-general)

37-X. The Cathode-Ray Oscilloscope. B. R. Evans. *Metal Treatment and Drop Forging,* v. 26, Feb. 1959, p. 53-59.
Metallurgical applications include tests for alloy composition, condition of material (process undergone during manufacture)

and presence of flaws, cracks or porosity. (X25j, X8)

38-X.* (French.) Apparatus for Testing the Corrosion of Stainless Steel in Aqueous Environment and at High Temperature. E. Pouillard, H. Coriou and M. Grall. *Metaux Corrosion-Industries*, v. 34, Jan. 1959, p. 20-35.

Autoclaves and apparatus for the investigation of corrosion occuring in nuclear reactor cooling systems. (X1a, R11; SS)

39-X. Interference Microscope With a Wide Range of Applications. *Machinery (London)*, v. 94, Mar. 11, 1959, p. 561-563.

New instrument suitable for measuring surface finishes. (X3q)

40-X.* (French.) Practicality of the Standardized Image Quality Indicator Used in Radiography. G. Chanty. *Soudage et Techniques Connexes*, v. 13, Jan-Feb. 1959, p. 33-42.

Stepped wedge indicator recently standardized in France is both flexible and economical. Machining procedures, protection against clogging of holes and marine corrosion. (X8g)

41-X. (Italian.) Measurement, Regulation and Reading of Temperatures. Pt. 2. *Trattamenti Termici*, v. 2, Jan-Feb. 1959, p. 22-24, 28.

(To be continued.) (X9)

42-X. (Russian.) Instrument for Testing Corrosion of Materials in Highly Agressive Media at Elevated Temperatures. V. I. Ginzburg. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 220-222.

(X1a)

(X8g, Q24)

45-X. (Russian.) Tensile Tests Samples Cast in an Arc Furnace. V. P. Vinokurov. *Zavodskaya Laboratoriya*, v. 25, no. 2, 1959, p. 240-241.

Details of a laboratory furnace. (X24f)

46-X. Instrumentation. Harold A. Kahler. *Technical Proceedings of the 45th Annual Convention, American Electroplaters' Society*, 1958, p. 123-127.

Control instrumentation in the plating room. 10 ref. (X-general, L17)

47-X. (German.) Optical Equipment for Material and Surface Testing. A. Metz. *Industrieblatt*, v. 59, Mar. 1959, p. 79-82.

Details of new camera metallographic microscopes, hardness testers, dilatometers, surface interference microscopes, light slit instruments and profilometers. (X23, X3, M23b, Q29)

48-X. Selection of Pumping Systems for Vacuum Metallurgical Processes. A. S. D. Barrett and M. E. Harper. *Institute of Metals, Journal*, v. 87, Mar. 1959, p. 227-234.

The four main types of systems are the oil-sealed rotary pump, the Rootes blower, the vapor diffusion pump and the vapor booster pump. 5 ref. (X13e, 1-73)

49-X. (Russian.) Apparatus for Measuring Temporary Deformation During Welding. K. K. Khrenov and I. M. Zhdanov. *Svarochnoe Proizvodstvo*, Mar. 1959, p. 16-18.

Apparatus measures transverse and longitudinal temporary deformation occurring during butt welding, with degree of error not exceeding 0.06%. (X29, K-general, 3-68)

50-X. Measures Thermal Conductivity. *Iron Age*, v. 183, May 7, 1959, p. 101.

Apparatus cuts off heat flow except by conduction through specimen. Thermocouples measure thermal gradient. (X24, P11h)

51-X. Low Temperature-BMF Characteristics of Chromel-Alumel Thermocouples. John F. Carlson. *Industrial Heating*, v. 26, Apr. 1959, p. 688, 690, 706.

(X9q, 2-63, 17-52)

52-X. A Metallograph for the Mill. G. H. Boss. *Metal Progress*, v. 75, May 1959, p. 81-83.

A portable metallograph, complete with polishing and etching equipment, has been devised for shop use. It is designed for examining heavy machine components on the spot; optical examination at 900 × is possible, and good photomicrographs at 250 × have been obtained. (X4a, X4e)

53-X.* Special Research Equipment in Physical Metallurgy. E. C. Roberts and D. H. Polonis. *Trend in Engineering*, v. 11, Apr. 1959, p. 13-18.

Electrical resistance apparatus, magnetic balance, quenching furnaces. (X25, X11, X24f)

54-X. Microscopes. Modern Design of Optical Equipment. *Metal Treatment and Drop Forging*, v. 26, Apr. 1959, p. 155-158, 160.
(X3p)

55-X. (German.) Vacuum Techniques in Metallurgy. *Industrie-Anzeiger*, v. 81, Jan. 30, 1959, p. 119.
Production and control of vacuum atmospheres. (X13e)

56-X. Method of Analysis and Control of Gas Atmospheres Used in the Processing of Electronic Parts and Devices. M. J. Elkind and D. R. Benn. Paper from "Symposium on Cleaning of Electronic Device Components and Materials". American Society for Testing Materials, STP no. 246, Philadelphia, 1958, p. 101-112.
Instruments for analyzing oxygen and moisture in atmospheres of heat treating furnace, crystal-growing furnaces, storage and assembly facilities. 4 ref. (X7j)

57-X. (Czech.) Electrolytic Polishing Equipment for Metallographs. Josef Krumpos. *Hutnicke Listy*, v. 14, May 1959, p. 448-451.
6 ref. (X4e, M20p)

58-X. (Czech.) Use of the Steeloscope in Production Control. L. Rockl. *Hutnicke Listy*, v. 14, May 1959, p. 451-454.
5 ref. (X3c)

59-X. Laboratory Evaluation of Nichrome-Foil Strain Gage Installations Up to 1200° F. William R. Forlifer. Paper from "Symposium on Elevated Temperature Strain Gages". American Society for Testing Materials, STP no. 230, Philadelphia 3, 1958, p. 42-50.
Bonding techniques, temperature compensation methods, effects of temperature cycling and sensitivity variations. (X28j, 2-62)

60-X. Optical Strain Gages for Use at Elevated Temperatures. H. K. Howerton. Paper from "Symposium on Elevated Temperature Strain Gages". American Society for Testing Materials, STP no. 230, Philadelphia, 3, 1958, p. 51-56.
Three types of commercially available optical gages suitable for operation at 500, 1000 and 1500° F. Their use is for the determination of mechanical properties of material at high temperature and for evaluating the performance of remote strain gages. (X28j, 2-62)

61-X. Evaluation of Several Gage Configurations Fabricated With Armour Alloy "D". Jack J. Shrager. Paper from "Symposium on Elevated Temperature Strain Gages". American Society for Testing Materials, STP no. 230, Philadelphia 3, 1958, p. 87-96.
Materials for measuring static strains at temperatures up to 1600° F. The most promising of the strain alloys proved to be alloy D which has a nominal composition of 70% Fe, 20% Cr and 10% Al. (X28j, 2-62; Fe-b, *Cr, Al*)

62-X. (Russian.) A Rapidly Acting Photoelectric Pyrometer. M. E. Gluberson. *Metallurg*, May 1959, p. 25-26.
(X9r)

63-X. (Book.) Symposium on Elevated Temperature Strain Gages. American Society for Testing Materials, STP no. 230. 163 p. June 1958. American Society for Testing Materials, 1916 Race St., Philadelphia 3, Pa. $4.50.
Sponsored by Aeronautical Structures Laboratory, Naval Air Material Center, Philadelphia, Dec. 4-5, 1957. Papers abstracted separately. (X28j, 2-62)

64-X. Pneumatic Comparator Calibrates Slip Gauges. P. J. Sim. *Metalworking Production*, v. 103, June 5, 1959, p. 991-995.
Construction, operation and design calculations of a prototype pneumatic slip gage comparator with a magnification of 30,000. (X28j)

65-X. Vacuum Pumping Systems. H. A. Steinherz. Paper from "Vacuum Metallurgy" Reinhold Publishing Corp., 1958, New York, p. 3-20.
Type of vacuum pumps currently available and criteria which govern their selection for specific applications. (X13e, 1-73)

66-X. Apparatus for Carbon Content Determination. R. Rew. *B.C.I.R.A. Journal*, v. 7, Apr. 1959, p. 651-655.
(X21, S11; CI)

67-X. Thermostatic Bimetal. *Australasian Manufacturer*, v. 44, June 6, 1959, p. 54-56.
Thermocouple materials having a wide range of sensitivity. (X9q; SGA-a)

68-X. Television in Industry. F. D. Grimmer. *Metal Treatment and Drop Forging*, v. 15, June 1959, p. 243-245.

Closed circuit television used in steel mils. (X15p, D-general)

69-X. Classical Potentiostat: Its Application to the Study of Passivity. N. D. Greene. *Corrosion*, v. 15, July 1959, p. 369t-372t.

The performance of a classical potentiostat can be increased by reducing its total series resistance and maximum current output. An improved classical potentiostat with an ultimate potential control of ± 1 millivolt. 24 ref. (X25h, X1, R10c)

70-X.* Refractory Metal Thermocouples. J. C. Lachman. *American Society of Mechanical Engineers*, Paper no. 59-HT-21, 1959, 10 p. $.80.

Thermo-electric properties of refractory metals. Pure metal combinations of Rh versus Mo and Rh versus W were calibrated to 4000° F. in vacuum, hydrogen and inert-gas atmospheres. Both Rh-Mo and Rh-W thermocouples have a high thermal emf. which is reasonably linear with temperature. The practical application of Rh-Mo is limited to about 3200° F. by loss of thermoelectric potential. (X9q, P15; RL, Mo, W, EG-d37)

71-X. (French.) Thermocouples Used in the Foundry. E. R. Perry. *Revue de Nickel*, v. 25, May-June 1959, p. 53-58.

8 ref. (X9q, E-general)

72-X.* An Electron Bombardment Furnace for the Production of Vacuum-Melted Metals. Ed. Candidus. Paper from "Proceedings of First Symposium on Electron-Beam Melting". Alloyd Research Corp., Watertown, Mass., 1959, p. 27-33.

Experimental and production furnaces for electron bombardment heating, water-cooled melting chamber and mold. (X24f, C5k, 1-52, 1-73; Ta, Cb, Mo, W)

73-X.* Recent Developments in Testing Machines and Related Instrumentation. Ib Jensen. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 277-283.

Instrumentation and controls adapting universal testing machines to creep and relaxation testing. Fatigue testing equipment. (X29n, Q3, Q7, 1-53)

74-X.* Recent Developments in Testing Machines and Instrumentation. Pt. 2. B. L. Lewis. Paper from "Mechanical Properties of Metals (Their Determination, Interpretation and Significance)". Pennsylvania State University, University Park, Pa., 1958, p. 285-296.

Development of universal testing machines. Electronic control and recording components. Programming. (X29n)

75-X. A Molybdenum Resistance Cooling Curve Furnace. W. Oldfield. *Journal of the Less Common Metals*, v. 1, Feb.1959, p. 77-79.

Design of a cooling curve furnace which gives an approximately uniform rate of loss or gain of heat over small temperature ranges during solidification. (X24f, N12)

76-X. Arc Furnace and Electron Bombardment Techniques Used in Studies of the Refractory Metals. F. O. Jones, A. G. Knapton and J. Savill. *Journal of the Less Common Metals*, v. 1, Feb. 1959, p. 80-84.

Use in melting point determinations and annealing. (X24f, P12n, J23; EG-d37)

77-X.* (Czech.) Recorder for Determination of Rolling Pressure. M. Kokeisl and Z. Sigut. *Strojirenstvi*, v. 9, May 1959, p. 385-387.

Instantaneous pressure value of the rolling mill provides maximum utilization of the rolls since pressure is recorded on a continuous graph. Cylinder containing strain gages is inserted and the elastic deformation occurring during rolling is recorded. (X29q, X12, F23)

78-X.* (French.) Results Obtained With an Electrostatically Excited Extensometer. R. Cabarat. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 131-143.

Apparatus and method for measuring modulus of elasticity and damping capacity based on possibility of maintaining longitudinal vibrations in the specimen by electrostatic excitation. Equipment can be used at temperatures to around 800° C. and permits calculation of logarithmic decrement of vibrations. 11 ref. (X29p, Q8g, Q21a, Q22)

79-X.* (French.) Development of an X-Ray Micro-Analyzer at the A.E.I. Research Laboratory at Aldermaston (England), Based on the Castaing-Guinier Technique. T. Mulvey. *Memoires Scientifiques de la Revue de Metallurgie*, v. 56, July 1959, p. 163-171.

New instrument makes possible mechanical and electronic scanning of specimen, in addition to point analysis. Preliminary results indicate that Castaing-Guinier method can be applied to light elements, such as carbon, as well as heavy elements. 22 ref. (X3, M21e, S11p)

80-X. Furnaces for the Study of High-Temperature Equilibria. C. W. Haworth. *Journal of the Less-Common Metals*, v. 1, Apr. 1959, p. 106-109.

Four kinds of laboratory furnaces described—conventional wound furnaces; induction heating; high-current furnaces; and argon-arc furnaces. 8 ref. (X24f)

81-X. (Russian.) Pressure of Saturated Aluminum Vapor. Yu. A. Priselkov, Yu. A. Sapozhnikov and A. V. Tseplyaeva. *Izvestiya Akademii Nauk SSSR-Otdelenie Tekhnicheskikh Nauk*, Jan-Feb. 1959, p. 106-109.

New device allowing measurement pressure and effusion. 4 ref. (X12, P12c; Al)

82-X.* The Measurement of Liquid Iron Temperatures. *Castings*, v. 5, June 1959, p. 25-28.

The type recommended is a radiation pyrometer mounted with a water-cooled jacket and temperature indicator with recorder. Calibration of emissivity guarantees accurate readings. The pyrometer can be used with an indicator, millivoltmeter or a recorder. (X9r, S16; Fe, 14-60)

83-X.* Mechanical Testing With a 3000° F. Radiant Heat Furnace. J. K. Hoy. *Metal Progress*, v. 76, Sept. 1959, p. 81-83.

Furnace is powered by quartz pencil lamps. Predetermined test temperatures with programmed heating cycles are obtained and accurately stabilized with an automatic control recording system. (X24f, Q27, 2-62)

84-X.* (German.) Practical Experience With the FH46 Thickness Indicator Applied in Rolling Mills. Rolf Hinkfoth. *Freiberger Forschungshefte*, v. B-36, May 1959, p. 83-107.

Possibilities of measuring rolled sheet thickness with or without direct contact with the rolled product. Comparison of noncontact thickness indicators of the pneumatic, ultrasonic, magnetic and induction types. (X20c, W23f)

85-X. (German.) Instruments for Thickness Measurements in Cold Rolling. Rolf Hinkfoth. *Neue Hutte*, v. 4, Aug. 1959, p. 478.

15 ref. (X20c, F23, 1-67, S14)

86-X. An Automatic Polishing Machine for Remote Metallography. F. L. Brown, S. H. Paine, R. J. Fousek and J. L. Armstrong. Argonne National Laboratory. *U. S. Atomic Energy Commission*, ANL-5904, Aug. 1959, 18 p. (Available from U. S. Office of Technical Services, Washington 25, D. C.) $.75.

Requirements for successful polishing of metallographic specimens, design of a machine for remote polishing of radioactive specimens. 10 ref. (X4e, M20p)

87-X. Back-Reflection Symmetrical Focusing Camera. R. A. Vandermeer. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 87-89.

Use in precision lattice constant measurement. (X5j, M26)

88-X. The Flat-Plate Camera. Alfred E. Attard. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 89-92.

Range of measurements possible with this type of X-ray equipment. (X5j, M22g)

89-X. Preferred Orentation Cameras. B. E. Sundquist. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 95-96.

Sample preparation techniques, instrumentation, interpretation of films and special applications. 14 ref. (X5j, M26c)

90-X. X-Ray Micro-Diffraction Cameras. Margot E. Bergmann. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 96-100.

10 ref. (X5j, M22g)

91-X. Small-Angle Scattering Camera. Robert H. Bragg. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 100-104.

Camera designs, experimental procedure and interpretation of data. 11 ref. (X5j, M22g)

92-X. Rotating-Crystal Camera. John A. Wheeler, Jr. *Norelco Reporter*, v. 6, July-Oct. 1959, p. 105-108.

Camera, method and interpretation. (X5j, M22g)

93-X. (French.) Platinum/Platinum-Rhodium Thermocouples for Measuring Temperatures in the Foundry. E. R. Perry. *Fonderie Belge*, v. 29, Sept. 1959, p. 201-205.

(X9q, E-general, S16a)

94-X. Apparatus for Conducting Tensile Tests at Moderately Elevated and Sub-Zero

Temperatures. F. J. Anders, M. W. Toaz and E. J. Ripling. *Society for Experimental Stress Analysis, Proceedings*, v. 16, no. 2, 1959, p. 127-138.
18 ref. (X29, Q27b, 2-63)

95-X. (English.) Method for Detection of Pinholes in Protective Coatings. F. L. Sos and E. Sterk. *Acta Technica (Budapest)*, v. 25, no. 3-4, 1959, p. 247-255.
Method based on copying the actual state of the surface coat. Method shows similarities to exposure of a photographic plate; the reduction of the Ag salt, however, is an electrochemical and not a photochemical reaction. 18 ref. (X23; NM-g, 9-68)

96-X. Tuyere Controls on No. 1 Blast Furnace at Fairless Works. Jack E. Webber. *ISA Proceedings. 1959 Conference*, v. 9, 1959, p. 13-20.
Theory and installation of air propositioning control on the tuyeres. (X7f, W17g)

SUBJECT INDEX

Since the annotations in this book are grouped into broad classes on the basis of process or property, the major emphasis in the index has been placed on materials, products and applications. Entries under the names of processes and properties usually refer only to general treatments of the subject. Wherever possible, items have been indexed under the name of the material or the type of material (metals, alloys, and metal forms) or product. For example, material on the rolling of aluminum appears as a subhead under the main entry "Aluminum alloys," and not under the main entry "Rolling."

The ASM-SLA Metallurgical Literature Classification, International (Second) Edition, has been used as an authority list, since this contains generally accepted and standardized metallurgical terminology and concepts. Index headings, therefore, fall mainly into the categories of materials (or products), forms of materials, properties, processes, and influencing factors, arrayed in approximately that order.

A

Abrasives, 248-L, 270-L
  wear, 229-Q
Actinium
  extraction and refining, 166-C
    ion exchange, 161-C
Addition agents
  for heat treatment, 249-J
  magnesium, 257-E
  silicon, 257-E
Adherence tests, 208-Q
Adhesive joining
  metal-to-metal, 1-K, 41-K, 75-K, 86-K, 97-K, 323-K, 346-K, 459-K, 13-T
Adsorption, 771-Q, 1468-Q
Age hardening, 226-N, 262-Q
  effect of composition, 135-N
  effect of deformation, 135-N
  volume and dimensional changes, 212-N
Agricultural equipment, 344-E, 45-L, 381-L, 259-T
  spot welding, 513-K
Aircraft, 57-A, 45-Q
  design, 341-T
  electroplating on, 815-L
Aircraft (cont.)
  fatigue, 1508-Q, 164-T
  flaw detection
    ultrasonic, 247-S
  forming and machining, 154-G
  fretting, 1508-Q
  materials
    alloy steel, 713-Q, 168-T
    cobalt alloys, 181-T
    magnesium, 314-T
    magnesium castings, 525-E
    nickel alloys, 233-T
    sandwich structures, 320-T
    stainless steel, 713-Q, 1452-Q, 168-T
    steel castings, 411-A
    titanium, 379-A, 260-T
    toolsteel, 163-T
  pumps, 56-J
  tensile properties, 1147-Q
Aircraft engines, 112-G, 1023-Q, 1024-Q, 63-T
  arc welding
    gas shielded, 170-K
  brazing, 345-K
  corrosion
    effect of high temperature, 355-L

Aircraft engines, corrosion (cont.)
stress, 458-R
creep
strength, 199-T
fatigue, 355-Q, 199-T

Zirconium-selenium alloys
electrical properties, 132-P
thermodynamic properties, 131-P
Zirconium-selenium system, 100-M
electrical properties, 130-P
Zirconium sheet
arc welding, 507-K
grinding
abrasive, 367-G
Zirconium sulphide, 100-M, 131-P, 132-P
Zirconium systems
binary, 431-A, 384-M
Zirconium-tantalum alloys
tensile properties, 1277-Q
Zirconium-tantalum-columbium alloys
hardness, 1277-Q
tensile properties, 1277-Q
Zirconium-tantalum-columbium system, 98-M
Zirconium-tellurium alloys
electrical properties, 132-P
thermodynamic properties, 131-P
Zirconium-tellurium system, 100-M
electrical properties, 130-P
Zirconium-uranium alloys, 64-C
corrosion by waters
fresh, 703-R
steam, 703-R
Zone melting, 19-C, 56-C, 135-C, 207-C, 242-C, 295-C, 304-C
equipment, 190-C, 265-C, 266-C, 270-C
